To Our Readers...

How to Crack the JEE

This new edition of our book, ***Complete Mathematics JEE Main,*** is primarily meant for the candidates due to appear in CBSE's JEE (Main). It thoroughly covers all the topics prescribed in the Mathematics syllabus of this examination. The book is divided into 28 chapters. Each chapter is organised as follows:

1. It begins with a review of **important definitions, formulae, theorems, tips, tricks and techniques** to solve problems. Difficult concepts have been explained by giving appropriate **illustrations** in sufficient numbers.
2. This theory is followed by examples. These **examples (solved in detail)** are divided into three categories:
   (a) **Concept Based** examples to further strengthen and enrich your conceptual understanding
   (b) **Level 1** examples carefully selected to groom you for the JEE Main examination. This section contains both **Straight Objective Type Questions** and **Assertion-Reason Type Questions**.
   (c) **Level 2** examples added to further boost your confidence by initiating you into tougher questions
3. The Solved Examples are followed by Exercises. These have been divided into five parts.
   (i) Concept Based Questions
   (ii) Level 1 Questions
   (iii) Level 2 Questions
   (iv) Previous Years' AIEEE/JEE (Main) Questions
   (v) Previous Years' B. Architecture Entrance Examination Questions.
   The philosophy behind (i), (ii) and (iii) is the same as that in Solved Examples. We have added (iv) and (v) to give you glimpse of the questions that have been asked in the previous years (till 2016). Questions from online JEE (Main) papers from 2013 and 2016 have also been added. As the Mathematics syllabus for B. Architecture Entrance Examination Questions is the same as that of JEE (Main) examination, questions from these papers have also been added for further practice.
4. Each exercise has been provided with **answers**.
5. **Hints and Solutions** to all the questions in (i), (ii), (iii), (iv) and (v) have been given at the end of the chapters.

How to Use this Book

Step 1

Read the theory given in the chapter carefully. Take meaningful notes in a notebook.

Step 2

Go to solved examples. First attempt the questions given in this section (Concept-based). Try to solve each example yourself. If you fail to do it within a reasonable time limit, go through the solution carefully.

The key to improvement is NOT merely understanding the explanation given in the solution, but to see exactly what clues in the question lead us to the correct answer.

Step 3

Repeat Step 2 with Concept-based questions in the exercise.

Step 4

Repeat Step 2 and Step 3 with Solved Examples and questions in Exercises at Level-1 and Level-2.

Important: Leave Previous Years' Questions for the future.

Facing the Examination

The analysis of previous fourteen years' papers shows that it is not possible to leave any topic. You get questions from each and every topic of mathematics. Thus, it is essential that you study each and every topic thoroughly.

Beginning the Preparation

The best time to begin preparation for JEE (Main) is when you have studied almost fifty percent of your Class XI course, that is, almost one and a half year before the day you wish to appear in the JEE (Main).

Effective Studying

You need to set priorities so that you can get the best return for time invested. Write down the time you wish to devote to Physics, Chemistry and Mathematics. As you study, you will develop a list of your problem areas, which will direct you further. This may require you to rearrange your priorities. Do not overestimate the time you have, extra preparation always helps. The key is to set up a workable plan and stick to it.

Some Tips for Preparation

- Identify your strengths and weaknesses.

  It is important to identify your problem areas early on. Your study plan would need to evolve as you identify these areas.

  Equally important is to know your strength areas. You should ensure that these areas are further strengthened and that you are not a victim of overconfidence.

  Your study plan should strike a balance between the time kept for strength areas and for problem areas. Though you need to concentrate more on your problem areas, mastering your strength areas in between would ensure that you do not get dejected.

- Make notes and continually review each section.

  Take meaningful notes in a notebook which will be of a great help at a later date. Good notes are short and crisp, but cover the key concepts. Very long notes are redundant as you never have time to go through them and too short notes are useless as they do not trigger any recall.

  Rapidly review the section you have just studied. Recall all the major ideas of this portion. If you have any difficulties, check your notes.

- Study for short durations.

  Your brain needs time to assimilate your thoughts and develop a deep understanding of each concept that you are learning. Try to study in short durations with rest breaks in between. During these rests, first blank out your mind so as to relax and then go over the key concepts that you have learnt in the just completed leg of your study.

- **Do each exercise keeping time in mind and look for clues.**

  This is very important. Before proceeding to another section, rework all the questions about which you were not sure or which you could not solve correctly. And make sure that you complete them in the time allocated for each section.

- **Always have a positive attitude.**

  Be motivated. Don't be discouraged if you are unable to solve a problem. When you cannot understand a problem you tend to think in different directions. This helps you to develop your mental faculties.

- **Always keep your goal in mind.**
- **Get your body clock in rhythm with the examination timings a few days before the examination.**

  Some students are in the habit of studying at night and sleeping during the day time. This habit should not be continued till the day of the exam. You should develop a habit of working during the same clock hours as the actual exam at least 15-20 days before the exam. This will help you to work effectively during the exam.

Test Taking Strategies

- Read the instructions in the question paper carefully and scrupulously follow these instructions.
- Read the entire question before attempting to answer it, and recognise the key concepts in the same. Each question typically contains certain key concepts; certain pieces of information that, if you recognise accurately, your ability to come to the right answer increases significantly. The correct answer will typically incorporate all the key concepts contained in the question.
- Read each question carefully. Answer the questions asked, not the one you may have expected.
- Budget your time. Work swiftly. Don't devote too much time to any difficult problem. There may be some simple ones waiting for you. Concentrate on those questions which you are absolutely or reasonably certain you know. Leave those questions for later where you have some doubts. Go through the exam answering questions that you can answer and skip questions you can't answer. Then go through the paper again, deliberating and answering the questions you had left unattended earlier.

Best wishes for your endeavours!

About JEE Main

1. Introduction and Scheme of Examination

The Joint Entrance Examination from the year 2013 for admission to the undergraduate programmes in Engineering is being held in two parts, JEE-Main and JEE-Advanced. Only the top 2,00,000 candidates (including all categories) based on performance in JEE Main will qualify to appear in the JEE Advanced examination. Admissions to IITs will be based only on category-wise All India Rank (AIR) in JEE Advanced, subject to condition that such candidates are in the top 20 percentile categories. Admission to NITs will be based on 40% weightage for performance in Class XII board marks (normalized) and the remainder 60% weightage would be given to performance in JEE Main and a combined All India Rank (AIR) would be decided accordingly.

In case any State opts to admit students in the engineering Colleges affiliated to state Universities where States require separate merit list to be provided based on relative weightages adopted by the states, then the merit list shall be prepared with such relative weightages as may be indicated by States.

2. Eligibility Criteria and List of Qualifying Examinations for JEE(Main) Exam

The minimum academic qualification for appearing in JEE(Main) is that the candidate must have passed in final examination of 10+2 (Class XII) or its equivalent referred to as the qualifying examination (see below).

However, admission criteria in the concerned institution/university will be followed as prescribed by concerned university/institution and as per the guidelines & criteria prescribed by AICTE.

Qualifying Examinations

List of Qualifying Examinations

(i) The +2 level examination in the 10+2 pattern of examination of any recognized Central/State Board of Secondary Examination, such as Central Board of Secondary Education, New Delhi, and Council for Indian School Certificate Examination, New Delhi

(ii) Intermediate or two-year Pre-University Examination conducted by a recognized Board/University.

(iii) Final Examination of the two-year course of the Joint Services Wing of the National Defence Academy.

(iv) Any Public School/Board/University Examination in India or in foreign countries recognized by the Association of Indian Universities as equivalent to 10+2 system.

(v) H.S.C. Vocational Examination.

(vi) A pass grade in the Senior Secondary School Examination conducted by the National Open School with a minimum of five subjects.

(vii) 3 or 4-year diploma recognized by AICTE or a State Board of Technical Education.

3. Pattern of Examination

Subject combination for each paper and type of questions in each paper are given below:

	Subjects	Type of Questions	Duration
Paper 1	Physics, Chemistry & Mathematics	Objective type questions with equal weightage to Physics, Chemistry & Mathematics	3 Hours
Paper 2	Mathematics – Part I	Objective type questions	3 Hours
	Aptitude Test – Part II &	Objective type questions	
	Drawing Test – Part III	Questions to test Drawing Aptitude	

Requirement of papers for different courses is given in the table below:

Course	Papers
B.E/B.TECH	Paper – 1
B.ARCH/B. PLANNING	Paper – 2

Scoring and Negative Marking

There will be objective type questions with four options having single correct answer. For each incorrect response, one fourth (1/4) of the total marks allotted to the question would be deducted. No deduction from the total score will, however, be made if no response is indicated for an item in the answer sheet.

Syllabus

Unit 1: Sets, Relations and Functions

Sets and their representation; Union, intersection and complement of sets and their algebraic properties; Power set; Relation, Types of relations, equivalence relations, functions;. one-one, into and onto functions, composition of functions.

Unit 2: Complex Numbers and Quadratic Equations

Complex numbers as ordered pairs of reals, Representation of complex numbers in the form $a + ib$ and their representation in a plane, Argand diagram, algebra of complex numbers, modulus and argument (or amplitude) of a complex number, square root of a complex number, triangle inequality, Quadratic equations in real and complex number system and their solutions. Relation between roots and co-efficients, nature of roots, formation of quadratic equations with given roots.

Unit 3: Matrices and Determinants

Matrices, algebra of matrices, types of matrices, determinants and matrices of order two and three. Properties of determinants, evaluation of determinants, area of triangles using determinants. Adjoint and evaluation of inverse of a square matrix using determinants and elementary transformations, Test of consistency and solution of simultaneous linear equations in two or three variables using determinants and matrices.

Unit 4: Permutations and Combinations

Fundamental principle of counting, permutation as an arrangement and combination as selection, Meaning of $P(n, r)$ and $C(n, r)$, simple applications.

Unit 5: Mathematical Induction

Principle of Mathematical Induction and its simple applications.

Unit 6: Binomial Theorem and its Simple Applications

Binomial theorem for a positive integral index, general term and middle term, properties of Binomial coefficients and simple applications.

Unit 7: Sequences and Series

Arithmetic and Geometric progressions, insertion of arithmetic, geometric means between two given numbers. Relation between A.M. and G.M. Sum upto n terms of special series: $\sum n$, $\sum n^2$, $\sum n^3$. Arithmetico - Geometric progression.

Unit 8: Limit, Continuity and Differentiability

Real—valued functions, algebra of functions, polynomials, rational, trigonometric, logarithmic and exponential functions, inverse functions. Graphs of simple functions. Limits, continuity and differentiability. Differentiation of the sum, difference, product and quotient of two functions. Differentiation of trigonometric, inverse trigonometric, logarithmic, exponential, composite and implicit functions; derivatives of order upto two. Rolle's and Lagrange's Mean Value Theorems. Applications of derivatives: Rate of change of quantities, monotonic—increasing and decreasing functions, Maxima and minima of functions of one variable, tangents and normals.

Unit 9: Integral Calculus

Integral as an anti-derivative. Fundamental integrals involving algebraic, trigonometric, exponential and logarithmic functions. Integration by substitution, by parts and by partial fractions. Integration using trigonometric identities.

Evaluation of simple integrals of the type

$$\int \frac{dx}{x^2 \pm a^2}, \int \frac{dx}{\sqrt{x^2 \pm a^2}}, \int \frac{dx}{a^2 - x^2}, \int \frac{dx}{\sqrt{a^2 - x^2}}, \int \frac{dx}{ax^2 + bx + c}$$

$$\int \frac{dx}{\sqrt{ax^2 + bx + c}}, \int \frac{(px + q)\,dx}{ax^2 + bx + c}, \int \frac{(px + q)\,dx}{\sqrt{ax^2 + bx + c}}$$

$$\int \sqrt{a^2 \pm x^2}\, dx \text{ and } \int \sqrt{x^2 - a^2}\, dx$$

Integral as limit of a sum. Fundamental Theorem of Calculus. Properties of definite integrals. Evaluation of definite integrals, determining areas of the regions bounded by simple curves in standard form.

Unit 10: Differential Equations

Ordinary differential equations, their order and degree. Formation of differential equations. Solution of differential equations by the method of separation of variables, solution of homogeneous and linear differential equations of the type:

$$\frac{dy}{dx} + p(x)y = q(x)$$

Unit 11: Co-ordinate Geometry

Cartesian system of rectangular co-ordinates in a plane, distance formula, section formula, locus and its equation, translation of axes, slope of a line, parallel and perpendicular lines, intercepts of a line on the coordinate axes.

Straight lines

Various forms of equations of a line, intersection of lines, angles between two lines, conditions for concurrence of three lines, distance of a point from a line, equations of internal and external bisectors of angles between two lines, coordinates of centroid, orthocentre and circumcentre of a triangle, equation of family of lines passing through the point of intersection of two lines.

Circles, conic sections

Standard form of equation of a circle, general form of the equation of a circle, its radius and centre, equation of a circle when the end points of a diameter are given, points of intersection of a line and a circle with the centre at the origin and condition for a line to be tangent to a circle, equation of the tangent. Sections of cones, equations of conic sections (parabola, ellipse and hyperbola) in standard forms, condition for $y = mx + c$ to be a tangent and point (s) of tangency.

Unit 12: Three Dimensional Geometry

Coordinates of a point in space, distance between two points, section formula, direction ratios and direction cosines, angle between two intersecting lines. Skew lines, the shortest distance between them and its equation. Equations of a line and a plane in different forms, intersection of a line and a plane, coplanar lines.

Unit 13: Vector Algebra

Vectors and scalars, addition of vectors, components of a vector in two dimensions and three dimensional space, scalar and vector products, scalar and vector triple product.

Unit 14: Statistics and Probability

Measures of Dispersion: Calculation of mean, median, mode of grouped and ungrouped data. Calculation of standard deviation, variance and mean deviation for grouped and ungrouped data.

Probability: Probability of an event, addition and multiplication theorems of probability, Baye's theorem, probability distribution of a random variate, Bernoulli trials and Binomial distribution.

Unit 15: Trigonometry

Trigonometrical identities and equations. Trigonometrical functions. Inverse trigonometrical functions and their properties. Heights and Distances.

Unit 16: Mathematical Reasoning

Statements, logical operations And, or, implies, implied by, if and only if. Understanding of tautology, contradiction, converse and contrapositive.

Trend Analysis *ix*
About JEE Main *xi*
Syllabus *xiii*
Format of Questions in this Book *xxix*

1. Sets, Relations and Functions **1.1–1.40**

Finite Set and Infinite Set *1.1*
Algebra of Sets *1.1*
Some Properties of Operations on Sets *1.2*
Some Definitions *1.3*
Algebraic Operations on Functions *1.4*
Domains and Ranges of Some Functions *1.4*
Types of Functions *1.4*
Graphs of Some Functions *1.5*
Inverse of a Function *1.9*
Direct and Inverse Images *1.9*
Solved Examples: *Concept-based: Straight Objective Type Questions* *1.10*
  LEVEL 1: Straight Objective Type Questions *1.12*
  Assertion-Reason Type Questions *1.19*
  LEVEL 2: Straight Objective Type Questions *1.20*
Exercises*: Concept-based: Straight Objective Type Questions* *1.24*
  LEVEL 1: Straight Objective Type Questions *1.24*
  Assertion-Reason Type Questions *1.27*
  LEVEL 2: Straight Objective Type Questions *1.27*
Previous Years' AIEEE/JEE Main Questions *1.28*
Previous Years' B-Architecture Entrance Examination Questions *1.30*
Answers *1.31*
Hints and Solutions *1.32*

2. Complex Numbers **2.1–2.59**

Definitions *2.1*
Algebraic Operations with Complex Numbers *2.1*
Conjugate of Complex Number *2.1*
Modulus of a Complex Number *2.2*
Geometrical Representation of Complex Numbers *2.2*
Argument of a Complex Number *2.2*
Polar Form of a Complex Number *2.4*
Vector Representation of Complex Numbers *2.4*
Geometrical Representation of Algebraic Operations on Complex Numbers *2.4*

Some Important Geometrical Results and Equations *2.6*
Recognizing Some Loci by Inspection *2.11*
Geometric Interpretation of Multiplying a Complex Number by $e^{i\alpha}$. *2.12*
De Moivre's Theorem and its Applications *2.13*

Solved Examples: *Concept-based: Straight Objective Type Questions 2.15*
 LEVEL 1: Straight Objective Type Questions 2.17
 Assertion-Reason Type Questions 2.27
 LEVEL 2: Straight Objective Type Questions 2.30

3. Quadratic Equations **3.1–3.58**

Quadratic Equations *3.1*
Nature of Roots *3.1*
Relation between Roots and Coefficients *3.1*
Quadratic Expression and its Graph *3.1*
Position of Roots of a quadratic Equation *3.2*
Conditions for a Number $\boldsymbol{k}$ to Lie Between the Roots of a Quadratic Equation *3.3*
Conditions for Exactly one Root of a Quadratic Equation to Lie in the Interval $(\boldsymbol{k}_1, \boldsymbol{k}_2)$ where $\boldsymbol{k}_1 < \boldsymbol{k}_2$ *3.3*
Conditions for Both the Roots of a Quadratic Equation to Lie in the Interval $(\boldsymbol{k}_1, \boldsymbol{k}_2)$ where $\boldsymbol{k}_1 < \boldsymbol{k}_2$. *3.4*
Conditions for a Quadratic Equation to Have a Repeated Root *3.5*
Condition for two Quadratic Equations to Have a Common Root *3.5*
Condition for Two Quadratic Equations to Have the Same Roots *3.5*
Equations of Higher Degree *3.5*
Cubic and Biquadratic Equations *3.5*
Transformation of Equations *3.6*
Descartes Rule of Signs for the Roots of a Polynomial *3.6*
Some Hints for Solving Polynomial Equations *3.6*
Use of Continuity and Differentiability to Find Roots of a Polynomial Equation *3.7*

Solved Examples: *Concept-based: Straight Objective Type Questions 3.7*
 LEVEL 1: Straight Objective Type Questions 3.10
 Assertion-Reason Type Questions 3.24
 LEVEL 2: Straight Objective Type Questions 3.27

Exercises: *Concept-based: Straight Objective Type Questions 3.31*

Architecture Entrance – 2017 **1–8**

JEE (Main) 2017 Questions with Solutions Mathematics (8th April - online) **9–16**

JEE (Main) 2017 Questions with Solution (9th April – online) **17–24**

JEE Main 2017 (Offline) **25–32**

Format of Questions in this Book

STRAIGHT OBJECTIVE TYPE QUESTIONS

Each Question has four choices—(a), (b), (c) and (d) out of which **ONLY ONE** is correct

ASSERTION-REASON TYPE QUESTIONS

Each Question has four choices—(a), (b), (c) and (d) out of which **ONLY ONE** is correct

Write (a), (b), (c) or (d) according to the following rules.

(a) STATEMENT-1 is True, STATEMENT-2 is True; STATEMENT-2 **is** a correct explanation for STATEMENT-1
(b) STATEMENT-1 is True, STATEMENT-2 is True; STATEMENT-2 **is NOT** a correct explanation for STATEMENT-1
(c) STATEMENT-1 is True, STATEMENT-2 is False
(d) STATEMENT-1 is False, STATEMENT-2 is True

CHAPTER ONE

Sets, Relations and Functions

By a *set* we mean any collection of objects. For example, we may speak of the set of all living Indians, the set of all letters of the English alphabet or the set of real numbers less than 5. The objects constituting a set are *elements* or *members* of the set.

If X is a set and an element x is a member of, or belongs to the set X, then this is expressed, as $x \in X$.

There are two methods of representing a set.

(a) Roster method (or tabular method) In this method, a set is represented by listing all its elements in curly brackets and separating them by commas.

For example, set having elements 1, 2, 3, 5 only is written as $\{1, 2, 3, 5\}$.

(b) Property method In this method a set is represented by stating all the properties which are satisfied by the elements of the set and not by other elements outside the set.

If X contains all values of 'x' for which the condition $P(x)$ is true, then we write $X = \{x : P(x)\}$.

Illustration 1

The set of all real roots of the equation $x^4 - 2x^2 - 3 = 0$ is denoted by

$\{x : x \in \mathbf{R}, x^4 - 2x^2 - 3 = 0\}$ or equivalently by $\left\{\sqrt{3}, -\sqrt{3}\right\}$.

Illustration 2

The set of integers strictly between 2 and 8 is represented by

$\{x : x \in \mathbf{I}, 2 < x < 8\}$ or equivalently by $\{3, 4, 5, 6, 7\}$.

Illustration 3

The set of Presidents of India can be represented by

$\{x : x$ is/was President of India$\}$ or equivalently

$A = \{$Rajendra Prasad, Sarvepalli Radhakrishnan,
Zakir Hussain, V.V. Giri, ...$\}$

The number of elements of A or the cardinality of A is denoted by $n(A)$. In Illustration 3, $n(A) = 13$.

FINITE SET AND INFINITE SET

A set is called a *finite set* if it contains only finite number of elements. A set which does not contain finite number of elements is called *infinite set*.

Null set A set containing no element is called a *null set* or *empty set* or *void set* and is denoted by 'ϕ'. Equivalently $P(x)$ is a property satisfied by no object at all.

Singleton set A set containing exactly one element is called a *singleton set*.

If a set X has 'r' elements then we write $n(X)$ (number of elements in X) = r.

Subset A set 'A' is said to be subset of the set X if every element of A is an element of X and we write $A \subseteq X$. A is said to be a proper subset of X if $A \subseteq X$. and $A \neq X$, this will be written as $A \underset{\neq}{\subset} X$. The denial of $A \subset B$ is written as $A \not\subset B$.

For two sets A and B, $A = B$ if and only if $A \subseteq B$ and $B \subseteq A$.

The set of all subsets of X is called *Power set* of X denoted by $P(X)$ i.e. $P(X) = \{A : A \subseteq X\}$.

Some Basic Properties:

(i) $A \subseteq A$

(i) $A \subseteq B$, $B \subseteq C$ then $A \subseteq C$

(iii) The only subset of ϕ is ϕ itself.

(iv) The subsets of $\{x\}$ are ϕ and $\{x\}$.

(v) The subsets of $\{x, y\}$ are ϕ, $\{x\}$, $\{y\}$, $\{x, y\}$

(vi) If $n(X) = r$ then number of all subsets of X will be 2^r i.e. $n(P(X)) = 2^r$.

ALGEBRA OF SETS

Union of two Sets

Union of two sets A and B is denoted by $A \cup B$

and, $A \cup B = \{x : x \in A \text{ or } x \in B\}$

Clearly $A \subseteq A \cup B$, $B \subseteq A \cup B$

and $A \cup B = B \cup A$, $A \cup A = A$,

$A \cup B = B$ if and only if $A \subseteq B$,

$(A \cup B) \cup C = A \cup (B \cup C)$ (Associativity).

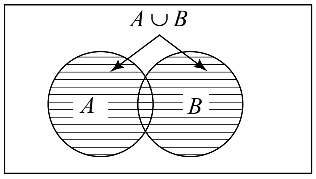

Fig. 1.1

Intersection of Two Sets

Intersection of two sets A and B is denoted by $A \cap B$ and, $A \cap B = \{x : x \in A \text{ and } x \in B\}$
Trivially, $A \cap B \subseteq A$, $A \cap B \subseteq B$ and $A \cap B = B \cap A$, $(A \cap B) \cap C = A \cap (B \cap C)$ (Associativity).

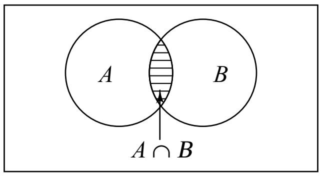

Fig. 1.2

Complement of a Set

Complement of a set B in a set A is written as

$$A \sim B = \{x : x \in A, x \notin B\}$$

e.g., $\mathbf{I} \sim \mathbf{N} = \ \dots -3, -2, -1, 0\}$. The set of irrational numbers = $\mathbf{R} \sim \mathbf{Q}$

Where **I** is the set of integers
N is the set of natural numbers
R is the set of real number and
Q is the set of rational numbers

In any discussion involving sets and their operations, we presume that all these sets are subsets of a parent set called *Universal set*, U. The complement of A in U is denoted by A^c or $A' = \{x : x \notin A\}$.

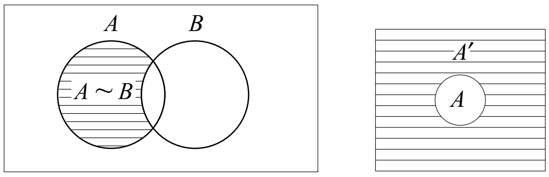

Fig. 1.3

SOME PROPERTIES OF OPERATIONS ON SETS

1. $A \cap (B_1 \cup B_2 \cup \dots \cup B_n) = (A \cap B_1) \cup (A \cap B_2) \cup \dots \cup (A \cap B_n)$ (Intersection is distributive over union)
2. $A \cup (B_1 \cap B_2 \cap \dots \cap B_n) = (A \cup B_1) \cap (A \cup B_2) \cap \dots \cap (A \cup B_n)$ (Union is distributive over intersection)
3. $(A \cap B)^c = A^c \cup B^c$ and $(A \cup B)^c = A^c \cap B^c$. (De Morgan's Laws)
4. $A \sim \left(\bigcap_{i=1}^{n} A_i\right) = \bigcup_{i=1}^{n} (A \sim A_i)$.
5. $A \sim \left(\bigcup_{i=1}^{n} A_i\right) = \bigcap_{i=1}^{n} (A \sim A_i)$.
6. $A \cap A^c = \phi$
7. $A \cup A^c = X$
8. $\phi^c = X$
9. $X^c = \phi$
10. $(A^c)^c = A$
11. $A \sim B = A \cap B^c$
12. $A \subseteq B$ if and only if $B^c \subseteq A^c$.
13. $A \sim A = \phi$.
14. $(A \sim B) \sim C = (A \sim C) \sim B$
15. $A \sim (B \cup C) = (A \sim B) \cap (A \sim C)$
16. If A and B are finite sets, then
$n(A \cup B) = n(A) + n(B) - n(A \cap \mathrm{B})$
17. If A, B and C are finite sets then
$n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$

Symmetric Difference of Two Sets

$$A \,\Delta\, B = (A \sim B) \cup (B \sim A)$$

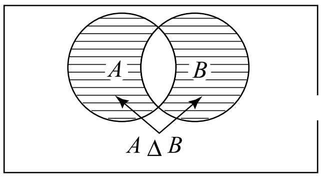

Fig. 1.4

$A \,\Delta\, A = \phi$, $A \,\Delta\, B = B \,\Delta\, A$

Cartesian Product

The cartesian product of sets A and B is denoted by $A \times B$ and, $A \times B = \{(a, b): a \in A, b \in B\}$

In general $A \times B \neq B \times A$, moreover,

$$A \times (B \cup C) = (A \times B) \cup (A \times C)$$

and $$A \times (B \cap C) = (A \times B) \cap (A \times C)$$

Illustration 4

If $A = \{0, 1, 2, 3, 5\}$, $B = \{0, 1, 2, 3)$, $C = \{0, 1, 4, 5\}$ then $B \subseteq A$, $C \not\subseteq A$, $A \cap C = \{0, 1, 5\}$, $B \cap C = \{0, 1\}$, $A \sim B = \{5\}$, $A \sim C = \{2, 3\}$, $B \sim C = \{2, 3\}$, $C \sim B = \{4, 5\}$, $A \,\Delta\, B = \{5\}$, $A \,\Delta\, C = \{2, 3, 4\}$ and $B \,\Delta\, C = \{2, 3, 4, 5\}$

Illustration 5

Simplify $(A \cup B \cup C) \cap (A \cap B^c \cap C^c)^c \cap C^c$

$$
\begin{aligned}
&(A \cup B \cup C) \cap (A \cap B^c \cap C^c)^c \cap C^c \\
&\quad = [(A \cup B \cup C) \cap (A^c \cup B \cup C)] \cap C^c \\
&\quad = [(A \cap A^c) \cup (B \cup C] \cap C^c \\
&\quad = [\phi \cup (B \cup C)] \cap C^c \\
&\quad = (B \cup C) \cap C^c = (B \cap C^c) \cup (C \cap C^c). \\
&\quad = (B \cap C^c) \cup \phi = B \cap C^c = B \sim C.
\end{aligned}
$$

Relations

A relation from a set of X to a set Y is a subset R of $X \times Y$. If $(a, b) \in R$, we say a is related to b and often write it as $a\,R\,b$. If $X = Y$, we say that R is relation on X.

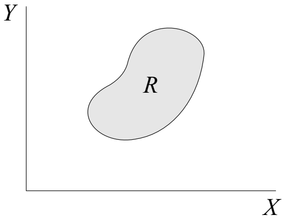

Fig. 1.5

Let R be a relation from X to Y. For each subset A of X, we write

$$R(A) = \{y \in Y\text{: } x\,R\,y \text{ for some } x \in A\}$$

and call it the (direct) image of A under R, and for each subset B of Y, we write $R^{-1}(B) = \{x \in X : x\,R\,y \text{ for some } y \in B\}$ and call it the *inverse image* of B under R.

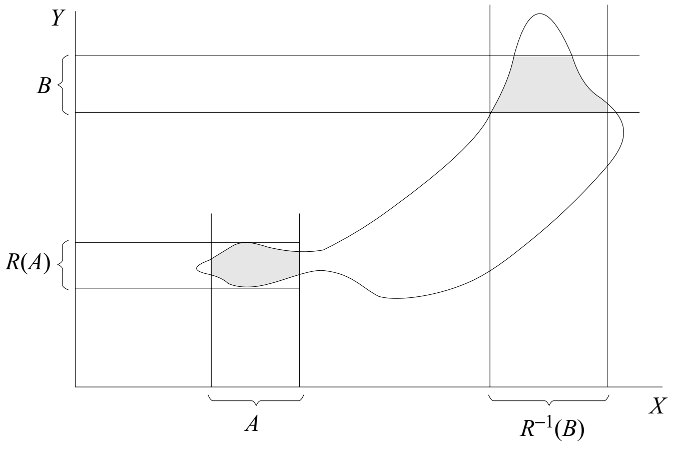

Fig. 1.6

One can think of R^{-1} as a relation from Y to X, where

$$yR^{-1}\,x \Leftrightarrow xRy$$

that is, $\quad R^{-1} = \{(y, x) : (x, y) \in R\}$

R^{-1} is called the *reverse* of the relation R.

Domain of a relation R from a set X to a set Y is the set of all first components of the elements of R, i.e., dom $R = \{a \in X\text{: } (a, b) \in R \text{ for some } b \in R\}$

Let R be a relation from X to Y and S from Y to Z, then $SoR = \{(x, z)|\ x \in X, z \in Z \text{ and } \exists\ y \in Y$ such that and $(x, y) \in R$ and $(y, z) \in S$.

If $n(A), n(B) < \infty$, then the number of relation from A to B will be $2^{n(A)\,n(B)}$

Equivalence Relation

A relation R on a set X (i.e. $R \subset X \times X$) is said to be

(i) *reflexive* if $x\,R\,x$ for all $x \in X$.
(ii) *symmetric* if $x\,R\,y \Rightarrow y\,R\,x$, where $x, y \in X$
(iii) *transitive* if $x\,R\,y$, $y\,R\,z \Rightarrow x\,R\,z$, where $x, y, z \in X$

Further, a relation R in a set X is said to be an equivalence relation if it is reflexive, symmetric and transitive. **R** is called anti-symmetric if $x\,R\,y$ and $y\,R\,x \Rightarrow x = y$.

Illustration 6

For $x, y \in$ **I**, write $x\,R\,y$ if $x - y$ divisible by 6; this is an equivalence relation and is usually written as $x \equiv y$ (mod. 6).

Illustration 7

The relation R on **R** defined as $R = \{(a, b)\text{: } a \le b\}$ is not symmetric as $(1, 3) \in R$ but $(3, 1) \notin R$ but is transitive and reflexive.

Illustration 8

If $A = \{1, 2, 3\}$; let $R = \{1, 1), (2, 2)\ (3, 3), (1, 2)\ (2, 1)\}$ then R is reflexive, symmetric and transitive.

The number of equivalence relations that can be defined on a set containing k elements is given

$$B_k = \sum_{n=0}^{k-1} \binom{k-1}{n} B_n$$

E.g. $\quad B_0 = 1, B_1 = 1, B_2 = 2, B_3 = \binom{2}{0}B_0 + \binom{2}{1}B_1 + \binom{2}{2}B_2$
$\qquad = 1 + 2 + 2 = 5$

Functions

A relation F from A to B is said to be a function if for each $a \in A$ there exists a unique $b \in B$ such that $(a, b) \in F$. b is called image of 'a' under F and is denoted by $F(a)$. Thus every function is a relation but the converse may not be true.

If $n(A) = n$ and $n(B) = m$ then total number of functions from A to B is n^m.

SOME DEFINITIONS

Let A and B be two non-empty sets. A function f from A to B can also be defined as a rule that assigns to each element in the set A, one and only one element of the set B. In general, the sets A and B need not be sets of real numbers. However, we consider only those functions for which A and B are both subsets of the real numbers. We shall denote by **R**, the set of all real numbers.

The set A in the above definition is called the **domain** of the function f. We usually denote it by dom f. If x is an element in the domain of a function f, then the element that

f associates with x is denoted by the symbol $f(x)$, and is called the *image* of x under f, or the *value* of f at x. The set of all possible values of $f(x)$ as x varies over the domain is called the **range of f**. If $f: A \to B$, then the range of f is a subset of B and the set B is called **co-domain of f**.

Remark

- ☐ If x is an element in the domain of a function f, the definition of a function requires that f assigns one and only one value to x. This means that a function cannot be *multiple-valued.* For example, the expression $\pm\sqrt{x}$ does not define a function of x, since it assigns two values to each positive x.

ALGEBRAIC OPERATIONS ON FUNCTIONS

1. If f and g are two functions, then *sum of the functions* $f + g$, is defined for all $x \in \operatorname{dom} f \cap \operatorname{dom} g$ by
$$(f+g)(x) = f(x) + g(x).$$
2. If k is any real number and f is a function, then kf is defined for all $x \in \operatorname{dom} f$ by $(kf)(x) = kf(x)$.
3. If f and g are two functions, then the *pointwise product* fg is defined for all $x \in \operatorname{dom} f \cap \operatorname{dom} g$ by
$$(fg)(x) = f(x)\, g(x).$$
4. If f and g are functions, then f/g is defined for all $x \in \operatorname{dom}(f) \cap \operatorname{dom}(g) \cap \{x: g(x) \neq 0\}$ by $(f/g)(x) = f(x)/g(x)$.
5. *Composition of functions* Let $f: A \to B$ and $g: B \to C$ be functions, then $gof: A \to C$ defined by $(gof)(x) = g(f(x))$.

We have the following formulae for domains of functions.

1. $\operatorname{dom}(f+g) = \operatorname{dom} f \cap \operatorname{dom} g$
2. $\operatorname{dom}(fg) = \operatorname{dom} f \cap \operatorname{dom} g$
3. $\operatorname{dom}(f/g) = \operatorname{dom} f \cap \operatorname{dom} g \cap \{x : g(x) \neq 0\}$
4. $\operatorname{dom}\sqrt{f} = \operatorname{dom} f \cap \{x : f(x) \geq 0\}$

Note

Note that if gof is defined, then fog may not be defined. For example if f : **A** $\to$ **B** and g : **B** $\to$ **C** then gof is defined but fog is not. Let f: **R** $\to$ **R** and g: **R** $\to$ **R** be defined by $f(x) = \cos x$ and $g(x) = x^3$. Then $gof(x) = g(f(x)) = g(\cos x) = \cos^3 x$ and $fog(x) = f(x^3) = \cos x^3$. Thus even if fog and gof are both defined it is not necessary that $fog = gof$.

DOMAINS AND RANGES OF SOME FUNCTIONS

1. *Constant functions* A function that assigns the same value to every member of its domain is called a constant function. The domain of the constant function $f(x) = c$ is **R** and its range is $\{c\}$.

2. *Polynomial functions* A function of the form cx^n, where c is a constant and n is a non-negative integer, is called a *monomial* in x. Examples are $2x^3$, $5x^4$, $-6x$ and x^8. The function $4x^{1/2}$ and x^{-3} and not monomials because the powers of x are not non-negative integers. A function that is expressible as the sum of finitely many monomials in x is called a *polynomial* in x. Thus

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x + a_0$$

is a polynomial. The domain of a polynomial is **R** and its range is a subset of **R**.

3. The domain of $f(x) = \log_e x$ (= ln x) is $(0, \infty) = \{x \in \mathbf{R}, x > 0\} = \mathbf{R}^+$, and its range is $(-\infty, \infty)$ (i.e., the whole of **R**).

4. The domain of $f(x) = e^x$ is **R** and its range is $\mathbf{R}^+$.

TYPES OF FUNCTIONS

1. *Rational function.* This function is defined as the ratio of two polynomials

$$y = \frac{a_0 x^n + a_1 x^{n-1} + \cdots + a_n}{b_0 x^m + b_1 x^{m-1} + \cdots + b_m}$$

For example, $y = (x^2 + 3)/(x^3 + 4)$ is rational function.

2. *Irrational function.* If in the function $y = f(x)$, the operations of addition, subtraction, multiplication, division and raising to a power with rational non-integral exponents are performed on the right-hand side, the function $y = f(x)$ is said to be irrational. Examples are $y = (3x^2 + \sqrt{x})/\sqrt{2+4x}$ and $y = \sqrt{x}$.

3. *Even function.* A function $y = f(x)$ is said to be an even function if $f(-x) = f(x)\ \forall\ x \in \operatorname{dom}(f)$. Examples are $y = |x|$, $y = \cos x$ and $y = x^{2n}$. The graph of an even function will be symmetric about y-axis

4. *Odd function.* A function $y = f(x)$ is said to be an odd function if $f(-x) = -f(x)\ \forall\ x \in \operatorname{dom}(f)$. Examples are $y = \sin x$ and $y = x^{2n+1}$.

Clearly, $y = f(x) + f(-x)$ is always an even function, and $y = f(x) - f(-x)$ is always odd. Any function $y = f(x)$ can be expressed uniquely as the sum of an even and an odd function as follows:

$$f(x) = \frac{1}{2}(f(x) + f(-x)) + \frac{1}{2}(f(x) - f(-x))$$

5. *Periodic function.* A function $y = f(x)$ is said to be periodic if there exists a number $T > 0$ such that $f(x + T) = f(x)$ for all x in the domain of f. The least such T is called the period of f. For example, the period of $\sin x$ and $\cos x$ is 2π, and that of $\tan x$ is π.

If $f(x)$ is a periodic function with period T, then the function $f(ax + b)$, $a > 0$, is periodic with period T/a. For example, $\sin 2x$ has a period π, $\cos 3x$ has a period $2\pi/3$ and $\tan(2x+4)$ has a period $\pi/2$. The function

$$f(x) = \begin{cases} 1 \text{ if } x \in \mathbf{Q} \\ -1 \text{ if } x \in \mathbf{R} \sim \mathbf{Q} \end{cases}$$

is a periodic function without any period. The sum of two periodic functions may not be periodic e.g., $f(x) = \{x\}$, the fractional part of x and $g(x) = \sin x$.

6. *Onto function (or Surjective Function).* If a function $f: A \to B$ is such that each element in B is the f-image of at least one element in A, then we say that f is a function of A 'onto' B. Equivalently a function f is an onto function if co-domain of f = Range of f.

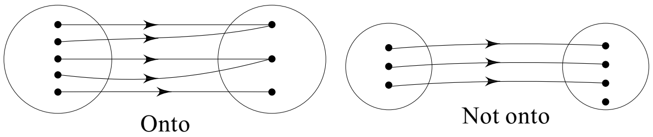

Fig. 1.7

For example, $f: \mathbf{R} \to [-1, 1]$ defined by $f(x) = \sin x$ is an onto function but $f: \mathbf{R} \to \mathbf{R}$ defined by $f(x) = \sin x$ is not onto since Range of $f = [-1, 1]$ and co-domain of $f = \mathbf{R}$.

In order to show that a function $f: A \to B$ is onto we start with any $y \in B$ and try to find $x \in A$ such that $f(x) = y$.

7. *One-to-one function (or injective function).* A function f is said to be *one-to-one* if it does not take the same value at two distinct points in its domain. For example, $f(x) = x^3$ is one-to-one, whereas $f(x) = x^2$ is not, as $f(1) = 1$ and $f(-1) = 1$. Note that a periodic function $f: R \to R$ cannot be one-to-one as $f(x + T) = f(x)$ for some $T > 0$.

In order to show that a function $f: A \to B$ is one-to-one, we may take any $x, y \in A$ such that $f(x) = f(y)$ and try to show that $x = y$.

If $n(A) = m$ and $n(B) = n (m \le n)$, then the number of injections (or one-one functions) from A to B is

$$^nP_m = \frac{n!}{(n-m)!}.$$

8. *Bijective function (One-to-One and Onto).* If a function f is both one-to-one and onto, then f is said to be a *bijective function*. For example an identity function $i_A : A \to A$ defined by $i_A(x) = x$ is trivially a bijective function. The function $f: [-\pi/2, \pi/2] \to [-1, 1]$ defined by $f(x) = \sin x$ is a bijective function. The function $f: (-\pi/2, \pi/2) \to \mathbf{R}$ defined by $f(x) = \tan x$ is also a bijective function.

If A and B are finite sets and $f: A \to B$ is a bijection then $n(A) = n(B)$. If $n(A) = n$, then the number of bijections from A to B is the total number of arrangements of n items taken all at a time which is $n!$

9. *Bounded and unbounded functions* A function f defined on an interval I is said bounded on I if there is $k > 0$ such that $|f(x)| \le k$ for all $x \in I$. Equivalently there is m and M such that $m \le f(x) \le M$ for all $x \in I$. E.g. $f(x) = \frac{1}{x}$ is not bounded on (0, 1) and $f(x) = x^2$ is bounded on [0, 1]. $f(x) = \sin x$ or $\cos x$ are bounded functions on $\mathbf{R}$ whereas $f(x) = \tan x$ is unbounded on $(-\pi/2, \pi/2)$.

GRAPHS OF SOME FUNCTIONS

1. *Constant function* $f(x) = c$ represents a constant function (Fig. 1.8).

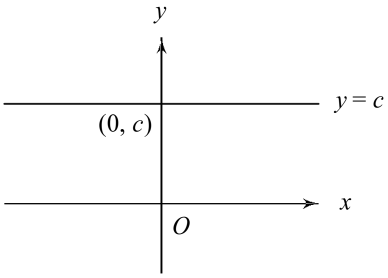

Fig. 1.8

2. *Proportional values*. If variables y and x are direct proportional, then the functional dependence between them is represented by the equation:

$$y = kx,$$

where k is a constant a *factor of proportionality*.

A graph of a direct proportionality is a straight line, going through an origin of coordinates and forming with an x-axis an angle α, a tangent of which is equal to k: $\tan \alpha = k$. Therefore, a factor of proportionality is called also a *slope*. These are shown in three graphs with $k = 1/3$, $k = 1$ and $k = -3$ on Fig.1.9

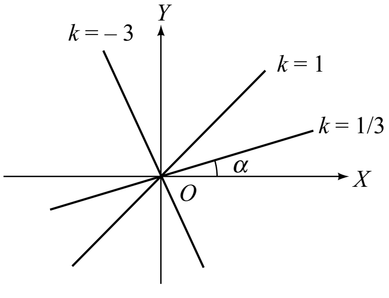

Fig. 1.9

3. *Linear function*. If variables y and x are related by the 1-st degree equation:

$$Ax + By = C,$$

(at least one of numbers A or B is non-zero), then a graph of the functional dependence is a straight line. If $C = 0$, then it goes through an origin of coordinates, otherwise – not. Graphs of linear functions for different combinations of A, B, C are represented on Fig.1.10

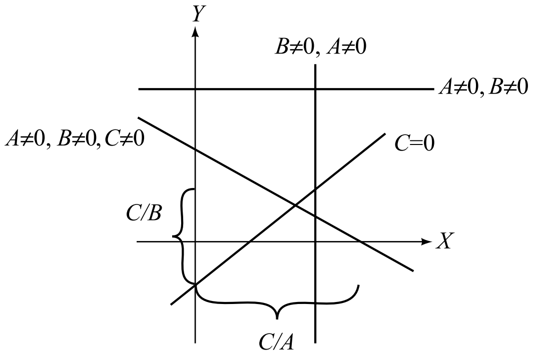

Fig. 1.10

4. *Inverse proportionality*. If variables y and x are *inverse proportional*, then the functional dependence between them is represented by the equation:

$$y = k/x,$$

where k is a constant.

A graph of an inverse proportionality is a curve, having two branches (Fig. 1.11). This curve is called a *hyperbola*. These curves are received at crossing a circular cone by a plane. As shown on Fig. 1.11, a product of coordinates of a hyperbola points is a constant value, equal in this case to 1. In general case this value is k, as it follows from a hyperbola equation:

$$xy = k$$

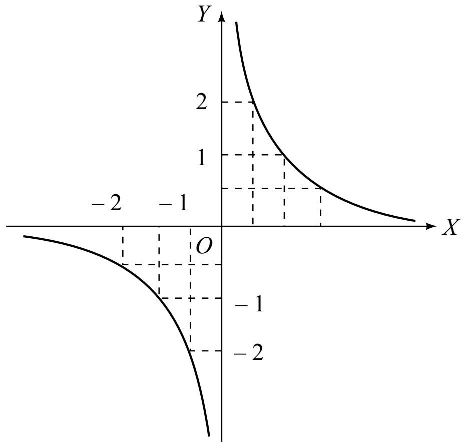

Fig. 1.11

The main characteristics and properties of hyperbola:

- the function domain: $x \neq 0$, and codomain: $y \neq 0$;
- the function is monotone (decreasing) at $x < 0$ and at $x > 0$, but it is not monotone on the whole, because of a point of discontinuity $x = 0$
- the function is unbounded, discontinuous at a point $x = 0$, odd, non-periodic;
- there are no zeros of the function.

5. *Quadratic function*. This is the function: $y = ax^2 + bx + c$, where a, b, c – constants, $a \neq 0$. In the simplest case we have $b = c = 0$ and $y = ax^2$. A graph of this function is a *quadratic parabola* – a curve going through an origin of coordinates. Every parabola has an axis of symmetry OY, which is called an *axis of parabola*. The point O of intersection of a parabola with its axis is a *vertex of parabola*.

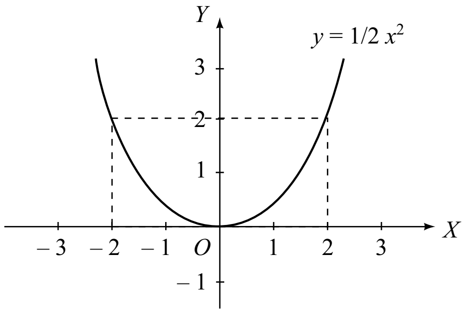

Fig. 1.12

A graph of the function $y = ax^2 + bx + c$ is also a quadratic parabola of the same shape, that $y = ax^2$, but its vertex is not an origin of coordinates, this is a point whose coordinates:

$$\left(-\frac{b}{2a}, c - \frac{b^2}{4a}\right)$$

The form and location of a quadratic parabola in a coordinate system depends completely on two parameters: the coefficient a of x^2 and *discriminant* D : $D = b^2 - 4ac$. These properties follow from analysis of the quadratic equation roots. All possible different cases for a quadratic parabola are shown on Fig. 1.13

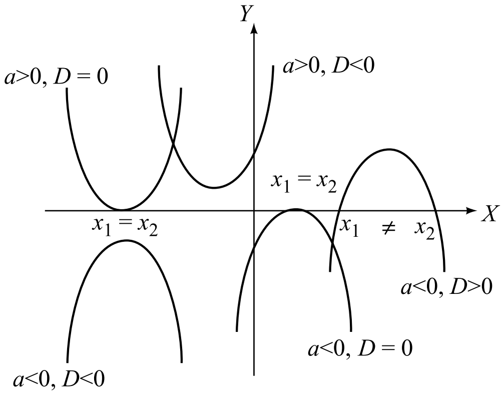

Fig. 1.13

The main characteristics and properties of a quadratic parabola:

- the function domain: $-\infty < x < +\infty$ (i.e. x is any real number)
- the function is not monotone on the whole, but to the right or to the left of the vertex it behaves as a monotone function;
- the function is unbounded, continuous in everywhere, even at $b = c = 0$, and non-periodic;
- the function has no zeros at $D < 0$.

6. *Power function*. This is the function: $y = ax^n$ where a, n are constants. At $n = 1$ we obtain the function, called a *direct proportionality*: $y = ax$; at $n = 2$ – a *quadratic parabola*; at $n = -1$ – an *inverse proportionality* or *hyperbola*. So, these functions are particular cases of a power function. We know, that a zero power of every non-zero number is 1, thus at $n = 0$ the power function becomes a constant: $y = a$, i.e. its graph is a straight line, parallel to an x-axis, except an origin of coordinates. All these cases (at $a = 1$) are shown on Fig. 1.14 ($n \geq 0$) and Fig. 1.15 ($n < 0$).

Negative values of x are not considered here, because then some of functions:

$$y = x^{1/2},\ \ y = x^{1/4}$$

lose a meaning.

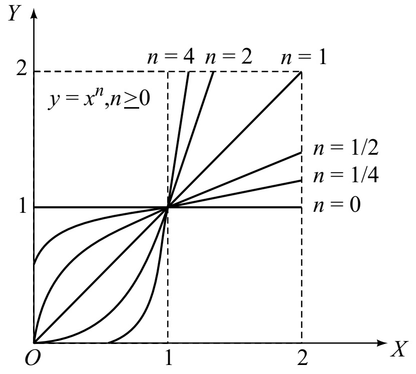

Fig. 1.14

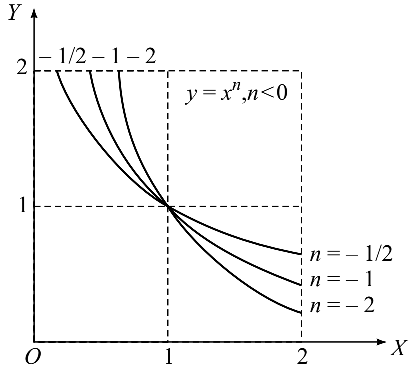

Fig. 1.15

If n – integer, power functions have a meaning also at $x < 0$, but their graphs have different forms depending on that is n an even or an odd number. In Fig. 1.16 two such power functions are shown: for $n = 2$ and $n = 3$.

At $n = 2$ the function is even and its graph is symmetric relatively an axis Y; at $n = 3$ the function is odd and its graph is symmetric relatively an origin of coordinates. The function $y = x^3$ is called a *cubic parabola*.

On Fig. 1.17 the function $y = \pm\sqrt{x}$ is represented. This function is inverse to the quadratic parabola $y = x^2$, its graph is received by rotating the quadratic parabola graph around a bisector of the 1-st coordinate angle. We see by the graph, that this is the two-valued function (the sign ± before the square root symbol says about this). Such functions are not studied in an elementary mathematics, therefore we consider usually as a function one of its branches: either an upper or a lower branch.

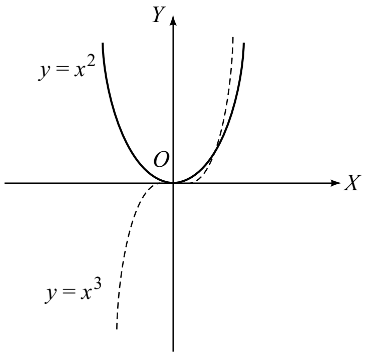

Fig. 1.16

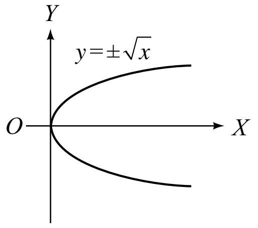

Fig. 1.17

7. *Exponential function*. The function $y = a^x$, where a is a positive constant number, is called an *exponential function*. The argument x adopts *any real* values; as the function values *only positive numbers* are considered, because otherwise we will have a multi-valued function. So, the function $y = 81^x$ has at $x = 1/4$ four different values: $y = 3$, $y = -3$, $y = 3i$ and $y = -3i$. But we consider as the function value only $y = 3$. Graphs of an exponential function for $a = 2$ and $a = 1/2$ are shown on Fig. 1.18. All they are going through the point (0, 1). At $a = 1$ we have as a graph a straight line, parallel to x-axis, i.e. the function becomes a constant value, equal to 1. At $a > 1$ an exponential function increases, and at $0 < a < 1$ – decreases.

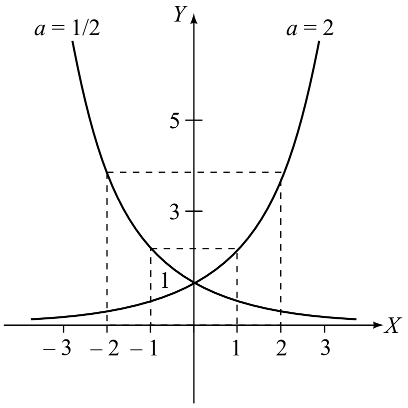

Fig. 1.18

The main characteristics and properties of an exponential function:

- the function domain: — $\infty < x < +\infty$ (i.e. x is any real number) and its codomain: $y > 0$;
- this is a monotone function: it increases at $a > 1$ and decreases at $0 < a < 1$;
- the function is unbounded, continuous in everywhere, non-periodic;
- the function has no zeros.

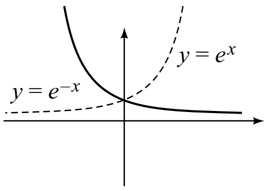

Fig. 1.19

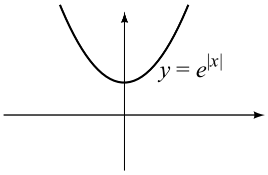

Fig. 1.20

8. *Logarithmic function*. The function $y = \log_a x$, where a is a positive constant number, not equal to 1 is called a *logarithmic function*. This is an inverse function relatively to an exponential function; its graph (Fig.1.19) can be obtained by rotating a graph of an exponential function around of a bisector of the 1-st coordinate angle.

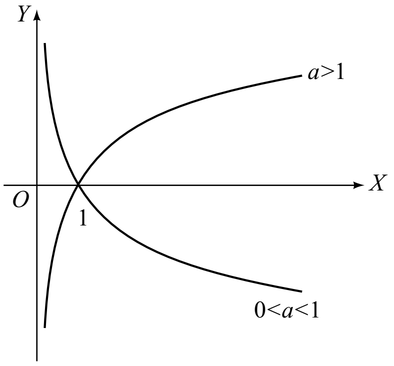

Fig. 1.21

The main characteristics and properties of a logarithmic function:

- the function domain: $x > 0$ and its codomain: $-\infty < y < +\infty$ (i.e. y is any real number);
- this is a monotone function: it increases for $a > 1$ and decreases for $0 < a < 1$;
- the function is unbounded, continuous in everywhere, non-periodic;
- the function has one zero: $x = 1$.

9. *Absolute-value function* is given by

$$y = |x| = \max\{x, -x\} = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$

It is depicted in Fig. 1.22.

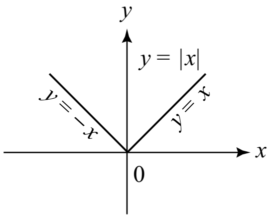

Fig. 1.22

Greatest Integer Function and **Fractional part function** $f(x) = [x]$ will denote the integral part of x or greatest integer less than or equal to x. E.g. $[5] = 5$, $[5.2]$, $= 5$, $[-5.1] = -6$, $[\pi] = 3$, $[e] = 2$. The domain of this function is **R** and the range is **I**. For positive x, this function might represent, for example, the legal age of a person is a function of his chronological age x.

The *fractional part* of x is the fractional part $\{x\}$ of x so $\{x\} = x - [x]$ e.g. $\{5.04\} = 0.04$, $\{-4\} = 0$, $\{-1.7\} = 0.3$, $\{\pi\} = \pi - 3$. The domain of this function is **R** whereas the range is $[0, 1)$.

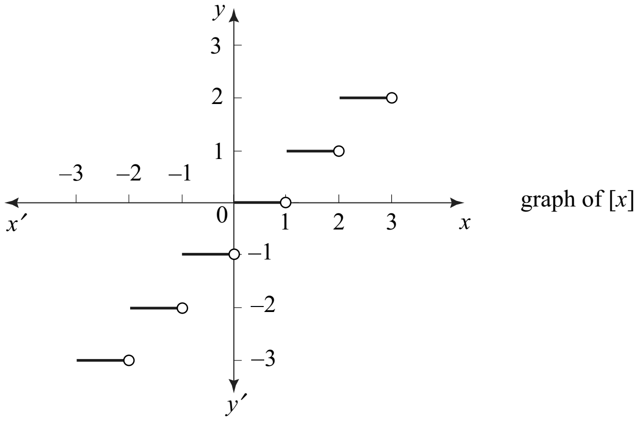

Fig. 1.23

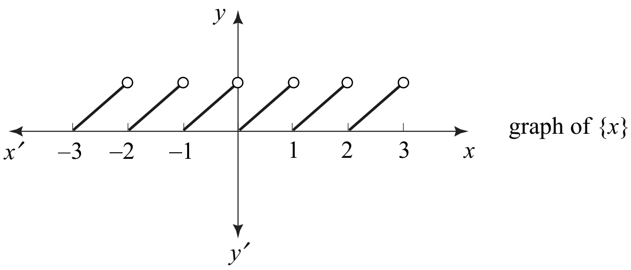

Fig. 1.24

Some Properties

1. $x - 1 < [x] \leq x$
2. $[\{x\}] = 0 = \{[x]\}$
3. If $n \leq x < n + 1$, $n \in$ **I**, then $[x] = n$ and conversely.
4. If $x \in$ I, then $[x] = x$ otherwise $[x] < x$.
5. $[-x] = \begin{cases} -[x], & \text{if } x \in \mathbf{I} \\ -[x]-1, & \text{if } x \notin \mathbf{I} \end{cases}$

$$\text{in other word, } [x] + [-x] = \begin{cases} 0, & \text{if } x \in \mathbf{I} \\ -1, & \text{if } x \notin \mathbf{I} \end{cases}$$

6. $[x + y] = [x] + [y]$, if x or $y \in \mathbf{I}$.

7. $[x + y] = \begin{cases} [x]+[y], & \text{if } \{x\}+\{y\}<1 \\ [x]+[y]+1, & \text{if } \{x\}+\{y\}\geq 1 \end{cases}$

   Moreover, $[x + y] \geq [x] + [y]$.

8. $\{x\} = \begin{cases} x, & \text{if } 0<x<1 \\ 0, & x\in \mathbf{I} \end{cases}$

9. $\{x\} + \{-x\} = \begin{cases} 0, & x\in \mathbf{I} \\ 1, & \text{if } x\notin \mathbf{I} \end{cases}$

10. $[x]+\left[x+\frac{1}{n}\right]+\cdots+\left[x+\frac{n-1}{n}\right]=[n\,x]$.

11. *Signum function* is given by

$$\operatorname{sgn}(x) = \begin{cases} 1 & \text{if } x > 0 \\ 0 & \text{if } x = 0 \\ -1 & \text{if } x < 0 \end{cases}$$

and it is depicted in Fig. 1.25

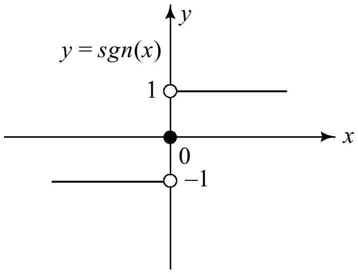

Fig. 1.25

12. The *least integer function*: The function whose value at any number x is the smallest integer greater than or equal to x is called *the least integer function*, e.g. if $f(x) = [x]'$ = smallest integer, greater than or equal to x.

   then $[1.5]' = 2$ $[1.99]' = 1$ $[1.4]' = 2$.

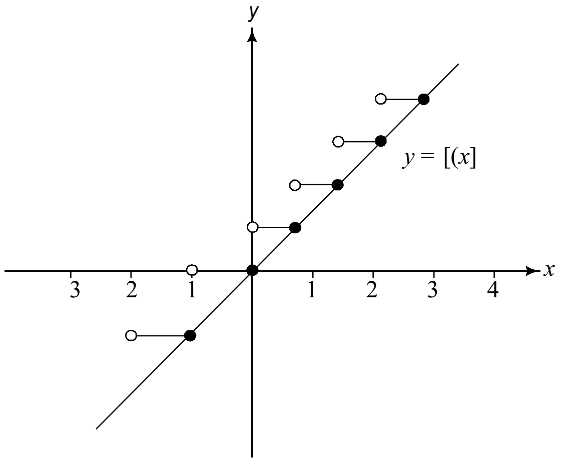

Fig. 1.26

Figure 1.26 shows the graph. For positive value of x, this function might represent for example, the cost of parking x hours in a parking lot which charges Rs 10 for each hour or part of an hour in this case $f(x) = 10\,[x]'$.

INVERSE OF A FUNCTION

The function $f(x) = x^{1/3}$ and $g(x) = x^3$ have the following property:

$$f(g(x)) = f(x^3) = (x^3)^{1/3} = x$$
$$g(f(x)) = g(x^{1/3}) = (x^{1/3})^3 = x$$

Similarly, the functions $f(x) = \log_e x$ and $g(x) = e^x$ cancel the effect of each other. If two functions f and g satisfy $f(g(x)) = x$ for every x in the domain of g, and $g(f(x)) = x$ for every x in the domain of f, we say that *f is the inverse of g and g is the inverse of f*, and we write $f = g^{-1}$, or $g = f^{-1}$. (**The symbol f^{-1} does not mean $1/f$.**) To find the inverse of f, write down the equation $y = f(x)$ and then solve x as a function of y. The resulting equation is $x = f^{-1}(y)$.

If f is one-to-one, then f has an inverse defined on its range and, conversely, if f has an inverse, then f is one-to-one. f^{-1} is defined on the range of f. If f is one-to-one from A to B, and g is one-to-one from B to C, then $f\,o\,g$ is one-to-one from A to C, and $(f\,o\,g)^{-1} = g^{-1}\,o\,f^{-1}$.

If $f : X \to Y$ is bijective then $f^{-1} : Y \to X$ is bijective and $\left(f^{-1}\right)^{-1} = f$. Moreover, $f^{-1}(\{y\}) = \{f^{-1}(y)\}$ for all $y \in Y$.

Illustration 9

Let $f(x) = \dfrac{ax+b}{cx+d}$. The domain of f is $\mathbf{R} \sim \left\{-\dfrac{d}{c}\right\}$.

Let $y = \dfrac{ax+b}{cx+d}$ so $cxy + dy = ax + b \Rightarrow x = \dfrac{b-dy}{cy-a}$.

Hence $f^{-1}(x) = \dfrac{b-dx}{cx-a}$.

DIRECT AND INVERSE IMAGES

Let f be a function with domain X and co-domain Y. If $A \subseteq X$, then the direct image of A under f is the subset of Y (denoted by $f(A)$) is defined to be $\{f(x) : x \in A\}$.

For example, let $f : \mathbf{R} \to \mathbf{R}$ be a function defined by $f(x) = x^2$. If $A = \{-3, -1, 0, 1, 3\}$, then $f(A) = \{0, 1, 9\}$.

Note that if $f(X) = Y$, then the function $f : X \to Y$ is onto. The following relations can be verified easily.

(i) $A \subset B \Rightarrow f(A) \subset f(B)$

(ii) $f(A \cup B) = f(A) \cup f(B)$

(iii) $f(A \cap B) \subset f(A) \cap f(B)$. The inclusion may be strict.

Let f be a function with domain X and range Y and let B be a subset of Y. The inverse image of B under f is a subset of X (denoted by $f^{-1}(B)$) is defined to be $\{x : f(x) \in B\}$.

Illustration 10

If f: $\mathbf{R} \to \mathbf{R}$ is a function defined by $f(x) = |x|$ and $A = (-\infty, 0)$, then $f^{-1}(A) = \{x: f(x) \in A\} = \{x: |x| \in (-\infty, 0)\} = \phi$ (the empty set). If $B = (-3, 3)$, then $f^{-1}(B) = (-3, 3)$.

Note that if f is one-to-one, then $f^{-1}(\{x\})$ is a singleton set. The following relations can be verified easily for $A, B \subset Y$.

(i) $A \subset B = f^{-1}(A) \subset f^{-1}(B)$
(ii) $f^{-1}(A \cup B) = f^{-1}(A) \cup f^{-1}(B)$
(iii) $f^{-1}(A \cap B) = f^{-1}(A) \cap f^{-1}(B)$.

SOLVED EXAMPLES

Concept-based
Straight Objective Type Questions

Example 1: Let **I** be set of integers, **N** = the set of non-negative integers, N_p = the set of non-positive integers. Then the sets A and B satisfying $A \cap B = \phi$ are

(a) $A = I \sim N_p$, $B = N \sim N_p$
(b) $A = I \sim N$, $B = I \sim N_p$
(c) $A = N \Delta N_p$, $B = I \sim N_p$
(d) $A = N \Delta N_p$, $B = (I \sim N) \cup \{0\}$

Ans. (b)

Solution: $I \sim \mathbf{N} = \{\ldots -3, -2, -1\}$, $I \sim N_p = \{1, 2, 3\ldots\}$, $\mathbf{N} \sim N_p = \{1, 2, \ldots\}$, $N \Delta N_p = (\mathbf{N} \sim N_p) \cup (N_p \sim \mathbf{N})$

$$= \{0, 1, 2, \ldots\}$$

$$(I \sim \mathbf{N}) \cup \{0\} = \{\ldots, -3, -2, -1, 0\}$$

The disjoint sets are $\mathbf{I} \sim \mathbf{N}$ and $\mathbf{I} \sim N_p$.

Example 2: Which of the following equality is not true.

(a) $A \cap (B \sim C) = A \cap B \sim (A \cap C)$
(b) $A \sim (A \cap B) = A \sim B$
(c) $A \sim (B \sim C) = (A \sim B) \cup (A \cap C)$
(d) $A \sim (B \Delta C) = (A \sim B) \Delta (A \sim C)$

Ans. (d)

Solution: For equality (a),

$$\begin{aligned} A \cap (B \sim C) &= A \cap (B \cap C') \\ &= \phi \cup (A \cap B \cap C') \\ &= (A \cap B \cap A') \cup (A \cap B \cap C') \\ &= A \cap B \cap (A' \cup C') \\ &= A \cap B \sim (A \cap C) \end{aligned}$$

For equality (b),

$$\begin{aligned} A \sim (A \cap B) &= A \cap (A' \cup B') \\ &= (A \cap A') \cup (A \cap B') \\ &= \phi \cup (A \cap B') = A \cap B' = A \sim B \end{aligned}$$

For equality (c)

$$\begin{aligned} A \sim (B \sim C) &= A \sim (B \cap C') = A \cap (B' \cup C) \\ &= (A \cap B') \cup (A \cap C) \\ &= (A \sim B) \cup (A \cap C) \end{aligned}$$

For (d) Let $A = \{1, 2, 3, 4, 5\}$, $B = \{3, 4, 5\}$, $C = \{1, 2, 3\}$

So, $B \Delta C = \{4, 5\} \cup \{1, 2\} = \{1, 2, 4, 5\}$

Thus $A \sim (B \Delta C) = \{3\}$

$$A \sim B = \{1, 2\}; A \sim C = \{4, 5\}$$

Therefore $(A \sim B) \Delta (A \sim C) = (\{1, 2\} \sim \{4, 5\}) \cup (\{4, 5\} \sim \{1, 2\})$

$$= \{1, 2\} \cup \{4, 5\} = \{1, 2, 4, 5\}.$$

Hence $A \sim (B \Delta C) \neq (A \sim B) \Delta (A \sim C)$

Example 3: A boating club consists of 82 members, each member is either a sailboat owner or a powerboat owner. If 53 members owned sailboats and 38 members owned powerboats, the number of members owned both sailboat and powerboat is

(a) 6 (b) 7
(c) 9 (d) 4

Ans. (c)

Solution: Let S = the set of all members owning sailboats and P = the set of all members owning powerboats

$$n(S \cup P) = n(S) + n(P) - n(S \cap P)$$

$$82 = 53 + 38 - n(S \cap P)$$

$$\Rightarrow \quad n(S \cap P) = 91 - 82 = 9.$$

Example 4: If, $B \underset{\neq}{\subset} A'$, then which of the following sets is equal to A'.

(a) $(A \cap B) \cup B$ (b) $(A \cap B) \cup A'$
(c) $(A \cup B) \cap A'$ (d) $(A \cup B) \cap B$

Ans. (b)

Solution: For (a), $(A \cap B) \cup B = (A \cup B) \cap (B \cup B)$

$$= (A \cup B) \cap B = B.$$

For (b), $(A \cap B) \cup A' = (A \cup A') \cap (B \cup A')$

$$= X \cap A' = A'$$

For (c), $(A \cup B) \cap A' = (A \cap A') \cup (B \cap A')$

$$= \phi \cup (B \cap A')$$

$$= B \cap A' = B.$$

For (d) $(A \cup B) \cap B = B$.

Example 5: If $\left[\frac{x}{2}\right] + \left[\frac{x}{3}\right] = \frac{5x}{6}$, then x is any term of the following

(a) 3, 6, 9, 12,… (b) 9, 18, 27, 36, …
(c) 6, 12, 18, 24,… (d) $\frac{6}{5}, \frac{12}{5}, \frac{18}{5}, \ldots$

Ans. (c)

◎ **Solution:** Since $\left[\frac{x}{2}\right], \left[\frac{x}{3}\right] \in \boldsymbol{I}$, so $\left[\frac{x}{2}\right] + \left[\frac{x}{3}\right] \in \boldsymbol{I}$

Thus $\frac{5x}{6} \in \boldsymbol{I} \Rightarrow x = \frac{6}{5}n, n \in \boldsymbol{I}$.

Substituting this value in $\left[\frac{x}{2}\right] + \left[\frac{x}{3}\right] = \frac{5x}{6}$, we have

$$\left[\frac{3}{5}n\right] + \left[\frac{2}{5}n\right] = n$$

$$\Rightarrow \quad \frac{3}{5}n - \left\{\frac{3}{5}n\right\} + \frac{2}{5}n - \left\{\frac{2}{5}n\right\} = n$$

$$\Rightarrow \quad \left\{\frac{3}{5}n\right\} + \left\{\frac{2}{5}n\right\} = 0$$

$$\Rightarrow \quad \left\{\frac{3}{5}n\right\} = 0 = \left\{\frac{2}{5}n\right\} \qquad (\text{Since } 0 \le \{x\} < 1)$$

Thus $3n = 5m_1$, $2n = 5m_2$, Therefore $xn = \frac{2n \cdot 3n}{5}$

$$= \frac{5m_1 \times 5m_2}{5} = 5m_1\, m_2 \Rightarrow \frac{x \cdot 5m_1}{3} = 5m_1\, m_2$$

$$\Rightarrow \quad x = 3m_2$$

Similarly $\frac{x \cdot 5m_2}{2} = 5m_1\, m_2 \Rightarrow x = 2m_1$

Hence x is multiple of 2 and 3 so of 6 and $x \in \mathbf{I}$

◉ **Example 6:** The relation R defined by '>' on the set **N** is

(a) reflexive (b) symmetric
(c) transitive (d) equivalence relation

Ans. (c)

◎ **Solution:** $2 \not> 2$ so > is not reflexive, $3 > 2$ but $2 \not< 3$ so $(3, 2) \in R$ but $(2, 3) \notin R$. Thus R is not symmetric. If $(a, b) \in R$ and $(b, c) \in R$ then $a > b$, $b > c \Rightarrow a > c$ so $(a, c) \in R$. R is not an equivalence relation.

◉ **Example 7:** The relation $a\, R\, b$ defined by a is factor of b on $\boldsymbol{N}$ is not

(a) reflexive (b) transitive
(c) anti symmetric (d) symmetric

Ans. (d)

◎ **Solution:** For $a \in \boldsymbol{N}$, a is a factor of a so R is reflexive. If a is factor b and b is factor of c then a is factor of c so R is transitive. If a is factor of b and b is factor of a then $a = b$ so R is anti symmetric, 2 is factor of 4 but 4 is not a factor of 2.

◉ **Example 8:** The domain of the function $f(x) = \log_2 \sin x$ is

(a) **R** (b) $\mathbf{R} \sim \{n\,\pi : n \in \mathbf{I}\}$
(c) $R \sim \{n\pi : n \in \mathbf{N}\}$ (d) $\bigcup\limits_{n \in \mathbf{I}} (2n\pi, (2n+1)\pi)$

Ans. (d)

◎ **Solution:** $f(x) = \log_2 \sin x$ is defined for all x for which $\sin x > 0$. But $\sin x > 0$ if $x \in (0, \pi) \cup (2\pi, 3\pi) \cup \ldots = \bigcup\limits_{n \in \mathbf{I}} (2n\pi, (2n+1)\pi)$.

◉ **Example 9:** The domain of $y = \cos^{-1} \frac{1-2x}{4}$ is

(a) $\left[-\frac{3}{2}, \frac{5}{2}\right]$ (b) [–1, 1]
(c) [0, 2] (d) $\left[-\frac{1}{2}, \frac{3}{2}\right]$

Ans. (a)

◎ **Solution:** The given function is defined if

$$-1 \le \frac{1-2x}{4} \le 1 \quad \text{i.e. if } -4 \le 1 - 2x \le 4,$$

$$\Rightarrow -5 \le -2x \le 3 \Rightarrow \frac{-3}{2} \le x \ge \frac{5}{2}$$

◉ **Example 10:** Which of the following functions is bounded

(a) $y = 1 - \log_{10}x$ (b) $y = e^{-2x}$
(c) $y = \sin^{-1}(2x + 1)$ (d) $y = \tan(4x + 1)$

Ans. (c)

◎ **Solution:** The range $\log_{10}x$ is $(-\infty, \infty)$ so $y = 1 - \log_{10}x$ is unbounded. $y = e^{-2x}$ is unbounded from below as $x \to -\infty$, $y \to \infty$. The range of $\sin^{-1}x$ is $\left[\frac{-\pi}{2}, \frac{\pi}{2}\right]$ so $y = \sin^{-1}(2x + 1)$ is a bounded function. The range of $\tan x$ is **R** so $y = \tan(4x + 1)$ is unbounded

◉ **Example 11:** A function out of the following whose period is not π is

(a) $\sin^2 x$ (b) $\cos^2 x$
(c) $\tan(2x + 3)$ (d) $y = |\sin x|$

Ans. (c)

◎ **Solution:** $y = \sin^2 x = \frac{1}{2}[1 - \cos 2x]$. Since period of $\cos x$ is 2π so period of $\cos 2x$ is π.

$y = 1 + \cos^2 x = 1 + \frac{1}{2}(1 + \cos 2x)$. The period of this is again π. The period of $\tan x$ is π so period of $\tan(2\pi + 3)$ is $\pi/2$. If $f(x) = |\sin x|$ then $f(x + \pi) = |\sin(x + \pi)| = |-\sin x| = |\sin x| = f(x)$. Thus the period of f is π.

◉ **Example 12:** Which of the following functions is an odd function

(a) $y = x^4 - 2x^2$ (b) $y = x - x^2$
(c) $y = \cos x$ (d) $y = x - \frac{x^3}{6} + \frac{x^5}{40}$

Ans. (d)

◎ **Solution:** If $f(x) = x^4 - 2x^2$ then $f(-x) = (-x)^4 - 2(-x)^2 = x^4 - 2x^2 = f(x)$. Hence f is an even function. If $u(x) = x - x^2$ then $u(-x) = x - x^2$ so u is neither even nor an odd function. $p(x) = \cos x$, $p(-x) = \cos(-x) = \cos x = p(x)$ so p is even function. If $s(x) = x - \frac{x^3}{6} + \frac{x^5}{40}$ then $s(-x) = -x - \frac{x^3}{6} - \frac{x^5}{40} = -\left(x - \frac{x^3}{6} + \frac{x^5}{40}\right) = -s(x)$, so s is an odd function.

LEVEL 1

Straight Objective Type Questions

Example 13: Let $X = \{x : x = n^3 + 2n + 1, n \in \mathbf{N}\}$ and $Y = \{x : x = 3n^2 + 7, n \in \mathbf{N}\}$ then

(a) $X \cap Y$ is a subset of $\{x : x = 3n + 5, n \in \mathbf{N}\}$
(b) $X \cap Y \subseteq \{x : x = n^2 + n + 1, n \in \mathbf{N}\}$
(c) $34 \in X \cap Y$
(d) none of these

Ans. (c)

Solution: If $n^3 + 2n + 1 = 3n^2 + 7$

$$\Rightarrow \quad n^3 - 3n^2 + 2n - 6 = 0$$
$$\Rightarrow \quad (n - 3)(n^2 + 2) = 0$$
$$\Rightarrow \quad n = 3 \text{ as } n \in \mathbf{N}$$
$$\text{So,} \quad x = 3 \times 3^2 + 7 = 34 \in X \cap Y.$$

In (a) and (b) $x \neq 34$, for any $n \in \mathbf{N}$.

Example 14: A, B, C are the sets of letters needed to spell the words STUDENT, PROGRESS and CONGRUENT, respectively. Then $n(A \cup (B \cap C))$ is equal to

(a) 8
(b) 9
(c) 10
(d) 11

Ans. (b)

Solution:
$$A = \{D, E, N, S, T, U]$$
$$B = \{E, G, O, P, R, S\}$$
$$C = \{C, E, G, N, O, R, T, U\}$$

So $A \cup (B \cap C)$
$$= \{D, E, N, S, T, U\} \cup \{E, G, O, R\}$$
$$= \{D, E, G, O, N, R, S, T, U\}$$

and $n[(A \cup (B \cap C)] = 9$.

Example 15: Let $A = \{x : x$ is a prime factor of $240\}$
$B = \{x : x$ is the sum of any two prime factors of $240\}$.

Then

(a) $5 \notin A \cap B$
(b) $7 \in A \cap B$
(c) $8 \in A \cap B$
(d) $8 \in A \cup B$

Ans. (d)

Solution: $240 = 2 \times 3 \times 5 \times 8$

So $A = \{2, 3, 5\}$, $B = \{5, 7, 8\}$.

Clearly $8 \in A \cup B$.

Example 16: A, B, C are three sets such that $n(A) = 25$, $n(B) = 20$, $n(c) = 27$, $n(A \cap B) = 5$, $n(B \cap C) = 7$ and $A \cap C = \phi$ then $n(A \cup B \cup C)$ is equal to

(a) 60
(b) 65
(c) 67
(d) 72.

Ans. (a)

Solution: $A \cap C = \phi \quad \Rightarrow \quad A \cap B \cap C = \phi$.

$$\therefore \; n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$$
$$= 25 + 20 + 27 - 5 - 7 - 0 + 0 = 60.$$

Example 17: Let $X = \{(x,y,z) \mid x,y,z \in \mathbf{N}.\ x + y + z = 10,\ x < y < z\}$ and $Y = \{(x,y,z) \mid x,y,z \in \mathbf{N},\ y = |x - z|\}$ then $X \cap Y$ is equal to

(a) $\{(2,3,5)\}$
(b) $\{1,4,5\}$
(c) $\{5,1,4\}$
(d) $\{(2,3,5), (1,4,5)\}$

Ans. (d)

Solution: $X = \{(1,2,7), (1,3,6), (1,4,5), (2,3,5)\}$.
Elements of X which belong to Y are $(1,4,5)$ and $(2,3,5)$ both so they belong to $X \cap Y$.

Example 18: If A,B,C are three non-empty sets such that $A \cap B = \phi$, $B \cap C = \phi$, then

(a) $A = C$
(b) $A \subset C$
(c) $C \subset A$
(d) none of these

Ans. (d)

Solution: Let $A = \{1,2,3,4,5\}$, $B = \{6,7,8,9\}$ and $C = \{11,12,13\}$ which satisfy the given conditions but none of (a), (b) or (c).

Example 19: Two finite sets have m and n elements respectively. The total number of subsets of first set is 56 more than the total number of subsets of the second set. The values of m and n respectively are

(a) 7, 6
(b) 6, 3
(c) 5, 1
(d) 8, 7

Ans. (b)

Solution: According to the given condition, we have $2^m = 2^n + 56$
$\Rightarrow 2^{m-3} - 2^{n-3} = 7 \Rightarrow 2^{n-3}(2^{m-n} - 1) = 7$. Since 7 is a prime number so we must have $n - 3 = 0$ (clearly $m \neq n$). Thus $n = 3$. Therefore, $2^m = 2^3 + 56 = 64 = 2^6 \Rightarrow m = 6$.

Example 20: Among employee of a company taking vacations last years, 90% took vacations in the summer, 65% in the winter, 10% in the spring, 7% in the autumn, 55% in winter and summer, 8% in the spring and summer, 6% in the autumn and summer, 4% in the winter and spring, 4% in winter and autumn, 3% in the spring and autumn, 3% in the summer, winter and spring, 3% in the summer, winter and autumn, 2% in the summer, autumn and spring, and 2% in the winter, spring and autumn. Percentage of employee that took vacations during every season:

(a) 4 (b) 3
(c) 2 (d) 8

Ans. (c)

◎ **Solution:** Suppose that number of employee taking vacations is 100.

Su – set of employee taking leave in Summer
W – set of employee taking leave in Winter
Sp – set of employee taking leave in Spring
A – set of employee taking leave in Autumn

$$n(Su) = 90,\ n(W) = 65,\ n(Sp) = 10,\ n(A) = 7$$
$$n(W \cap Su) = 55,\ n(Sp \cap Su) = 8,\ n(A \cap Su) = 6$$
$$n(W \cap Sp) = 4,\ n(W \cap Au) = 4,\ n(Sp \cap A) = 3$$
$$n(Su \cap A) = 3,\ n(Su \cap W \cap A) = 3$$
$$n\ (Su \cap W \cap Sp) = 3,\ n(Su \cap A \cap Sp) = 2$$
$$n(W \cap Sp \cap A) = 2$$

$$\begin{aligned} n(Su \cap Sp \cap W \cap A) &= n(Su) + n(Sp) + n(W) + n(A) - n(Su \cap Sp) \\ &\quad - n(Sp \cap W) - n(W \cap A) - n(Su \cap A) - n(Su \cap W) \\ &\quad - n(Sp \cap A) + n(Su \cap Sp \cap W) + n(Su \cap W \cap A) \\ &\quad + n(W \cap A \cap Su) + n(Su \cap Sp \cap A) \\ &\qquad - n(Sp \cup Su \cup A \cup W) \\ &= 90 + 65 + 10 + 7 - 55 - 8 - 6 - 4 - 4 - 3 \\ &\qquad + 3 + 3 + 2 + 2 - 100 = 2 \end{aligned}$$

◉ **Example 21:** If $A = \{1, 2, 3, 4\}$, $B = \{3, 4, 5\}$ then the number of elements in $(A \cup B) \times (A \cap B) \times (A \,\Delta\, B)$ is

(a) 5 (b) 30
(c) 10 (d) 4

Ans. (b)

◎ **Solution:** $A \cup B = \{1, 2, 3, 4, 5\}$. $n(A \cup B) = 5$

$$A \cap B = \{3, 4\},\ n(A \cap B) = 2$$
$$A \,\Delta\, B = (A \sim B) \cup (B \sim A) = \{1, 2\} \cup \{5\} = \{1, 2, 5\}$$
$$n(A \,\Delta\, B) = 3. \text{ Hence } n((A \cup B) \times (A \cap B) \times (A \,\Delta\, B)\} = 5 \times 2 \times 3 = 30.$$

◉ **Example 22:** Let **I** be the set of integers. For $a, b \in \mathbf{I}$, $a\,R\,b$ if and only if $|a - b| < 1$, then

(a) R is not reflexive
(b) R is not symmetric
(c) $R = \{(a,a);\ a \in \mathbf{I}\}$
(d) R is not an equivalence relation.

Ans. (c)

◎ **Solution:** For any integers a, b, $|a - b| < 1$ if and only if $|a - b| = 0$ so $a = b$. Hence $R = \{(a,a);\ a \in \mathbf{I}\}$.Thus R is reflexive, symmetric and transitive.

◉ **Example 23:** Let W denote the words in the English Dictionary. Define the relation **R** by $\mathbf{R} = \{(x, y) \in W \times W$: the words x and y have at least one letter common$\}$, then **R** is

(a) reflexive, not symmetric and transitive
(b) not reflexive, symmetric and transitive
(c) reflexive, symmetric and not transitive
(d) reflexive, symmetric and transitive

Ans. (c)

◎ **Solution:** $(x, x) \in \mathbf{R}\quad \forall\ x \in W$ as all letters in both are common. If $(x, y) \in \mathbf{R}$ then x and y have a letter in common $\Rightarrow (y, x) \in \mathbf{R}$.

Next, let x = fix, y = six and z = son then$(x, y) \in \mathbf{R}$, $(y, z) \in \mathbf{R}$ but $(x, z) \notin \mathbf{R}$

So **R** is reflexive, symmetric but not transitive

◉ **Example 24:** If the relation $R : A \to B$, where $A = \{1, 2, 3, 4\}$ and $B = \{1, 3, 5\}$ is defined by $R = \{(x, y);\ x < y,\ x \in A,\ y \in B\}$ then RoR^{-1} is

(a) $\{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)\}$
(b) $\{(3, 1), (5, 1), (5, 2), (5, 3), (5, 4)\}$
(c) $\{(3, 3), (3, 5), (5, 3), (5, 5)$
(d) none of these

Ans. (c)

◎ **Solution:** $R = \{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5), (4, 5)\}$

and $\quad R^{-1} = \{(3, 1), (5, 1), (3, 2), (5, 2), (5, 3), (5, 4)\}$.

Thus $\quad RoR^{-1} = \{(3, 3), (3, 5), (5, 3), (5, 5)\}$.

◉ **Example 25:** Let $A = \{x \in \mathbf{R} : [x + 3] + [x + 4] \le 3\}$ and $B = \left\{x \in \mathbf{R} : 3^x \left(\sum_{r=1}^{\infty} \frac{3}{10^r}\right)^{x-3} < 3^{-3x}\right\}$ then

(a) $A = B$ (b) $A \underset{\neq}{\subset} B$
(c) $B \underset{\neq}{\subset} A$ (d) $A \cap B = \phi$

Ans. (a)

◎ **Solution:** Let $x \in A$, $[x + 3] + [x + 4] \le 3$

$$\Rightarrow \quad [x] + 3 + [x] + 4 \le 3$$
$$\Rightarrow \quad 2[x] \le -4 \ \Rightarrow\ [x] \le -2$$
$$\Rightarrow \quad x \in (-\infty, -1)$$
$$A = (-\infty, -1)$$

If $x \in B$ then $3^x\, 3^{x-3}\left(\sum_{r=1}^{\infty} \frac{1}{10^r}\right)^{x-3} < 3^{-3x}$

$$\Rightarrow \quad 3^{2x-3}\left(\frac{1/10}{1-1/10}\right)^{x-3} < 3^{-3x}$$
$$\Rightarrow \quad 3^{2x-3}\left(3^{-2}\right)^{x-3} < 3^{-3x}$$
$$\Rightarrow \quad 3^3 < 3^{-3x} \ \Rightarrow\ 3 < -3x$$

so $x \in (-\infty, -1)$

Hence $B = (-\infty, -1)$. Thus $A = B$.

◉ **Example 26:** The range of the function $f(x) = {}^{7-x}P_{x-3}$ is

(a) $\{1, 2, 3, 4\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{1, 2, 3\}$ (d) $\{1, 2, 3, 4, 5\}$

Ans. (c)

Solution: $7 - x \geq 1, x - 3 \geq 0$

and $\quad 7 - x \geq x - 3$

$\Rightarrow \quad x \leq 6, x \geq 3, x \leq 5.$

Thus $\quad 3 \leq x \leq 5$

$$\therefore \quad \text{Range} = \{4P_0, 3P_1, 2P_2\} = \{1, 3, 2\}$$

Example 27: The domain of the function

$f(x) = \dfrac{\sin^{-1}(x-3)}{\sqrt{9-x^2}}$ is

(a) [1, 2] (b) [2, 3)

(c) [1, 3) (d) [1, 2]

Ans. (b)

Solution: $-1 \leq x - 3 \leq 1$ and $9 - x^2 > 0$

$\Rightarrow \quad 2 \leq x \leq 4$ and $-3 < x < 3$.

So domain of f is [2, 3).

Example 28: The solution of $8x \equiv 6 \pmod{14}$ is

(a) [8], [6] (b) [6], [14]

(c) [6], [13] (d) [8], [14], [16]

where $[a] = \{a + 14k : k \in \mathbf{I}\}$

Ans. (c)

Solution: We need to solve $14|(8x - 6)$ i.e., $8x - 6 = 14k$, for $k \in I$. The values 6 and 13 satisfy this equation, while 8, 14 and 16 do not.

Example 29: Let $R = \{(x, y): x, y \in A, x + y = 5\}$, where $A = \{1, 2, 3, 4, 5\}$ then

(a) R is not reflexive, symmetric and not transitive

(b) R is an equivalence relation

(c) R is reflexive, symmetric but not transitive

(d) R is not reflexive, not symmetric but transitive

Ans. (a)

Solution: $R = \{(1, 4), (4, 1), (2, 3), (3, 2)\}$, so R is not reflexive as $(1, 1) \notin R$. R is symmetric by definition and R is not transitive as $(1, 4) \in R$, $(4, 1) \in R$ but $(1, 1) \notin R$.

Example 30: Let R be a relation on a set A such that $R = R^{-1}$ then R is

(a) reflexive (b) symmetric

(c) transitive (d) an equivalence relation

Ans. (b)

Solution: If $(a, b) \in R$ then $(b, a) \in R^{-1} = R$ so R is symmetric. The relation in Example 29 satisfy $R = R^{-1}$ but is neither reflexive nor transitive.

Example 31: For $x, y \in \mathbf{R}$, define a relation R by $x\,R\,y$ if and only if $x - y + \sqrt{2}$ is an irrational number. Then R is

(a) reflexive (b) symmetric

(c) transitive (d) none of these

Ans. (a)

Solution: Since $x - x + \sqrt{2} = \sqrt{2}$ which is an irrational number so $x\,R\,x$ for all $x \in \mathbf{R}$. Hence R is reflexive. R is not symmetric as $(\sqrt{2}, 1) \in R$ but $(1, \sqrt{2}) \notin R$. Again R is not transitive since $(\sqrt{2}, 1) \in R$ and $(1, 2\sqrt{2}) \in R$ but $(\sqrt{2}, 2\sqrt{2}) \notin R$.

Example 32: If $n|q$ and $A = \{z \in C : z^n = 1\}$, $B = \{z : z^q = 1\}$ then

(a) $A = B$ (b) $A \cap B = \{1\}$

(c) $B \subseteq A$ (d) $A \subsetneq B$

Ans. (d)

Solution: $q = p\,n$ for some $p \in \mathbf{N}$

$$z^q - 1 = (z^n)^p - 1 = (z^n - 1)\,(z^{(p-1)n} + \cdots + z^n + 1)$$

Every root of $z^n - 1$ is a root of $z^q - 1$ and every root of $z^{(p-1)n} + \cdots + z^n + 1 = 0$ is also a root of $z^q - 1$. Hence $A \subsetneq B$ and $A \cap B = A$.

Example 33: If $A = \{z : (1 + 2i)\,\bar{z} + (1 - 2i)\,z + 2 = 0\}$ and $B = \{z : (3 + 2i)\,\bar{z} + (3 - 2i)\,z + 3 = 0\}$, then

(a) $A \cap B$ is a singleton set

(b) $A \subseteq B$

(c) $B \subseteq A$

(d) $A \cap B = \phi$.

Ans. (a)

Solution: Equations in sets A and B represent straight line with $\bar{\alpha}_1 = 1 + 2i$ and $\bar{\alpha}_2 = 3 + 2i$. Since $\dfrac{\bar{\alpha}_1}{\alpha_1} \neq \dfrac{\bar{\alpha}_2}{\alpha_2}$ so the lines are intersecting, hence $A \cap B$ is a singleton set.

Example 34: Let $x, y \in \mathbf{I}$ and suppose that a relation R on $\mathbf{I}$ is defined by $x\,R\,y$ if and only if $x \leq y$ then

(a) R is reflexive but not symmetric

(b) R is an equivalence relation

(c) R is neither reflexive nor symmetric

(d) R is symmetric but not transitive

Ans. (a)

Solution: Since $x \leq x$ for all $x \in \mathbf{I}$ so R is reflexive but is not symmetric as $(1, 2) \in R$ and $(2, 1) \notin R$. Also R is transitive as $x \leq y, y \leq z \Rightarrow x \leq z$.

Example 35: If $f : \mathbf{R} \to \mathbf{R}$ is defined by $f(x) = x^2 + 1$, then value of $f^{-1}(17)$ and $f^{-1}(-3)$ are, respectively,

(a) ϕ, {4, –4} (b) ϕ, {3, –3}

(c) {3, –3}, ϕ (d) {4, –4}, ϕ

Ans. (d)

Solution: For any $A \subseteq \mathbf{R}$, we have $f^{-1}(A) = \{x \in \mathbf{R} : f(x) \in A\}$. Thus,

$f^{-1}(17) = \{x : f(x) \in \{17\}\} = \{x : f(x) = 17\}$

$= \{x : x^2 + 1 = 17\} = \{4, -4\}$,

and similarly, $f^{-1}(-3) = \{x \in \mathbf{R} : x^2 + 1 = -3\} = \phi$.

Example 36: The functions f and g are given by $f(x) = \{x\}$, the fractional part of x and $g(x) = \frac{1}{2}\sin [x]\pi$, where $[x]$ denotes the integral part of x. Then range of gof is

(a) $[-1, 1]$ (b) $\{0\}$
(c) $\{-1, 1\}$ (d) $[0, 1]$

Ans. (b)

Solution: $(gof)(x) = g(f(x)) = 1/2 \sin [\{x\}]\pi = 0$, for all $x \in \mathbf{R}$. Hence the range of gof is $\{0\}$.

Example 37: The period of the function $f(x) = \cos^2 3x + \tan 4x$ is

(a) $\pi/3$ (b) $\pi/4$
(c) $\pi/6$ (d) π

Ans. (d)

Solution: $f(x) = (1/2)(1 + \cos 6x) + \tan 4x$. The period of $\cos 6x$ is $2\pi/6 = \pi/3$ and the period of $\tan 4x$ is $\pi/4$. Hence the period of f is l.c.m. of $\pi/3$ and $\pi/4 = \pi$.

Example 38: The domain of the function

$$f(x) = \sin^{-1}\left(\log_3 \frac{x}{3}\right) \text{ is}$$

(a) $[-1, 9]$ (b) $[1, 9]$
(c) $[-9, 1]$ (d) $[3, 9]$

Ans. (b)

Solution: The function f is defined only if $-1 \le \log_3 (x/3) \le 1$. This inequality is possible only if $1/3 \le x/3 \le 3$ i.e., $1 \le x \le 9$.

Example 39: The domain of the function

$$f(x) = \frac{\sqrt{-\log_{0.3}(x-1)}}{\sqrt{-x^2 + 2x + 8}} \text{ is}$$

(a) $(1, 4)$ (b) $(-2, 4)$
(c) $(2, 4)$ (d) none of these

Ans. (c)

Solution: Since for, $0 < a < 1$, $\log_a x < 0$ for $x > 1$ so $\log_{0.3}(x - 1) < 0$ for $x > 2$. Also $-x^2 + 2x + 8 > 0$ if and only if $x \in (-2, 4)$. Hence the domain of the given function is $(2, 4)$.

Example 40: The function f: $[-1/2, 1/2] \to [-\pi/2, \pi/2]$ defined by $f(x) = \sin^{-1}(3x - 4x^3)$ is

(a) both one-one and onto
(b) neither one-one nor onto
(c) onto but not one-one
(d) one-one but not onto

Ans. (a)

Solution: Since $\sin^{-1}(3x - 4x^3) = 3\sin^{-1} x \in [-\pi/2, \pi/2]$ i.e., $\sin^{-1} x \in [-\pi/6, \pi/6]$ or $x \in [-1/2, 1/2]$ so f is onto. Also $f'(x) = \frac{3}{\sqrt{1-x^2}} > 0$ for $-1/2 < x < 1/2$. Therefore, f increases on $[-1/2, 1/2]$ and hence f is one-one.

Example 41: Given $f(x) = \frac{1}{\sqrt{|x| - x}}$ and $g(x) = \frac{1}{\sqrt{x - |x|}}$ then

(a) dom $f \ne \phi$ and dom $g = \phi$
(b) dom $f = \phi$ and dom $g \ne \phi$
(c) f and g have the same domain
(d) dom $f = \phi$ and dom $g = \phi$

Ans. (a)

Solution: dom $f = \{x : |x| > x\}$ and dom $g = \{x : x > |x|\} = \phi$. Thus dom $f = \mathbf{R}^-$ (the set of all negative real numbers) and dom $g = \phi$.

Example 42: Which of the following functions is not onto

(a) f: $\mathbf{R} \to \mathbf{R}$, $f(x) = 3x + 4$
(b) f: $\mathbf{R} \to \mathbf{R}^+$, $f(x) = x^2 + 2$
(c) f: $R^+ \to R^+$, $f(x) = \sqrt{x}$
(d) none of these

Ans. (b)

Solution: The function $f(x) = 3x + 4$ is onto as for $y \in \mathbf{R}$, $f\left(\frac{y-4}{3}\right) = y$. The function $f : \mathbf{R}^+ \to \mathbf{R}^+$, $f(x) = \sqrt{x}$ is onto as for $y \in \mathbf{R}^+$, $f(y^2) = y$. $f : \mathbf{R} \to \mathbf{R}^+$, $f(x) = x^2 + 2$ is not onto as $1 \in \mathbf{R}^+$ has no pre-image.

Example 43: Which of the following functions is not one-one

(a) f: $\mathbf{R} \to \mathbf{R}$, $f(x) = 2x + 5$
(b) f: $[0, \pi] \to [-1, 1]$, $f(x) = \cos x$
(c) f: $[-\pi/2, \pi/2] \to [1, 7]$ $f(x) = 3 \sin x + 4$
(d) f : $\boldsymbol{R} \to [-1, 1]$, $f(x) = \sin x$

Ans. (d)

Solution: The function in (*a*) is one-one as $2x_1 + 5 = 2x_2 + 5$ is possible only if $x_1 = x_2$. The function in (*b*) is one-one as $\cos x_1 = \cos x_2$ if and only if $\sin \frac{x_1 - x_2}{2} = 0$ i.e., $x_1 = x_2$. Similarly the function in (*c*) is also one-one. The function in (*d*) is not one-one as $f(\pi) = f(2\pi) = 0$.

Example 44: Which of the following functions is non-periodic

(a) $f(x) = x - [x]$

(b) $f(x) = \begin{cases} 1 \text{ if } x \text{ is a rational number} \\ 0 \text{ if } x \text{ is an irrational number} \end{cases}$

(c) $f(x) = \sqrt{\frac{8}{1 + \cos x} + \frac{8}{1 - \cos x}}$

(d) none of these

Ans. (d)

◎ **Solution:** The function in (a) is periodic with period 1 and the function in (b) is also periodic since $f(x + r) = f(x)$ for every rational r. The function in (c) is equal to $\dfrac{4}{|\sin x|}$ and thus has period π.

◉ **Example 45:** Let $f(x) = \dfrac{\alpha x}{x+1}$, $x \neq -1$. Then, for what value of α is $f(f(x)) = x$?

(a) $\sqrt{2}$ (b) $-\sqrt{2}$
(c) 1 (d) –1

Ans. (d)

◎ **Solution:** $f(f(x)) = \dfrac{\alpha f(x)}{f(x)+1} = \dfrac{\alpha^2 x}{(\alpha+1)x+1}$

$$\text{Thus } f(f(x)) = x \Leftrightarrow \alpha^2 x = (\alpha+1)x^2 + x$$
$$\Leftrightarrow (\alpha^2 - 1)x = (\alpha + 1)\, x^2$$
$$\Leftrightarrow (\alpha + 1)\,((\alpha - 1) - (\alpha + 1)x) = 0$$

Since $(\alpha - 1) - (\alpha + 1)\, x \neq 0$ for all x so $\alpha = -1$.

◉ **Example 46:** Let $R = \{(x, y): x, y \in \mathbf{R}, x^2 + y^2 \leq 25\}$

$$R' = \left\{(x, y): x, y \in \mathbf{R}, y \geq \frac{4}{9}x^2\right\} \text{ then}$$

(a) dom $R \cap R' = [-4, 4]$
(b) range $R \cap R' = [0, 4]$
(c) range $R \cap R' = [0, 5]$
(d) $R \cap R'$ defines a function.

Ans. (c)

◎ **Solution:** The equation $x^2 + y^2 = 25$ represents a circle with centre (0, 0) and radius 5 and the equation $y = \dfrac{4}{9}x^2$ represents a parabola with vertex (0, 0) and focus (0, 1/9). Hence $R \cap R'$ is the set of points indicated in the Fig.1.27

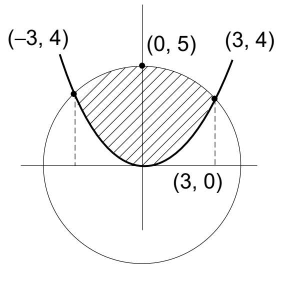

Fig. 1.27

$= \{(x, y): -3 \leq x \leq 3, 0 \leq y \leq 3]\}$. Thus
dom $R \cap R' = [-3, 3]$ and range $R \cap R' = [0, 5] \supset [0, 4]$
Since $(0, 0) \in R \cap R'$ and $(0, 5) \in R \cap R'$
$\therefore$ 0 is related to 0 as well as 5.
Hence $R \cap R'$ doesn't define a function.

◉ **Example 47:** In a factory 70% of the workers like oranges and 64% like apples. If x% like both oranges and apples, then

(a) $x \leq 34$ (b) $x \geq 64$
(c) $34 \leq x \leq 64$ (d) none of these.

Ans. (c)

◎ **Solution:** Let the total number of workers be 100. A, the set of workers who like oranges and B, the set of workers who like apples.

So $n(A) = 70, n(B) = 64, n(A \cap B) = x.$
Also $n(A \cup B) \leq 100.$
$\Rightarrow$ $n(A) + n(B) - n(A \cap B) \leq 100$
$\Rightarrow$ $70 + 64 - x \leq 100 \Rightarrow x \geq 34$
Since $n(A \cap B) \leq n(B) \Rightarrow x \leq 64$
Hence $34 \leq x \leq 64.$

◉ **Example 48:** The Cartesian product of $A \times A$ has 16 elements. $S = \{(a, b) \in A \times A | a < b\}$. (– 1, 2) and (0, 1) are two elements belonging to S. The remaining elements of S are given by.

(a) {(–1, 0), (– 1, 1), (0, 2), (1, 2)}
(b) {(–1, 0), (1, 1), (2, –1), (1, 2)}
(c) {(0, –1), (1, – 1), (0, 2), (1, 2)}
(d) none of these

Ans. (a)

◎ **Solution:** $(-1, 2) \in A \times A$
$\Rightarrow$ $-1 \in A,\ 2 \in A$ and $(0, 1) \in A \times A \Rightarrow 0 \in A, 1 \in A$
So, $A = \{-1, 0, 1, 2\}$ as A has four elements
and $S = \{(-1, 0), (-1, 1), (-1, 2), (0, 1), (0, 2), (1, 2)\}.$
Hence the required element of S are given by (a)

◉ **Example 49:** If R and R' are two symmetric relations (not disjoint) on a set A, then the relation $R \cap R'$ is

(a) reflexive (b) symmetric
(c) transitive (d) none of these.

Ans. (b)

◎ **Solution:**
Let $(a, b) \in R \cap R'$ for some $a, b \in A$.
$\Rightarrow$ $(a, b) \in R$ and $(a, b) \in R'$
$\Rightarrow$ $(b, a) \in R$ and $(b, a) \in R'$ as R and R' are symmetric
$\Rightarrow$ $(b, a) \in R \cap R'$ showing that $R \cap R'$ is symmetric.

◉ **Example 50:** α, β, γ denote respectively the sets containing the letters in the names Apoorv, Mannan and Manvi of three children playing together. Which of the following is not correct.

(a) $n(\alpha \cap \gamma) | n(\alpha \cup \beta \cup \gamma)$
(b) $n(\beta \cap \gamma) | n(\alpha \cup \beta \cup \gamma)$
(c) $n(\alpha \cup \beta \cup \gamma) = 8$
(d) $n(\alpha \cup \beta \cup \gamma) = n(\alpha \cup \gamma)$

Ans. (b)

◎ **Solution:** $\alpha = \{a, o, p, r, v\}, \beta = \{a, m, n\}$
$\gamma = \{a, i, m, n, v\}$
$\alpha \cap \beta = \{a\}, \alpha \cap \gamma = \{a, v\}, \beta \cap \gamma = \{a, m, n\}$
$\alpha \cup \beta \cup \gamma = \{a, i, m, n, o, p, r, v\} = \alpha \cup \gamma.$

Example 51: If $f: \mathbf{R} \rightarrow \mathbf{R}$, defined by $f(x) = x^3 + 7$, then the value of $f^{-1}(71)$ and $f^{-1}(-1)$ respectively are

(a) $\{4\}, \phi$ (b) $\phi, \{-2\}$

(c) $\{4\}, \{-2\}$ (d) $\{2\}, \{-4\}$

Ans (c)

Solution: $f(x) = x^3 + 7 = 71 \Rightarrow x^3 = 64 \Rightarrow x = 4$

$$\Rightarrow \qquad f^{-1}(71) = \{4\}$$

and $f(x) = x^3 + 7 = -1 \Rightarrow x^3 = -8 \Rightarrow x = -2 \Rightarrow f^{-1}(-1) = \{-2\}$

Example 52: If $A = \{1, 3, 5, 7, 9, 11, 13, 15, 17\}$, $B = \{2, 4, 6, 8, 10, 12, 14, 16, 18\}$ and **N**, the set of natural numbers is the universal set, then $A' \cup [(A \cup B) \cap B']$ is

(a) A (b) A'

(c) B (d) **N**.

Ans. (d)

Solution: $(A \cup B) \cap B' = A$ as $A \cap B = \phi$

$$\Rightarrow \qquad A' \cup [(A \cup B) \cap B'] = A' \cup A = \mathbf{N}.$$

Example 53: If $X = \{1, 2, 3, 4,\}$, then a one-one onto mapping $f: X \rightarrow X$ such that $f(1) = 1$, $f(2) \neq 2$ and $f(4) \neq 4$ is given by

(a) $\{(1, 1), (2, 3), (3, 4), (4, 2)\}$

(b) $\{(1, 1), (2, 4), (3, 1), (4, 2)\}$

(c) $\{(1, 2), (2, 4), (3, 2), (4, 3)\}$

(d) none of these

Ans. (a)

Solution: f in (a) is clearly one-one and onto also satisfies $f(1) = 1$, $f(2) = 3 \neq 2$, $f(4) = 2 \neq 4$.

Example 54: Let $f(x) = (x + 1)^2 - 1$, $x \geq -1$ then the set $\{x : f(x) = f^{-1}(x)\}$ is equal to

(a) $\{0, -1\}$ (b) $\{0, 1\}$

(c) $\{-1, 1\}$ (d) $\{0\}$

Ans. (a)

Solution: Let $y = (x + 1)^2 - 1$, $x \geq -1$

$$\Rightarrow \qquad (x + 1)^2 = y + 1$$

$$\Rightarrow \qquad x + 1 = \sqrt{y+1} \text{ as } x \geq -1$$

$$\Rightarrow \qquad x = -1 + \sqrt{y+1}, \; y \geq -1$$

$$\text{Thus} \qquad f^{-1}(x) = -1 + \sqrt{x+1}$$

$$\text{So} \qquad f(x) = f^{-1}(x)$$

$$\Rightarrow \qquad (x + 1)^2 - 1 = -1 + \sqrt{x+1}$$

$$\Rightarrow \qquad \sqrt{x+1} = 0 \text{ or } (x + 1)^{3/2} = 1$$

$$\Rightarrow \qquad x = -1 \text{ or } x = 0$$

Example 55: Let $P = \{\theta : \sin\theta - \cos\theta = \sqrt{2}\cos\theta\}$ and $Q = \{\theta : \sin\theta + \cos\theta = \sqrt{2}\sin\theta\}$ be two sets, then

(a) $P \subset Q$ and $Q \sim P \neq \phi$ (b) $Q \not\subset P$

(c) $P \not\subset Q$ (d) $P = Q$.

Ans. (d)

Solution: $\sin\theta - \cos\theta = \sqrt{2}\cos\theta$

$$\Leftrightarrow \qquad \sin\theta = (\sqrt{2} + 1)\cos\theta$$

$$\Leftrightarrow \qquad \cos\theta = (\sqrt{2} - 1)\sin\theta$$

$$\Leftrightarrow \qquad \sin\theta + \cos\theta = \sqrt{2}\sin\theta$$

$$\Rightarrow \qquad P = Q.$$

Example 56: If A, B, C are three sets such that $A \cap B = A \cap C$ and $A \cup B = A \cup C$, then

(a) $B = C$ (b) $A \cap B = \phi$

(c) $A = B$ (d) $A = C$

Ans. (a)

Solution: Let $x \in B \Rightarrow x \in A \cup B$

$\Rightarrow \qquad x \in A \cup C \Rightarrow x \in A$ or $x \in C$

If $x \in A$, then $x \in A \cap B = A \cap C \Rightarrow x \in C$

So $\qquad x \in B \Rightarrow x \in C$.

Similarly $\quad x \in C \Rightarrow x \in B$, Hence $B = C$.

Example 57: The domain of the function

$$f(x) = \frac{\sin^{-1}(x-3)}{\sqrt{9-x^2}} \text{ is}$$

(a) $[1, 2]$ (b) $[2, 3]$

(c) $[1, 3]$ (d) $[1, 2]$

Ans. (b)

Solution: $x^2 < 9 \Rightarrow -3 < x < 3$

and $-1 \leq x - 3 \leq 1 \Rightarrow 2 \leq x < 3$

Example 58: Let $X = \{1, 2, 3, 4, 5\}$. The number of different ordered pairs (Y, Z) that can be formed such that $Y \subseteq X$, $Z \subseteq X$, and $Y \cap Z$ is empty is

(a) 2^5 (b) 5^3

(c) 5^2 (d) 3^5

Ans. (d)

Solution: For each $x \in X$, we have three choices

$x \in Y,\ x \notin Z; \quad x \notin Y,\ x \in Z; \quad x \notin Y,\ x \notin Z$

So the required number of ordered pairs is 3^5.

Example 59: Let $X = \{1, 2, 3, 4\}$. The number of equivalence relations that can be defined on X is

(a) 10 (b) 15

(c) 16 (d) 8

Ans. (b)

Solution: The number of equivalence relations

$$B_k = \sum_{n=0}^{k-1} \binom{k-1}{n} B_n; \quad B_0 = 1, B_1 = 1, B_2 = 2, B_3 = 5$$

$$B_4 = \binom{3}{0}B_0 + \binom{3}{1}B_1 + \binom{3}{2}B_2 + \binom{3}{3}B_3$$

$$= 1 + 3 + 3 \times 2 + 1 \times 5 = 15$$

Example 60: The function $f(x) = \sin\dfrac{\pi x}{n!} - \cos\dfrac{\pi x}{(n+1)!}$ is

(a) non periodic
(b) periodic with period $2(n!)$
(c) periodic with period $2\,(n+1)!$
(d) periodic with period $n!$

Ans. (c)

Solution: Since the period of sin x is 2π so the period of $\sin\dfrac{\pi x}{n!}$ is $\dfrac{2\pi n!}{\pi}$ = $2(n!)$. The period of $\cos\dfrac{\pi x}{(n+1)!}$ is $2(n+1)!$ The period of $f(x)$ = l.c.m. $(2(n!), 2(n+1)!)$ = $2(n+1)!$

Example 61: If $f(x)^2\ f\left(\dfrac{1-x}{1+x}\right)=x^3,\ x \neq -1, 1$ and $f(x) \neq 0$, then $\{f(-2)\}$ (the fractional part of $f(-2)$) is equal to

(a) 2/3 (b) 1/3
(c) 1/2 (d) 0

Ans. (a)

Solution: Replacing x by $\dfrac{1-x}{1+x}$ in the equation

$$(f(x))^2\, f\left(\frac{1-x}{1+x}\right)=x^3 \qquad \text{...(i)}$$

We have

$$\left(f\left(\frac{1-x}{1+x}\right)\right)^2 f(x) = \left(\frac{1-x}{1+x}\right)^3 \qquad \text{... (ii)}$$

Solving (i) and (ii), we have

$$\left(\frac{x^3}{(f(x))^2}\right)^2 f(x) = \left(\frac{1-x}{1+x}\right)^3$$

$$\Rightarrow \qquad \frac{(f(x))^3}{x^6} = \left(\frac{1+x}{1-x}\right)^3$$

$$\Rightarrow \qquad f(x) = x^2\left(\frac{1+x}{1-x}\right)$$

$$f(-2) = 4\left(\frac{-1}{3}\right) = -\frac{4}{3}$$

$$\{f(-2)\} = -\frac{4}{3}-\left[-\frac{4}{3}\right] = -\frac{4}{3}+2=\frac{2}{3}.$$

Example 62: Let $f(x)$ be a function such that $f(x-1) + f(x+1) = \sqrt{2}f(x)$ for all $x \in \mathbf{R}$. If $f(3) = 5$ then $\sum_{r=0}^{10} f(3+8r)$ is equal to

(a) 50 (b) 55
(c) 0 (d) 10

Ans. (b)

Solution: The given equation is

$$f(x-1) + f(x+1) = \sqrt{2}f(x) \qquad \text{... (i)}$$

Replace x by $x-1$ in (i)

$$f(x-2) + f(x) = \sqrt{2}f(x-1) \qquad \text{... (ii)}$$

Replace x by $x+1$ in (ii)

$$f(x) + f(x+2) = \sqrt{2}f(x+1) \qquad \text{... (iii)}$$

Adding (ii) and (iii), we have

$$\begin{aligned} f(x-2) + f(x+2) + 2f(x) &= \sqrt{2}\,(f(x-1) + f(x+1)) \\ &= \sqrt{2}\,\sqrt{2}f(x) = 2f(x) \end{aligned}$$

$$\Rightarrow \qquad f(x-2) = -f(x+2)$$

Replacing x by $x+2$, we have

$$f(x) = -f(x+4) = -(f(x+8)) = f(x+8)$$

$$\sum_{r=0}^{10} f(3+8r) = 11 \times f(3) = 11 \times 5 = 55.$$

Example 63:

$$\text{Let } f(\theta) = \begin{vmatrix} \sin^2\theta & \cos^2\theta & 1+4\sin 4\theta \\ \sin^2\theta & 1+\cos^2\theta & 4\sin 4\theta \\ 1+\sin^2\theta & \cos^2\theta & 4\sin 4\theta \end{vmatrix}$$

then f is

(a) a non periodic function
(b) periodic with period π
(c) periodic with period $\pi/2$
(d) odd function

Ans. (c)

Solution: $f(\theta) = \begin{vmatrix} -1 & 0 & 1 \\ -1 & 1 & 0 \\ 1+\sin^2\theta & \cos^2\theta & 4\sin 2\theta \end{vmatrix}$

$$\begin{pmatrix} R_1 \to R_1 - R_3 \\ R_2 \to R_2 - R_3 \end{pmatrix}$$

$$= \begin{vmatrix} 0 & 0 & 1 \\ -1 & 1 & 0 \\ \begin{matrix} 1+\sin^2\theta \\ +4\sin 4\theta \end{matrix} & \cos^2\theta & 4\sin 4\theta \end{vmatrix} \qquad (C_1 \to C_1 + C_3)$$

$$= -(\cos^2\theta + 1 + \sin^2\theta + 4\sin 4\theta)$$

$$= -2\,(1 + 2\sin 4\theta)$$

which is periodic function with period $\dfrac{2\pi}{4}=\dfrac{\pi}{2}$.

Assertion-Reason Type Questions

Example 64: Let **R** be the real line. Consider the following subsets of the plane $\mathbf{R} \times \mathbf{R}$:

$$S = \{(x, y) : y = x + 1 \text{ and } 0 < x < 2\}$$
$$T = \{(x, y) : x - y \text{ is an integer}\}$$

Statement-1 : T is an equivalence relation on R but S is not an equivalence relation on R.
Statement-2 : S is neither reflexive nor symmetric but T is reflexive, symmetric and transitive.
Ans. (a)

Solution: Since $x \neq x + 1$, $(x, x) \notin S$, so S is not reflexive. Next $x, y \in S$, $\Rightarrow y = x + 1 \Rightarrow x = y - 1 \Rightarrow (y, x) \notin S$, so is not symmetric.
Since $x - x = 0$ is an integer $(x, x) \in T \; \forall \; x \in T$
$\Rightarrow$ T is reflexive.
Again $(x, y) \in T \Rightarrow x - y$ is an integer
$\Rightarrow$ $y - x$ is also an integer $\Rightarrow (y, x) \in T$
So T is symmetric.
Also $(x, y) \in T$, $(y, z) \in T$.
$\Rightarrow$ $x - y$ and $y - z$ are integers
$\Rightarrow$ $x - z = (x - y) - (y - z)$ is also an integer
$\Rightarrow$ $(x, z) \in T$
So T is Transitive.
Which shows that statement-2 is true and hence statement-1 is also true.

Example 65: Consider the following relations.
$R = \{(x, y) \mid x, y$ are real numbers and $x = wy$ for some rational number $w\}$
$S = \left\{\left(\frac{m}{n}, \frac{p}{q}\right)\right\}$ m, n, p, q, are integer such that $n \cdot q \neq 0$ and $qm = pn\}$

Statement-1: S is an equivalence relation but R is not an equivalence relation.
Statement-2: R and S both are symmetric.
Ans. (c)

Solution: Since $(0, 1) \in R$ but $(1, 0) \notin R$, R is not symmetric and hence is not an equivalence relation so statement-2 is false.
Next, For the relation S, $qm = pn \Rightarrow \frac{m}{n} = \frac{p}{q}$

Thus $\left(\frac{m}{n}, \frac{p}{q}\right) \in S \Rightarrow \frac{m}{n} = \frac{p}{q}$ which shows that S is reflexive and symmetric

Again, $\left(\frac{m}{n}, \frac{p}{q}\right) \in S$ and $\left(\frac{p}{q}, \frac{r}{s}\right) \in S$

$$\Rightarrow \quad \frac{m}{n} = \frac{p}{q} = \frac{r}{s} \quad \Rightarrow \left(\frac{m}{n}, \frac{r}{s} \in S\right)$$

Thus S is transitive and hence S is an equivalence relation. So, statement 1 is true.

Example 66: Let R be a relation on the set N of natural numbers defined by $n \, Rm \Leftrightarrow n$ is a factor of m (*i.e.* $n \mid m$).
Statement-1: R is not an equivalence relation
Statement-2: R is not symmetric
Ans. (a)

Solution: Statement-2 is true as $2 \mid 6 \Rightarrow 2\mathbf{R}6$ but 6 does not divide 2 so R is not symmetric $\Rightarrow R$ is not an equivalence relation and the statement-1 is also true.

Example 67: Let $A = \{1, 2, 3\}$ and $B = \{3, 8\}$
Statement-1: $(A \cup B) \times (A \cap B) = \{(1, 3), (2, 3), (3, 3), (8, 3)\}$
Statement-2: $(A \times B) \cap (B \times A) = \{(3, 3)\}$
Ans. (b)

Solution: $A \cup B = \{1, 2, 3, 8\}$, $A \cap B = \{3\}$
$\Rightarrow$ $(A \cup B) \times (A \cap B) = \{(1, 3), (2, 3), (3, 3), (8, 3)\}$
$\Rightarrow$ Statement-1 is True.
$(x, y) \in (A \times B) \cap (B \times A)$
$\Rightarrow$ $(x, y) \in A \times B$ and $(x, y) \in B \times A$
$\Rightarrow$ $x \in A \cap B$, $y \in A \cap B$
$\Rightarrow$ $\{(3, 3)\} = (A \times B) \cap (B \times A) \Rightarrow$ Statement-2 is also true but is not a correct explanation for statement-1.

Example 68: Statement-1: The number of bijective functions from the set A containing 100 elements to itself is 2^{100}.
Statement-2: The total number of bijections from a set containing n elements to itself is $n!$
Ans. (d)

Solution: Statement-2 is true and so, statement-1 is False.

Example 69: Statement-1: $f : R \to R$ is a function defined by $f(x) = 5x + 3$. If $g = f^{-1}$, then $g(x) = \frac{x - 3}{5}$.
Statement-2: If $f : A \to B$ is a bijection and $g : B \to A$ is the inverse of f, then fog is the identity function on A.
Ans. (c)

Solution: Let $y = 5x + 3 \Rightarrow x = \frac{y - 3}{5}$.

$\Rightarrow$ $g(x) = \frac{x - 3}{5}$ is the inverse of f, so statement-1 is True.

Statement-2 is false because $g : B \to A$ and $f : A \to B$

⇒ $fog : B \to B$ and $g = f^{-1} \Rightarrow fog$ is an identity function on B.

◉ **Example 70:** Let X and Y be two sets.

Statement-1: $X \cap (Y \cup X)' = \phi$

Statement-2: If $X \cup Y$ has m elements and $X \cap Y$ has n elements then symmetric difference $X \Delta Y$ has $m - n$ elements

Ans. (b)

◎ **Solution:** $X \cap (Y \cup X)' = X \cap (Y' \cap X') = X \cap X' \cap Y' = \phi$.

⇒ Statement-1 is True.

$X \Delta Y = (X \sim Y) \cup (Y \sim X) = (X \cup Y) \sim (X \cap Y)$

⇒ number of elements in $X \Delta Y = m - n$.

⇒ Statement-2 is True but does explain statement-1.

◉ **Example 71:** Let f be a function defined by

$f(x) = (x - 1)^2 + 1$, $(x \ge 1)$

Statement-1: The set $\{x : f(x) = f^{-1}(x)\} = \{1, 2\}$

Statement-2: f is a bijection and $f^{-1}(x) = 1 + \sqrt{x-1}$, $x \ge 1$

Ans. (a)

◎ **Solution:** Let $y = f(x) = (x - 1)^2 + 1$

⇒ $y - 1 = (x - 1)^2 \Rightarrow x = 1 + \sqrt{y-1}$, $y \ge 1$

Thus $f^{-1}(x) = 1 + \sqrt{x-1}$, $x \ge 1$. So statement-2 is true.

Now $f(x) = f^{-1}(x)$

⇒ $(x - 1)^2 = \sqrt{x-1}$

⇒ $\sqrt{x-1}\,[(x-1)^{3/2} - 1] = 0$

⇒ $x = 1, 2$.

So statement-1 is true and statement-2 is a correct explanation for statement-1.

◉ **Example 72:** Let R be the set of real numbers

Statement-1: $A = \{(x, y) \in \mathbf{R} \times \mathbf{R} : y + x$ is an integer$\}$ is an equivalence relation on $\mathbf{R}$.

Statment-2: $B = \{(x, y) \in \mathbf{R} \times \mathbf{R} : y = \alpha x$ for some rational number $\alpha\}$ is not equivalence relation on $\mathbf{R}$.

Ans. (d)

◎ **Solution:** A is neither reflexive nor transitive as $x + x$ may not be integer $\forall\, x \in \mathbf{R}$ and if $x + y$ and $y + z$ are integers, $x + z$ may not be an integer for $x, y, z \in \mathbf{R}$.

So statement-1 is false.

Statememt-2 is true as B is not symmetric, because $(\sqrt{3}, 0) \in B$ as $0 = \sqrt{3} \times 0$ for $\alpha = 0$, but $(0, \sqrt{3}) \notin B$.

◉ **Example 73:** Consider the following relation R on the set of real square matrices of order 3.

$R = \{ (A, B) : A = P^{-1}BP$ for some invertible matrix $P\}$

Statement-1: R is an equivalence relation.

Statement-2: For any two invertible 3×3 matrices M and N, $(MN)^{-1} = N^{-1}M^{-1}$.

Ans. (b)

◎ **Solution:** Statement-2 in true (See Text.)

In statement-1, $A = I^{-1} A I$

for all real square matrices A of order 3.

⇒ $(A, A) \in R \Rightarrow R$ is reflexive,

Next, let $(A, B) \in R$

⇒ $\exists$ a invertible matrix P of order 3.

such that $A = P^{-1} B P$

⇒ $B = P A P^{-1} = (P^{-1})^{-1} A (P^{-1})$

⇒ R in symmetric

If Now $(A, B) \in R$ and $(B, C) \in R$

Then $\exists$ invertible matrices P and Q

of order 3 such that

$A = P^{-1} B P$ and $B = Q^{-1} C Q$.

⇒ $A = P^{-1} Q^{-1} C Q P = (QP)^{-1} C QP$ (From statement-2)

⇒ $(A, C) \in R$ and thus R in transitive. Hence R is an equivalence relation and the statement-1 in also true but statement-2 is not a correct explanation for it.

LEVEL 2

Straight Objective Type Questions

◉ **Example 74:** From 50 students taking examinations in Mathematics, Physics and Chemistry, 37 passed Mathematics, 24 Physics and 43 Chemistry. At most 19 passed Mathematics and Physics, at most 29 Mathematics and Chemistry and at most 20 Physics and Chemistry. The largest possible number that could have passed all three exams is

(a) 10 (b) 12

(c) 9 (d) none of these.

Ans. (d)

◎ **Solution:** The given conditions can be expressed as

$n(M \cup P \cup C) = 50$, $n(M) = 37$, $n(P) = 24$, $n(C) = 43$, $n(M \cap P) \le 19$,

$n(M \cap C) \le 29$ and $n(P \cap C) \le 20$,

$$n(M \cup P \cup C) = n(M) + n(P) + n(C) - n(M \cap P) - n(M \cap C) - n(P \cap C) + n(M \cap P \cap C)$$

⇒ $50 = 37 + 24 + 43 - n(M \cap P) - n(P \cap C)$

$$- n(M \cap C) + n(M \cap P \cap C)$$

$$\Rightarrow \quad n(M \cap P \cap C) \le n(M \cap P) + n(M \cap C) + n(P \cap C) - 54.$$

Therefore, the number of students that could have passed all three exams is at most
19 + 29 + 20 − 54 = 14.

◉ **Example 75:** Suppose $A_1, A_2, \ldots, A_{30}$ are thirty sets each having 5 elements and $B_1, B_2 \ldots, B_n$ are n sets each with 3 elements, let $\bigcup\limits_{i=1}^{30} A_i = \bigcup\limits_{j=1}^{n} B_j = S$ and each element of S belongs to exactly 10 of the A_i's and exactly 9 of the B_j's. Then n is equal to

(a) 15 (b) 3
(c) 45 (d) none of these

Ans. (c)

◎ **Solution:** $S = \bigcup\limits_{i=1}^{30} A_i$, so $n(S) = \dfrac{1}{10}(5 \times 30) = 15$ (since element in the union S belongs to exactly 10 of the A_i's).

Again $S = \bigcup\limits_{i=1}^{n} B_i$ so

$$n(S) = 1/9(3 \times n) = n/3 = 15 \Rightarrow n = 45$$

◉ **Example 76:** Let $R = \{(3, 3), (6, 6), (9, 9) (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set A = {3, 6, 9, 12}.

The relation is

(a) an equivalence relation.
(b) reflexive and symmetric only.
(c) reflexive and transitive only
(d) reflexive only.

Ans. (c)

◎ **Solution:** R is reflexive as
$(3, 3), (6, 6), (9, 9), (12, 12) \in R$.
R is not symmetric as $(6, 12) \in R$ but $(12, 6) \notin R$.
R is transitive as the only pair which needs verification is $(3, 6)$ and $(6, 12) \in R \Rightarrow (3, 12) \in R$.

◉ **Example 77:** Let $R = \{(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)\}$ be a relation on the set A = {1, 2, 3, 4}, the relation R is

(a) not symmetric (b) transitive
(c) a function (d) reflexive

Ans. (a)

◎ **Solution:** R is not symmetric as $(2, 3) \in R$ but $(3, 2) \notin R$. It is not transitive as $(1, 3), (3, 1) \in R$. but $(1, 1) \notin$ R so is not reflexive also.
Again as $(2, 4)$ and $(2, 3) \in R$, it is not a function.

◉ **Example 78:** Let **I** be the set of integers, **N** the set of non-negative integers; Np the set of non-positive integers ; E is the set of even integers and P is set of prime numbers. Then

(a) $\mathbf{N} \cap Np = \phi$ (b) $\mathbf{I} - \mathbf{N} = Np$
(c) $\mathbf{N} \,\Delta\, Np = I - \{0\}$ (d) $E \cap P = \phi$.

Ans. (c)

◎ **Solution:** $N \cap Np = \{0\}$,

$$\mathbf{I} - N = \{\ldots, -2, -1\}$$
$$N \,\Delta\, Np = \{N - Np) \cup (Np - N)$$
$$= \{1, 2, 3 \,-\,-\} \cup \{\ldots, -3, -2, -1\}$$
$$= \mathbf{I} \sim \{0\}$$

and $E \cap P = \{2\}$.

◉ **Example 79:** If $n(A) = n$ then $n\{(x, y, z);\ x, y, z \in A, x \ne y, y \ne z, z \ne x\} =$

(a) n^3 (b) $n(n-1)^2$
(c) $n^2(n-2)$ (d) $n^3 - 3n^2 + 2n$

Ans. (d)

◎ **Solution:** There are n choices for the first coordinate, $n - 1$ choices for second coordinate and $n - 2$ choices for the third coordinate, hence $n(\{(x, y, z);\ x, y, z \in A, x \ne y \ne z\}) = n(n-1)(n-2) = n^3 - 3n^2 + 2n$.

◉ **Example 80:** If $A = \{x : x \in \mathbf{I}, -2 \le x \le 2\}$, $B = \{x \in \mathbf{I}, 0 \le x \le 3\}$, $C = \{x: x \in \mathbf{N}, 1 \le x \le 2\}$ and $D = \{x, y) \in \mathbf{N} \times \mathbf{N};\ x + y = 8\}$. Then

(a) $n(A \cup (B \cup C) = 5$ (b) $n(D) = 6$
(c) $n(B \cup C) = 5$ (d) none of these

Ans. (d)

◎ **Solution:** $A = \{-2, -1, 0, 1, 2\}$, $B = \{0, 1, 2, 3\}$, $C = \{1, 2\}$

so $B \cup C = \{0, 1, 2, 3\}$,
$A \cup (B \cup C) = \{-2, -1, 0, 1, 2, 3\}$
so $n(A \cup (B \cup C) = 6$, $n(B \cup C) = 4$
and $D = \{(1, 7), (2, 6), (3, 5), (4, 4), (5, 3), (6, 2), (7, 1)\}$ so
$n(D) = 7$.

◉ **Example 81:** If $A = \{4^n - 3n - 1 | n \in \mathbf{N}\}$ and $B = \{9n - 9: n \in \mathbf{N}\}$, then $A \cup B$ is equal to

(a) B (b) A
(c) **N** (d) none of these

Ans. (a)

◎ **Solution:** It can be shown by induction that $9 \mid 4^n - 3n - 1$ for every $n \in \mathbf{N}$. Thus $A \subseteq B$. Clearly $A \ne B$ as $27 \in B$ but $27 \notin A$. Thus $A \cup B = B$.

◉ **Example 82:** A and B are two sets having 3 and 4 elements respectively and having 2 elements in common. The number of relations which can be defined from A to B is

(a) 2^5 (b) $2^{10} - 1$
(c) 2^{12} (d) none of these.

Ans. (c)

◎ **Solution:** The number of elements in $A \times B$ is 12. Hence the number of subsets of $A \times B$ is 2^{12}, which includes the empty set

Example 83: If R and S are two symmetric relations then

(a) $R \; o \; S$ is a symmetric relation
(b) $S \; o \; R$ is a symmetric relation
(c) $R \; o \; S^{-1}$ is a symmetric relation
(d) $R \; o \; S$ is a symmetric relation if and only if $RoS = SoR$.

Ans. (d)

Solution: Since R and S are symmetric relations so $R^{-1} = R$ and $S^{-1} = S$. But $(R \; o \; S)^{-1} = S^{-1} \; o \; R^{-1} = S \; o \; R$. Thus RoS is symmetric if and only if $RoS = SoR$.

Example 84: Let A be the set of all determinants of order 3 with entries 0 or 1 only, B the subset of A consisting of all determinants with value 1, and C the subset consisting of all determinants with value –1. Then if $n(B)$ and $n(C)$ denote the number of elements in B and C, respectively, we have

(a) $C = \phi$ (b) $n(B) = n(C)$
(c) $A = B \cup C$ (d) $n(B) = 2n(C)$

Ans. (b)

Solution: C cannot be the empty set because, for instance,

$$-1 = \begin{vmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{vmatrix} \in C. \text{ We also have } \begin{vmatrix} 1 & 0 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \end{vmatrix} = 2,$$

so $A \neq B \cup C$. In general, the determinant

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{matrix} a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} \\ -a_{11}a_{22}a_{32} - a_{12}a_{21}a_{33} - a_{13}a_{31}a_{22}, \end{matrix}$$

with the a's being 0 or 1, equals 1 only if $a_{11}a_{22}a_{33} = 1$ and the remaining terms are zero; if $a_{12}\,a_{23}\,a_{31} = 1$ and the remaining terms are zero; or if $a_{13}\,a_{21}\,a_{32} = 1$ and the remaining terms are zero. Since there are three similar relations for determinants that equal – 1, we must have $n\,(B) = n\,(C)$.

Example 85: The domain of the function

$$f(x) = \log_2\left(-\log_{1/2}\left(1 + \frac{1}{\sqrt[4]{x}}\right) - 1\right) \text{ is}$$

(a) $0 < x < 1$ (b) $0 < x \leq 1$
(c) $x \geq 1$ (d) $x > 1$

Ans. (a)

Solution: For f to be defined we must have $\log_{1/2}\left(1 + \frac{1}{\sqrt[4]{x}}\right) < -1 \Leftrightarrow 1 + \frac{1}{\sqrt[4]{x}} > (2^{-1})^{-1} = 2$ which is possible if and only if $\frac{1}{\sqrt[4]{x}} > 1$ i.e., $0 < x < 1$.

Hence the domain of the given function is $\{x : 0 < x < 1\}$.

Example 86: The domain of definition of

$$f(x) = \sqrt{\log_{0.4}\left(\frac{x-1}{x+5}\right)} \times \frac{1}{x^2 - 36} \text{ is}$$

(a) $\{x : x < 0, x \neq -6\}$
(b) $\{x : x > 0, x \neq 1, x \neq 6\}$
(c) $\{x : x > 1, x \neq 6\}$
(d) $\{x : x \geq 1, x \neq 6\}$

Ans. (c)

Solution: For $\sqrt{\log_{0\cdot 4}\left(\frac{x-1}{x+5}\right)}$ to be defined, we must have $0 < \frac{x-1}{x+5} < 1$, which is true if $x > 1$. Morever, $\frac{1}{x^2 - 36}$ is defined for $x \neq \pm 6$. Hence the domain of f is $\{x : x > 1, x \neq 6\}$.

Example 87: The set of all x for which $f(x) = \log_{\frac{x-2}{x+3}} 2$ and $g(x) = \frac{1}{\sqrt{x^2 - 9}}$ are both not defined is

(a) $(-3, 2)$ (b) $[-3, 2)$
(c) $(-3, 2]$ (d) $[-3, 2]$

Ans. (d)

Solution: The function f is not defined for $-3 \leq x \leq 2$ and g is not defined for those x for which $x^2 - 9 \leq 0$ i.e., $x \in [-3, 3]$. Thus f and g are not defined on $[-3, 2]$.

Example 88: If $f(x)$ is a polynomial satisfying $f(x)\,f(1/x) = f(x) + f(1/x)$ and $f(3) = 28$, then $f(4)$ is given by

(a) 63 (b) 65
(c) 67 (d) 68

Ans. (b)

Solution: Any polynomial satisfying the functional equation $f(x) \cdot f(1/x) = f(x) + f(1/x)$ is of the form $x^n + 1$ or $-x^n + 1$. If $28 = f(3) = -3^n + 1$ then $3^n = -27$ which is not possible for any n. Hence $28 = f(3) = 3^n + 1 \Rightarrow 3^n = 27 \Rightarrow n = 3$. Thus $f(x) = x^3 + 1$, so $f(4) = 4^3 + 1 = 65$.

Example 89: Part of the domain of the function $f(x) = \sqrt{\frac{\cos x - 1/2}{6 + 35x - 6x^2}}$ lying in the interval $[-1, 6]$ is

(a) $[-1/6, \pi/3] \cup [5\pi/3, 6]$
(b) $(-1/6, \pi/3] \cup [5\pi/3, 6)$
(c) $(-1/6, 6)$
(d) none of these

Ans. (a)

Solution: The function f is meaningful only if $\cos x - 1/2 \geq 0$, $6 + 35x - 6x^2 > 0$ or $\cos x - 1/2 \leq 0$, $6 + 35x - 6x^2 < 0$ i.e., $\cos x \geq 1/2$, $(6 - x)(1 + 6x) > 0$ or $\cos x \leq 1/2$, $(6 - x)(1 + 6x) < 0$. These inequalities are satisfied if $x \in (-1/6, \pi/3] \cup [5\pi/3, 6)$.

Example 90: Let f: $\mathbf{R} \to \mathbf{R}$ be a function defined by $f(x) = \frac{e^{|x|} - e^{-x}}{e^x + e^{-x}}$. Then

(a) f is both one-one and onto
(b) f is one-one but not onto

(c) f is onto but not one-one
(d) f is neither one-one nor onto

Ans. (d)

◎ **Solution:** f is not one-one as $f(0) = 0$ and $f(-1) = 0$. f is also not onto as for $y = 1$ there is no $x \in \mathbf{R}$ such that $f(x) = 1$. If there is such a $x \in \mathbf{R}$ then $e^{|x|} - e^{-x} = e^x + e^{-x}$, clearly $x \neq 0$. For $x > 0$, this equation gives $-e^{-x} = e^{-x}$ which is not possible. For $x < 0$, the above equation gives $e^x = -e^{-x}$ which is also not possible.

◉ **Example 91:** Let $f(x) = x^2$ and $g(x) = 2^x$ then the solution set of $fog\ (x) = g\ of(x)$ is

(a) $\mathbf{R}$	(b) $\{0\}$
(c) $\{0, 2\}$	(d) none of these

Ans. (c)

◎ **Solution:** $fog\ (x) = f(g(x)) = f(2^x) = (2^x)^2 = 2^{2x}$ and $gof\ (x) = g\ (f(x)) = g\ (x^2) = 2^{x^2}$. Thus the solution of $2^{x^2} = 2^{2x}$ is given by $x^2 = 2x$ which is $x = 0, 2$.

◉ **Example 92:** A function $f: \mathbf{R} \to \mathbf{R}$ satisfies the equation $f(x) f(y) - f(xy) = x + y$ for all $x, y \in \mathbf{R}$ and $f(1) > 0$, then

(a) $f(x) = x + 1/2$	(b) $f(x) = (1/2)x + 1$
(c) $f(x) = (1/2)x - 1$	(d) $f(x) = x + 1$

Ans. (d)

◎ **Solution:** Taking $x = y = 1$, we get

$$f(1) f(1) - f(1) = 1 + 1 \Rightarrow f(1)^2 - f(1) - 2 = 0$$

$$\Rightarrow \quad (f(1) - 2)(f(1) + 1) = 0 \Rightarrow f(1) = 2 \ (\because f(1) > 0)$$

Taking $y = 1$, we get

$$f(x) f(1) - f(x) = x + 1 \Rightarrow 2f(x) - f(x) = x + 1$$

$$\Rightarrow \quad f(x) = x + 1.$$

◉ **Example 93:** If $f: [1, \infty) \to [2, \infty)$ is given by $f(x) = x + 1/x$ then $f^{-1}(x)$ equals

(a) $\dfrac{x + \sqrt{x^2 - 4}}{2}$	(b) $\dfrac{x}{1 + x^2}$
(c) $\dfrac{x - \sqrt{x^2 - 4}}{2}$	(d) $1 + \sqrt{x^2 - 4}$

Ans. (a)

◎ **Solution:** $y = x + 1/x \Rightarrow x^2 - xy + 1 = 0$

$$\Rightarrow \quad x = \frac{y \pm \sqrt{y^2 - 4}}{2}$$

Since $x \in [1, \infty)$ so $x = \dfrac{y + \sqrt{y^2 - 4}}{2}$.

Hence $f^{-1}(x) = \dfrac{x + \sqrt{x^2 - 4}}{2}$.

◉ **Example 94:** Consider the function $f = \{(x, \sin x) | -\infty < x < \infty\}$. Let $A = \left[0, \frac{\pi}{6}\right]$ and $B = \left[0, \frac{\pi}{2}\right]$ then

(a) $f(A \cap B) = f(A) \cap f(B)$	(b) $f(A \cap B) = [0, 1]$
(c) $f(A) \cap f(B) = [0, 1]$	(d) $f(A) \cup f(B) = \left[0, \frac{1}{2}\right]$

Ans. (a)

◎ **Solution:** $f(x) = \sin x$ is an increasing function on $[0, \pi/2]$ so $f(A) = \left[0, \sin\frac{\pi}{6}\right] = \left[0, \frac{1}{2}\right]$ and $f(B) = [0, 1]$. Thus $f(A) \cap f(B) = \left[0, \frac{1}{2}\right]$. Also $A \cap B = \left[0, \frac{\pi}{6}\right]$, so $f(A \cap B) = \left[0, \sin\frac{\pi}{6}\right] = \left[0, \frac{1}{2}\right]$. Thus $f(A) \cap f(B) = \left[0, \frac{1}{2}\right] = f(A \cap B)$, Also $f(A) \cup f(B) = [0, 1]$.

◉ **Example 95:** Let $f(x)$ be a polynomial of even degree satisfying $f(2x)\left(1 - f\left(\frac{1}{2x}\right)\right) + f\left(16x^2 y\right) = f(-2) - f(4xy)$ for all $x, y \in \mathbf{R} \sim \{0\}$ and $f(4) = -255$, $f(0) = 1$. Then the value of $\left|\dfrac{f(2) + 1}{2}\right|$ is

(a) 4	(b) 5
(c) 7	(d) 6

Ans. (c)

◎ **Solution:** Replacing y by $\dfrac{1}{8x^2}$ in the given functional equation, we obtain

$$f(2x)\left(1 - f\left(\frac{1}{2x}\right)\right) + f(2) = f(-2) - f\left(\frac{1}{2x}\right).$$

Since f is an even function so $f(2) = f(-2)$,

$$\text{so} \quad f(2x) - f(2x) f\left(\frac{1}{2x}\right) = -f\left(\frac{1}{2x}\right)$$

$$\Rightarrow \quad f(2x) + f\left(\frac{1}{2x}\right) = f(2x)\, f\left(\frac{1}{2x}\right)$$

Replacing x by $\dfrac{x}{2}$, we have

$$f(x) + f\left(\frac{1}{x}\right) = f(x)\, f\left(\frac{1}{x}\right)$$

Since f is a polynomial, so $f(x) = \pm x^n + 1$ (see Example 88) But $-255 = f(4) = \pm 4^n + 1$. Only negative sign is possible, thus $4^n = 256 \Rightarrow n = 4$. i.e. $f(x) = -x^4 + 1$. $f(2) = -2^4 + 1 = -15$

$$\left|\frac{f(2) + 1}{2}\right| = \left|-\frac{14}{2}\right| = 7.$$

◉ **Example 96:** The domain of the function $f(x) = \dfrac{1}{\sqrt{\sin x}} + \sqrt[3]{\sin x} + \log_{10} \dfrac{x - 5}{x^2 - 10x + 24}$ is

(a) $\{(2k\pi, (2k + 1)\pi) : k \in \mathbf{I}\}$
(b) $\{(2k\pi, (2k + 1)\pi) : k \in \mathbf{N}\}$
(c) $(6, \infty) \cup (4, 5)$
(d) $\{(2k\pi, (2k + 1)\pi) : k \in \mathbf{I}\} \cup (6, \infty)$

Ans. (b)

◎ **Solution:** The domain of $\sqrt[3]{\sin x}$ is **R**.

The domain of $\dfrac{1}{\sqrt{\sin x}} = \{x : \sin x > 0\}$

$= \{(2k\pi, (2k+1)\pi) : k \in \mathbf{I}\}$

The domain of $\log_{10} \dfrac{x-5}{x^2-10x+24} = \log_{10} \dfrac{x-5}{(x-6)(x-4)}$

$= \{x : x \neq 5, x > 5, x > 6, x > 4$ or $x \neq 5, x < 5, 4 < x < 6\}$

$= (4, 5) \cap (6, \infty)$

Thus the domain of $f(x)$

$= \{(2k\pi, (2k+1)\pi) : k \in \mathrm{I}\} \cap \{(4, 5) \cup (6, \infty)\}$

$= \{(2k\pi, (2k+1)\pi) : k \in \mathbf{N}\}$

(since (4, 5) does not intersect $\{(2k\pi, 2k+1)\pi : k \in \mathrm{I}\}$)

EXERCISE

Concept-based Straight Objective Type Questions

1. Let U be a Universal set and $n(U) = 12$. If $A, B \subseteq U$ are such that $n(B) = 6$ and $n(A \cap B) = 2$ then $n(A \cup B')$ is equal to
   (a) 6 (b) 10
   (c) 7 (d) 8

2. Let R be a relation on **R** defined as $a \, R \, b$ if $|a| \leq b$. Then, relation R is
   (a) reflexive (b) symmetric
   (c) transitive (d) not antisymetric

3. Let $f(x) = ax + b$, $x \in$ **R**, and $g(x) = x + d$, $x \in$ **R**, then $fog = gof$ if and only if
   (a) $f(a) = g(c)$ (b) $f(d) = g(b)$
   (c) $f(b) = g(d)$ (d) $f(c) = g(a)$

4. The domain of the function $f(x) = \dfrac{\sin x}{\sqrt{|x| - x}}$ is
   (a) **R** (b) **R** ~ {0}
   (c) $\mathbf{R}^+$ (d) $\mathbf{R}^-$

   ($\mathbf{R}^+$ is the set of positive real numbers and $\mathbf{R}^-$ is the set of negative real numbers)

5. The domain of $y = \cos^{-1}(1 - 2x)$ is
   (a) [– 1, 1] (b) [0, 1]
   (c) [–1, 0] (d) $\left[-\dfrac{1}{2}, \dfrac{1}{2}\right]$

6. If $f(x) = \sin x - \cos x$ is written as $f_1(x) + f_2(x)$ where $f_1(x)$ is even and $f_2(x)$ is odd then
   (a) $f_1(x) = \cos x$ (b) $f_1(x) = -\cos x$
   (c) $f_2(x) = -\sin x + \cos x$ (d) $f_2(x) = \sin(2\pi - x)$

7. The range of $y = 1 - \sin x$ is
   (a) [–1, 1] (b) [0, 1]
   (c) [–1, 2] (d) [0, 2]

8. The function $f(x) = x^2 \log \dfrac{1-x}{1+x}$ is
   (a) a periodic function (b) a bounded function
   (c) an odd function (d) an even function

LEVEL 1

Straight Objective Type Questions

9. If $A = \{2, 3, 4, 5, 7\}$, $B = \{1, 2, 4, 7, 9\}$ then $((A \sim B) \cup (B \sim A)) \cap A$ is equal to
   (a) {3, 5} (b) {2, 4}
   (c) {3, 7} (d) {2, 7}

10. If $A = \{2x : x \in N\}$, $B = \{3x : x \in N\}$ and $C = \{5x : x \in N)$ then $A \cap (B \cap C)$ is equal to
    (a) {15, 30, 45, ... }
    (b) {10, 20, 30 ... }
    (c) {30, 60, 90, ... }
    (d) {7, 14, 21 ... }.

11. If X and Y are two sets such that $X \cap Y = X \cup Y$, then
    (a) $X \subset Y, X \neq Y$ (b) $Y \subset X, Y \neq X$
    (c) $X = Y$ (d) none of these

12. If X, Y and A are three sets such that $A \cap X = A \cap Y$ and $A \cup X = A \cup Y$ then
    (a) $X \subset Y$ (b) $Y \subset X$
    (c) $X = Y$ (d) none of these

13. If $A = \{x : x \in R$ and satisfy $x^2 - 15x + 56 = 0\}$
    $B = \{x : x \in N$ and $x + 5 \leq 14\}$
    and $C = \{x : x \in N$ and $x/112\}$.
    Then $A \cup (B \cap C)$ is equal to
    (a) {1, 2, 3,....8} (b) {8, 7}
    (c) {1, 2, 8, 7} (d) {1, 2, 4, 7, 8}

14. If A is the set of letters needed to spell “MATHEMATICS” and B is the set of letters needed to spell STATISTICS, then

(a) $A \subset B$ (b) $A \sim B = \phi$
(c) $A \Delta B = A \sim B$ (d) none of these

15. If A and B are two sets such that $n(A \cup B) = 36$, $n(A \cap B) = 16$ and $n(A \sim B) = 15$, then $n(B)$ is equal to

(a) 21 (b) 31
(c) 20 (d) 52

16. The maximum number of sets obtainable from A and B by applying union and difference operations is

(a) 5 (b) 6
(c) 7 (d) 8

17. If A and B both contain same number of elements and are finite sets then

(a) $n(A \cup B) = n(A \cap B)$ (b) $n(A \sim B) = n(B \sim A)$
(c) $n(A \Delta B) = n(B)$ (d) $n(A \sim B) = n(A)$

18. If $A \Delta B = A \cup B$ then

(a) $A = B$ (b) $A \cap B = \phi$
(c) $A \Delta B = \phi$ (d) $A \Delta B = A \sim B$

19. In a class 60% passed their Physics examination and 58% passed in Mathematics. Atleast what percentage of students passed both their Physics and Mathematics examination?

(a) 18% (b) 17%
(c) 16% (d) 2%

20. If the relation $R: A \to B$, where $A = \{1, 2, 3\}$ and $B = \{1, 3, 5\}$ is defined by
$R = \{(x, y): x < y, x \in A, y \in B\}$, then

(a) $R = \{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5)\}$
(b) $R = \{(1, 1), (1, 5), (2, 3), (3, 5)\}$
(c) $R^{-1} = \{(3, 1), (5, 1), (3, 2), (5, 3)\}$
(d) $R^{-1} = \{(1, 1), (5, 1), (3, 2), (5, 3)\}$

21. The relation R defined on the set $A = \{1, 2, 3, 4, 5\}$ by

$$R = \{(x, y): |x^2 - y^2| < 16\}$$

is given by

(a) $R_1 = \{(1, 1), (2, 1), (3, 1), (4, 1), (2, 3)\}$
(b) $R_2 = \{(2, 2), (3, 2), (4, 2), (2, 4)\}$
(c) $R_3 = \{(3, 3), (4, 3), (5, 4), (3, 4)$
(d) none of these

22. Let L be the set of all lines in a plane and R be a relation on L defined by $l_1 R\, l_2$ if and only if $l_1 \perp l_2$ then R is

(a) reflexive (b) symmetric
(c) transitive (d) an equivalence relation

23. For non-empty subsets A and B,

(a) Any subset of $A \times B$ defines a function from A to B.
(b) Any subset of $A \times B$ defines an equivalence relation
(c) Any subset of $A \times A$ defines a function on A
(d) none of these.

24. Let $f(x) = (x + 1)^2 - 1$ $(x \geq -1)$. Then the set $S = \{x : f(x) = f^{-1}(x)\}$ contains

(a) $\left\{0, -1, \dfrac{-3 + i\sqrt{3}}{2}, \dfrac{-3 - i\sqrt{3}}{2}\right\}$
(b) $\{0, 1, -1\}$
(c) $\{0, -1\}$
(d) none of these

25. If a set A has n elements then the number of all relations on A is

(a) 2^{n^2} (b) $2^{n^2} - 1$
(c) 2^n (d) none of these

26. The function f: $\mathbf{R} \to \mathbf{R}$ given by $f(x) = 3 - 2 \sin x$ is

(a) one-one (b) onto
(c) bijective (d) none of these

27. Which of the following are functions?

(a) $\{(x, y): y^2 = 4ax, x, y \in \mathbf{R}\}$
(b) $\{(x, y): y = |x|, x, y \in \mathbf{R}\}$
(c) $\{(x, y): x^2 + y^2 = 1, x, y \in \mathbf{R}\}$
(d) $\{(x, y): x^2 - y^2 = 1, x, y \in \mathbf{R}\}$

28. If f: $\mathbf{R} \to \mathbf{R}$ defined by $f(x) = x^4 + 2$ then the value of f^{-1} (83) and $f^{-1}(-2)$ respectively are

(a) ϕ, $\{3, -3\}$ (b) $\{3, -3\}$, ϕ
(c) $\{4, -4\}$, ϕ (d) $\{4, -4\}$, $\{2, -2\}$.

29. The minimum number of elements that must be added to the relation $R = \{(1, 2), (2, 3)\}$ on the sub set $\{1,2,3\}$ of natural numbers so that it is an equivalence relation is

(a) 4 (b) 7
(c) 6 (d) 5

30. Let X be a non-empty set and $P(X)$ be the set of all subsets of X. For $A, B \in P(X)$, ARB if and only if $A \cap B = \phi$ then the relation

(a) R is reflexive
(b) R is symmetric
(c) R is transitive
(d) R is an equivalence relation

31. Let f be a function satisfying $2f(x) - 3f(1/x) = x^2$ for any $x \neq 0$. Then the value of $f(2)$ is

(a) – 2 (b) – 7/4
(c) – 7/8 (d) 4

32. If $f(x) = \begin{vmatrix} 1 & x & (x+1) \\ 2x & x(x-1) & (x+1)x \\ 3x(x-1) & x(x-1)(x-2) & x(x-1)(x+1) \end{vmatrix}$

then

$f(50) + f(51) + \ldots\ldots + f(99)$ is equal to

(a) 0 (b) 1275
(c) 3725 (d) none of these

33. The domain of definition of the functions $y(x)$ given by the equation $a^x + a^y = a$ $(a > 1)$ is

(a) $0 < x \le 1$ (b) $0 \le x \le 1$
(c) $-\infty < x < 1$ (d) $-\infty < x \le 0$

34. Let $f(x) = \dfrac{x - [x]}{1 + x - [x]}$, where $[x]$ denotes the greatest integer less than or equal to x, then the range of f is

(a) $[0, 1/2]$ (b) $[0, 1)$
(c) $[0, 1/2)$ (d) $[0, 1]$

35. If $2f(x^2) + 3f(1/x^2) = x^2 - 1$, then $f(x^2)$ is

(a) $(1 - x^4)/5x^2$ (b) $(1 - x^2)/5x$
(c) $5x^2/(1 - x^4)$ (d) none of these

36. If $f(x + 3y, x - 3y) = 12xy$, then $f(x, y)$ is

(a) $2xy$ (b) $2(x^2 - y^2)$
(c) $x^2 - y^2$ (d) none of these

37. If the function $f : [1, \infty) \to [1, \infty)$ is defined by $f(x) = 2^{x(x-1)}$ then $f^{-1}(x)$ is

(a) $(1/2)^{x(x-1)}$ (b) $\dfrac{1}{2}\left(1 + \sqrt{1 + 4\log_2 x}\right)$
(c) $\dfrac{1}{2}\left(1 - \sqrt{1 + 4\log_2 x}\right)$ (d) not defined

38. If $n(A) = 3$ and $n(B) = 5$ then number of one-one functions that can be defined from A to B is

(a) 30 (b) 40
(c) 120 (d) 60

39. Let f: $\{x, y, z\} \to \{1, 2, 3\}$ be a one-one function. If it is given that exactly one of the following statements is true,

Statement-1: $f(x) = 1$, Statement-2: $f(y) \ne 1$, Statement-3: $f(z) \ne 2$.

then $f^{-1}(1)$ is

(a) x (b) y
(c) z (d) none of these

40. The value of $n \in \mathbf{z}$ for which the function

$f(x) = \dfrac{\sin nx}{\sin(x/n)}$ has 4π as its period is

(a) 2 (b) 3
(c) 4 (d) 5

41. Let R be a relation on $\mathbf{N}$ defined by

$$R = \{(m, n) : m, n \in N \text{ and } m = n^2\}.$$

Which of the following is true.

(a) $(n, n) \in R$. $\forall\, n \in \mathrm{N}$
(b) $(m, n) \in R \Rightarrow (n, m) \in R$
(c) $(m, n) \in R$, $(n, p) \in R \Rightarrow (m, p) \in R$
(d) none of these

42. Of the number of three athletic teams in a school, 21 are in the basketball team, 26 in hockey team and 29 in the football team, 14 play hockey and basketball, 15 play hockey and football, 12 play football and basketball and 8 play all the games. The total number of members is

(a) 42 (b) 43
(c) 45 (d) none of these

43. E, I, R, O denote respectively the sets of all equilateral, isosceles, right angled and obtuse angled triangles in a plane, then which of the following is not true.

(a) $R \cap E = \phi, R \cap I \ne \phi$
(b) $E \cap O = \phi, O \cap I \ne \phi$
(c) $E \cap I = \phi, E \cap O \ne \phi$
(d) $E \cap I \ne \phi, E \subset I$

44. If $A = \{3^n : n \in \mathbf{N}, n \le 6\}$, $B = \{9^n : n \in \mathbf{N}, n \le 4\}$ then which of the following is false

(a) $A \,\Delta\, B = \{6561\}$
(b) $A \sim B = \{3, 27, 243\}$
(c) $A \cap B = \{9, 81, 729\}$
(d) $A \cup B = \{3, 9, 27, 81, 243, 729, 6561\}$

45. If $f : \mathbf{R} \to \mathbf{R}$ given by $f(x) = ax + \sin x + a$, then f is one-one and onto for all

(a) $a \in \mathbf{R}$ (b) $a \in \mathbf{R} \sim [-1, 1]$
(c) $a \in \mathbf{R} \sim \{0\}$ (d) $a \in \mathbf{R} \sim \{-1\}$

46. If f: $(0, \pi) \to \mathbf{R}$ is given by $f(x) = \sum_{k=1}^{n} [1 + \sin kx]$, $[x]$ denotes the greatest integer function, then the range of $f(x)$ is

(a) $\{n-1, n+1\}$ (b) $\{n\}$
(c) $\{n, n+1\}$ (d) $\{n-1, n\}$

47. If the number of elements in $(A \sim B) \sim C$, $(B \sim C) \sim A$, $(C \sim A) \sim B$ and $A \cap B \cap C$ is 10, 15, 20, and 5 respectively then the number of elements in $(A \Delta B) \Delta C$ is

(a) 35 (b) 50
(c) 40 (d) 45

48. Let $f(x) = \dfrac{x-3}{x+1}, x \ne -1$. Then $f^{2010}(2014)$ (where $f^n(x) = fof \ldots$ of (x) (n times)) is

(a) 2010 (b) 4020
(c) 4028 (d) 2014

Assertion-Reason Type Questions

49. Let $R = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 3), (1, 3)\}$ be a relation on set $A = \{1, 2, 3\}$

    Statement-1: R is not an equivalence relation on A.
    Statement-2: R is function from A to A.

50. **Statement-1:**

    If A is a set with 5 elements and B is a set containing 9 elements, then the number of injective mappings from A to B to $9! - 4!$.

    Statement-2: The total number of injective mappings from a set with m elements to a set with n elements, $m \le n$, is $\dfrac{n!}{(n-m)!}$.

51. Let $f(x) = \sin x + \cos x$, $g(x) = \dfrac{\sin x}{1-\cos x}$.

    Statement-1: f is neither an odd function nor an even function.

    Statement-2: g is an odd function.

52. **Statement-1:** A function $f : R \to R$ satisfies the equation $f(x) - f(y) = x - y \ \forall\ x, y \in R$ and $f(3) = 2$, then $f(xy) = xy - 1$

    Statement-2: $f(x) = f(1/x) \ \forall\ x \in R$, $x \ne 0$, and $f(2) = 7/3$ if $f(x) = \dfrac{x^2+x+1}{x^2-x+1}$.

53. **Statement-1:** Let $A = \{2, 3, 7, 9\}$ and $B = \{4, 9, 49, 81\}$ $f : A \to B$ is a function defined as $f(x) = x^2$. Then f is a bijection from A to B.

    Statement-2: A function f from a set A to a set B is a bijection if $f(A) = B$ and $f(x_1) \ne f(x_2)$ if $x_1 \ne x_2$ for all $x_1, x_2 \in A$ and $n(A) = n(B)$.

LEVEL 2

Straight Objective Type Questions

54. The range of the function $f(x) = \cos [x]$ for $-\pi/2 < x < \pi/2$ contains

    (a) $\{-1, 1, 0\}$
    (b) $\{\cos 1, 1, \cos 2\}$
    (c) $\{\cos 1, -\cos 1, 1\}$
    (d) $[-1, 1]$.

55. The domain of the function

    $f(x) = \log_{10} \dfrac{x-5}{x^2-10x+24} - 3\sqrt{x+5}$ is

    (a) $(-5, \infty)$
    (b) $(5, \infty)$
    (c) $(2, 5) \cup (5, \infty)$
    (d) $(4, 5) \cup (6, \infty)$

56. If $g(x) = 1 + \sqrt[3]{x}$ then a function f such that $f(g(x)) = 3 - 3(\sqrt[3]{x}) + x$ is

    (a) $f(x) = x^3 - 3x^2 + x + 5$
    (b) $f(x) = x^3 + 3x^2 - x - 5$
    (c) $f(x) = x^3 - 3x^2 + 5$
    (d) $f(x) = x^3 - 3x^2 + 3x + 3$

57. The function $f(x) = \dfrac{x}{e^x-1} + \dfrac{x}{2} + 1$ is

    (a) even
    (b) periodic
    (c) odd
    (d) neither even nor odd

58. Let f and g be two functions defined by $f(x) = \dfrac{x}{x+1}$, $g(x) = \dfrac{x}{1-x}$. Then $(f \ o\ g)^{-1}(x)$ is equal to

    (a) x
    (b) 1
    (c) $2x$
    (d) none of these

59. Let $f : (-1, 1) \to (0, \pi)$ be defined by

    $f(x) = \cot^{-1} \dfrac{2x}{1-x^2}$ Then

    (a) f is one-one but not onto
    (b) f is onto but not one-one
    (c) f is both one-one and onto
    (d) f is neither one-one nor onto

60. Let $f : X \to [1, 27]$ be a function by $f(x) = 5 \sin x + 12 \cos x + 14$. The set X so that f is one-one and onto is

    (a) $[-\pi/2, \pi/2]$
    (b) $[0, \pi]$
    (c) $[0, \pi/2]$
    (d) none of these

61. Let $f(x) = \dfrac{1-x}{1+x}$. Then $f \ o\ f(\cos x)$ is equal to

    (a) $\cos 2x$
    (b) $\cos x$
    (c) $\tan 2x$
    (d) $\tan x$

62. Let $f(x) = \sin\sqrt{x}$, then

    (a) $f(x)$ is periodic with period $\sqrt{2\pi}$
    (b) $f(x)$ is periodic with period $\sqrt{\pi}$
    (c) $f(x)$ is periodic with period $4\pi^2$
    (d) none of these

63. Let $X = Y = \mathbf{R} \sim \{1\}$. The function $f : X \to Y$ defined by $f(x) = \dfrac{x+2}{x-1}$ is
    (a) one-one but not onto
    (b) onto but not one-one
    (c) neither one-one nor onto
    (d) one-one and onto

64. If $f(x) = \dfrac{a^x + a^{-x}}{2}$ and $f(x+y) + f(x-y) = K f(x) f(y)$ then K is equal to
    (a) 2 (b) 4
    (c) -2 (d) none of these

65. If $f(x) = 2\sin^{-1}\sqrt{x-3}$, then the domain of f is
    (a) [3, 4] (b) [– 1, 1]
    (c) $[-\pi/2, \pi/2]$ (d) [6, 8]

66. Let $f(x) = x\,|x|$ and $g(x) = \sqrt{|x|}$ then the number of elements in the set $\{x \in \mathbf{R} : f(x) = g(x)\}$ is
    (a) 1 (b) 2
    (c) 3 (d) infinitely many

67. Which of the following functions are odd functions
    (a) $f(x) = x\left(\dfrac{a^x + a^{-x}}{a^x - a^{-x}}\right)$
    (b) $f(x) = \dfrac{a^x + x}{a^x - x}$
    (c) $f(x) = \dfrac{a^x - 1}{a^x + 1}$
    (d) $f(x) = x\log_2\left(x + \sqrt{x^2+1}\right)$

68. Let $g(x) = 1 + x - [x]$ and $f(x) = \text{sgn}\, x$. Then for all x, $f \circ g(x)$ is equal to
    (a) x (b) 1
    (c) $f(x)$ (d) $g(x)$

    Note $f(x) = \text{sgn}\, x = 1$ if $x > 0$
    $= 0$ if $x = 0$
    $= -1$ if $x < 0$

69. The domain of definition of the function $f(x) = \log_2(\log_{1/2}(x^2 + 4x + 3)) + \sin^{-1}(2[x]^2 - 3)$, $[x]$ denotes the greatest integer $\le x$ is
    (a) $0 < x \le 1$ (b) $0 \le x \le 1$
    (c) $-\infty < x \le 0$ (d) none of these

70. If $g(f(x)) = |\sin x|$ and $f(g(x)) = (\sin\sqrt{x})^2$, then f and g may be given by
    (a) $f(x) = \sin^2 x$, $g(x) = \sqrt{x}$
    (b) $f(x) = \sin x$, $g(x) = |x|$
    (c) $f(x) = x^2$, $g(x) = \sin x$
    (d) f and g cannot be determined

71. If $f(x) = 3x - 5$, then $f^{-1}(x)$
    (a) is given by $\dfrac{1}{3x-5}$
    (b) is given by $\dfrac{x+5}{3}$
    (c) does not exist because f is not one-one
    (d) does not exist because f is not onto

72. Let $f(x) = |x - a|$, $a \ne 0$ then
    (a) $f(x^2) = (f(x))^2$
    (b) $f(|x|) = |f(x)|$
    (c) $f(x+y) = f(x) + f(y)$
    (d) none of these

73. If $n(A) = n(B) = 4$ then number of bijections from A to B is
    (a) 6 (b) 24
    (c) 12 (d) 18

Previous Years' AIEEE/JEE Main Questions

1. Let R = {(1, 3), (4, 2), (2, 4), (2, 3), (3, 1)} be a relation on the set $A = \{1, 2, 3, 4\}$. The relation R is
    (a) not symmetric (b) transitive
    (c) a function (d) reflexive **[2004]**

2. The range of the function is $f(x) = {}^{7-x}P_{x-3}$ is
    (a) {1, 2, 3, 4} (b) {1, 2, 3, 4, 5, 6}
    (c) {1, 2, 3} (d) {1, 2, 3, 4, 5} **[2004]**

3. The domain of the function $f(x) = \dfrac{\sin^{-1}(x-3)}{\sqrt{9-x^2}}$ is
    (a) [1, 2] (b) [2, 3]
    (c) [2, 3] (d) [1, 2] **[2004]**

4. If $f : R \to S$ defined by $f(x) = \sin x - \sqrt{3}\cos x + 1$ is onto, then the interval of S is
    (a) [0, 1] (b) [–1, 1]
    (c) [0, 3] (d) [–1, 3] **[2004]**

5. The graph of the function $y = f(x)$ is symmetrical about $x = 2$ then

(a) $f(x) = f(-x)$ (b) $f(2 + x) = f(2 - x)$
(c) $f(x + 2) = f(x - 2)$ (d) $f(x) = -f(-x)$ **[2004]**

6. Let $R = \{(3, 3), (6, 6), (9, 9), (12, 12), (6, 12), (3, 9), (3, 12), (3, 6)\}$ be a relation on the set $A = \{3, 6, 9, 12\}$

The relation is

(a) an equivalence relation
(b) reflexive and symmetric only
(c) reflexive and transitive only
(d) reflexive only **[2005]**

7. A real valued function $f(x)$ satisfies the functional equation

$$f(x - y) = f(x)f(y) - f(a - x)f(a + y)$$

where a is a given constant and $f(0) = 1$, $f(2a - x)$ is equal to

(a) $f(a) + f(a - x)$ (b) $f(-x)$
(c) $-f(x)$ (d) $f(x)$ **[2005]**

8. Let W denote the words in the English Dictionary. Define the relation R by $R = \{(x, y) \in W \times W$: the words x and y have at least one letter in common$\}$, then R is

(a) reflexive, not symmetric and transitive.
(b) not reflexive, symmetric and transitive.
(c) reflexive, symmetric and not transition.
(d) reflexive, symmetric and transitive **[2006]**

9. The largest interval lying in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ for which the function $f(x) = 4^{-x^2} + \cos^{-1}\left(\frac{x}{2} - 1\right) + \log \cos x$ is defined is

(a) $\left(0, \frac{\pi}{2}\right)$ (b) $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$
(c) $\left[-\frac{\pi}{4}, \frac{\pi}{2}\right)$ (d) $\left[0, \frac{\pi}{2}\right)$ **[2007]**

10. Let **R** be the real line. Consider the following subsets of the plane **R** × **R**:

$S = \{(x, y): y = x + 1 \text{ and } 0 < x < 2\}$

$T = \{(x, y): x - y \text{ is an integer}\}$

which of the following is true :

(a) T is an equivalence relation on R but S is not
(b) Neither S nor T is an equivalence relation.
(c) Both S and T are equivalence relation on R.
(d) S is an equivalence relation but T is not. **[2008]**

11. Let $f : N \to Y$ be a function defined as

$$f(x) = 4x + 3 \text{ where } Y = \{y \in N : y = 4x + 3 \text{ for some } x \in N\}.$$

Show that f is invertible and its inverse is

(a) $g(y) = \frac{3y + 4}{3}$ (b) $g(y) = 4 + \frac{y + 3}{4}$
(c) $g(y) = \frac{y + 3}{4}$ (d) $g(y) = \frac{y - 3}{4}$ **[2008]**

12. If A, B and C are three sets such that $A \cap B = A \cap C$ and $A \cup B = A \cup C$, then

(a) $B = C$ (b) $A \cap B = \phi$
(c) $A = B$ (d) $A = C$ **[2009]**

13. Consider the following relations

$R = \{(x, y) \mid x, y$ are real numbers and $x = wy$ for some rational number $w\}$

$S = \left\{\left(\frac{m}{n}, \frac{p}{q}\right)\right\}$ $\{m, n, p, q$ are integers such that $n \cdot q \neq 0$ and $qm = pn\}$

Then

(a) S is an equivalence relation but R is not an equivalence relation
(b) R and S both are equivalence relations.
(c) R is an equivalence relation but S is not an equivalence relation.
(d) Neither R nor S is an equivalence relation. **[2010]**

14. Let R be the set of real numbers.

Statement-1:

$A = \{(x,y) \in R \times R : y - x$ is an integer$\}$ is an equivalence relation on R.

Statement-2:

$B = \{(x, y) \in R \times R : x = \alpha y$ for some rational numbers $\alpha\}$ in an equivalence relation on R. **[2011]**

15. Let f be a function defined by

$$f(x) = (x - 1)^2 + 1, (x \geq 1)$$

Statement-1:

The set $\{x : f(x) = f^{-1}(x)\} = \{1, 2\}$

Statement-2: f is a bijection and

$f^{-1}(x) = 1 + \sqrt{x - 1}, x \geq 1.$ **[2011]**

16. Consider the following relation R on the set of real square matrices of order 3.

$R = \{(A,B): A = P^{-1} B P$ for some invertible matrix $P\}$

Statement-1: R is an equivalence relation.

Statement-2: For any two invertible 3 × 3 matrices M and N, $(M N)^{-1} = N^{-1}M^{-1}$ **[2011]**

17. Let $X = \{1, 2, 3, 4, 5\}$. The number of different ordered pairs (Y, Z) that can be formed such that $Y \subseteq X$, $Z \subseteq X$ and $Y \cap Z$ is empty is

(a) 2^5 (b) 5^3
(c) 5^2 (d) 3^5. **[2012]**

18. Let A and B be two sets containing 2 elements and 4 elements respectively. The number of subsets of $A \times B$ having 3 or more elements is
(a) 211 (b) 256
(c) 220 (d) 219 **[2013]**

19. Let P be the relation defined on the set of all real numbers such that
$P = \{(a, b) : \sec^2 a - \tan^2 b = 1\}$. Then P is
(a) reflexive and symmetric but not transitive.
(b) reflexive and transitive but not symmetric.
(c) symmetric and transitive but not reflexive.
(d) an equivalence relation. **[2014]**

20. Let $f(n) = \left[\frac{1}{3}+\frac{3n}{100}\right]n$, where $[n]$ denotes the greatest integer less than or equal to n. Then $\sum_{n=1}^{56} f(n)$ is equal to
(a) 689 (b) 1399
(c) 1287 (d) 56 **[2014]**

21. The function $f(x) = |\sin 4x| + |\cos 2x|$ is a periodic function with period
(a) $\pi/2$ (b) 2π
(c) π (c) $\pi/4$ **[2014]**

22. Let $f : \mathbf{R} \to \mathbf{R}$ be defined by $f(x) = \frac{|x|-1}{|x|+1}$ then f is
(a) onto but not one-one
(b) both one-one and onto
(c) one-one but not onto
(d) neither one-one nor onto **[2014]**

23. A relation on the set $A = \{x: |x| < 3, x \in \mathbf{Z}\}$, where $\mathbf{Z}$ is the set of integers is defined by $R = \{(x, y) : y = |x|, \ x \neq -1\}$. Then the number of elements in the power set of R is
(a) 32 (b) 16
(c) 8 (d) 64 **[2014]**

24. Let A and B be two sets containing four and two elements respectively. Then the number of subsets of the set $A \times B$, each having atleast three elements is
(a) 219 (b) 256
(c) 275 (d) 510 **[2015]**

25. In a certain town, 25% of the families own a phone and 15% own a car, 65% families own neither a phone nor a car and 2000 families own both a car and a phone. Consider the following three statements:
(a) 5% families own both a car and a phone
(b) 35% families own either a car or a phone
(c) 40,000 families live in town. Then,
(a) only (a) and (b) are correct
(b) only (a) and (c) are correct
(c) only (b) and (c) are correct
(d) all (a), (b) and (c) are correct **[2015, online]**

26. Let $A = \{x_1, x_2, \ldots x_7\}$ and $B = \{y_1, y_2, y_3\}$ be two sets containing seven and three distinct elements respectively. Then the total number of functions $f : A \to B$ that are onto, if there exist exactly three x in A such $f(x) = y_2$ is equal to
(a) $14.{}^7C_2$ (b) $16.{}^7C_3$
(c) $12.{}^7C_2$ (d) $14.{}^7C_3$ **[2015, online]**

27. If $f(x) + 2f\left(\frac{1}{x}\right) = 3x, x \neq 0$ and $S = \{x \in \mathbf{R} : f(x) = f(-x)\}$; then S
(a) is an empty set
(b) contains exactly one element
(c) contains exactly two elements
(d) contains more than two elements **[2016]**

28. If the function $f : [1, \infty[\to [1, \infty[$ is defined by $f(x) = 3^{x(x-1)}$, then $f^{-1}(x)$ is
(a) $\frac{1}{2}\left(1-\sqrt{1+4\log_3 x}\right)$ (b) $\frac{1}{2}\left(1+\sqrt{1+4\log_3 x}\right)$
(c) not defined 2(d) $\left(\frac{1}{3}\right)^{x(x-1)}$ **[2016]**

29. For $x \in \mathbf{R}$, $x \neq 0$, $x \neq 1$, let $f_0(x) = \frac{1}{1-x}$ and $f_{n+1}(x) = f_0(f_n(x))$, $n = 0, 1, 2, \ldots$. Then the $f_{100}(3) + f_1\left(\frac{2}{3}\right) + f_2\left(\frac{3}{2}\right)$ is equal to
(a) $\frac{8}{3}$ (b) $\frac{4}{3}$
(c) $\frac{5}{3}$ (d) $\frac{1}{3}$ **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. The domain of the function
$f(x) = \sqrt{2x-3} + \sin x + \sqrt{x-1}$ is
(a) $(-\infty, 1]$ (b) $[0, 1]$
(c) $\left[\frac{3}{2}, \infty\right)$ (d) $[1, \infty]$ **[2006]**

2. Let $f : (1, \infty) \rightarrow (1, \infty)$ be defined by $f(x) = \dfrac{x+2}{x-1}$. Then
   (a) f is 1 – 1 and onto
   (b) f is 1 – 1 but not onto
   (c) f is not 1 – 1 but onto
   (d) f is neither 1 – 1nor onto **[2008]**

3. Let $A = \{(x, y) : x > 0, y > 0, x^2 + y^2 = 1\}$ and let $B = \{(x, y) : x > 0, y > 0, x^6 + y^6 = 1\}$ Then $A \cap B$
   (a) A (b) B
   (c) ϕ (d) $\{(0, 1), (1, 0)\}$ **[2008]**

4. A school awarded 38 medals in football, 15 in basketball and 20 in cricket. Suppose these medals went to a total of 58 students and only three students got medals in all three sports. If only 5 students got medals in football and basketball, then the number of medals received in exactly two of three sports is
   (a) 7 (b) 9
   (c) 11 (d) 13 **[2008]**

5. Let Q be the set of all rational numbers and R be the relation defined as

   $R = \{(x, y) : 1 + xy > 0, x, y \in Q\}$

   Then relation R is
   (a) symmetric and transitive
   (b) reflexive and transitive
   (c) an equivalence relation
   (d) reflexive and symmetric **[2009]**

6. The domain of the function $f(x) = \dfrac{1}{3 - \log_3 (x-3)}$ is
   (a) $(-\infty, 30)$ (b) $(-\infty, 30) \cup (30, \infty)$
   (c) $(3, 30) \cup (30, \infty)$ (d) $(4, \infty)$ **[2009]**

7. Let $f : \mathbf{R} \rightarrow \mathbf{R}$ be a function defined by $f(x) = x^{2009} + 2009x + 2009$
   Then $f(x)$ is
   (a) one-one but not onto
   (b) not one-one but onto
   (c) neither one-one nor onto
   (d) one-one and onto **[2010]**

8. Let f be a function defined on $\left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$ by

   $f(x) = 3\cos^4 x - 6\cos^3 x - 6\cos^2 x - 3$

   Then the range of $f(x)$ is
   (a) $[-12, -3]$ (b) $[-6, -3]$
   (c) $[-6, 3)$ (d) $(-12, 3]$ **[2010]**

9. **Statement-1:** The function $f(x) = x^2 e^{-x^2} \sin|x|$ is even

   Statement-2: Product of two odd function is an even function **[2011]**

10. Consider the following relations
    $R_1 = \{(x, y) : x$ and y are integers and $x = ay$ or $y = ax$ for some integer $a\}$
    $R_2 = \{(x, y)$: x and y are integres and $ax + by = 1$ for some integers $a, b\}$
    Then
    (a) R_1, R_2 are not equivalence relations
    (b) R_1, R_2 are equivalence relation
    (c) R_1 is an equivalence relation but R_2 is not
    (d) R_2 is an equivalence relation but R_1 is not **[2012]**

11. Let f and g be functions defined by $f(x) = \dfrac{1}{x+1}$ $x \in \mathbf{R}$, $x \neq -1$ and $g(x) = x^2 + 1$, $x \in \mathbf{R}$. Then $g \circ f$ is
    (a) one-one but not onto
    (b) onto but not one-one
    (c) both one-one and onto
    (d) neither one-one nor onto **[2013]**

12. Let $\mathbf{N}$ be the set of natural number and for $a \in \mathbf{N}$, $a\mathbf{N}$ denotes the set $\{ax : x \in \mathbf{N}\}$.

    If $b\mathbf{N} \cap c\mathbf{N}, = d\mathbf{N}$, where b, c, d are natural numbers greater than 1 and the greatest common divisor of b and c is 1 then d equals
    (a) $\max\{b, c\}$ (b) $\min\{b, c\}$
    (c) bc (d) $b + c$ **[2014]**

13. Let $f(x) = (x+1)^2 - 1$, $x \geq -1$, then the set $\{x : f(x) = f^{-1}(x)\}$:
    (a) is an empty set
    (b) contains exactly one element
    (c) contains exactly two elements
    (d) contains more than two elements **[2014]**

14. Let $f : \mathbf{R} \rightarrow \mathbf{R}$ be a function defined by

    $f(x) = \dfrac{e^{|x|} - e^{-x}}{e^x + e^{-x}}$, then f is
    (a) one-one and onto (b) one-one but not onto
    (c) onto but not one-one (d) neither onto nor one-one **[2015]**

15. If f is a function of real variable x satisfying $f(x+4) - f(x+2) + f(x) = 0$, then f is periodic with period
    (a) 8 (b) 10
    (c) 12 (d) 6 **[2016]**

Hints and Solutions

Concept-based

1. $n(A \cup B') = n(A) + n(B') - n(A \cap B')$
$= n(A) + n(U) - n(B) - (n(A) - n(A \cap B))$
$= n(U) - n(B) + n(A \cap B)$
$= 12 - 6 + 2 = 8.$

2. If $a = -1$ than a is not related to a. So R is not reflexive. If $a = -1$, $b = 2$ then $|a| \le b$ but $|b| > a$, so R is not symmetric. If $|a| \le b$ and $|b| \le c$ then $|a| \le b \le |b| \le c$ so $|a| \le c$, hence a is related to c. Thus R is transitive. If $|a| \le b$, and $|b| \le a$ then $a \le |a| \le b \le |b| \le a$. So $a = b$, R is anti symmetric.

3. $f(g(x)) = g(f(x))$ for all $x \in \mathbf{R} \Leftrightarrow f(cx + d) = g(ax + b)$
$\Leftrightarrow a(cx + d) + b = c(ax + b) + d \Leftrightarrow ad + b = cb + d$
$\Leftrightarrow f(d) = g(b)$

4. For $f(x)$ to be defined, we have $|x| > x$. Since $|x| \ge x \;\forall\; x \in \mathbf{R}$ and $|x| = x$ for $x \in [0, \infty)$ so $|x| > x$ if $x \in \mathbf{R} = (-\infty, 0)$

5. The function is defined if $-1 \le 1 - 2x \le 1 \Leftrightarrow$
$-2 \le -2x \le 0$
$\Leftrightarrow 0 \le x \le 1.$

6. $f_1(x) = \dfrac{f(x)+f(-x)}{2} = \dfrac{1}{2}\,[\sin x - \cos x - \sin x - \cos x]$
$= -\cos x$
$f_2(x) = \dfrac{f(x)-f(-x)}{2} = \dfrac{1}{2}\,[\sin x - \cos x + \sin x + \cos x]$
$= \sin x$

7. $-1 \le \sin x \le 1 \Leftrightarrow -1 \le -\sin x \le 1 \Leftrightarrow 0 \le 1 - \sin x \le 2$

8. $f(-x) = (-x)^2 \log\dfrac{1+x}{1-x} = x^2 \log\left(\dfrac{1-x}{1+x}\right)^{-1} =$
$-x^2 \log\dfrac{1-x}{1+x} = -f(x).$

Level 1

9. $((A \sim B) \cup (B \sim A)) \cap A$
$= ((A \sim B) \cap A) \cup (B \sim A) \cap \text{A}$
$= (A \sim B) \cup \phi = (A \sim B) = \{3, 5\}$

10. $(A \cap B) \cap C = \{2 \times 3 \times 5\, x : x \in N\}$
$= \{30x : x \in \mathbf{N}\}$

11. $X \subset Y \Rightarrow X \cap Y = X, X \cup Y = Y$
$Y \subset X \Rightarrow X \cap Y = Y, X \cup Y = X.$
So $X \cap Y = X \cup Y \Rightarrow X = Y$

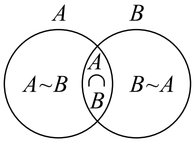
12. If $X \underset{\neq}{\subset} Y$, let $y \in Y$ and $y \notin X$ then either $y \notin A$. or $y \in A$
So if $y \in A$, then $y \in A \cap Y$ but $y \notin A \cap X$ and thus $A \cap X \ne A \cap Y$.
If $y \notin A$, then $y \in A \cup Y$ but $y \notin A \cup X$ and thus $A \cup X \ne A \cup Y$
So $X \subseteq Y$, similarly $Y \subseteq X$.
$\Rightarrow \qquad X = Y.$

13. $A = \{7, 8\}$, $B = \{1, 2, 3, ... 9\}$
$C = \{1, 2, 4, 7, 8, 14, 16, ...\}$
$B \cap C = \{1, 2, 4, 7, 8\}$
$A \cup (B \cap C) = \{1, 2, 4, 7, 8\}$

14. $A = \{\text{M, A, T, H, E, I, C, S}\}$
$B = \{\text{S, T, A, I, C}\}$
$B \sim A = \phi$, So $A \,\Delta\, B = (A \sim B) \cup (B \sim A)$
$= A \sim B.$
Verify (a) and (b) are not correct.

15. $n(A \sim B) = n(A) - n(A \cap B)$
$\Rightarrow \quad 15 = n(A) - 16 \Rightarrow n(A) = 31$
$n(A \cup B) = n(A) + n(B) - n(A \cap B)$
$\Rightarrow \quad 36 = 31 + n(B) - 16$
$\Rightarrow \quad n(B) = 21.$

16. $A \cup B, A \sim B, B \sim A$
$(A \cup B) \sim (A \sim B) = B$
$(A \cup B) \sim (B \sim A) = A$
$A \Delta B = (A \sim B) \cup (B \sim A)$
$(A \cup B) \sim (A \Delta B) = A \cap B$
and $(A \sim B) \sim A = \phi$
Thus, the required no is 8.



17. $n(A \sim B) = n(A) - n(A \cap B)$
$= n(B) - n(A \cap B) = n(B \sim A)$

18. $A \cup B = A \Delta B \cup (A \cap B)$
So $A \cup B = A \Delta B \Rightarrow A \cap B = \phi$.

19. $n(P) = 60$, $n(M) = 58$, $n(P \cup M) = 100$, $N(P \cap M)$
$= n(P) + M(M) - n(P \cup M)$

20. $R = \{(1, 3), (1, 5), (2, 3), (2, 5), (3, 5)\}$

21. $(1, 2) \in R$ but $(1, 2) \notin R_1$ or R_2 or R_3 so $R \neq R_1$ or R_2 or R_3.

22. L_1 is not $\perp L_1$, so R is not reflexive
$L_1 \perp L_2 \Rightarrow L_2 \perp L_1 \Rightarrow R$ is symmetric.
$L_1 \perp L_2$ and $L_2 \perp L_3 \Rightarrow L_1 \parallel L_3 \Rightarrow R$ is not transitive.

23. See the definition of function

24. $f(x) = f^{-1}(x) \Rightarrow f(f(x)) = x.$
$\Rightarrow \quad [(x + 1)^2 - 1 + 1]^2 - 1 = x.$
$\Rightarrow \quad (x + 1)^2 = x + 1 \Rightarrow x = 0$ or $x = -1$
So $S = \{0, -1\}$.

25. $A \times A$ has $n \times n = n^2$ elements and any subset of $A \times A$ is a relation on A. The number of such subsets is 2^{n^2}.

26. $-1 \leq \sin x \leq 1 \Rightarrow 1 \leq f(x) \leq 5 \Rightarrow f(x)$ is not onto, $f(x) = f(x + 2\pi) \Rightarrow f$ is not one-one and f is not bijective.

27. In (a) $a \to 2a$ and $a \to -2a$, so it is not a function
In (b) for each $x \in R$ there is unique $|x| = y \in R$, so it is a function.

28. $f(x) = x^4 + 2 = y \Rightarrow x = (y - 2)^{1/4}$.
$\Rightarrow \quad f^{-1}(x) = (x - 2)^{1/4}$
$\Rightarrow \quad f^{-1}(83) = (81)^{1/4} = \pm 3$
and $f^{-1}(-2) = (-4)^{1/4} = \phi$.

29. R is reflexive if $(x, x). \in R$ for all $x \in \{1, 2, 3\}$
$\Rightarrow \quad (1, 1), (2, 2), (3, 3) \in R$
R is symmetric if $(1, 2), (2, 3) \in R$
$\Rightarrow \quad (2, 1), (3, 2) \in R.$
R is transitive if $(1, 2), (2, 3) \in R$
$\Rightarrow \quad (1, 3) \in R$ also $(3, 1) \in R$ as
R is symmetric.
So the total numbers of elements is 9.

30. $A \cap A = A \neq \phi$ if $A \neq \phi$, So R is not reflexive.
$A \cap B = \phi \quad \Rightarrow \quad B \cap A = \phi$
$ARB \quad \Rightarrow \quad BRA \quad \Rightarrow \quad R$ is symmetric
Note R is not transitive and not an equivalence relation.

31. $2f(2) - 3f(1/2) = 2^2 = 4$
$2f(1/2) - 3f(2) = (1/2)^2 = 1/4$
$\Rightarrow \quad 5(f(2) - f(1/2)) = 4 - 1/4 = 15/4$
$\Rightarrow \quad f(1/2) = f(2) - 3/4.$
So $\quad 2f(2) - 3[f(2) - 3/4] = 4$
$$\Rightarrow \quad f(2) = \frac{9}{4} - 4 = -\frac{7}{4}.$$

32. Applying $C_3 \to C_3 - (C_1 + C_2)$ we get $f(x) = 0$ for all x.

33. $a^{x-1} + a^{y-1} = 1$
$\Rightarrow \quad a^{y-1} = 1 - a^{x-1} \Rightarrow (y - 1)\log a = \log(1 - a^{x-1})$
R.H.S is defined if $1 - a^{x-1} > 0$
$\Rightarrow \quad a^{x-1} < 1 = a^{\circ} \Rightarrow x - 1 < 0$ as $a > 1$
$\Rightarrow \quad x < 1$ and the required domain is $-\infty < x < 1$.

34. If x is an integer, $f(x) = 0$
if x is not an integer $x - [x] = \dfrac{p}{q}$ where p and q are positive integers and $p < q$, so that $f(x) = \dfrac{p}{p+q} < \dfrac{1}{2}$
so $0 \leq f(x) < \dfrac{1}{2}$ and the required range is $[0, \dfrac{1}{2}]$

35. $2f(x^2) + 3f(1/x^2) = x^2 - 1$
$\Rightarrow \quad 2f(1/x^2) + 3f(x^2) = 1/x^2 - 1$
Subtracting, $f(x^2) - f(1/x^2) = 1/x^2 - x^2$
$\Rightarrow \quad f(x^2) = 1/x^2.$

36. $f(x + 3y, x - 3y) = 12xy = (x + 3y)^2 - (x - 3y)^2$
$\Rightarrow \quad f(x, y) = x^2 - y^2.$

37. Let $f(x) = y = 2^{x(x - 1)}$
$\Rightarrow \quad \log y = x(x - 1) \log^2$
$\Rightarrow \quad x^2 - x - \log_2 y = 0$
$$\Rightarrow \quad x = \frac{1 \pm \sqrt{1 + 4 \log_2 y}}{2}$$
$$\Rightarrow \quad x = f^{-1}(y) = \frac{1 \pm \sqrt{1 + 4 \log_2 y}}{2}$$
$$\Rightarrow \quad f^{-1}(x) = \frac{1 + \sqrt{1 + 4 \log_2 y}}{2} \text{ as } f^{-1}(x) \geq 1.$$

38. Number of one-one functions $= 5 \times 4 \times 3 = 60$.

39. If we take $f(x) = 1$, then $f(y) \neq 1$ as the function is one-one. So $f(x) \neq 1$
If $f(z) = 1$, then statements 2 and 3 both are true, so $f(z) \neq 1$ hence $f(y) = 1$ and $f^{-1}(1) = y$.
[**Note** $f(x) = 2, f(y) = 1, f(z) = 3$)]

40. $f(x + 4\pi) = f(x)$
$$\text{If } \frac{\sin n(x + 4\pi)}{\sin \frac{x + 4\pi}{n}} = \frac{\sin nx}{\sin \frac{x}{n}}$$
which holds if $n = 2$.

41. $(n, n) \in R$ only for $n = 1$

$m = n^2 \Rightarrow n = m^2$ unless $m = n = 1$

$m = n^2$ and $n = p^2 \;\not\Rightarrow\; m = p^2$ for $m, n, p \neq 1$

hence (a), (b), (c) none is true.

42. Let B, H, F be the sets of the three teams respectively

so $n(B) = 21, n(H) = 26, n(F) = 29,$

$n(H \cap B) = 14$ $n(H \cap F) = 15, n(F \cap B) = 12,$

$n(B \cap H \cap F) = 8$

and $n(B \cup H \cup F) = n(B) + n(H) + n(F) - n(H \cap B)$

$- n(H \cap F) - n(F \cap B) + n(B \cap H \cap F) = 21 + 26$

$+ 29 - 14 - 15 - 12 + 8 = 43$

43. An equilateral triangle cannot be obtuse angled or right angled but is an isosceles triangle.

So $E \subset I$ and $E \cap I = E$.

44. $A = \{3, 9, 27, 81, 243, 729\}$, $B = \{9, 81, 729, 6561\}$

$A \cup B = \{3, 9, 27, 81, 243, 729, 6561\}$

$A \cap B = \{9, 81, 729\}$

$A \sim B = \{3, 27, 243\}$

$B \sim A = \{6561\}$

$A \,\Delta\, B = (A \sim B) \cup (B \sim A) = \{3, 27, 243, 6561\}$

45. For $a \neq 0$, the range of f is $\mathbf{R}$. f is differentiable function so f is one-one and only if f is monotonic.

$$f'(x) = a + \cos x$$

If $a > 1$, $f'(x) > 0$ i.e. f is increasing

If $a < -1$, $f'(x) < 0$ i.e. f is decreasing

Thus f is monotonic if $a \in \mathbf{R} \sim [-1, 1]$.

46. $f(x) = \sum_{k=1}^{n} 1 + [\sin kx] = n + [\sin x] + [\sin 2x] + \cdots + [\sin nx]$. If $kx \neq \frac{\pi}{2}$ for any $k = 1, 2 \ldots n$ then $0 < kx < \pi$ and $kx \neq \pi/2$ so $0 < \sin kx < 1$. Hence $[\sin kx] = 0$, $k = 1, 2 \ldots n$. i.e. $f(x) = n$. If $kx = \frac{\pi}{2}$ for some k then $x = \frac{\pi}{2k}$, hence $\sin x, \sin 2x, \ldots, \sin(k-1)x$ will lie between 0 and 1 so $[\sin jx] = 0$ $1 \leq j \leq k-1$; $\sin kx = 1$ so $f(x)$ can be $n + 1$ or n.

47. $(A \Delta B) \Delta C$ is disjoint union of $(A \sim B) \sim C$, $(B \sim C) \sim A$, $(C \sim A) \sim B$ and $A \cap B \cap C$.

Threfore, number of elements is $(A \Delta B) \Delta C$ is $10 + 15 + 20 + 5 = 50$.

48. $f^2(x) = fof(x) = f(f(x)) = f\left(\frac{x-3}{x+1}\right)$

$$= \frac{\frac{x-3}{x+1} - 3}{\frac{x-3}{x+1} + 1} = -\frac{x+3}{x-1}$$

$$f^3(x) = f\left(-\frac{x+3}{x-1}\right) = \frac{\frac{-x-3}{x-1} - 3}{\frac{-x-3}{x-1} + 1} = x.$$

Hence $f^{3k}(x) = x$

$$f^{2010}(2014) = f^{3.670}(2014) = 2014.$$

49. $(1, 2) \in R$, But $(2, 1) \notin R \Rightarrow R$ is not symmetric and hence not an equivalence relation.

$\Rightarrow$ Statement-1 is True. Staement-2 is False as $1 \to 1, 2, 3$.

50. Statement-2 is True. Because if A has m elements, then first elements can be mapped to n elements. For the 2nd element the choice is $n - 1$ and so on. So the total number of injective mappings is $n(n - 1)(n - 2) \ldots\ldots (n - m + 1) = n! / (n - m)!$ Which shows that statement-1 is False.

51. $f(-x) = -\sin x + \cos x \neq f(x)$ or $-f(x)$, $\Rightarrow f$ is neither odd nor even. So statement-1 is True

$g(-x) = \frac{-\sin x}{1 - \cos x} = -(g(x)) \Rightarrow g$ is an odd function

$\Rightarrow$ Statement-2 is also True but does not lead to statement-1.

52. Taking $y = 3$, $f(x) - f(3) = x - 3$

$\Rightarrow f(x) = x - 3 + f(3) = x - 3 + 2 = x - 1$

$\Rightarrow f(xy) = xy - 1 \Rightarrow$ Statement –1 is True

$$f(x) = \frac{x^2 + x + 1}{x^2 - x + 1} \Rightarrow f(1/x) = \frac{1 + x + x^2}{1 - x + x^2} = f(x)$$

and $f^{(2)} = 7/3 \Rightarrow$ Statement-2 is also True, but does not lead to statement-1.

53 . Statement-2 is true by definition of a bijective mapping, using which statement-1 is also true.

Level 2

54. $-\pi/2 < x < \pi/2 \Rightarrow [x] = -2, -1, 0, 1$

$\Rightarrow f(x) = \cos[x]$

$= \cos(-2), \cos(-1), \cos(0), \cos 1$

$= \cos 2, \cos 1, 1 \cos 1$

55. $\frac{x-5}{x^2 - 10x + 24} > 0$ and $x + 5 > 0$

$\Rightarrow x > 5, x > 6 \Rightarrow x > 6 \Rightarrow x \in (6, \infty)$

or $x < 5, x > 4 \Rightarrow 4 < x < 5 \Rightarrow x \in (4, 5)$

56. Let $g(x) = 1 + \sqrt[3]{x} = y \Rightarrow x^{1/3} = y - 1$

so $f(g(x)) = 3 - 3x^{1/3} + x$

$\Rightarrow f(y) = 3 - 3(y - 1) + (y - 1)^3$

$= y^3 - 3y^2 + 5$

57. $f(-x) = \frac{-x}{e^x - 1} - \frac{x}{2} + 1$

$$= \frac{-xe^x}{1 - e^x} - \frac{x}{2} + 1$$

$$= \frac{x(e^x - 1 + 1)}{e^x - 1} - \frac{x}{2} + 1$$

$$= \frac{x}{e^x - 1} + \frac{x}{2} + 1 = f(x)$$

58. $(\text{fog})\,(x) = f(g(x)) = f\left(\dfrac{x}{1-x}\right)$

$$= \frac{\dfrac{x}{1-x}}{\dfrac{x}{1-x} + 1} = \frac{x}{x + 1 - x} = x$$

$\Rightarrow (\text{fog})^{-1}\,(x) = x$

59. $f(x) = \cot^{-1} \dfrac{2x}{1 - x^2}$ is clearly one-one as

$f(x_1) = f(x_2)$

$\Rightarrow x_1 = x_2$

Next, let $y = f(x) \Rightarrow \cot y = \dfrac{2x}{1 - x^2}$

$$= \frac{2\tan(\theta/2)}{1 - \tan^2(\theta/2)} = \tan\theta$$

$\Rightarrow y = \pi/2 - \theta = \pi/2 - 2\tan^{-1}x$. Taking $x = \tan(\theta/2)$

so $y \in (0, \pi) \Rightarrow 0 < y < \pi$

$\Rightarrow -\pi/4 < \tan^{-1} x < \pi/4$

$\Rightarrow -1 < x < 1 \Rightarrow x \in (-1, 1)$

and thus f is onto.

60. As $-\sqrt{5^2 + 12^2} \le 5 \sin x + 12 \cos x \le \sqrt{5^2 + 12^2}$ for all x

$\Rightarrow 14 - 13 \le 5 \sin x + 2 \cos x \le 14 + 13$

$\Rightarrow 1 \le f(x) \le 27$

f is not one-one as it is periodic.

61. $\text{fof}\,(\cos x) = f\left(\dfrac{1 - \cos x}{1 + \cos x}\right) = f(\tan^2(x/2))$

$$= \frac{1 - \tan^2(x/2)}{1 + \tan^2(x/2)} = \cos x.$$

62. Since $f(x + T) = \sin \sqrt{x + T} \ne \sin\sqrt{x}$ for any value T.

$f(x)$ is not periodic.

63. Let $y = f(x) = \dfrac{x + 2}{x - 1}$, $y \in Y = \mathbf{R} - \{1\}$

$\Rightarrow x = \dfrac{y + 2}{y - 1}$, $x \in X = \mathbf{R} \sim \{1\}$

$\Rightarrow f$ is onto

Also $f(x_1) = f(x_2) \Rightarrow x_1 = x_2 \Rightarrow f$ is one-one.

64. $f(x + y) + f(x - y)$

$$= \frac{a^{x+y} + a^{-(x+y)}}{2} + \frac{a^{x-y} + a^{-(x-y)}}{2}$$

$$= \frac{a^x(a^y + a^{-y}) + a^{-x}(a^{-y} + a^y)}{2}$$

$$= \frac{\left(a^x + a^{-x}\right)\left(a^y + a^{-y}\right)}{2}$$

$= 2.\ f(x)\, f(y) \Rightarrow k = 2.$

65. $x - 3 \ge 0 \Rightarrow x \ge 3$ and $-1 \le \sqrt{x - 3} \le 1$

$\Rightarrow x \le 4. \Rightarrow x \in [3, 4].$

66. $x[x] = \sqrt{|x|} \Rightarrow x^2 = x$ if x is an integer

$\Rightarrow \ x = 0, 1$

67. $f(x) = x\dfrac{a^x + a^{-x}}{a^x - a^{-x}} \Rightarrow f(-x) = f(x) \Rightarrow f$ is not odd.

$f(x) = \dfrac{a^x + x}{a^x - x} \Rightarrow f(-\,x) = \dfrac{1 - xa^x}{1 + xa^x} \ne -f(x)$

$\Rightarrow f$ is not odd

$f(x) = \dfrac{a^x - 1}{a^x + 1} \Rightarrow f(-\,x) = \dfrac{1 - a^x}{1 + a^x} = -f(x) \Rightarrow f$ is odd.

$f(x) = x \log_2 \sqrt{\left(x + \sqrt{x^2 + 1}\right)} \Rightarrow f(-x)$

$= -\,x \log \left(-x + \sqrt{x^2 + 1}\right) \ne f(-x).$

68. $g(x) = 1 + x - [x] > 0$ for all x

$\Rightarrow (\text{fog})\,(x) = f(g(x)) = 1.$

69. The function $f(x) = \log_2 (\log_{1/2}(x^2 + 4x + 3) + \sin^{-1}[x]$ is defined if

$0 < x^2 + 4x + 3 < 1$ and $-1 \le x \le 2$ (I)

$x^2 + 4x + 3 > 0 \Rightarrow x > -1$ or $x < -3$ (II)

$x^2 + 4x + 3 < 1 \Rightarrow -2 - \sqrt{2} < x < -2 + \sqrt{2}$ (III)

So the domain of the function is $-1 < x < -2 + \sqrt{2}$.

70. $g\,(f(x)) = |\sin x| = \sqrt{\sin^2 x}$

which is satisfied if $f(x) = \sin^2 x$ and $g(x) = \sqrt{x}$

Also it satisfies $f(g(x)) = f\left(\sqrt{x}\right) = (\sin\sqrt{x}\,)^2$

71. $f(x) = 3x - 5 = y \Rightarrow x = \dfrac{y+5}{3} = f^{-1}(y)$

$\Rightarrow f^{-1}(x) = \dfrac{x+5}{3}$

72. $f(x^2) = |\,x^2 - a| \neq (f(x))^2$

$f(|x|) = |\,|x| - a| \neq |\,f(x)|$

$f(x + y) = |x + y - a| \neq |x - a| + |y - a|$.

73. Required number is 4! = 24.

Previous Years' AIEEE/JEE Main Questions

1. R is not symmetric as $(2, 3) \in R$ but $(3, 2) \notin R$

2. We must have

$7 - x \geq 1,\ x - 3 \geq 0$ and $7 - x \geq x - 3$

$\Rightarrow\ \ x \leq 6,\ x \geq 3$ and $x \leq 5$

Thus,

$3 \leq x \leq 5$

$\therefore$ Range of $f = \{{}^4P_0,\ {}^3P_1,\ {}^2P_2)$

$= \{1, 3, 2\}$

3. We have $-1 \leq x - 3 \leq 1$ and $9 - x^2 > 0$

$\Rightarrow\ \ 2 \leq x \leq 4$ and $-3 < x < 3$

$\therefore$ domain of f is [2, 3,)

4. We have

$-\sqrt{a^2+b^2} \leq a \sin x + b \cos x \leq \sqrt{a^2+b^2}$

Thus,

$-\sqrt{1+3} \leq \sin x - \sqrt{3}\cos x \leq \sqrt{1+3}$

$\therefore\ \ -2 + 1 \leq f(x) \leq 2 + 1\ \ \Rightarrow\ \ -1 \leq f(x) \leq 3$

5. A function $f(x)$ is symmetrical about the line $x = a$ if

$$f(a - x) = f(a + x).$$

6. Relation R is clearly reflexive. Since $(6, 12) \in R$ but $(12, 6) \notin R$, R is not symmetric.

Also, as $(3,3) \in R$, $(3, 6) \in R \Rightarrow (3, 6) \in R$;

$(3, 3) \in R$, $(3, 9) \in R \Rightarrow (3, 9) \in R$;

$(3, 3) \in R$, $(3, 12) \in R \Rightarrow (3, 12) \in R$

$(6, 6) \in R$, $(6, 12) \in R \Rightarrow (6, 12) \in R$

Thus, R is transitive.

$\therefore$ R is reflexive and transitive.

7. Putting $x = y = 0$, we get

$$f(0) = f(0)f(0) - f(a)f(a)$$

$\Rightarrow\qquad f(a)^2 = 1^2 - 1 = 0\ \ \Rightarrow f(a) = 0$

Putting $x = a$, $y = a$, we get

$$f(0) = [f(a)]^2 - f(0)f(2a)$$

$$1 = 0 - f(2a)\ \ \Rightarrow\ f(2a) = -1$$

Next, we put $x = 0$, $y = a$ to obtain

$$f(-a) = f(0)f(a) - f(a)f(2a) = 0$$

Now, putting $x = 2a$, $y = x$, we get

$$f(2a - x) = f(2a)\,f(x) - f(-a)\,f(a + x)$$

$$= (-1)\,f(x) - (0)\,f(a + x) = -f(x)$$

8. Let $\omega \in W$, then $(\omega, \omega) \in R$.

$\therefore$ R is reflexive.

Also, if $\omega_1, \omega_2, \in W$ and $(\omega_1, \omega_2) \in R$, then $(\omega_2, \omega_1) \in$ R.

$\therefore$ R is symmetric.

Next, let ω_1 = ink ω_2 = link and ω_3, = let, then $(\omega_1, \omega_2) \in R$,

$$(\omega_2, \omega_3) \in R \text{ but } (\omega_1, \omega_3) \notin R.$$

Thus, R is not transitive.

9. 4^{-x^2} is defined for all $x \in R$.

$\cos^{-1}\left(\dfrac{x}{2} - 1\right)$ is defined if

$-1 \leq \dfrac{x}{2} - 1 \leq 1$ or for $0 \leq x \leq 4$

and log cos x is defined if

$\cos x > 0$ or for $2n\pi - \dfrac{\pi}{2} < x < 2n\pi + \dfrac{\pi}{2}$

where $n \in N$.

Thus, domain of f is $0 \leq x < \dfrac{\pi}{2}$ or $\left[0, \dfrac{\pi}{2}\right)$

10. As $x \neq x + 1$, S is not reflexive

$\Rightarrow S$ is not an equivalence relation.

As $x - x = 0 \in \mathbf{I}$, T is reflexive

$xTy \Rightarrow x - y \in \mathbf{I}\ \ \Rightarrow y - x \in \mathbf{I} \Rightarrow yTx$

$\therefore$ T is symmetric

Suppose xTy and yTz

$\Rightarrow x - y \in \mathbf{I},\ \ y - z \in \mathbf{I}$

$\Rightarrow (x - y) + (y - z) \in \mathbf{I} \Rightarrow x - z \in \mathbf{I} \Rightarrow xTz$

$\therefore$ T is transitive

11. As f is one-one and onto, f is invertible. So

$y = 4x + 3 \Rightarrow x = \dfrac{1}{4}(y - 3)$

Thus, inverse of f is $g(y) = \dfrac{1}{4}(y - 3)$.

12. $B = ((A \cup B) - A) \cup (A \cap B)$

$= ((A \cup C) - A) \cup (A \cap C) = C.$

13. Note that R is not symmetric as $(0, 1) \in$ R but $(1, 0) \notin$ R.

Next, note that $qm = pm \Leftrightarrow \frac{m}{n} = \frac{p}{q}$

Thus, $\left(\frac{m}{n}, \frac{p}{q}\right) \in S \Rightarrow \frac{m}{n} = \frac{p}{q}$

Clearly, S is reflexive and symmetric

Next, note that

$$\left(\frac{m}{n}, \frac{p}{q}\right) \in S \text{ and } \left(\frac{p}{q}, \frac{r}{s}\right) \in S \Rightarrow \frac{m}{n} = \frac{p}{q} \text{ and } \frac{p}{q} = \frac{r}{s}$$

$$\Rightarrow \quad \frac{m}{n} = \frac{r}{s} \quad \Rightarrow \quad \left(\frac{m}{n}, \frac{r}{s}\right) \in \text{S}$$

Thus S is transitive so is an equivalence relation.

14. A is *reflexive*

Let $x \in \mathbf{R}$. $(x, x) \in A$ as $x - x = 0$ is an integer.
A is *symmetric*
Suppose $(x, y) \in A \Rightarrow x - y$ is an integer
$\Rightarrow$ $y - x$ is an integer
$\Rightarrow$ $(y, x) \in A$
A is *transitive*
Let $(x, y) \in A$ and $(y, z) \in A$
$\Rightarrow x - y$ and $y - z$ are integers
$\Rightarrow$ $(x - y) + (y - z)$ is an integer
$\Rightarrow x - z$ is an integer.
$\Rightarrow (x, z) \in A$
Thus, A is an equivalence relation.
B is not *symmetric*

Note that $(0, \sqrt{3}) \in B$ as $0 = (0)\sqrt{3}$ and 0 is a rational number, but $(\sqrt{3}, 0) \notin B$ as there is no rational number a such that $\sqrt{3} = (a)(0)$.

$\therefore$ Statement-1 is true but statement-2 is false. TIP As statement-2 is false, only possible answer is (*d*).

15. Let $y = f(x) = (x - 1)^2 + 1$

$\Rightarrow y - 1 = (x - 1)^2 \Rightarrow x = 1 + \sqrt{y-1}, y \geq 1.$
Thus, $f^{-1}(x) = 1 + \sqrt{x-1}, x \geq 1.$

Now, $f(x) = f^{-1}(x)$

$\Rightarrow (x - 1)^2 + 1 = \sqrt{x-1} + 1$

$\Rightarrow \sqrt{x-1}\,[(x - 1)^{3/2} - 1] = 0$

$\Rightarrow x = 1, 2$

16. As $A = I^{-1} AI$, we get
$(A, A) \in R$ for all A.
$\therefore$ R is reflexive.
Next, assume $(A, B) \in R$
$\Rightarrow$ there exists a non-singular matrix P such that $A = P^{-1}BP$
$\Rightarrow$ $B = PAP^{-1} = (P^{-1})^{-1}AP^{-1}$
Thus, $(B, A) \in R$
$\therefore$ R is symmetric.

Next, assume that $(A, B) \in R$ and $(B, C) \in R$

$\Rightarrow$ there exist non-singular matrices P and Q such that

$A = P^{-1}BP$ and $B = Q^{-1}CQ$

$\therefore \quad A = P^{-1}(Q^{-1}CQ)P$

$= (P^{-1}Q^{-1})\,C(QP)$

$= (QP)^{-1}\,C(QP)$ [using statement-2]

$\Rightarrow (A, C) \in R$

$\therefore$ Statement-1 is true and statement-2 is true and is correct explanation for statement-1.

17. For each $x \in X$, we have the following four choices:
(a) $x \in Y$ and $x \in Z$ (b) $x \notin Y$ and $x \in Z$
(c) $x \in Y$ and $x \notin$ Z (d) $x \notin Y$ and $x \notin Z$

As we do not want $x \in Y \cap Z$, we are left with three choices for each $x \in X$.

Thus, the total number of ways in which Y and Z can be chosen is 3^5.

18. A × B contain (2) (4) = 8 elements.
The number of subsets of A × B having 3 or more elements
= Number of subsets of A × B – [number of subsets with at most 2 elements]

$= 2^8 - ({}^8C_1 + {}^8C_1 + {}^8C_2) = 219$

19. $P = \{(a, b) : \sec^2 a - \tan^2 b = 1\}$
P is not reflexive as $(\pi/2, \pi/2) \notin P$.

P is symmetric.
Suppose $(a, b) \in P$, then
$\sec^2 a - \tan^2 b = 1$
$\Rightarrow \quad (1 + \tan^2 a) - (\sec^2 b - 1) = 1$
$\Rightarrow \quad \sec^2 a - \tan^2 b = 1$
$\Rightarrow \quad (b, a) \in P.$
Suppose $(a, b) \in P$, $(b, c) \in P$
$\Rightarrow \sec^2 a - \tan^2 b = 1$ and $\sec^2 b - \tan^2 c = 1$
Adding, we get
$\Rightarrow \quad \sec^2 a + \sec^2 b - \tan^2 b - \tan^2 c = 2$

$\Rightarrow \quad \sec^2 a + 1 - \tan^2 c = 2$

$\Rightarrow \quad \sec^2 a - \tan^2 c = 1$

$\therefore \ (a, c) \in P.$

20. $\frac{1}{3}+\frac{3n}{100}<1 \ \Rightarrow n \le 22;$

$1 \le \frac{1}{3}+\frac{3n}{100}<2 \quad \Rightarrow 300 \le 100 + 9n < 600$

$\Rightarrow \quad 23 \le n \le 55;$

Also, $\frac{1}{3}+\frac{3(56)}{100}=2\frac{1}{75}$

Thus, $\sum_{n=1}^{56} f(n) = \sum_{n=1}^{22} f(n) + \sum_{n=23}^{55} f(n) + f(56)$

$= 0 + \sum_{n=23}^{55} f(n) + 2(56)$

$= \frac{33}{2}(55+23)+112 = 1399$

21. Period $|\sin(4x)|$ is $\pi/4$ and period of $|\cos 2x|$ is $\pi/2$.

$\therefore$ period of $f(x) = |\sin 4x| + |\cos (2x)|$ is

$\left(l\text{cm}\left(\frac{1}{2},\frac{1}{4}\right)\right)\pi = \frac{\pi}{2}$

22. $f(-1) = f(1) = 0 \ \therefore f$ is not one-one.

Also $f(x) = \frac{|x|-1}{|x|+1} = 1 - \frac{2}{|x|+1} \le 1$ for all $x \in \mathbf{R}$

Thus f cannot be onto.

23. $A = \{-2, -1, 0, 1, 2\}$

$R = \{(-2, 2), (0, 0), (1, 1), (2, 2)\}$

As R has four elements, the power set of R contains 16 elements.

24. $n(A \times B) = n(A)n(B) = 4.2 = 8$

The number of subsets of $A \times B$ which contains at least three elements.

$= {}^8C_3 + {}^8C_4 + {}^8C_5 + {}^8C_6 + {}^8C_7 + {}^8C_8$

$= 2^8 - ({}^8C_0 + {}^8C_1 + {}^8C_2) = 256 - (1 + 8 + 28)$

$= 219$

25. Let total number of families in the town be x. Then $n(P) = 0.25x$, $n(C) = 0.15x$, $n(P' \cap C') = 0.65x$,

$n(P \cup C) = x - n(P' \cap C') = 0.35x$

i.e. 35% of the families own either a car or a phone.

$n(P \cup C) = n(P) + n(C) - n(P \cap C)$

$\Rightarrow 0.35x = 0.25x + 0.15x - n(P \cap C)$

$\Rightarrow n(P \cap C) = 0.05x$

i.e. 5% of the families own a car and a phone

As $0.05x = 2000 \Rightarrow x = 40{,}000$

Thus, (a), (b), (c) are all true.

26. We can choose three elements out of seven in ${}^7C_3$ ways. These three elements are mapped to y_2. The remaining 4 elements are to be mapped to y_1 and y_3. This can be done is 2^4 ways. But these include two ways in which all the four elements are mapped to either y_1 or y_3. Therefore, there are $2^4 - 2 = 14$ ways to map containing four elements to y_1 and y_3. Thus the required number of onto mappings is $14.{}^7C_3$.

27. $f(x) + 2f\left(\frac{1}{x}\right) = 3x \ \forall \ x \ne 0 \qquad$ (i)

Replacing x by $\frac{1}{x}$, we have

$f\left(\frac{1}{x}\right) + 2f(x) = \frac{3}{x} \qquad$ (ii)

(i) – 2(ii) gives $f(x) - 4f(x) = 3x - \frac{6}{x}$

$\Rightarrow f(x) = \frac{2}{x} - x$

$f(x) = f(-x) \Rightarrow \frac{2}{x} - x = -\frac{2}{x} + x \Rightarrow \frac{4}{x} = 2x \Rightarrow x^2 = 2$

$x = \pm\sqrt{2}$. Thus S has exactly two elements.

28. Let $y = 3^{x(x-1)}$, so $y \ge 1$

$\Rightarrow \log_3 y = x(x - 1)$

$\Rightarrow x^2 - x - \log_3 y = 0$

$\Rightarrow x = \frac{1 \pm \sqrt{1 + 4\log_3 y}}{2}$. As $x \ge 1$, so

$x = \frac{1}{2}\left[1 + \sqrt{1 + 4\log_3 y}\right].$

Thus $f^{-1}(x) = \frac{1}{2}\left[1 + \sqrt{1 + 4\log_3 y}\right].$

29. $f_1(x) = f_0(f_0(x)) = \frac{1}{1 - f_0(x)} = \frac{1}{1 - \frac{1}{1-x}}$

$= \frac{1-x}{1-x-1} = 1 - \frac{1}{x}$

$f_2(x) = f_0(f_1(x)) = \frac{1}{1 - f_1(x)} = \frac{1}{1 - \left(1 - \frac{1}{x}\right)} = x$

$f_3(x) = f_0(f_2(x)) = f_0(x)$

Thus $f_{3k}(x) = f_0(x)$, $f_{3k+1}(x) = f_1(x)$,

$f_{3k+2}(x) = f_2(x)$ for all $x \in \mathbf{R} \sim \{0, 1\}$, $k \ge 0$

So, $f_{100}(3) + f_1\left(\frac{2}{3}\right) + f_2\left(\frac{3}{2}\right)$

$= f_1(3) + f_1\left(\frac{2}{3}\right) + f_2\left(\frac{3}{2}\right)$

$= 1-\frac{1}{3}+1-\frac{3}{2}+\frac{3}{2} = \frac{5}{3}.$

Previous Years' B-Architecture Entrance Examination Questions

1. f is defined if $2x - 3 \ge 0$, $x \ge 1$

   So the domain of f is $\left[\frac{3}{2}, \infty\right)$.

2. If $\frac{x_1+2}{x_1-1} = \frac{x_2+2}{x_2-1} \Rightarrow x_1x_2 + 2x_2 - x_1 - 2$

   $= x_1x_2 + 2x_1 - x_2 - 2$

   $\Rightarrow 3x_2 = 3x_1 \Rightarrow x_1 = x_2$

   So f is one-one

   If $y = f(x) = \frac{x+2}{x-1} \Rightarrow yx - y = x + 2$

   $\Rightarrow (y - 1)x = y + 2$

   $\Rightarrow x = \frac{y+2}{y-1} \in (1, \infty)$

   Thus f is onto

3. $x^6 + y^6 = (x^2 + y^2)(x^4 - x^2y^2 + y^4)$, so if $(x, y) \in A \cap B$ then $1 = x^4 - x^2y^2 + y^4 = (x^2 + y^2)^2 - 3x^2y^2$

   $= 1 - 3x^2y^2$

   $\Rightarrow x^2y^2 = 0 \Rightarrow x = 0$ or $y = 0$ but $x > 0$, $y > 0$

   so $A \cap B = \phi$

4. $58 = n(F \cup B \cup C)$
   $= n(f) + n(B) + n(C) - n(F \cap B) - n(B \cap C)$
   $- n(F \cap C) + n(F \cap B \cap C)$

   $= 38 + 15 + 20 - n(F \cap B) - n(B \cap C)$
   $- n(F \cap C) + 3$

   $\Rightarrow n(F \cap B) + n(B \cap C) + n(F \cap C) = 18$

   Number of medals received in exactly two of three sports is

   $= n(F \cap B \cap C') + n(B \cap C \cap F')$
   $+ n(F \cap C \cap B')$

   $= n(F \cap B) + n(B \cap C) + n(F \cap C)$
   $- 3\,n(F \cap \mathrm{B} \cap C)$

   $= 18 - 9 = 9$

5. Since $1 + x^2 > 0$ for all $x \in Q$, so R is reflexive. If $(x, y) \in R \Rightarrow 1 + xy > 0$
   $\Rightarrow 1 + yx > 0 \Rightarrow (y, x) \in R$

   Thus R is symmetric. Take $x = 2$, $y = -\frac{1}{4}$, $z = -1$

   $1 + xy = 1 - \frac{1}{2} = \frac{1}{2} > 0$ so $(x, y) \in R$

   $1 + yz = 1 + \frac{1}{4} = \frac{5}{4} > 0$ so $(y, z) \in R$

   $1 + xz = 1 - 2 = -1 \Rightarrow (x, z) \notin R$. Hence R is not transitive.

6. f is defined if $x > 3$ and $3 \ne \log_3(x - 3)$

   $\Rightarrow x > 3$, $x - 3 \ne 27$ i.e. $x \in (3, \infty) \sim \{30\}$

   $= (3, 30) \cup (30, \infty\}$

7. f is continuous function and $f'(x) = 2009\,x^{2008} + 2009 > 0$. So f is one-one and onto.

8. For $x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, $0 \le \cos x \le 1$. So

   $0 \le \cos^4 x \le 1$ and $-5 \le -2\cos^2 x - 2\cos x - 1 \le -1$

   $\Rightarrow -4 \le \cos^4 x - 2\cos^2 x - 2\cos x - 1 \le -1$

   $\Rightarrow -12 \le f(x) \le -3$

9. $f(-x) = (-x)^2 e^{-(-x)^2} \sin|-x| = x^2e^{-x^2} \sin|x| = f(x)$. Product of two odd functions is an even function.

10. $x = 1\cdot x$ so $(x, x) \in R_1$. If $(x, y) \in R_1$ then $x = ay$ or $y = ax$ for some integer a

    $\Rightarrow y = ax$ or $x = ay \Rightarrow (y, x) \in R_1$

    If $x = ay$ or $y = ax$ and $z = by$ or $y = bz$

    for some integer a and b then $x = abz$ or $z = abx$, so $(x, z) \in R_1$. Thus R_1 is an equivalence relation.

    Since $(2, 2) \notin R_2$ so R_2 is not reflexive. Thus R_2 is not an equivalence relation.

11. $\text{gof}\,(x) = g\left(\frac{1}{x+1}\right) = \left(\frac{1}{x+1}\right)^2 + 1 = \frac{1+(x+1)^2}{(x+1)^2} \ge 1$
    so gof is not onto, gof is not one-one as gof (1) = gof (–3).

12. Since g: $cd\,(b, c) = 1$ so $bc = \text{l.c.m}\,(b, c)$. Hence $d = bc$

13. $y = f(x) = (x + 1)^2 - 1 \Rightarrow x = \sqrt{y+1} - 1$

    Hence $f^{-1}(x) = \sqrt{x+1} - 1$. Now $f(x) = f^{-1}(x)$

    $\Leftrightarrow (x + 1)^2 - 1 = \sqrt{x+1} - 1 \Rightarrow (x + 1)^4 = x + 1$

    $\Rightarrow (x + 1)\,[x^3 + 3x^2 + 3x] = 0$

$\Rightarrow (x + 1)\, x(x^2 + 3x + 3) = 0$

$\Rightarrow x = 0, -1$

14. For $x < 0$, $f(x) = \dfrac{e^{-x} - e^{-x}}{e^x + e^{-x}} = 0$

$\therefore$ f cannot be one-one

For $x \geq 0$, $f(x) = \dfrac{e^x - e^{-x}}{e^x + e^{-x}} \geq 0$

Thus $f(x)$ cannot take negative values so range of f cannot be **R**. Therefore f is not onto.

15. $f(x + 4) - f(x + 2) + f(x) = 0 \ \forall\ x \in \mathbf{R}$

Replace x by $x + 2$,

$f(x + 6) - f(x + 4) + f(x + 2) = 0$

Adding above two equations, we have

$f(x + 6) + f(x) = 0 \ \forall\ x \in \mathbf{R}$

Replace x by $x + 6$, we get

$f(x + 12) + f(x + 6) = 0$

$\Rightarrow f(x + 12) = -f(x + 6) = f(x)$

f is periodic with period 12.

CHAPTER TWO

Complex Numbers

DEFINITIONS

A number of the form $a + ib$ where $a, b \in \mathbf{R}$, the set of real numbers, and $i = \sqrt{-1}$, is called a *complex number*. A complex number can also be defined as an *ordered pair* of real numbers a and b, and may be written as (a, b), where the first number denotes the *real part* and the second number denotes the *imaginary part*. If $z = a + ib$, then the real part of z is denoted by $\text{Re}(z)$ and the imaginary part of z is denoted by $\text{Im}(z)$.

A complex number z is said to be *purely real* if $\text{Im}(z) = 0$ and is said to be *purely imaginary* if $\text{Re}(z) = 0$. Note that the complex number $0 = 0 + i0$ is both purely real and purely imaginary. It is the only complex number with this property.

We denote the set of all complex numbers by $\mathbf{C}$. That is, $\mathbf{C} = \{a + ib | \ a, b \in \mathbf{R}\}$. Two complex numbers $z_1 = a_1 + ib_1$ and $z_2 = a_2 + ib_2$ are said to be *equal* if $a_1 = a_2$ and $b_1 = b_2$.

Very Important

- ☐ The main advantage of complex number is to use **one** symbol z for an ordered pair (x, y) of real numbers. We lose this advantage whenever we replace z by $x + iy$.
- ☐ As far as possible do not write $z = x + iy$ while solving the problems. Putting $z = x + iy$ should be the last resort rather than the first option.

ALGEBRAIC OPERATIONS WITH COMPLEX NUMBERS

1. *Addition:* $(a + ib) + (c + id) = (a + c) + i(b + d)$
2. *Subtraction:* $(a + ib) - (c + id) = (a - c) + i(b - d)$
3. *Multiplication:* $(a + ib)(c + id)$
$$= (ac - bd) + i(ad + bc)$$
4. *Reciprocal:* If at least one of a, b is non-zero then the reciprocal of $a + ib$ is given by
$$\frac{1}{a+ib} = \frac{a-ib}{(a+ib)(a-ib)} = \frac{a}{a^2+b^2} - i\frac{b}{a^2+b^2}$$
5. *Quotient:* If at least one of c, d is non-zero, then quotient of $a + ib$ and $c + id$ is given by
$$\frac{a+ib}{c+id} = \frac{(a+ib)(c-id)}{(c+id)(c-id)} = \frac{(ac+bd)+i(bc-ad)}{c^2+d^2}$$
$$= \frac{ac+bd}{c^2+d^2} + i\frac{bc-ad}{c^2+d^2}$$

CONJUGATE OF COMPLEX NUMBER

Let $z = a + ib$ be a complex number. We define conjugate of z, denoted by $\bar{z}$ to be the complex number $a - ib$. That is, if $z = a + ib$, then $\bar{z} = a - ib$.

Properties of Conjugate of a Complex Number

(i) $z_1 = z_2 \Leftrightarrow \bar{z}_1 = \bar{z}_2$

(ii) $\overline{(\bar{z})} = z$

(iii) $z + \bar{z} = 2\,\text{Re}(z)$

(iv) $z - \bar{z} = 2i\,\text{Im}(z)$

(v) $z = \bar{z} \Leftrightarrow z$ is purely real

(vi) $z + \bar{z} = 0 \Leftrightarrow z$ is purely imaginary

(vii) $z\bar{z} = [\text{Re}(z)]^2 + [\text{Im}(z)]^2$

(viii) $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$

(ix) $\overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2$

(x) $\overline{z_1 z_2} = \bar{z}_1 \bar{z}_2$

(xi) $\overline{\left(\frac{z_1}{z_2}\right)} = \frac{\bar{z}_1}{\bar{z}_2}$ if $z_2 \neq 0$

(xii) If $P(z) = a_0 + a_1 z + a_2 z^2 + \ldots + a_n z^n$ where $a_0, a_1, \ldots a_n$ and z are complex number, then
$$\overline{P(z)} = \bar{a}_0 + \bar{a}_1(\bar{z}) + \bar{a}_2(\bar{z})^2 + \cdots + \bar{a}_n(\bar{z})^n$$
$$= \bar{P}(\bar{z})$$
where $\bar{P}(z) = \bar{a}_o + \bar{a}_1 z + \bar{a}_2 z^2 + \cdots + \bar{a}_n z^n$

(xiii) If $R(z) = \dfrac{P(z)}{Q(z)}$ where $P(z)$ and $Q(z)$ are polynomials in z, and $Q(z) \neq 0$, then

$$\overline{R(z)} = \frac{\bar{P}(\bar{z})}{\bar{Q}(\bar{z})}$$

Illustration 1

$$\overline{\left(\frac{z+3z^2}{z-1}\right)} = \frac{\bar{z}+3\bar{z}^2}{\bar{z}-1}$$

(xiv) If $z = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$, then $\bar{z} = \begin{vmatrix} \bar{a}_1 & \bar{a}_2 & \bar{a}_3 \\ \bar{b}_1 & \bar{b}_2 & \bar{b}_3 \\ \bar{c}_1 & \bar{c}_2 & \bar{c}_3 \end{vmatrix}$

where a_i, b_i, c_i $(i = 1, 2, 3)$ are complex numbers.

MODULUS OF A COMPLEX NUMBER

Let $z = a + ib$ be a complex number. We define the *modulus* or the *absolute value* of z to be the real number $\sqrt{a^2+b^2}$ and denote it by $|z|$.
Note that $|z| \geq 0 \ \forall \ z \in \mathbf{C}$

Properties of Modulus

If z is a complex number, then

(i) $|z| = 0 \Leftrightarrow z = 0$

(ii) $|z| = |\bar{z}| = |-z| = |-\bar{z}|$

(iii) $-|z| \leq \text{Re}(z) \leq |z|$

(iv) $-|z| \leq \text{Im}(z) \leq |z|$

(v) $z\bar{z} = |z|^2$

In particular, note that if $z \neq 0$, then $\dfrac{1}{z} = \dfrac{\bar{z}}{|z|^2}$ so that $\text{Re}\left(\dfrac{1}{z}\right) = \dfrac{\text{Re}(z)}{|z|^2}$ and $\text{Im}\left(\dfrac{1}{z}\right) = -\dfrac{\text{Im}(\bar{z})}{|z|^2}$.

If z_1, z_2 are two complex numbers, then

(vi) $|z_1 z_2| = |z_1|\,|z_2|$

(vii) $\left|\dfrac{z_1}{z_2}\right| = \dfrac{|z_1|}{|z_2|}$, if $z_2 \neq 0$

(viii) $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + \bar{z}_1 z_2 + z_1\bar{z}_2$

$= |z_1|^2 + |z_2|^2 + 2\text{Re}(z_1\bar{z}_2)$

(ix) $|z_1 - z_2|^2 = |z_1|^2 + |z_2|^2 - \bar{z}_1 z_2 - z_1\bar{z}_2$

$= |z_1|^2 + |z_2|^2 - 2\text{Re}(z_1\bar{z}_2)$

(x) $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2(|z_1|^2 + |z_2|^2)$

(xi) If a and b are real numbers and z_1, z_2 are complex numbers, then

$|az_1 + bz_2|^2 + |bz_1 - az_2|^2 = (a^2 + b^2)(|z_1|^2 + |z_2|^2)$

(xii) If $z_1, z_2 \neq 0$, then $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 \Leftrightarrow z_1/z_2$ is purely imaginary.

(xiii) *Triangle Inequality*. If z_1 and z_2 are two complex numbers, then $|z_1 + z_2| \leq |z_1| + |z_2|$.

The equality holds if and only if $z_1\bar{z}_2 \geq 0$.

In general, $|z_1 + z_2 + \ldots + z_n| \leq |z_1| + |z_2| + \ldots + |z_n|$ and the equality sign holds if and only if the ratio of any two non-zero terms is positive.

(xiv) $|z_1 - z_2| \leq |z_1| + |z_2|$

(xv) $\big||z_1| - |z_2|\big| \leq |z_1| + |z_2|$

(xvi) $|z_1 - z_2| \geq \big||z_1| - |z_2|\big|$

(xvii) If a_1, a_2, a_3 and a_4 are four complex numbers, then $|z - a_1| + |z - a_2| + |z - a_3| + |z - a_4| \geq \max\{|a_1 - a_l| + |a_m - a_n|$: l, m, n are distinct integers lying in $\{2, 3, 4\}$ and $m < n\}$.

GEOMETRICAL REPRESENTATION OF COMPLEX NUMBERS

A complex number $z = x + iy$ can be represented by a point P whose Cartesian co-ordinates are (x, y) referred to rectangular axes Ox and Oy, usually called the *real* and *imaginary* axes respectively. The plane is called the *Argand plane, complex plane* or *Gaussian plane*. The point $P(x, y)$ is called the *image* of the complex number z and z is said to be the *affix* or *complex co-ordinate* of point P.

Note

All purely real numbers lie on the real axis and all purely imaginary numbers lie on the imaginary axis. The complex number $0 = 0 + i0$ lies at the origin O.

We have $OP = \sqrt{x^2 + y^2} = |z|$. Thus, $|z|$ is the length of OP.

ARGUMENT OF A COMPLEX NUMBER

If z is a non-zero complex numbers represented by point P in the complex plane, then argument of z is the angle which OP makes with the positive direction of the real axis. See Fig. 2.1.

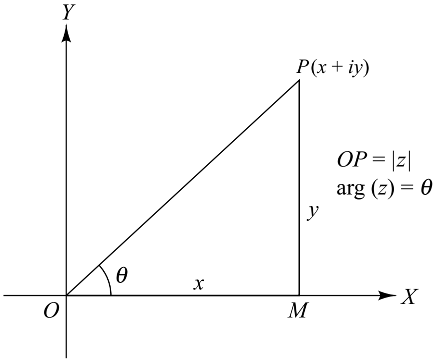


Fig. 2.1

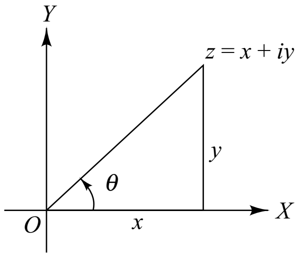
Note

Argument of a non-zero complex number is not unique, since, if θ is a value of the argument, then $2n\pi + \theta$ where $n \in \mathbf{I}$, the set of integers, are also values of the argument of z. The value θ of the argument which satisfies the inequality $-\pi < \theta \leq \pi$ is called the ***principal value*** of the argument or ***principal argument***.

Principal Value of the Argument for Different Positions of *z* in the Complex Plane

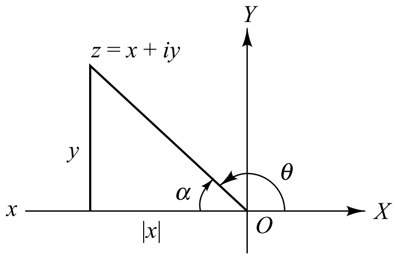
1. When z lies in the first quadrant



$$\arg(z) = \tan^{-1}\left(\frac{y}{x}\right)$$

Fig. 2.2 (i)

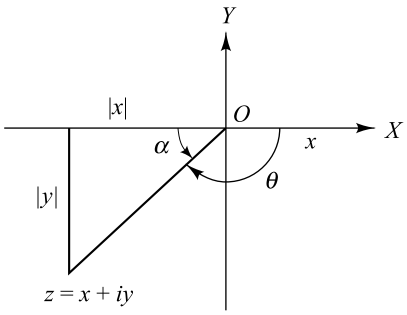
2. When z lies in the second quadrant



$$\arg(z) = \pi - \tan^{-1}\left(\frac{y}{|x|}\right)$$

Fig. 2.2 (ii)

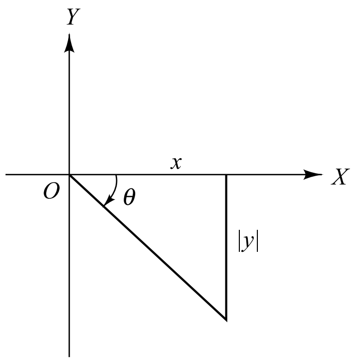
3. When z lies in the third quadrant



$$\arg(z) = -\pi + \tan^{-1}\left(\frac{|y|}{|x|}\right)$$

Fig. 2.2 (iii)

4. When z lies in the fourth quadrant



$$\arg(z) = -\tan^{-1}\left(\frac{|y|}{x}\right)$$

Fig. 2.2 (iv)

Thus, if $z = x + iy$, then

$$\arg(z) = \begin{cases} \tan^{-1}(y/x) & \text{if } x > 0 \\ \tan^{-1}(y/x) + \pi & \text{if } x < 0, y \geq 0 \\ \tan^{-1}(y/x) - \pi & \text{if } x < 0, y < 0 \\ \pi/2 & \text{if } x = 0, y > 0 \\ -\pi/2 & \text{if } x = 0, y < 0 \end{cases}$$

Common Mistake

A usual mistake committed by the students is to take the argument of $z = x + iy$ as $\tan^{-1}(y/x)$ irrespective of the values of x and y. Kindly remember that $\tan^{-1}(y/x)$ lies in the interval $(-\pi/2, \pi/2)$ whereas the principal value of argument of z lies in the interval $(-\pi, \pi]$.

POLAR FORM OF A COMPLEX NUMBER

Let z be a non-zero complex number, then we can write

$$z = r(\cos\theta + i\sin\theta)$$

where $r = |z|$ and $\theta = \arg(z)$.

Illustration 2

$$-1 + i = \sqrt{2}\left(\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right)$$

and $$-1 - i = \sqrt{2}\left\{\cos\left(-\frac{3\pi}{4}\right) + i\sin\left(-\frac{3\pi}{4}\right)\right\}$$

In fact, if $z = r(\cos\theta + i\sin\theta)$, then z is also given by

$$z = r[\cos(2k\pi + \theta) + i\sin(2k\pi + \theta)]$$

where k is any integer.

Euler's Formula

The complex number $\cos\theta + i\sin\theta$ is denoted by $e^{i\theta}$ or cis θ. That is

$$e^{i\theta} = \text{cis}\,\theta = \cos\theta + i\sin\theta$$

Some Important Results Involving Argument

If z, z_1 and z_2 are non-zero complex numbers, then

(i) $\arg(\bar{z}) = -\arg(z)$

(ii) *$\arg(z_1 z_2) = \arg(z_1) + \arg(z_2)$

In fact,

$\arg(z_1 z_2) = \arg(z_1) + \arg(z_2) + 2k\pi$

where

$$k = \begin{cases} 0 \text{ if } -\pi < \arg(z_1) + \arg(z_2) \le \pi \\ 1 \text{ if } -2\pi < \arg(z_1) + \arg(z_2) \le -\pi \\ -1 \text{ if } \pi < \arg(z_1) + \arg(z_2) \le 2\pi \end{cases}$$

(iii) *$\arg(z_1 \bar{z}_2) = \arg(z_1) - \arg(z_2)$

(iv) *$\arg\left(\dfrac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2)$

In fact,

$$\arg\left(\frac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2) + 2k\pi$$

where k is defined as in (ii) with + sign between $\arg(z_1)$ and $\arg(z_2)$ replaced by –

(v) $|z_1 + z_2| = |z_1 - z_2|$

$\Leftrightarrow \quad \arg(z_1) - \arg(z_2) = \pi/2$

(vi) $|z_1 + z_2| = |z_1| + |z_2|$

$\Leftrightarrow \quad \arg(z_1) = \arg(z_2)$

If $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$

and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$

where $r_1 = |z_1|$, $r_2 = |z_2|$

and $\theta_1 = \arg(z_1)$, $\theta_2 = \arg(z_2)$, then

(vii) $$|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + 2|z_1||z_2|\cos(\theta_1 - \theta_2)$$
$$= r_1^2 + r_2^2 + 2r_1r_2\cos(\theta_1 - \theta_2)$$

$$|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 \Leftrightarrow \cos(\theta_1 - \theta_2) = 0$$

$\Leftrightarrow Oz_1$ is at right angles to Oz_2.

(viii) $$|z_1 - z_2|^2 = |z_1|^2 + |z_2|^2 - 2|z_1||z_2|\cos(\theta_1 - \theta_2)$$
$$= r_1^2 + r_2^2 - 2r_1r_2\cos(\theta_1 - \theta_2)$$

$$|z_1 - z_2|^2 = |z_1|^2 + |z_2|^2$$

$\Leftrightarrow Oz_1$ is perpendicular to Oz_2.

VECTOR REPRESENTATION OF COMPLEX NUMBERS

We can also represent the complex number $z = x + iy$ by using the vector $\overrightarrow{OP}$ joining the origin O of the complex plane to the point $P(x, y)$, instead of using point P itself. The length of the vector $\overrightarrow{OP}$, that is, $|\overrightarrow{OP}|$ is the modulus of z. The angle between the positive real axis and the vector $\overrightarrow{OP}$, more exactly, the angle through which the positive real axis must be rotated to cause it to have the same direction as $\overrightarrow{OP}$ (considered positive if the rotation is counter-clockwise and negative otherwise) is the argument of the complex number z.

GEOMETRICAL REPRESENTATION OF ALGEBRAIC OPERATIONS ON COMPLEX NUMBERS

Let z_1 and z_2 be two complex numbers represented by the points $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ respectively.

Sum

By definition, $z_1 + z_2$ should be represented by the point $(x_1 + x_2, y_1 + y_2)$. This point is nothing but the vertex P which completes the parallelogram with the line segments joining the origin with z_1 and z_2 as the adjacent sides. See Fig. 2.3

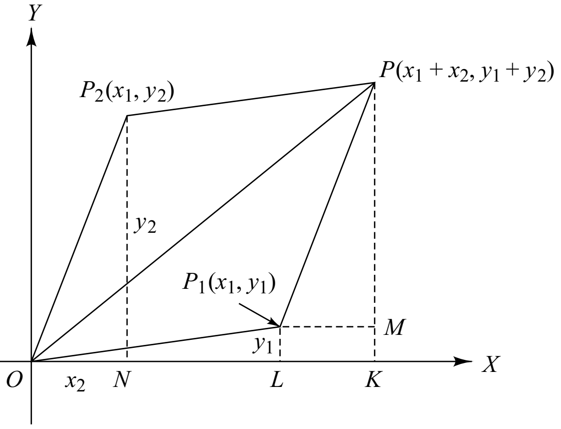


Fig. 2.3

---

* L.H.S. and R.H.S. may differ by a multiple of 2π.

Note that the addition of two complex numbers z_1 and z_2 follows the same law of addition as that of vectors, represented both in magnitude and direction by the line segments joining the origin and the points representing z_1 and z_2, for

$$\mathbf{OP_1} + \mathbf{OP_2} = \mathbf{OP_1} + \mathbf{P_1P} = \mathbf{OP}$$

Difference

We first represent $-z_2$ by P'_2 so that $P_2P'_2$ is bisected at O. Complete the parallelogram $OP_1\ PP'_2$. Then, it can be easily seen that P represents the difference $z_1 - z_2$. See Fig. 2.4.

As $OP_1\ PP'_2$ is a parallelogram so $P_1P = OP'_2$. Using vector notation, we have

$$\begin{aligned} z_1 - z_2 &= \mathbf{OP_1} - \mathbf{OP_2} = \mathbf{OP_1} + \mathbf{P_2O} = \mathbf{OP_1} + \mathbf{OP'_2} \\ &= \mathbf{OP_1} + \mathbf{P_1P} = \mathbf{OP} = \mathbf{P_2P_1} \end{aligned}$$

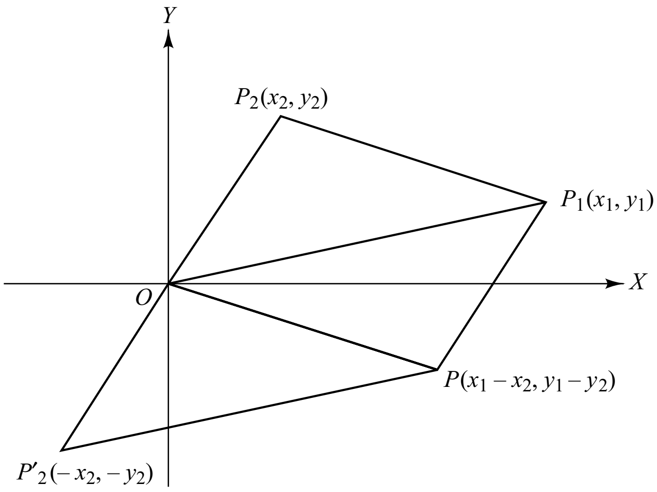

Fig. 2.4

Note the complex number $z_1 - z_2$ is represented by the vector $\mathbf{P_2P_1}$, where the points P_2 and P_1 represent the complex number z_2 and z_1 respectively.

Note that $\arg(z_1 - z_2)$ is the angle through which OX must be rotated in the anticlockwise direction so that it becomes parallel to P_2P_1.

Product (Multiplication)

Let $z_1 = r_1(\cos\ \theta_1 + i \sin\ \theta_1)$ and $z_2 = r_2\ (\cos\ \theta_2 + i\ \sin\ \theta_2)$. Then

$$\begin{aligned} z_1 z_2 &= r_1 r_2 (\cos\theta_1 + i \sin\ \theta_1)\ (\cos\ \theta_2 + i\ \sin\ \theta_2) \\ &= r_1\ r_2\ \{\cos(\theta_1 + \theta_2) + i\ \sin\ (\theta_1 + \theta_2)\} \end{aligned}$$

Thus $|z_1 z_2| = r_1\ r_2$ and $\arg(z_1 z_2) = \theta_1 + \theta_2$

This shows that modulus of the product of two complex numbers is the product of their moduli, and the argument of the product of any two complex numbers is the sum of their arguments. Using this, we shall derive a geometrical interpretation of the product of two complex numbers.

Let E be a point on the x-axis such that $OE = 1$ unit. (See Fig 2.5.) Complete the triangle OP_1E. Now, taking OP_2 as the base, construct a triangle OPP_2 similar to OP_1E so that

$$OP : OP_1 = OP_2 : OE$$

i.e., $\quad OP = OP_1 \cdot OP_2 \qquad [\because\ OE = 1]$

Also $\quad \angle P_2OP = \angle EOP_1 = \angle XOP_1 = \theta_1$

Thus $\quad \angle XOP = \theta_1 + \theta_2$

Hence P represents the complex number for which the modulus is $r_1 r_2$ and the argument is $\theta_1 + \theta_2$. That is, it represents the complex number $z_1\, z_2$.

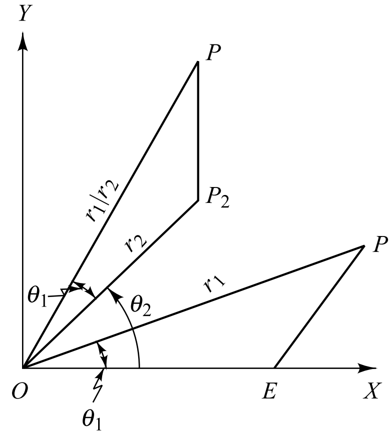

Fig. 2.5

Quotient

Let $z_1 = r_1\ (\cos\ \theta_1 + i\ \sin\ \theta_1)$ and $z_2 = r_2\ (\cos\ \theta_2 + i\ \sin\ \theta_2)$. We take $z_2 \neq 0$, so that $r_2 \neq 0$. Now

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{r_1\ (\cos\theta_1 + i \sin\theta_1)}{r_2\ (\cos\theta_2 + i \sin\theta_2)} \\ &= \frac{r_1}{r_2}\ \{\cos\ (\theta_1 - \theta_2) + i\ \sin\ (\theta_1 - \theta_2)\} \end{aligned}$$

We shall use this to get a geometrical interpretation of the quotient of a complex number by a non-zero complex number.

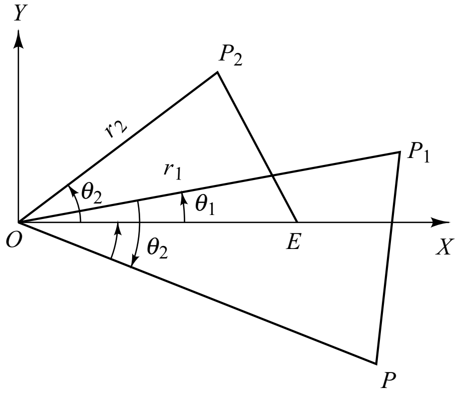

Fig. 2.6

Let P_1 and P_2 represent z_1 and z_2 respectively. On OP_1 construct the triangle OPP_1 similar to OEP_2, where E lies on the x-axis and $OE = 1$ unit. (See Fig. 2.6.)

Now, $\quad OP : OE = r_1 : r_2 \quad \Rightarrow \quad OP = \dfrac{r_1}{r_2}$

Also $\quad \angle XOP = \theta_1 - \theta_2$

The point P thus represents the quotient z_1/z_2, since its modulus is r_1/r_2 and its arguments is $\theta_1 - \theta_2$.

Remark

Note that if θ_1 and θ_2 are the principal values of arg z_1 and arg z_2 then $\theta_1 + \theta_2$ is not necessarily the principal value of $\arg(z_1\, z_2)$, nor is $\theta_1 - \theta_2$ necessarily the principal value of $\arg(z_1/z_2)$.

Interpretation of $\arg\left(\dfrac{z_3 - z_1}{z_2 - z_1}\right)$

If z_1, z_2, z_3 are the vertices of a triangle ABC described in the counter-clockwise sense, then

(i) $\arg\left(\dfrac{z_3 - z_1}{z_2 - z_1}\right) = \angle BAC = \alpha$ (say), and

(ii) $\dfrac{z_3 - z_1}{z_2 - z_1} = \dfrac{CA}{BA}(\cos\alpha + i\sin\alpha)$

See Fig. 2.7.

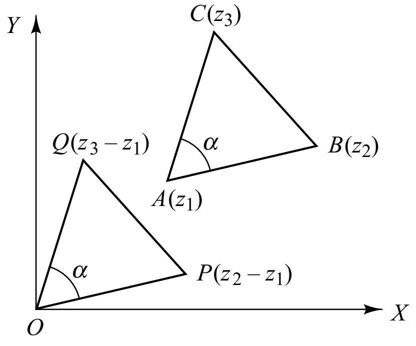

Fig. 2.7

Corollary The points z_1, z_2, z_3 will be collinear if and only if angle $\alpha = 0$ or π, i.e., if and only if $\dfrac{z_3 - z_1}{z_2 - z_1}$ is purely real.

Interpretation of arg $\left(\dfrac{z_1 - z_2}{z_3 - z_4}\right)$

Let z_1, z_2, z_3 and z_4 be four complex numbers. Then the line joining z_4 and z_3 is inclined to the line joining z_2 and z_1 at the following angle:

$$\arg\left(\frac{z_1 - z_2}{z_3 - z_4}\right)$$

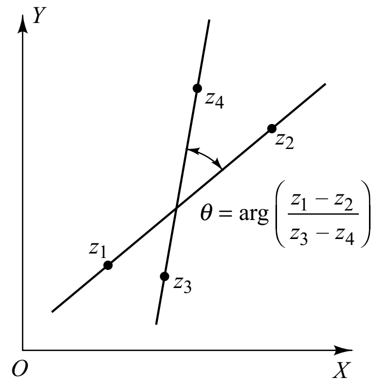

Fig. 2.8

Corollary The line joining z_4 and z_3 is inclined at 90° to the line joining z_2 and z_1 if

$$\arg\left(\frac{z_1 - z_2}{z_3 - z_4}\right) = \pm\frac{\pi}{2}$$

i.e., if $z_1 - z_2 = \pm\, ik(z_3 - z_4)$, where k is a non-zero real number. (Fig. 2.9).

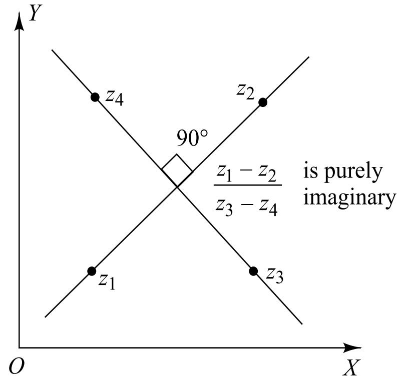

Fig. 2.9

SOME IMPORTANT GEOMETRICAL RESULTS AND EQUATIONS

1. **Distance Formula**

   Distance between $A(z_1)$ and $B(z_2)$ is given by

   $AB = |z_2 - z_1|$

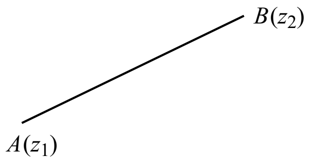

Fig. 2.10

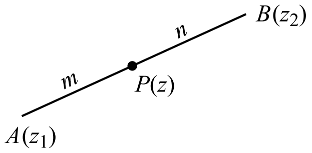
2. **Section Formula**

   The point $P(z)$ which divides the join of the segment AB in the ratio $m : n$ is given by

$$z = \frac{mz_2 + nz_1}{m+n}$$



$B(z_2)$
n
m
$P(z)$
$A(z_1)$

Fig. 2.11

3. **Mid-point Formula**

Mid-point $M(z)$ of the segment AB is given by

$$z = \frac{1}{2}(z_1 + z_2)$$

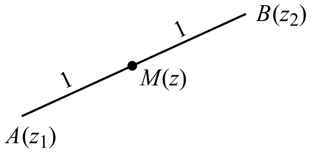


Fig. 2.12

4. **Condition(s) *for four non-collinear* $A(z_1)$, $B(z_2)$, $C(z_3)$ *and* $D(z_4)$ *to represent vertices of a***

(i) Parallelogram

The diagonals AC and BD must bisect each other

$$\Leftrightarrow \quad \frac{1}{2}(z_1 + z_3) = \frac{1}{2}(z_2 + z_4)$$

$$\Leftrightarrow \quad z_1 + z_3 = z_2 + z_4$$

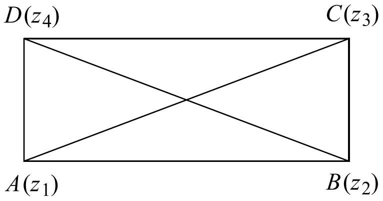
(iv) Rectangle

(a) the diagonals AC and BD bisect each other

$\Leftrightarrow \quad z_1 + z_3 = z_2 + z_4$

(b) the diagonals AC and BD are equal

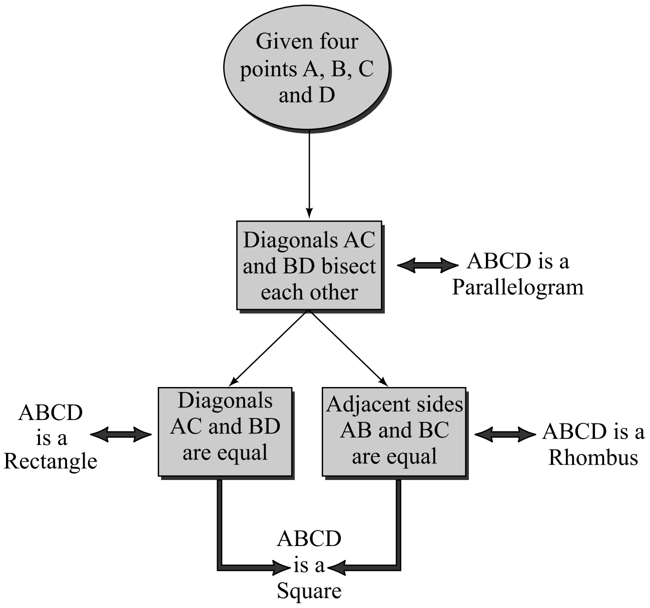
$\Leftrightarrow \quad |z_3 - z_1| = |z_4 - z_2|$.



$D(z_4)$
$C(z_3)$
$A(z_1)$
$B(z_2)$

Fig. 2.16

Showing that four points, no three of which are collinear, form a Parallelogram/Rhombus/Square/Rectangle



Given four points A, B, C and D
Diagonals AC and BD bisect each other
ABCD is a Parallelogram
ABCD is a Rectangle
Diagonals AC and BD are equal
Adjacent sides AB and BC are equal
ABCD is a Rhombus
ABCD is a Square

5. Centroid, Incentre, Orthocentre and Circumcentre of a Triangle

Let ABC be a triangle with vertices $A(z_1)$, $B(z_2)$ and $C(z_3)$,

(i) **Centroid** $G(z)$ of the ΔABC is the point of concurrence of medians of ΔABC and is given by

$$z = \frac{1}{3}\,(z_1 + z_2 + z_3)$$

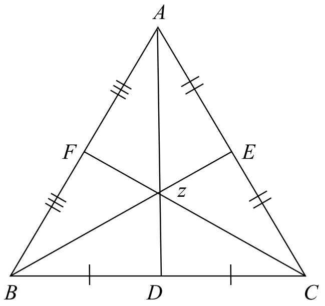


Fig. 2.17

(ii) Incentre $I(z)$ of the ΔABC is the point of concurrence of internal bisectors of angles of ΔABC and is given by

$$z = \frac{az_1 + bz_2 + cz_3}{a + b + c}$$

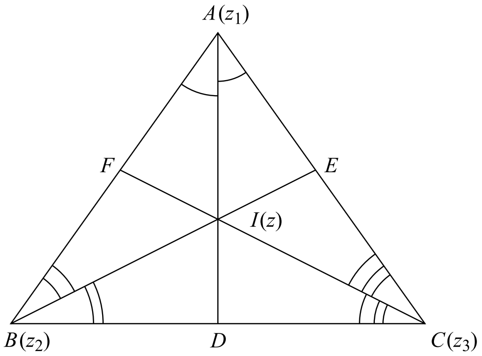

Fig. 2.18

(iii) Circumcentre $S(z)$ of the ΔABC is the point of concurrence of perpendicular bisectors of sides of ΔABC and is given by

$$z = \frac{(z_2 - z_3)|z_1|^2 + (z_3 - z_1)|z_2|^2 + (z_1 - z_2)|z_3|^2}{\bar{z}_1(z_2 - z_3) + \bar{z}_2(z_3 - z_1) + \bar{z}_3(z_1 - z_2)}$$

$$z = \frac{\begin{vmatrix} |z_1|^2 & z_1 & 1 \\ |z_2|^2 & z_2 & 1 \\ |z_3|^2 & z_3 & 1 \end{vmatrix}}{\begin{vmatrix} \bar{z}_1 & z_1 & 1 \\ \bar{z}_2 & z_2 & 1 \\ \bar{z}_3 & z_3 & 1 \end{vmatrix}}$$

Also $$z = \frac{z_1(\sin 2A) + z_2(\sin 2B) + z_3(\sin 2C)}{\sin 2A + \sin 2B + \sin 2C}$$

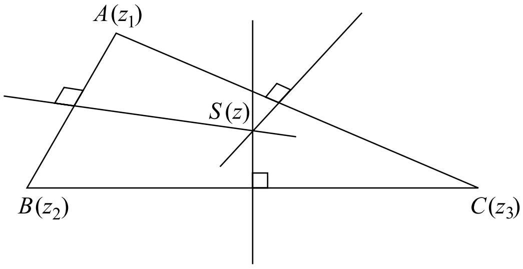

Fig. 2.19

(iv) **Orthocentre** $H(z)$ of the ΔABC is the point of concurrence of altitudes of ΔABC and is given by

$$z = \frac{\begin{vmatrix} z_1^2 & \bar{z}_1 & 1 \\ z_2^2 & \bar{z}_2 & 1 \\ z_3^2 & \bar{z}_3 & 1 \end{vmatrix} + \begin{vmatrix} |z_1|^2 & z_1 & 1 \\ |z_2|^2 & z_2 & 1 \\ |z_3|^2 & z_3 & 1 \end{vmatrix}}{\begin{vmatrix} \bar{z}_1 & z_1 & 1 \\ \bar{z}_2 & z_2 & 1 \\ \bar{z}_3 & z_3 & 1 \end{vmatrix}}$$

or $$z = \frac{(\tan A)\,z_1 + (\tan B)\,z_2 + (\tan C)z_3}{\tan A + \tan B + \tan C}$$

or $$z = \frac{(a \sec A)\,z_1 + (b \sec B)z_2 + (c \sec C)z_3}{a \sec A + b \sec B + c \sec C}$$

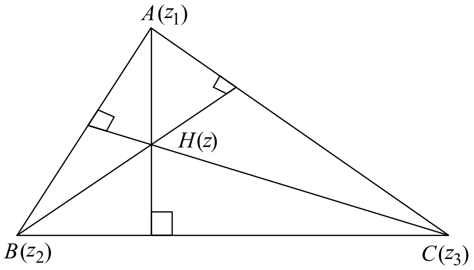

Fig. 2.20

Remark

In case circumcentre of ΔABC is at the origin, then orthocentre of triangle is given by $z_1 + z_2 + z_3$.

Important Note

It is not necessary to remember formulae for circumcentre and orthocentre of a triangle.

Euler's Line

The centroid G of a triangle lies on the segment joining the orthocentre H and the circumcentre S of the triangle. G divides the join of H and S in the ratio 2 : 1.

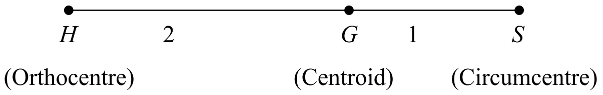

Fig. 2.21

Thus,

$$z_G = \frac{1}{3}(z_H + 2z_S)$$

6. Area of a Triangle

Area of ΔABC with vertices $A(z_1)$, $B(z_2)$ and $C(z_3)$ is given by

$$\Delta = \left|\frac{1}{4i}\begin{vmatrix} z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \\ z_3 & \bar{z}_3 & 1 \end{vmatrix}\right|$$

$$= \left|\frac{1}{2}\operatorname{Im}(\bar{z}_1 z_2 + \bar{z}_2 z_3 + \bar{z}_3 z_1)\right|$$

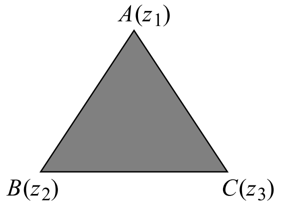

Fig. 2.22

7. Condition for Triangle to be Equilateral

Triangle ABC with vertices $A(z_1)$, $B(z_2)$ and $C(z_3)$ is equilateral if and only if

$$\frac{1}{z_2 - z_3} + \frac{1}{z_3 - z_1} + \frac{1}{z_1 - z_2} = 0$$

$$\Leftrightarrow \quad z_1^2 + z_2^2 + z_3^2 = z_2 z_3 + z_3 z_1 + z_1 z_2$$

$$\Leftrightarrow \quad z_1 \bar{z}_2 = z_2 \bar{z}_3 = z_3 \bar{z}_1$$

$$\Leftrightarrow \quad z_1^2 = z_2 z_3 \text{ and } z_2^2 = z_1 z_3$$

$$\Leftrightarrow \quad \begin{vmatrix} 1 & z_2 & z_3 \\ 1 & z_3 & z_1 \\ 1 & z_1 & z_2 \end{vmatrix} = 0$$

$$\Leftrightarrow \quad \frac{z_2 - z_1}{z_3 - z_2} = \frac{z_3 - z_2}{z_1 - z_3}$$

$$\Leftrightarrow \quad \frac{1}{z - z_1} + \frac{1}{z - z_2} + \frac{1}{z - z_3} = 0$$

where $$z = \frac{1}{3}(z_1 + z_2 + z_3)$$

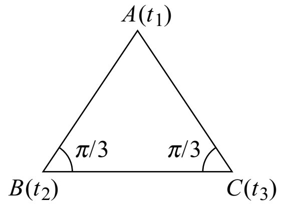

Fig. 2.23

8. Equation of a Straight Line

(i) Non-parametric form

An equation of a straight line joining the two points $A(z_1)$ and $B(z_2)$ is

$$\begin{vmatrix} z & \bar{z} & 1 \\ z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \end{vmatrix} = 0$$

or $$\frac{z - z_1}{z_2 - z_1} = \frac{\bar{z} - \bar{z}_1}{\bar{z}_2 - \bar{z}_1}$$

or $$z(\bar{z}_1 - \bar{z}_2) - \bar{z}(z_1 - z_2) + z_1\bar{z}_2 - z_2\bar{z}_1 = 0$$

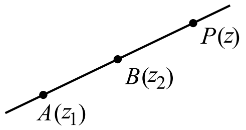

Fig. 2.24

(ii) Parametric form

An equation of the straight line joining the points $A(z_1)$ and $B(z_2)$ is

$$z = tz_1 + (1 - t)z_2$$

where t is a real parameter.

(iii) General Equation of a Straight Line

The general equation of a straight line is

$$\bar{a}z + a\bar{z} + b = 0$$

where a is a non-zero complex number and b is a real number.

9. Complex Slope of a Line

If $A(z_1)$ and $B(z_2)$ are two points in the complex plane, then complex slope of AB is defined to be

$$\mu = \frac{z_1 - z_2}{\bar{z}_1 - \bar{z}_2}$$

Two lines with complex slopes μ_1 and μ_2 are

(i) parallel, if $\mu_1 = \mu_2$

(ii) perpendicular, if $\mu_1 + \mu_2 = 0$

The complex slope of the line

$\bar{a}z + a\bar{z} + b = 0$ is given by $-(a/\bar{a})$

10. Length of Perpendicular from a Point to a Line

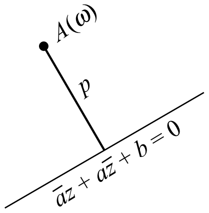

Fig. 2.25

Length of perpendicular of point $A(\omega)$ from the line $\bar{a}z + a\bar{z} + b = 0$ ($a \in \mathbf{C} - \{0\}, b \in \mathbf{R}$) is given by

$$p = \frac{|\bar{a}\omega + a\bar{\omega} + b|}{2|a|}$$

11. Some Results on Circle

(i) Equation of a circle

An equation of a circle with centre at z_0 and radius r is

$$|z - z_0| = r$$

or $\quad z = z_0 + re^{i\theta}, 0 \le \theta < 2\pi$ (parametric form)

or $\quad z\bar{z} - z_0\bar{z} - \bar{z}_0 z + z_0\bar{z}_0 - r^2 = 0$

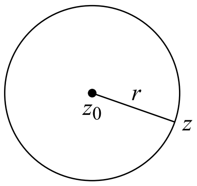

Fig. 2.26

(ii) General equation of a circle

General equation of a circle is

$$z\bar{z} + a\bar{z} + \bar{a}z + b = 0 \tag{1}$$

where a is a complex number and b is a real number such that $a\bar{a} - b \ge 0$

Centre of (1) is $-a$ and its radius is $\sqrt{a\bar{a} - b}$.

(iii) Diameter form of a circle

An equation of the circle one of whose diameter is the line segment joining $A(z_1)$ and $B(z_2)$ is

$$(z - z_1)(\bar{z} - \bar{z}_2) + (\bar{z} - \bar{z}_1)(z - z_2) = 0$$

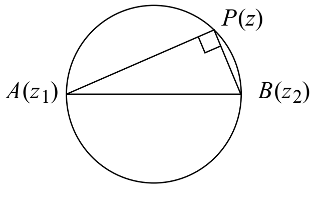

Fig. 2.27

(iv) An equation of circle through two points

An equation of the circle passing through two points $A(z_1)$ and $B(z_2)$ is

$$(z - z_1)(\bar{z} - \bar{z}_2) + (\bar{z} - \bar{z}_1)(z - z_2) + ik\begin{vmatrix} z & \bar{z} & 1 \\ z_1 & \bar{z}_1 & 1 \\ z_2 & \bar{z}_2 & 1 \end{vmatrix} = 0$$

where k is real a parameter.

(v) Equation of a circle passing through three non-collinear points.

Let three non-collinear points be $A(z_1)$, $B(z_2)$ and $C(z_3)$. Let $P(z)$ be any point on the circle. Then either

$\angle ACB = \angle APB$

[when angles are in the same segment]

$\angle ACB + \angle APB = \pi$

[when angles are in the opposite segment]

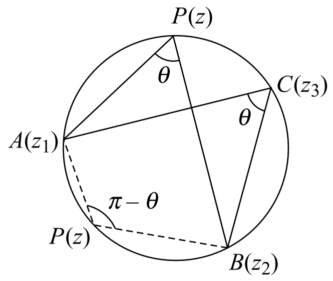

Fig. 2.28

$$\Rightarrow \quad \arg\left(\frac{z_3 - z_2}{z_3 - z_1}\right) - \arg\left(\frac{z - z_2}{z - z_1}\right) = 0$$

or

$$\arg\left(\frac{z_3 - z_2}{z_3 - z_1}\right) + \arg\left(\frac{z - z_1}{z - z_2}\right) = \pi$$

$$\Rightarrow \quad \arg\left[\left(\frac{z_3 - z_2}{z_3 - z_1}\right)\left(\frac{z - z_1}{z - z_2}\right)\right] = 0$$

$$\text{or} \quad \arg\left[\left(\frac{z - z_1}{z - z_2}\right)\left(\frac{z_3 - z_2}{z_3 - z_1}\right)\right] = \pi$$

[using $\arg\left(\frac{z_1}{z_2}\right) = \arg(z_1) - \arg(z_2)$ and $\arg(z_1 z_2) = \arg(z_1) + \arg(z_2)$]

In any case, we get $\dfrac{(z - z_1)(z_3 - z_2)}{(z - z_2)(z_3 - z_1)}$ is purely real.

$$\Leftrightarrow \quad \frac{(z - z_1)(z_3 - z_2)}{(z - z_2)(z_3 - z_1)} = \frac{(\bar{z} - \bar{z}_1)(\bar{z}_3 - \bar{z}_2)}{(\bar{z} - \bar{z}_2)(\bar{z}_3 - \bar{z}_1)}$$

(vi) Condition for four points to be concyclic.

Four points z_1, z_2, z_3 and z_4 will lie on the same circle if and only if $\dfrac{(z_4 - z_1)(z_3 - z_2)}{(z_4 - z_2)(z_3 - z_1)}$ is purely real.

$$\Leftrightarrow \quad \frac{(z_1 - z_3)(z_2 - z_4)}{(z_1 - z_4)(z_2 - z_3)} \text{ is purely real.}$$

RECOGNIZING SOME LOCI BY INSPECTION

(i) $\arg(z) = \alpha \ (-\pi < \alpha \le \pi)$

$\arg(z) = \alpha$ represents a ray starting at the origin (excluding the origin) and making an angle α with the positive direction of the real axis. See Fig. 2.29.

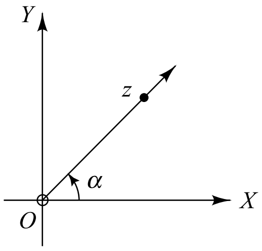

Fig. 2.29

(ii) $\arg(z - z_0) = \alpha \ (-\pi < \alpha \le \pi)$

$\arg(z - z_0) = \alpha$ represents a ray starting at the fixed point z_0 (excluding the point z_0) and making an angle α with the positive direction of the real axis.

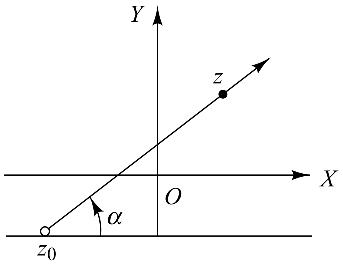

Fig. 2.30

(iii) If z_1 and z_2 are two fixed points, then

$$|z - z_1| = |z - z_2|$$

represents the perpendicular bisector of the segment joining $A(z_1)$ and $B(z_2)$.

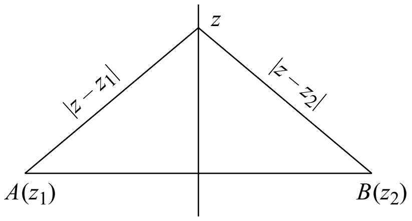

Fig. 2.31

(iv) If z_1 and z_2 are two fixed points, and $k > 0$, $k \ne 1$ is a real number, then

$$\frac{|z - z_1|}{|z - z_2|} = k$$

represents a circle.

For $k = 1$, it represents perpendicular bisector of the segment joining $A(z_1)$ and $B(z_2)$.

(v) $|z - z_1| + |z - z_2| = k$

Let z_1 and z_2 be two fixed points and k be a positive real number.

(a) If $k > |z_1 - z_2|$, then

$|z - z_1| + |z - z_2| = k$ represents an ellipse with foci at $A(z_1)$ and $B(z_2)$ and length of major axis $= k$. See Fig. 2.32

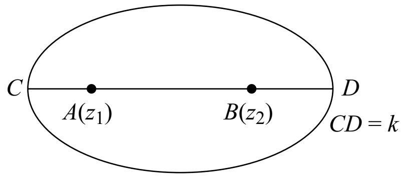

Fig. 2.32

(b) If $k = |z_1 - z_2|$, then

$|z - z_1| + |z - z_2| = k$

represents the segment joining z_1 and z_2.

(c) If $k < |z_1 - z_2|$, then

$|z - z_1| + |z - z_2| = k$

does not represent any curve in the *Argand* plane.

(vi) $|z - z_1| - |z - z_2| = k$

Let z_1 and z_2 be two fixed points, k be a positive real number.

(a) If $k < |z_1 - z_2|$, then

$||z - z_1| - |z - z_2|| = k$

represents a hyperbola with foci at $A(z_1)$ and $B(z_2)$. See Fig 2.33

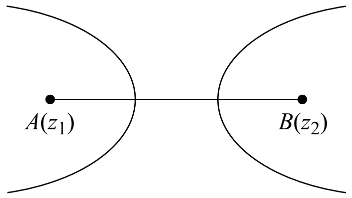

Fig. 2.33

(b) If $k = |z_1 - z_2|$, then $||z - z_1| - |z - z_2|| = k$ represents the straight line joining $A(z_1)$ and $B(z_2)$ but excluding the segment AB. See Fig. 2.34.

Fig. 2.34

Remark

If $k > |z_1 - z_2|$, then

$||z - z_1| - |z - z_2|| = k$

does not represent any curve in the *Argand* plane.

(vii) If z_1 and z_2 are two fixed points, then

$$|z - z_1|^2 + |z - z_2|^2 = |z_1 - z_2|^2$$

represent a circle with z_1 and z_2 as the extremities of a diameter. See Fig. 2.35.

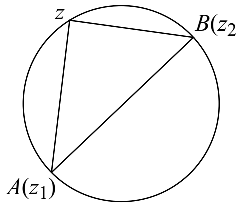

Fig. 2.35

(viii) $\arg\left(\dfrac{z - z_1}{z - z_2}\right) = \alpha$

Let z_1 and z_2 be two fixed points, and α be a real number such $0 \le \alpha \le \pi$.

(a) If $0 < \alpha < \pi$ and $\alpha \ne \pi/2$, then

$$\arg\left(\frac{z - z_1}{z - z_2}\right) = \alpha$$

represents a segment of the circle passing through $A(z_1)$ and $B(z_2)$. See Fig. 2.36.

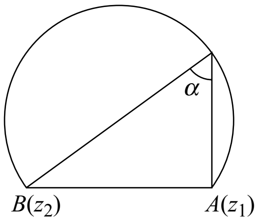

Fig. 2.36

(b) If $\alpha = \pi/2$, then

$$\arg\left(\frac{z - z_1}{z - z_2}\right) = \alpha\left(= \frac{\pi}{2}\right)$$

represents a circle with diameter as the segment joining $A(z_1)$ and $B(z_2)$. See Fig. 2.37.

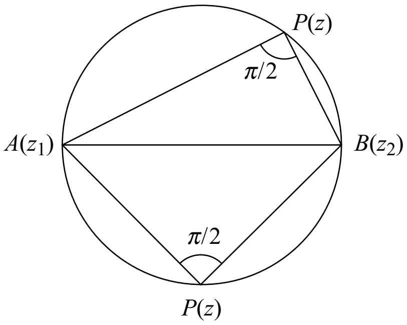

Fig. 2.37

(c) If $\alpha = \pi$, then

$$\arg\left(\frac{z - z_1}{z - z_2}\right) = \alpha\ (= \pi)$$

represents the straight line joining $A(z_1)$ and $B(z_2)$ but excluding the segment AB. See Fig. 2.38

Fig. 2.38

(d) If $\alpha = 0$, then

$$\arg\left(\frac{z - z_1}{z - z_2}\right) = \alpha\ (= 0)$$

represents the segment joining $A(z_1)$ and $B(z_2)$ see Fig. 2.39.

Fig. 2.39

GEOMETRIC INTERPRETATION OF MULTIPLYING A COMPLEX NUMBER BY $e^{i\alpha}$.

Let z be a non-zero complex number. We can write z in the polar form as follows:

$$z = r(\cos\theta + i\sin\theta) = re^{i\theta}$$

where $r = |z|$ and $\arg(z) = \theta$

We have

$$ze^{i\alpha} = re^{i\theta}e^{i\alpha} = re^{i(\theta + \alpha)}$$

Thus, $ze^{i\alpha}$ represents the complex number whose modulus is r and argument is $\theta + \alpha$. Geometrically, $ze^{i\alpha}$ can be obtained by rotating the segment joining O and $P(z)$ through an angle α in the anticlockwise direction. See Fig. 2.40

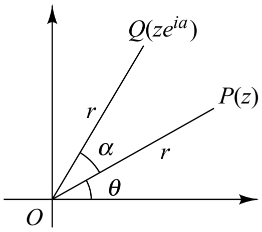

Fig. 2.40

In particular iz is obtained by rotating OP through an angle of $\pi/2$ in the anticlockwise direction.

Corollary If $A(z_1)$ and $B(z_2)$ are two complex number such that angle $\angle AOB = \theta$, then we can write

$$z_2 = \frac{|z_2|}{|z_1|} z_1 e^{i\theta}$$

Suppose $\quad z_1 = r_1 e^{i\alpha}$ and $z_2 = r_2 e^{i\beta}$,

where $\quad |z_1| = r_1, |z_2| = r_2$.

then $\quad \dfrac{z_2}{z_1} = \dfrac{r_2 e^{i\beta}}{r_1 e^{i\alpha}} = \dfrac{r_2}{r_1} e^{i(\beta-\alpha)}$

Note that

$$\beta - \alpha = \theta$$

Thus,

$$\frac{z_2}{z_1} = \frac{r_2}{r_1} e^{i\theta}$$

$$\Rightarrow \quad z_2 = \frac{|z_2|}{|z_1|} z_1 e^{i\theta}$$

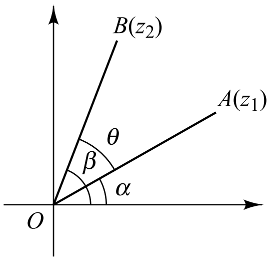

Fig. 2.41

Square Roots of a Complex Number

Let $z = x + iy$. If $a + ib$ is a square root of z, then

$$(a + ib)^2 = x + iy$$

$$\Rightarrow \quad a^2 - b^2 = x,\ 2ab = y$$

Also, $\quad a^2 + b^2 = \sqrt{x^2 + y^2}$

Thus, $\quad a = \pm \dfrac{1}{\sqrt{2}} \sqrt{\sqrt{x^2 + y^2} + x}$

$$b = \pm \frac{1}{\sqrt{2}} \sqrt{\sqrt{x^2 + y^2} - x}$$

If $y > 0$, then a and b both have the same signs.
If $y < 0$, then a and b have opposite signs.

Illustration 3

$$\sqrt{3 + 4i} = \pm \frac{1}{\sqrt{2}} \left[\sqrt{\sqrt{3^2 + 4^2} + 3} + \left(\sqrt{\sqrt{3^2 + 4^2} - 3}\right)i\right]$$

$$= \pm \frac{1}{\sqrt{2}} [2\sqrt{2} + \sqrt{2}i] = \pm (2 + i)$$

Alternatively we can use De Moivre's Theorem.

DE MOIVRE'S THEOREM AND ITS APPLICATIONS

(a) *De Moivre's Theorem for integral index.*
If n is an integer, then

$$(\cos\theta + i\sin\theta)^n = \cos(n\theta) + i\sin(n\theta)$$

(b) *De Moivre's Theorem for rational index.*
If n is a rational number, then value of or one of the values of $(\cos\theta + i\sin\theta)^n$ is $\cos(n\theta) + i\sin(n\theta)$. In fact, if $n = p/q$ where $p, q \in \mathbf{I}, q > 0$ and p,q have no factors in common, then $(\cos\theta + i\sin\theta)^n$ has q distinct values, one of which is $\cos(n\theta) + i\sin(n\theta)$.

Note

The values of $(\cos\theta + i\sin\theta)^{p/q}$ where $p, q \in \mathbf{I}$, $q > 0$, hcf $(p,q) = 1$ are given by

$$\cos\left[\frac{p}{q}(2k\pi + \theta)\right] + i\sin\left[\frac{p}{q}(2k\pi + \theta)\right]$$

where $\quad k = 0, 1, 2, \ldots, q-1$.

nth Roots of Unity

By an nth root of unity we mean any complex number z which satisfies the equation

$$z^n = 1 \tag{1}$$

Since, an equation of degree n has n roots, there are n values of z which satisfy the equation (1). To obtain these n values of z, we write

$$1 = \cos(2k\pi) + i\sin(2k\pi)$$

where $k \in \mathbf{I}$ and

$$\Rightarrow \quad z = \cos\left(\frac{2k\pi}{n}\right) + i\sin\left(\frac{2k\pi}{n}\right)$$

[using the De Moivre's Theorem]

where $\quad k = 0, 1, 2, \ldots, n-1$.

Note

We may use any n consecutive integral values to k. For instance, in case of 3, we may take -1, 0 and 1 and in case of 4, we may take -1, 0, 1 and 2 or -2, -1, 0 and 1.

Notation $\quad$ Let $\omega = \cos\left(\dfrac{2\pi}{n}\right) + i\sin\left(\dfrac{2\pi}{n}\right)$

By using the De Moivre's theorem, we can write the nth roots of unity as

$$1, \omega, \omega^2, \ldots, \omega^{n-1}.$$

Sum of the Roots of Unity is Zero

We have

$$1 + \omega + \ldots + \omega^{n-1} = \frac{1 - \omega^n}{1 - \omega}$$

But $\quad \omega^n = 1$ as ω is a nth root of unity.

$$\therefore \quad 1 + \omega + \ldots + \omega^{n-1} = 0$$

Also, note that

$$\frac{1}{x-1} + \frac{1}{x-\omega} \ldots + \frac{1}{x-\omega^{n-1}} = \frac{nx^{n-1}}{x^n - 1}$$

Writing *n*th Roots of Unity When *n* is Odd

If $n = 2m + 1$, then nth roots of unity are also given by

$$z = \cos\left(\frac{2k\pi}{n}\right) + i\sin\left(\frac{2k\pi}{n}\right)$$

where $k = -m, -(m-1), \ldots, -1, 0, 1, 2, \ldots m$.

Since $\qquad \cos\left(-\frac{2k\pi}{n}\right) = \cos\left(\frac{2k\pi}{n}\right)$

and $\qquad \sin\left(-\frac{2k\pi}{n}\right) = -\sin\left(\frac{2k\pi}{n}\right)$

we may take the roots as

$$1, \cos\left(\frac{2k\pi}{n}\right) \pm i\sin\left(\frac{2k\pi}{n}\right)$$

where $\quad k = 1, 2, \ldots, m$.

In terms, ω we may take nth roots of unity to be 1, $\omega^{\pm 1}$, $\omega^{\pm 2}, \ldots \omega^{\pm m}$.

Writing *n*th Roots of Unity When *n* is Even

If $n = 2m$, then nth roots of unity are given

$$z = \pm 1, \pm \omega, \pm \omega^2, \ldots \pm \omega^{m-1}$$

where $\omega = \cos\left(\frac{2\pi}{2m}\right) + i\sin\left(\frac{2\pi}{2m}\right) = \cos\left(\frac{\pi}{m}\right) + i\sin\left(\frac{\pi}{m}\right)$

Cube Roots of Unity

Cube roots of unity are given by 1, ω, ω^2, where

$$\omega = \cos\left(\frac{2\pi}{3}\right) + i\sin\left(\frac{2\pi}{3}\right) = \frac{-1+\sqrt{3}i}{2} \text{ and } \omega^2 = \frac{-1-\sqrt{3}i}{2}$$

Some Results Involving Complex Cube Root of Unity (ω)

(i) $\omega^3 = 1$, $\bar{\omega} = \omega^2$ and $\frac{1}{\omega} = \omega^2$

(ii) $1 + \omega + \omega^2 = 0$

(iii) $x^3 - 1 = (x-1)(x-\omega)(x-\omega^2)$

(iv) ω and ω^2 are roots of $x^2 + x + 1 = 0$

(v) $a^3 - b^3 = (a-b)(a-b\omega)(a-b\omega^2)$

$\qquad = (a-b)(a\omega - b\omega^2)(a\omega^2 - b\omega)$

(vi) $a^2 + b^2 + c^2 - bc - ca - ab$

$\qquad = (a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$

(vii) $a^3 + b^3 + c^3 - 3abc$

$\qquad = (a+b+c)(a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$

(viii) $x^3 + 1 = (x+1)(x+\omega)(x+\omega^2)$

(ix) $a^3 + b^3 = (a+b)(a+b\omega)(a+b\omega^2)$

(x) Cube roots of real number a are $a^{1/3}$, $a^{1/3}\,\omega$, $a^{1/3}\,\omega^2$.

To obtain cube roots of a real number a, we write $x^3 = a$ as $y^3 = 1$ where $y = x/a^{1/3}$.

Solution of $\quad y^3 = 1$ are 1, ω, ω^2.

$\therefore \qquad x = a^{1/3}, a^{1/3}\,\omega, a^{1/3}\,\omega^2$.

Illustration 4

To obtain cube roots of –27, we write $\left(\frac{x}{-3}\right)^3 = 1$

$\Rightarrow \qquad x = -3, -3\omega, -3\omega^2$

*n*th Roots of a Complex Number

Let $z \neq 0$ be a complex number. We can write z in the polar form as follows:

$$z = r(\cos\theta + i\sin\theta)$$

where $\quad r = |z|$ and $\theta = \arg(z)$. Recall $-\pi < \theta \leq \pi$.

The nth root of z has n values one of which is equal to $z_0 = \sqrt[n]{|z|}\left[\cos\left(\frac{\arg z}{n}\right) + i\sin\left(\frac{\arg z}{n}\right)\right]$ and is called as the principal value of $\sqrt[n]{|z|}$. To obtain other values of $\sqrt[n]{|z|}$, we write z as

$$z = r\,[\cos(\theta + 2k\pi) + i\sin(\theta + 2k\pi)]$$

$$\Rightarrow \quad z^{1/n} = r^{1/n}\left[\cos\left(\frac{\theta + 2k\pi}{n}\right) + i\sin\left(\frac{\theta + 2k\pi}{n}\right)\right]$$

$$= z_0\,\omega^k \text{ where } k = 0, 1, 2, \ldots, n-1.$$

and $\omega = \cos\frac{2\pi}{n} + i\sin\frac{2\pi}{n}$ is a complex nth root of unity.

Thus, all the nth roots of z can be obtained by multiplying the principal value of $\sqrt[n]{|z|}$ by different roots of unity.

Rational Power of a Complex Number

If z is a complex number and m/n is a rational number such that m and n are relatively prime integers and $n > 0$. We define

$$z^{m/n} = \left(\sqrt[n]{z}\right)^m$$

Thus, $z^{m/n}$ has n distinct values which are given by

$$z^{m/n} = \left(\sqrt[n]{|z|}\right)^m\left[\cos\left(\frac{m}{n}(\theta + 2k\pi)\right) + i\sin\left(\frac{m}{n}(\theta + 2k\pi)\right)\right]$$

where $k = 0, 1, 2, \ldots, n-1$.

SOLVED EXAMPLES

Concept-based
Straight Objective Type Questions

Example 1: If $a + ib = \sum_{k=1}^{101} i^k$, then (a, b) equals

(a) (0, 1) (b) (0, 0)
(c) (0, –1) (d) (1, 1)

Ans. (a)

Solution: Write

$$a + ib = i + (i^2 + i^3 + i^4 + i^5) + (i^6 + i^7 + i^8 + i^9) + \dots (i^{98} + i^{99} + i^{100} + i^{101})$$

TIP Use

$$i^m + i^{m+1} + i^{m+2} + i^{m+3} = 0 \ \forall \ m \in \mathbf{I}$$

to obtain

$$a + ib = 0 + i \quad \Rightarrow \quad a = 0, b = 1$$

Example 2: If $\left(\frac{1+i}{1-i}\right)^n = -1$, n $\in \mathbf{N}$, then least value of n is

(a) 1 (b) 2
(c) 3 (d) 4

Ans. (b)

Solution: Write $1 = -i^2$ in the numerator, to obtain

$$\frac{1+i}{1-i} = \frac{-i^2+i}{1-i} = \frac{i(1-i)}{1-i} = i$$

$$\therefore \qquad -1 = \left(\frac{1+i}{1-i}\right) = i^n$$

The least value of n is 2.

Example 3: The conjugate of a complex number z is $\frac{2}{1-i}$. Then Re (z) equals

(a) –1 (b) 0
(c) 1 (d) 2

Ans. (c)

Solution: $\bar{z} = \frac{2}{1-i} = \frac{1-i^2}{1-i} = 1 + i$

Now, Re (z)= Re $(\bar{z})$ = 1.

Example 4: The number of complex numbers z such that $|z - i| = |z + i| = |z + 1|$ is

(a) 0 (b) 1
(c) 2 (d) infinite

Ans. (b)

Solution:

TIP
Note z is circum-centre of the circle passing through three non-collinear points A $(0 + i)$, B $(0 - i)$ and $C(-1 + 0i)$

Thus, there is only one value of z.

Example 5: If $z + 2|z| = \pi + 4i$, then Im (z) equals

(a) π (b) 4
(c) $\sqrt{\pi^2 + 16}$ (d) none of these

Ans. (b)

Solution: The given equation can be written as

$$z = (\pi - 2|z|) + 4i$$

As $\pi - 2|z|$ is real, we get

$$\text{Im}(z) = 4$$

Example 6: If $|z| = z + 3 - 2i$, then z equals

(a) $7/6 + i$ (b) $-7/6 + 2i$
(c) $-5/6 + 2i$ (d) $5/6 + i$

Ans. (c)

Solution:

$$z = |z| - 3 + 2i$$

$$\Rightarrow \qquad |z|^2 = (|z| - 3)^2 + 4$$

$$= |z|^2 - 6|z| + 9 + 4$$

$$\Rightarrow \qquad |z| = 13/6$$

Thus, $\qquad z = -5/6 + 2i$

Example 7: If ω $(\neq 1)$ is a cube root of unity and $(1 + \omega^2)^{11} = a + b\omega + c\omega^2$, then (a, b, c) equals

(a) (1, 1, 0) (b) (0, 1, 1)
(c) (1, 0, 1) (d) (1, 1, 1)

Ans. (a)

Solution:

$$a + b\omega + c\omega^2 = (1 + \omega^2)^{11} = (-\omega)^{11}$$

$$= -(\omega^3)^3\omega^2 = 1 + \omega \qquad [\because 1 + \omega + \omega^2 = 0]$$

$$\Rightarrow \qquad a = 1, b = 1, c = 0$$

Example 8: If $x^2 + y^2 = 1$ and $x \neq -1$ then $\frac{1+y+ix}{1+y-ix}$ equals

(a) 1 (b) $x + iy$
(c) 2 (d) $y + ix$

Ans. (d)

Solution:

> **TIP**
> Sometimes, it is helpful to write $x^2 + y^2 = z\bar{z}$
> where $z = x + iy$ or $y + ix$

Put $z = y + ix$, then $1 = x^2 + y^2 = z\bar{z}$

Now,

$$\frac{1+y+ix}{1+y-ix} = \frac{z\bar{z}+z}{1+\bar{z}} = \frac{z(\bar{z}+1)}{1+\bar{z}}$$
$$= z = y + ix$$

Example 9: If z is a non-zero complex number, then $\arg(z) + \arg(\bar{z})$ equals

(a) 0 (b) π
(c) 2π (d) None of these

Ans. (d)

Solution: If $z \in \mathbf{R}$ and $z < 0$, then

$$\arg(z) = \arg(\bar{z}) = \pi$$
$$\Rightarrow \quad \arg(z) + \arg(\bar{z}) = 2\pi$$

Suppose $z \in \mathbf{C}$, $z \neq 0$ and z is not a negative real number.

Let $\arg(z) = \alpha$, where $-\pi < \alpha < \pi$

In this case $\arg(\bar{z}) = -\alpha$, so that

$\arg(z) + \arg(\bar{z}) = 0$

Example 10: If $z \in \mathbf{C}$ and $2z = |z| + i$, then z equals

(a) $\frac{\sqrt{3}}{6} + \frac{1}{2}i$ (b) $\frac{\sqrt{3}}{6} + \frac{1}{3}i$
(c) $\frac{\sqrt{3}}{6} + \frac{1}{4}i$ (d) $\frac{\sqrt{3}}{6} + \frac{1}{6}i$

Ans. (a)

Solution:

$$|2z|^2 = |z|^2 + 1$$
$$\Rightarrow \quad 3|z|^2 = 1 \Rightarrow |z| = 1/\sqrt{3}$$

Thus, $z = \frac{\sqrt{3}}{6} + \frac{1}{2}i$

Example 11: If $z = \left(\frac{1}{\sqrt{3}} + \frac{1}{2}i\right)^7 + \left(\frac{1}{\sqrt{3}} - \frac{1}{2}i\right)^7$, then

(a) $\mathrm{Re}(z) = 0$
(b) $\mathrm{Im}(z) = 0$
(c) $\mathrm{Re}(z) > 0$, $\mathrm{Im}(z) < 0$
(d) $\mathrm{Re}(z) < 0$, $\mathrm{Im}(z) > 0$

Ans. (b)

Solution:

$$\bar{z} = \left(\frac{1}{\sqrt{3}} - \frac{1}{2}i\right)^7 + \left(\frac{1}{\sqrt{3}} + \frac{1}{2}i\right)^7 = z$$

$\Rightarrow$ z is purely real.

$\therefore \quad \mathrm{Im}(z) = 0$

Example 12: If $\omega\,(\neq 1)$ is a complex cube root of unity and $(1 + \omega^4)^n = (1 + \omega^8)^n$, then the least positive integral value of n is

(a) 2 (b) 3
(c) 6 (d) 12

Ans. (b)

Solution:

As $\omega^4 = \omega$, $\omega^8 = \omega^2$, we get

$$(1 + \omega)^n = (1 + \omega^2)^n$$
$$\Rightarrow \quad (-\omega^2)^n = (-\omega)^n$$
$$\Rightarrow \quad \omega^n = 1$$
$$\therefore \quad n = 3$$

Example 13: If $z = \frac{1+\cos\theta + i\sin\theta}{\sin\theta + i(1+\cos\theta)}$ $(0 < \theta < \pi/2)$

then $|z|$ equals

(a) $2\,|\sin\theta|$ (b) $2|\cos\theta|$
(c) 1 (d) $|\cot(\theta/2)|$

Ans. (c)

Solution: Using $\left|\frac{z_1}{z_2}\right| = \frac{|z_1|}{|z_2|}$ if $z_2 \neq 0$, we get

$$|z|^2 = \frac{(1+\cos\theta)^2 + \sin^2\theta}{\sin^2\theta + (1+\cos\theta)^2} = 1$$
$$\Rightarrow \quad |z| = 1$$

Example 14: All the roots of $(z + 1)^4 = z^4$ lie on

(a) a straight line parallel to x-axis
(b) a straight line parallel to y-axis
(c) a circle with centre at $-1 + 0i$
(d) a circle with centre at $1 + i$

Ans. (b)

Solution:

> **TIP**
> It is unnecessary to find roots of $(z + 1)^4 = z^4$.

If z is a root of $(z + 1)^4 = z^4$, then $|(z + 1)^4| = |z^4|$

$$\Rightarrow \quad |z + 1| = |z|$$
$$\Rightarrow \quad |z - (-1)| = |z - 0|$$

$\Rightarrow$ z lies on the perpendicular bisector of the segment joining $-1 + 0i$ and 0 i.e. z lies on the line $\mathrm{Re}(z) = -1/2$.

Example 15: If $\alpha\,(\neq 1)$ is a fifth root of unity and $\beta\,(\neq 1)$ is a fourth root of unity then

$$z = (1 + \alpha)(1 + \beta)(1 + \alpha^2)(1 + \beta^2)(1 + \alpha^3)(1 + \beta^3)$$

equals

(a) α (b) β
(c) $\alpha\beta$ (d) 0

Ans. (d)

Solution: As $\beta \neq 1$ is a fourth root of unity,

$$\beta^4 = 1 \Rightarrow (1 - \beta)(1 + \beta + \beta^2 + \beta^3) = 0$$

As $\beta \neq 1,\ 1 + \beta + \beta^2 (1 + \beta) = 0$

$\Rightarrow \quad (1 + \beta)(1 + \beta^2) = 0$

$\therefore \quad z = 0$

Example 16: Suppose z_1, z_2, z_3 are vertices of an equilateral triangle whose circumcentre $-3 + 4i$, then $|z_1 + z_2 + z_3|$ is equal to

(a) 5 (b) $10\sqrt{3}$

(c) 15 (d) $15\sqrt{3}$

Ans. (c)

Solution: As triangle is equilateral, circumcentre and centroid of the triangle coincides, therefore,

$$\frac{1}{3}(z_1 + z_2 + z_3) = -3 + 4i$$

$$\Rightarrow \quad |z_1 + z_2 + z_3| = 3\sqrt{(-3)^3 + 4^2} = 15$$

Example 17: If $z \neq 0$ lies on the circle $|z - 1| = 1$ and $\omega = 5/z$, then ω lies on

(a) a circle (b) an ellipse

(c) a straight line (d) a parabola

Ans. (c)

Solution: $z = 5/\omega$ and $|z - 1| = 1$

$$\Rightarrow \quad \left|\frac{5}{\omega} - 1\right| = 1 \Rightarrow |\omega - 5| = |\omega|$$

that is, ω lies on the perpendicular bisector of the segment joining 0 and $5 + 0i$.

Therefore ω lies on the straight line Re $(\omega) = 5/2$

Example 18: If $\bar{z} = 3i + \dfrac{25}{z + 3i}$, then $|z|$ cannot exceed

(a) 3 (b) 8

(c) 16 (d) 18

Ans. (b)

Solution: $(\bar{z} - 3i)(z + 3i) = 25$

$\Rightarrow \quad |z - 3i|^2 = 25$ or $|z - 3i| = 5$

Now, $\quad |z| = |(z - 3i) + 3i|$

$\quad \leq |z - 3i| + |3i| = 5 + 3 = 8$

Example 19: If $|z - 1| = |z + 1| = |z - 2i|$, then value of $|z|$ is

(a) 1 (b) 2

(c) 5/4 (d) 3/4

Ans. (d)

Solution: z is centre of the circle passing through $1 + 0i$, $-1 + 0i$ and $0 + 2i$. Clearly centre lies on the y-axis.

If $z = 0 + ai$ the centre, then

$$\sqrt{1 + a^2} = |a + 2|$$

$\Rightarrow \quad 1 + a^2 = a^2 + 4a + 4$

$\Rightarrow \quad a = 3/4$

$\therefore \quad |z| = 3/4$

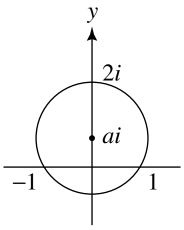

Fig. 2.42

Example 20: The number of complex numbers satisfying $\bar{z} = iz^2$ is

(a) 1 (b) 2

(c) 3 (d) 4

Ans. (d)

Solution: $|\bar{z}| = |iz^2| \quad \Rightarrow \quad |z| = |z|^2$

$\Rightarrow \quad |z| = 0 \quad$ or $\quad |z| = 1.$

If $|z| = 0$, then $z = 0$.

If $|z| = 1$, we get $\bar{z} = 1/z$, so that the equation becomes $1/z = iz^2$

or $\quad z^3 = -i = i^3 \Rightarrow z = i, i\omega, i\omega^2$

where ω ($\neq 1$) is a cube root of unity.

LEVEL 1

Straight Objective Type Questions

Example 21: If $z \in \mathbf{C}$, $z \notin \mathbf{R}$, and $a = z^2 + 3z + 5$, then a cannot take value

(a) –2/5 (b) 5/2

(c) 11/4 (d) –11/5

Ans. (c)

Solution: $a = \left(z + \dfrac{3}{2}\right)^2 + \dfrac{11}{4}$

As $z \notin \mathbf{R}$, $z \neq -\dfrac{3}{2}$, thus, $a \neq \dfrac{11}{4}$

Example 22: Suppose $a, b, c \in \mathbf{C}$, and $|a| = |b| = |c| = 1$ and $abc = a + b + c$, then $bc + ca + ab$ is equal to

(a) 0 (b) –1

(c) 1 (d) none of these

Ans. (c)

Solution: $|a|^2 = |b|^2 = |c|^2 = 1$

$\Rightarrow \quad a\bar{a} = b\bar{b} = c\bar{c} = 1$

Now, $\quad abc = a + b + c$

$\Rightarrow \quad \bar{a}\,\bar{b}\,\bar{c} = \bar{a} + \bar{b} + \bar{c}$

$$\Rightarrow \quad \frac{1}{abc} = \frac{1}{a}+\frac{1}{b}+\frac{1}{c}$$

$$\Rightarrow \quad bc + ca + ab = 1$$

Example 23: The number of complex numbers z which satisfy $z^2 + 2|z|^2 = 2$ is

(a) 0 (b) 2
(c) 3 (d) 4

Ans. (d)

Solution: As $z^2 = 2(1 - |z|^2)$ is real, z is either purely real or purely imaginary.

If z is purely real, then

$$z^2 = 2\,(1 - z^2) \quad \Rightarrow \quad z = \pm\sqrt{\frac{2}{3}}$$

TIP
If z is purely imaginary, then $|z|^2 = -z^2$.

In this case $z^2 = 2(1 + z^2) \quad \Rightarrow \quad z = \pm\sqrt{2}i$

Thus, there are four complex numbers satisfying

$$z^2 + 2|z|^2 = 2$$

Example 24: Suppose $a \in \mathbf{R}$ and the equation $z + a|z| + 2i = 0$ has no solution in $\mathbf{C}$, then a satisfies the relation.

(a) $|a| > 1$ (b) $|a| \ge 1$
(c) $|a| > \sqrt{2}$ (d) $|a| \ge \sqrt{2}$

Ans. (b)

Solution: $z = -a\,|z| - 2i$

$$\Rightarrow \quad |z|^2 = a^2\,|z|^2 + 4$$

$$\Rightarrow \quad |z|^2\,(1 - a^2) = 4$$

This equation has no solution if $1 - a^2 \le 0$ or $|a| \ge 1$

For $|a| < 1$, $|z| = \dfrac{2}{\sqrt{1-a^2}}$ and

$$z = \frac{2a}{\sqrt{1-a^2}} - 2i$$

Example 25: Suppose z is a complex number and $n \in \mathbf{N}$ be such that $z^n = (1 + z)^n = 1$, then the least value of n is

(a) 3 (b) 6
(c) 9 (d) 18

Ans. (b)

Solution: $|z|^n = |1 + z|^n = 1 \quad \Rightarrow \quad |z| = |z + 1| = 1$

$\Rightarrow$ $|z| = 1$ and z lies on the perpendicular bisector of the segment joining $0 + 0i$ and $-1 + 0i$, that z lies on the line $\text{Re}\,(z) = -1/2$.

Let $\quad z = -\dfrac{1}{2} + iy$, then $|z| = 1$

$$\frac{1}{4} + y^2 = 1 \quad \Rightarrow \quad y = \pm\frac{\sqrt{3}}{2}$$

$$\therefore \quad z = -\frac{1}{2} \pm i\frac{\sqrt{3}}{2} = \omega,\ \omega^2$$

where ω is complex cube root of unity.

If $z = \omega$, $\omega^n = (1 + \omega)^n = (-1)^n\,\omega^{2n}$

$\Rightarrow n$ is even and multiple of 3. Thus, least value of n is 6.

Similarly, for $z = \omega^2$.

Example 26: Let $z \ne \pm i$ be a complex number such that $\dfrac{z-i}{z+i}$ is purely imaginary number, then $z + \dfrac{1}{z}$ is

(a) a non-zero real number other than 1
(b) a purely imaginary number
(c) a non-zero real number
(d) 0

Ans. (c)

Solution: Let $\dfrac{z-i}{z+i} = ik$, where $k \in \mathbf{R}$.

$$\Rightarrow \quad z - i = ikz - k$$

$$\Rightarrow \quad z\,(1 - ik) = -k + i$$

$$\Rightarrow \quad z = \frac{-k+i}{1-ik}$$

Note that $|z|^2 = \dfrac{k^2+1}{1+k^2} = 1$

$$\Rightarrow \quad z\bar{z} = 1 \quad \Rightarrow \quad \bar{z} = 1/z$$

Thus, $\quad z + \dfrac{1}{z} = z + \bar{z}$, which is a real number.

Also, $\quad z + \bar{z} = 0$

$$\Rightarrow \quad 2\text{Re}\,(z) = 0 \quad \Rightarrow \quad \text{Re}\,(z) = 0$$

$\Rightarrow \quad z = ai$ for some $a \in \mathbf{R}$.

But in this case

$\dfrac{z-i}{z+i}$ is a real number

Therefore, $z + \bar{z} \ne 0$.

Example 27: The points z_1, z_2, z_3, z_4 in the complex plane are the vertices of a parallelogram taken in order if and only if

(a) $z_1 + z_4 = z_2 + z_3$
(b) $z_1 + z_3 = z_2 + z_4$
(c) $z_1 + z_2 = z_3 + z_4$
(d) None of these

Ans. (b)

Solution: See theory.

Example 28: If the complex numbers z_1, z_2 and z_3 represent the vertices of an equilateral triangle such that $|z_1| = |z_2| = |z_3|$, then

(a) $z_1 + z_2 + z_3 = 0$ (b) $z_1 + z_2 - z_3 = 0$
(c) $z_1 - z_2 + z_3 = 0$ (d) $z_1 + z_2 + z_3 \ne 0$

Ans. (a)

◎ **Solution:** Let $|z_1| = |z_2| = |z_3| = k$ (say),
⇒ z_1, z_2, z_3 lie on a circle with centre at the origin and radius k. As z_1, z_2, z_3 are vertices of an equilateral triangle, the circumcentre and the centroid of the triangle coincide. Therefore,

$$\frac{1}{3}(z_1 + z_2 + z_3) = 0 \quad \Rightarrow \quad z_1 + z_2 + z_3 = 0$$

● **Example 29:** The value of $S = \sum_{k=1}^{6}\left(\sin\frac{2\pi k}{7} - i\cos\frac{2\pi k}{7}\right)$ is

(a) – 1 (b) 0
(c) – i (d) i

Ans. (d)

◎ **Solution:** $\sin\left(\frac{2\pi k}{7}\right) - i\cos\left(\frac{2\pi k}{7}\right)$

$$= -i\left[\cos\left(\frac{2\pi k}{7}\right) + i\sin\left(\frac{2\pi k}{7}\right)\right]$$

$$= -i\,\omega^k \text{ [De Moivre's Theorem]}$$

where $\omega = \cos\left(\frac{2\pi}{7}\right) + i\sin\left(\frac{2\pi}{7}\right)$.

Note that $\omega^7 = 1$.

$$\therefore \qquad S = -i\sum_{k=1}^{6}\omega^k = \frac{-i\,\omega(1-\omega^6)}{1-\omega}$$

$$= \frac{-i\,(\omega - \omega^7)}{1-\omega} = \frac{-i\,(\omega - 1)}{1-\omega} = i$$

● **Example 30:** The complex numbers $\sin x + i\cos 2x$ and $\cos x - i\sin 2x$ are conjugate to each other for

(a) $x = n\pi, n \in \mathbf{I}$ (b) $x = \left(n + \frac{1}{2}\right)\pi, n \in \mathbf{I}$
(c) $x = 0$ (d) no value of x.

Ans. (d)

◎ **Solution:** $\overline{\sin x + i\cos 2x} = \cos x - i\sin 2x$

⇒ $\sin x - i\cos 2x = \cos x - i\sin 2x$

⇒ $\sin x = \cos x$ and $\cos 2x = \sin 2x$

⇒ $\tan x = 1$ and $\tan 2x = 1$

These two equations cannot hold simultaneously.

● **Example 31:** If z_1 and z_2 are two complex numbers and a, b are two real numbers, then $|az_1 - bz_2|^2 + |bz_1 + az_2|^2$ equals

(a) $(a^2 + b^2)|z_1 z_2|$
(b) $(a^2 + b^2)(z_1^2 + z_2^2)$
(c) $(a^2 + b^2)(|z_1|^2 + |z_2|^2$
(d) $2ab|z_1 z_2|$

Ans. (c)

◎ **Solution:** We have

$$|az_1 - bz_2|^2 + |bz_1 + az_2|^2$$
$$= a^2|z_1|^2 + b^2|z_2|^2 - abz_1\bar{z}_2 - ab\bar{z}_1 z_2$$
$$+ b^2|z_1|^2 + a^2|z_2|^2 + ba\,z\bar{z}_2 + ba\bar{z}_1 z_2$$
$$= (a^2 + b^2)(|z_1|^2 + |z_2|^2)$$

● **Example 32:** If a and b are real numbers between 0 and 1 such that the points $z_1 = a + i$, $z_2 = 1 + bi$ and $z_3 = 0$ form an equilateral triangle, then

(a) $a = b = 2 - \sqrt{3}$ should look like this
(b) $a = 2 - \sqrt{3}$, $b = \sqrt{3} - 1$
(c) $a = \sqrt{3} - 1$, $b = 2 - \sqrt{3}$
(d) none of these

Ans. (a)

◎ **Solution:** By the hypothesis $0 < a, b < 1$

and $|z_1 - z_2| = |z_2 - z_3| = |z_3 - z_1|$

⇒ $|(a - 1) + i(1 - b)| = |1 + ib| = |a + i|$

⇒ $(a - 1)^2 + (1 - b)^2 = 1 + b^2 = a^2 + 1$

⇒ $a^2 - 2a + 1 - 2b = 0$ and $b^2 = a^2$

As $0 < a, b < 1$ and $a^2 = b^2$, we get $a = b$.

∴ $a^2 - 2a + 1 - 2a = 0 \Rightarrow a^2 - 4a + 1 = 0$

⇒ $a = 2 \pm \sqrt{3}$ As $0 < a < 1$, $a = 2 - \sqrt{3}$.

● **Example 33:** If $z \neq 0$ is a complex number such that $\arg(z) = \pi/4$, then

(a) $\text{Re}(z^2) = 0$ (b) $\text{Im}(z^2) = 0$
(c) $\text{Re}(z^2) = \text{Im}(z^2)$ (d) none of these

Ans. (a)

◎ **Solution:** As $\arg(z) = \pi/4$, we can write

$$z = r\left(\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right) \text{where } r = |z|$$

$$\Rightarrow \qquad z^2 = r^2\left(\cos\frac{\pi}{2} + i\sin\frac{\pi}{2}\right)$$

[Using De Moivre's Theorem]

$$= r^2(0 + i) = ir^2$$

⇒ $\text{Re}(z^2) = 0$

● **Example 34:** Let z and w be two non-zero complex numbers such that $|z| = |w|$ and $\arg(z) + \arg(w) = \pi$. Then z equal

(a) w (b) $-w$
(c) $\bar{w}$ (d) $-\bar{w}$

Ans. (d)

◎ **Solution:** Let $|z| = |w| = r$ and $\arg(w) = \theta$, so that $\arg(z) = \pi - \theta$.

We have

$$z = r[\cos(\pi - \theta) + i\sin(\pi - \theta)]$$

$$= r(-\cos\theta + i\sin\theta)$$
$$= \overline{-r(\cos\theta + i\sin\theta)} = -\bar{w}$$

Example 35: If $|z| = 1$ and $w = \dfrac{z-1}{z+1}$ (where $z \neq -1$), then Re(w) equals

(a) 0 (b) $-\dfrac{1}{|z+1|^2}$

(c) $\left|\dfrac{z}{z+1}\right| \dfrac{1}{|z+1|^2}$ (d) $\dfrac{\sqrt{2}}{|z+|^2}$

Ans. (a)

Solution: $|z| = 1 \Rightarrow z\bar{z} = 1$.

$$2\text{Re}(w) = w + \bar{w} = \frac{z-1}{z+1} + \frac{\bar{z}-1}{\bar{z}+1}$$
$$= \frac{z-1}{z+1} + \frac{(1/z)-1}{(1/z)+1}$$
$$= \frac{z-1}{z+1} + \frac{1-z}{1+z} = 0$$

$\Rightarrow \quad \text{Re}(w) = 0$

Example 36: Let z and w be two complex numbers such that $|z| = |w| = 1$ and $|z + iw| = |z - i\bar{w}| = 2$. Then z equals

(a) 1 or i (b) i or $-i$
(c) 1 or -1 (d) i or -1

Ans. (c)

Solution: We have $|-iw| = |-i|\,|w| = 1$
and $|i\bar{w}| = |i|\,|\bar{w}| = 1$

$\Rightarrow -iw$ and $i\bar{w}$ lie on the circle $|z| = 1$.

As $|z - (-iw)| = |z - i\bar{w}| = 2$ we get z and $-iw$, as well as z and $i\bar{w}$ are the end points of the same diameter, with one end point at z.

$\therefore \quad -iw = i\bar{w} \quad \Rightarrow \quad w + \bar{w} = 0$

$\Rightarrow$ w is purely imaginary.

Let $w = ik$ where $k \in \mathbf{R}$.

As $|w| = 1$, we get $|ik| = 1$

$\Rightarrow \quad |k| = 1 \quad \Rightarrow \quad k = \pm 1$.

$\therefore \quad w = \pm i \Rightarrow -iw = i\bar{w} = \pm 1$

When $i\bar{w} = 1$, then $z = -1$ and
when $i\bar{w} = -1$ then $z = 1$

Example 37: The complex numbers $z = x + iy$ which satisfy the equation $\left|\dfrac{z-5i}{z+5i}\right| = 1$, lie on

(a) the x – axis
(b) the straight line $y = 5$
(c) a circle passing through origin
(d) none of these

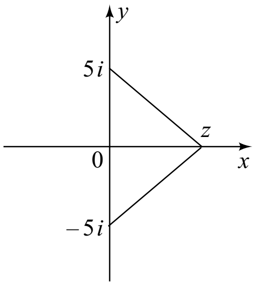

Fig. 2.43

Ans. (a)

Solution: $\left|\dfrac{z-5i}{z+5i}\right| = 1 \quad \Rightarrow \quad |z - 5i| = |z - (-5i)|$

$\Rightarrow$ z lies on the perpendicular bisector of the segment joining $5i$ and $-5i$, i.e., z lies on the x-axis.

Example 38: The inequality $|z - 4| < |z - 2|$ represents the region given by

(a) $\text{Re}(z) \geq 0$ (b) $\text{Re}(z) < 3$
(c) $\text{Re}(z) \leq 0$ (d) $\text{Re}\,z > 3$

Ans. (d)

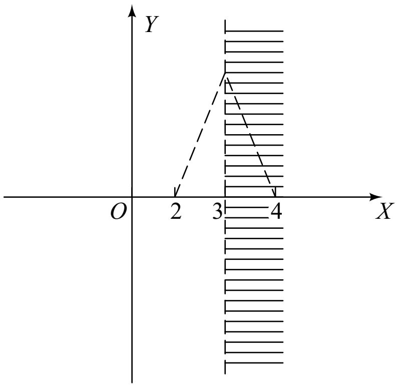

Fig. 2.44

Solution: If z satisfies $|z - 4| = |z - 2|$, then z lies on the perpendicular bisector of the segment joining $z = 2$ and $z = 4$.

i.e., $|z - 4| = |z - 2| \quad \Rightarrow \quad \text{Re}(z) = 3$.

As $z = 0$ does not satisfy $|z - 4| < |z - 2|$, we get $|z - 4| < |z - 2|$ represents the region $\text{Re}(z) > 3$.

Example 39: If z_1 and z_2 are two complex numbers such that $\left|\dfrac{z_1 - z_2}{z_1 + z_2}\right| = 1$, then

(a) $z_2 = kz_1, k \in \mathbf{R}$ (b) $z_2 = ikz_1, k \in \mathbf{R}$
(c) $z_1 = z_2$ (d) none of these

Ans. (b)

Solution: Note that at least one of z_1, z_2 is different from 0. Suppose $z_2 \neq 0$. We can write

$$\left|\frac{z_1 - z_2}{z_1 + z_2}\right| = 1, \text{ as } \left|\frac{z_1/z_2 - 1}{z_1/z_2 + 1}\right| = 1 \text{ or as } \left|\frac{z_1}{z_2} - 1\right| = \left|\frac{z_1}{z_2} + 1\right|.$$

This shows that z_1/z_2 lies on the perpendicular bisector of the segment joining $A\,(-1 + i0)$ and $B(1 + i0)$ [See Theory]. Thus, z_1/z_2 lies on the imaginary axis.

$\therefore \quad \dfrac{z_1}{z_2} = ia$ for some $a \in \mathbf{R}$. $\Rightarrow \dfrac{z_2}{z_1} = \dfrac{1}{ia} = \dfrac{-i}{a}$

$\Rightarrow \quad z_2 = ikz_1$ for some $k \in \mathbf{R}$

Example 40: For any complex number z, the minimum value of $|z| + |z - 2i|$ is

(a) 0 (b) 1

(c) 2 (d) none of these

Ans. (c)

Solution: We have, for $z \in \mathbf{C}$

$$|2i| = |z + (2i - z)| \le |z| + |2i - z|$$

$$\Rightarrow \qquad 2 \le |z| + |z - 2i|$$

Thus, minimum value of $|z| + |z - 2i|$ is 2 and it is attained when $z = i$.

Example 41: If $x = 2 + 5i$, then the value of $x^3 - 5x^2 + 33x - 19$ is equal to

(a) – 5 (b) – 7

(c) 7 (d) 10

Ans. (d)

Solution: $x = 2 + 5i \;\Rightarrow\; x - 2 = 5i$

$\Rightarrow \quad (x - 2)^2 = (5i)^2 \;\Rightarrow\; x^2 - 4x + 4 = -25$

$\Rightarrow x^2 - 4x + 29 = 0$. We now divide $x^3 - 5x^2 + 33x - 19$ by $x^2 - 4x + 29$.

$$
\begin{array}{rl}
 & x-1 \\
x^2-4x+29\,\big) & x^3-5x^2+33x-19 \\
 & x^3-4x^2+29x \\
 & \ominus \quad \oplus \quad \ominus \\
\cline{2-2}
 & -x^2+4x-19 \\
 & -x^2+4x-29 \\
 & \oplus \quad \ominus \quad \oplus \\
\cline{2-2}
 & 10
\end{array}
$$

Thus, $x^3 - 5x^2 + 33x - 19 = (x - 1)(x^2 - 4x + 29) + 10$

$$= (x - 1)(0) + 10 = 10$$

Example 42: If $z = x + iy$ and $w = \dfrac{1 - iz}{z - i}$, then $|w| = 1$ implies, that, in the complex plane

(a) z lies on the imaginary axis

(b) z lies on the real axis

(c) z lies on the unit circle

(d) none of these

Ans. (b)

Solution: $|w| = 1 \quad \Rightarrow \quad \left|\dfrac{1 - iz}{z - i}\right| = 1$

$\Rightarrow \quad |-i^2 - iz| = |z - i| \quad \Rightarrow \quad |(-i)(z + i)| = |z - i|$

$\Rightarrow \quad |z + i| = |z - i|$

$\Rightarrow$ z lies on the perpendicular bisector of the segment joining i and $-i$.

$\Rightarrow$ z lies on the real axis.

Example 43: The real part of $z = \dfrac{1}{1 - \cos\theta + i\sin\theta}$ is

(a) $\dfrac{1}{1 - \cos\theta}$ (b) $\dfrac{1}{2}$

(c) $\dfrac{1}{2}\tan\theta$ (d) 2

Ans. (b)

Solution:

TIP

If $\quad z = \dfrac{1}{\omega}$, then

$$\text{Re}(z) = \frac{\text{Re}(\omega)}{|\omega|^2}$$

$$\therefore \quad \text{Re}(z) = \frac{1 - \cos\theta}{(1 - \cos\theta)^2 + \sin^2\theta}$$

$$= \frac{1 - \cos\theta}{1 - 2\cos\theta + \cos^2\theta + \sin^2\theta}$$

$$= \frac{1 - \cos\theta}{2\,(1 - \cos\theta)} = \frac{1}{2}$$

Example 44: If the imaginary part of $\dfrac{2z + 1}{iz + 1}$ is – 4, then the locus of the point representing z in the complex plane is

(a) a straight line (b) a parabola

(c) a circle (d) an ellipse

Ans. (c)

Solution: Let $z = x + iy$, then

$$\frac{2z + 1}{iz + 1} = \frac{2(x + iy) + 1}{i(x + iy) + 1} = \frac{(2x + 1) + 2iy}{(1 - y) + ix}$$

$$= \frac{[(2x + 1) + 2iy][(1 - y) - ix]}{(1 - y)^2 + x^2}$$

As $\text{Im}\left(\dfrac{2z + 1}{iz + 1}\right) = -4$, we get

$$\frac{2y(1 - y) - x(2x + 1)}{x^2 + (1 - y)^2} = -4$$

$$\Rightarrow \qquad 2x^2 + 2y^2 + x - 2y = 4x^2 + 4(y^2 - 2y + 1)$$

$$\Rightarrow \qquad 2x^2 + 2y^2 - x - 6y + 4 = 0$$

which represents a circle.

Example 45: The area of the triangle whose vertices are the points represented by the complex number z, iz and $z + iz$ is

(a) $\dfrac{1}{4}\,|z|^2$ (b) $\dfrac{1}{8}\,|z|^2$

(c) $\dfrac{1}{2}\,|z|^2$ (d) $\dfrac{1}{2}\,|z|$

Ans. (c)

Solution: Area of the triangle is given by

$$\Delta = \frac{1}{4}\left|\begin{vmatrix} z & \overline{z} & 1 \\ iz & -i\overline{z} & 1 \\ z+iz & \overline{z}-i\overline{z} & 1 \end{vmatrix}\right|$$

Applying $R_3 \to R_3 - R_1 - R_2$, we get

$$\Delta = \frac{1}{4}\left|\begin{vmatrix} z & \overline{z} & 1 \\ iz & -i\overline{z} & 1 \\ 0 & 0 & -1 \end{vmatrix}\right| = \frac{1}{4}\left|(-1)\begin{vmatrix} z & \overline{z} \\ iz & -i\overline{z} \end{vmatrix}\right|$$

$$= \frac{1}{4}\left|(-1)\,(i)z\,\overline{z}\right|\begin{vmatrix} 1 & 1 \\ 1 & -1 \end{vmatrix} = \frac{1}{4}|z|^2\,(2) = \frac{1}{2}|z|^2$$

Example 46: If ω is a complex cube root of unity, then a root of the equation $\begin{vmatrix} x+1 & \omega & \omega^2 \\ \omega & x+\omega^2 & 1 \\ \omega^2 & 1 & x+\omega \end{vmatrix} = 0$ is

(a) $x = 1$ (b) $x = \omega$

(c) $x = \omega^2$ (d) $x = 0$

Ans. (d)

Solution: Let us denote the given determinant by Δ. Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} x+1+\omega+\omega^2 & \omega & \omega^2 \\ x+1+\omega+\omega^2 & x+\omega^2 & 1 \\ x+1+\omega+\omega^2 & 1 & x+\omega \end{vmatrix} = \begin{vmatrix} x & \omega & \omega^2 \\ x & x+\omega^2 & 1 \\ x & 1 & x+\omega \end{vmatrix}$$

Clearly $\Delta = 0$ for $x = 0$.

Example 47: Let z_1 and z_2 be two non-zero complex numbers such that $\frac{z_1}{z_2} + \frac{z_2}{z_1} = 1$, then the origin and points represented by z_1 and z_2

(a) lie on a straight line

(b) form a right triangle

(c) form an equilateral triangle

(d) none of these

Ans. (c)

Solution: Let $z = \frac{z_1}{z_2}$, then $z + \frac{1}{z} = 1 \Rightarrow z^2 - z + 1 = 0$

$$\Rightarrow \quad z = \frac{1 \pm \sqrt{3}\,i}{2} \quad \Rightarrow \quad \frac{z_1}{z_2} = \frac{1 \pm \sqrt{3}i}{2}$$

If z_1 and z_2 are represented by A and B respectively and O be the origin, then

$$\frac{OA}{OB} = \frac{|z_1|}{|z_2|} = \left|\frac{1 \pm \sqrt{3}i}{2}\right| = \sqrt{\frac{1}{4} + \frac{3}{4}} = 1$$

$\Rightarrow \quad OA = OB$

Also, $$\frac{AB}{OB} = \frac{|z_2 - z_1|}{|z_2|} = \left|1 - \frac{z_1}{z_2}\right|$$

$$= \left|1 - \left(\frac{1}{2} \pm \frac{\sqrt{3}}{2}i\right)\right| = \left|\frac{1}{2} \mp \frac{\sqrt{3}}{2}i\right| = \sqrt{\frac{1}{4} + \frac{3}{4}} = 1$$

$\Rightarrow \quad AB = OB$

Thus, $\quad OA = OB = AB$.

$\therefore$ ΔOAB is an equilateral triangle.

Example 48: If $(1 + x + x^2)^n = a_0 + a_1x + a_2x^2 + \ldots + a_{2n}\,x^{2n}$, then value of $a_0 + a_3 + a_6 + \ldots$ is

(a) 1 (b) 2^n

(c) 2^{n-1} (d) 3^{n-1}

Ans. (d)

Solution: Putting $x = 1, \omega, \omega^2$ in

$(1 + x + x^2)^n = a_0 + a_1x + a_2x^2 + \ldots + a_{2n}\,x^{2n}$, we get

$(1 + 1 + 1)^n = a_0 + a_1 + a_2 + a_3 + \ldots + a_{2n}$,

$(1 + \omega + \omega^2)^n = a_0 + a_1\omega + a_2\omega^2 + a_3\omega^3 + \ldots + a_{2n}\,\omega^{2n}$,

and $(1 + \omega^2 + \omega^4)^n = a_0 + a_1\omega^2 + a_2\omega^4 + a_3\omega^6 + \ldots + a_{2n}\,\omega^{4n}$

Adding the above three equations and using $1 + \omega + \omega^2 = 0$, $\omega^3 = 1$ we get

$$3^n = 3(a_0 + a_3 + a_6 + \ldots)$$

$\Rightarrow a_0 + a_3 + a_6 + \ldots = 3^{n-1}$.

Example 49: Let

$$z = \begin{vmatrix} 1 & 1-2i & 3+5i \\ 1+2i & -5 & 10i \\ 3-5i & -10i & 11 \end{vmatrix}, \text{ then}$$

(a) z is purely imaginary

(b) z is purely real

(c) $z = 0$

(d) none of these

Ans. (b)

Solution: Conjugate of z equals the determinant obtained by taking conjugate of each of its element. Therefore,

$$\overline{z} = \begin{vmatrix} 1 & 1+2i & 3-5i \\ 1-2i & -5 & -10i \\ 3+5i & 10i & 11 \end{vmatrix} = \begin{vmatrix} 1 & 1-2i & 3+5i \\ 1+2i & -5 & 10i \\ 3-5i & -10i & 11 \end{vmatrix} = z$$

Thus, z is purely real.

Example 50: If $(x + iy)^{1/3} = a + ib$, then $\frac{x}{a} + \frac{y}{b}$ equals

(a) $4(a^2 - b^2)$ (b) $2(a^2 - b^2)$

(c) $2(a^2 + b^2)$ (d) none of these

Ans. (a)

Solution: $(x + iy)^{1/3} = a + ib$

$\Rightarrow \quad x + iy = (a + ib)^3 = a^3 + 3a^2(ib) + 3a(ib)^2 + (ib)^3$

$\Rightarrow \quad x + iy = (a^3 - 3ab^2) + (3a^2b - b^3)i$

Equating real and imaginary parts, we get

$$x = a^3 - 3ab^2 \text{ and } y = 3a^2b - b^3$$

$$\Rightarrow \quad \frac{x}{a} = a^2 - 3b^2 \text{ and } \frac{y}{b} = 3a^2 - b^2.$$

Thus, $\dfrac{x}{a} + \dfrac{y}{b} = 4a^2 - 4b^2 = 4(a^2 - b^2)$

Example 51: If $z \varepsilon \mathbf{C}$, the minimum value of $|z| + |z - i|$ is attained at

(a) exactly one point
(b) exactly two points
(c) infinite number of points
(d) none of these

Ans. (c)

Solution: We have

$$1 = |i| = |z + (i - z)| \le |z| + |i - z|$$

$$\Rightarrow \quad |z| + |z - i| \ge 1$$

The minimum value 1 is attained at all points $z = i\,t$ where $t \in [0, 1]$.

Example 52: For all complex numbers z_1, z_2 satisfying $|z_1| = 12$ and $|z_2 - 3 - 4i| = 5$, the minimum value of $|z_1 - z_2|$ is

(a) 0	(b) 2
(c) 7	(d) 17

Ans. (b)

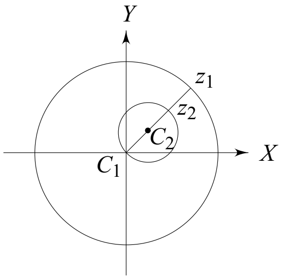

Fig. 2.45

Solution: $|z_1| = 12$ implies that z_1 lies on the circle with centre C_1 at the origin and radius 12 whereas $|z_2 - 3 - 4i| = 5$ implies z_2 lies on the circle with centre at C_2 $(3 + 4i)$ and radius 5. See Fig. 2.45. The quantity $|z_1 - z_2|$ will be least if z_1 and z_2 lie on the line joining C_1 and C_2 i.e. on the line $z = (3 + 4i)t$

In fact, when we take $z_2 = 6 + 8i$ and $z_1 = \dfrac{12}{5}$ $(3 + 4i)$, we obtain $|z_1 - z_2| = \left|\dfrac{12}{5}(3+4i) - (6+8i)\right| = \dfrac{2}{5}\,|3+4i| = 2.$

Example 53: If z lies on the circle $|z - 1| = 1$, then $\dfrac{z-2}{z}$ equals

(a) 0
(b) 2
(c) – 1
(d) none of these

Ans. (d)

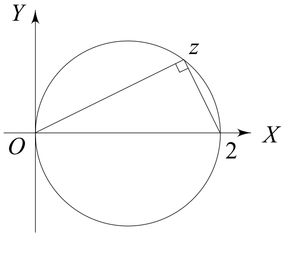

Fig. 2.46

Solution: Note that $|z - 1| = 1$ represents a circle with the segment joining $z = 0$ and $z = 2 + 0i$ as a diameter. See Fig. 2.46. If z lies on the circle, then $\dfrac{z-2}{z-0}$ is purely imaginary.

Example 54: If $1, \omega, \ldots, \omega^{n-1}$ are the nth roots of unity, then value of $\dfrac{1}{2-\omega} + \dfrac{1}{2-\omega^2} + \cdots + \dfrac{1}{2-\omega^{n-1}}$ equals

(a) $\dfrac{1}{2^n - 1}$	(b) $\dfrac{n(2^n - 1)}{2^n + 1}$
(c) $\dfrac{(n-2)\,2^{n-1}}{2^n - 1}$	(d) none of these

Ans. (d)

Solution: We know that

$$\frac{1}{x-1} + \frac{1}{x-\omega} + \frac{1}{x-\omega^2} + \cdots + \frac{1}{x-\omega^{n-1}} = \frac{n(x^{n-1})}{x^n - 1}$$

Putting $x = 2$, we get

$$\frac{1}{2-\omega} + \frac{1}{2-\omega^2} + \cdots + \frac{1}{2-\omega^{n-1}} = \frac{n(2^{n-1})}{2^n - 1}$$

Example 55: If $\omega = \cos\dfrac{\pi}{n} + i\,\sin\dfrac{\pi}{n}$, then value of $1 + \omega + \omega^2 + \ldots + \omega^{n-1}$ is

(a) $1 + i\cot\left(\dfrac{\pi}{2\pi}\right)$	(b) $1 + i\tan\left(\dfrac{\pi}{n}\right)$
(c) $1 + i$	(d) none of these

Ans. (a)

Solution: We have

$$1 + \omega + \omega^2 + \ldots + \omega^{n-1} = \frac{1-\omega^n}{1-\omega} = \frac{2}{1-\omega}.$$

as $\omega^n = \cos\left(\dfrac{n\pi}{n}\right) + i\sin\left(\dfrac{n\pi}{n}\right) = \cos\pi + i\sin\pi = -1$

$$\text{Now,} \quad \frac{2}{1-\omega} = \frac{2(1-\bar{\omega})}{(1-\omega)(1-\bar{\omega})} = \frac{2(1-\bar{\omega})}{1-(\omega+\bar{\omega})+\omega\bar{\omega}}$$

$$= \frac{2(1-\bar{\omega})}{2-2\,\mathrm{Re}(\omega)} \qquad [\because\ \omega\bar{\omega} = |\omega|^2 = 1]$$

$$= \frac{1-\mathrm{Re}(\omega)+i\,\mathrm{Im}(\omega)}{1-\mathrm{Re}(\omega)} = 1 + i\frac{\mathrm{Im}(\omega)}{1-\mathrm{Re}(\omega)}$$

$$= 1 + i\frac{\sin\left(\dfrac{\pi}{n}\right)}{1-\cos\left(\dfrac{\pi}{n}\right)} = 1 + i\frac{2\sin\left(\dfrac{\pi}{2n}\right)\cos\left(\dfrac{\pi}{2n}\right)}{2\sin^2\left(\dfrac{\pi}{2n}\right)}$$

$$= 1 + i\cot(\pi/2n)$$

Example 56: If $|z| = 1$ and $z \ne \pm 1$, then all the values of $\dfrac{z}{1-z^2}$ lie on:

(a) a line not passing through the origin.
(b) $|z| = 2$
(c) the x – axis
(d) the y – axis

Ans. (d)

◎ **Solution:** As $|z| = 1$, we get $z\bar{z} = 1$.

Let $w = \dfrac{z}{1-z^2}$, then

$$w + \bar{w} = \frac{z}{1-z^2} + \frac{\bar{z}}{1-\bar{z}^2} = \frac{z}{1-z^2} + \frac{1/z}{1-(1/z)^2}$$

$$= \frac{z}{1-z^2} + \frac{z}{z^2-1} = 0$$

$\Rightarrow \quad 2\text{Re}(w) = 0 \quad \Rightarrow \quad \text{Re}(w) = 0$

Thus, w lies on the y-axis.

Alternate Solution

$$w = \frac{z}{1-z^2} = \frac{z}{z\bar{z}-z^2} = \frac{1}{\bar{z}-z}$$

$$= \frac{1}{-2i\,\text{Im}(z)}$$

$\Rightarrow w$ is purely imaginary, that is, w lies on the y-axis.

● **Example 57:** The locus of the centre of a circle which touches the circle $|z - z_1| = a$ and $|z - z_2| = b \neq a$ externally is

(a) an ellipse (b) a hyperbola
(c) a circle (d) a pair of straight lines.

Ans. (b)

◎ **Solution:** Suppose $|z - w| = r$ touches $|z - z_1| = a$ and $|z - z_2| = b$ externally.

Then $|w - z_1| = a + r$, $|w - z_2| = b + r$

$\Rightarrow \quad |w - z_1| - |w - z_2| = a - b$

$\Rightarrow \quad w$ lies on a hyperbola with focii at z_1 and z_2

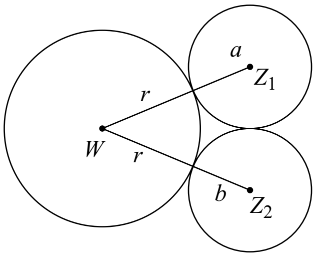

Fig. 2.47

● **Example 58:** If $|z^2 - 1| = |z|^2 + 1$, then z lies on

(a) a circle (b) the imaginary axis
(c) the real axis (d) an ellipse

Ans. (b)

◎ **Solution:** $|z^2 - 1| = |z|^2 + 1$ can be written as $|z^2 + (-1)| = |z^2| + |-1|$

$\Leftrightarrow \quad \dfrac{z^2}{-1}$ is a non-negative real number.

$\Leftrightarrow \quad z^2$ is a non-positive real number.

$\Leftrightarrow \quad z$ lies on the imaginary axis.

● **Example 59:** If $z^2 + z + 1 = 0$, where z is a complex number, then values of

$$S = \left(z + \frac{1}{z}\right)^2 + \left(z^2 + \frac{1}{z^2}\right)^2 + \left(z^3 + \frac{1}{z^3}\right)^2 + \text{---} + \left(z^6 + \frac{1}{z^6}\right)^2 \text{ is}$$

(a) 12 (b) 18
(c) 54 (d) 6

Ans. (a)

◎ **Solution:** $z^2 + z + 1 = 0 \quad \Rightarrow \quad z = \omega, \omega^2$.

Let $z = \omega$ then $(\omega + \omega^2)^2$

$= (\omega^2 + \omega^4)^2 = (\omega^4 + \omega^8)^2$

$= (\omega^5 + \omega^{10})^2 = 1$

and $(\omega^3 + \omega^6)^2 = (\omega^6 + \omega^{12})^2 = 4$.

Thus, $S = 12$.

● **Example 60:** If $|z + 4| \leq 3$, then maximum value of $|z + 1|$ is

(a) 4 (b) 10
(c) 6 (d) 0

Ans. (c)

◎ **Solution:** $|z+4| \leq 3$ represents the interior and boundary of the circle with center at – 4 and radius equal to 3. As – 1 is an end point of a diameter of the circle, maximum possible value of $|z + 1|$ is 6 which is attained when $z = -7$. See Fig. 2.48

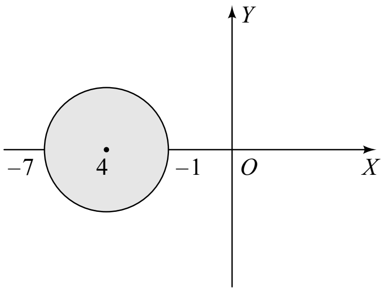

Fig. 2.48

● **Example 61:** Let z, w be two complex numbers such that $\bar{z} + i\bar{w} = 0$ and arg $(zw) = \pi$, then arg z equals

(a) $\dfrac{3\pi}{4}$ (b) $\dfrac{\pi}{2}$

(c) $\dfrac{\pi}{4}$ (d) $\dfrac{5\pi}{4}$

Ans. (a)

◎ **Solution:** $\bar{z} + i\bar{w} = 0 \quad \Rightarrow \quad z - iw = 0$

Now, $\quad \arg(zw) = \pi \quad \Rightarrow \quad \arg\left(\dfrac{z^2}{i}\right) = \pi$

$\Rightarrow \quad 2\arg(z) - \arg(i) = \pi$

$\Rightarrow \quad 2\arg(z) = \pi + \dfrac{\pi}{2} = \dfrac{3\pi}{2} \quad \Rightarrow \quad \arg(z) = \dfrac{3\pi}{4}$

Example 62: If $z_1 + z_2 + z_3 = 0$ and $|z_1| = |z_2| = |z_3| = 1$, then value of $z_1^2 + z_2^2 + z_3^2$ equals

(a) -1 (b) 0
(c) 1 (d) 3

Ans. (b)

Solution: $z_1^2 + z_2^2 + z_3^2$

$$= (z_1 + z_2 + z_3)^2 - 2(z_2 z_3 + z_3 z_1 + z_1 z_2)$$

$$= 0 - 2z_1 z_2 z_3 \left(\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right)$$

$$= -2z_1 z_2 z_3 (\overline{z}_1 + \overline{z}_2 + \overline{z}_3)$$

$$[\because |z_1| = |z_2| = |z_3| = 1]$$

$$= -2z_1 z_2 z_3(0)$$

$$= 0$$

Example 63: If z satisfies the relation

$$|z - i|z|| = |z + i|z||, \qquad (1)$$

then

(a) $\text{Im}(z) = 0$ (b) $|z| = 1$
(c) $\text{Re}(z) = 0$ (d) none of these

Ans. (a)

Solution: $z = 0$ clearly satisfies (1).
For $z \neq 0$, (1) can be written as

$$\left|\frac{z}{|z|} - 1\right| = \left|\frac{z}{|z|} + i\right|$$

$\Rightarrow \dfrac{z}{|z|}$ is equidistant from i and $-i$

$\Rightarrow \dfrac{z}{|z|}$ lies on the real axis.

$\Rightarrow$ z is real.

Thus, $\text{Im}(z) = 0$.

Example 64: If α, β are distinct complex numbers with $|\beta| = 1$, then value of $\left|\dfrac{\beta - \alpha}{1 - \overline{\alpha}\beta}\right|$ equals

(a) 1 (b) $|\alpha|$
(c) 2 (d) none of these

Ans. (a)

Solution: $|\beta| = 1 \Rightarrow \beta\overline{\beta} = 1$

$$\therefore \quad \left|\frac{\beta - \alpha}{1 - \overline{\alpha}\beta}\right| = \left|\frac{\beta - \alpha}{1 - \overline{\alpha}/\overline{\beta}}\right| = \left|\frac{\overline{\beta}(\beta - \alpha)}{\overline{\beta} - \overline{\alpha}}\right| = |\beta| \frac{|\beta - \alpha|}{|\overline{\beta} - \overline{\alpha}|}$$

$$= |\beta|(1) = 1. \qquad [\because \ |z| = |\overline{z}|]$$

Example 65: Suppose $z \in \mathbf{C}$, and $z \notin \mathbf{R}$. If $w = \dfrac{1 - z + z^2}{1 + z + z^2}$ is a real number, then $|z|$ equals

(a) 1 (b) 2
(c) $\sqrt{3}$ (d) $2\sqrt{3}$

Ans. (a)

Solution: Note that $z \neq 0$ and $1 - w = \dfrac{2z}{1 + z + z^2} \in \mathbf{R}$.

$$\Rightarrow \frac{z}{1 + z + z^2} \in \mathbf{R} \Rightarrow \frac{1}{1 + z + 1/z} \in \mathbf{R} \Rightarrow z + \frac{1}{z} \in \mathbf{R}$$

$$\Rightarrow z + \frac{1}{z} = \overline{z} + \frac{1}{\overline{z}} \quad \Rightarrow \quad z - \overline{z} = \frac{1}{\overline{z}} - \frac{1}{z} = \frac{z - \overline{z}}{|z|^2}$$

As $z \notin \mathbf{R}$, $z \neq \overline{z}$, therefore $|z|^2 = 1$ or $|z| = 1$

Example 66: If $\left|z - \dfrac{4}{z}\right| = 2$, then the maximum value of $|z|$ is equal to

(a) 1 (b) $2 + \sqrt{2}$
(c) $\sqrt{3} + 1$ (d) $\sqrt{5} + 1$

Ans. (d)

Solution: $|z| - \dfrac{4}{|z|} \le \left||z| - \dfrac{4}{|z|}\right| \le \left|z - \dfrac{4}{z}\right| = 2$

$$\Rightarrow \quad |z|^2 - 2|z| - 4 \le 0$$

$$\Rightarrow \quad (|z| - 1)^2 \le 5 \Rightarrow |z| \le 1 + \sqrt{5}.$$

The maximum value $\sqrt{5} + 1$ is attained when $z = \sqrt{5} + 1$.

Example 67: If $|\omega| = 2$, then the set of points $x + iy = \omega - \dfrac{1}{\omega}$ lie on

(a) circle (b) ellipse
(c) parabola (d) hyperbola

Ans. (b)

Solution: $|\omega| = 2 \Rightarrow \omega = 2e^{i\theta} = 2(\cos\theta + i\sin\theta)$

$$\Rightarrow \quad x + iy = \omega - \frac{1}{\omega} = 2e^{i\theta} - \frac{1}{2}e^{-i\theta}$$

$$\Rightarrow \quad x = \frac{3}{2}\cos\theta,\ y = \frac{5}{2}\sin\theta \Rightarrow \frac{x^2}{9/4} + \frac{y^2}{25/4} = 1$$

which represents an ellipse.

Example 68: If $|z| = 1$, $z \neq 1$, then value of $\arg\left(\dfrac{1}{1 - z}\right)$ cannot exceed

(a) $\pi/2$ (b) π
(c) $3\pi/2$ (d) 2π

Ans (a)

Solution: As $|z| = 1$, $z \neq 1$, $z = \cos\theta + i\sin\theta$, $-\pi < \theta$, $\le \pi$, $\theta \neq 0$. Now

$$\omega = \frac{1}{1 - z} = \frac{1}{1 - \cos\theta - i\sin\theta}$$

$$= \frac{(1-\cos\theta)+i\sin\theta}{(1-\cos\theta)^2+\sin^2\theta} = \frac{(1-\cos\theta)+i\sin\theta}{2(1-\cos\theta)}$$

$$= \frac{1}{2}+\frac{i}{2}\cot\left(\frac{\theta}{2}\right) = \frac{1}{2}+\frac{i}{2}\tan\left(\frac{\pi}{2}-\frac{\theta}{2}\right)$$

This shows that ω lies on the line $x = 1/2$ and $-\pi/2 < \arg(\omega) < \pi/2$, $\text{Arg}(\omega) \neq 0$, The maximum value of Arg(ω) is never attained.

Example 69: If $z \neq 1$, $\dfrac{z^2}{z-1}$ is real, then point represented by the complex number z lies

- (a) on circle with centre at the origin.
- (b) either on the real axis or on a circle not passing through the origin.
- (c) on the imaginary axis.
- (d) either on the real axis or on a circle passing through the origin

Ans (b)

Solution: As $\dfrac{z^2}{z-1}$ is real, we get

$$\frac{z^2}{z-1} = \frac{\bar{z}^2}{\bar{z}-1}$$

$\Leftrightarrow \quad z^2(\bar{z} - 1) = \bar{z}^2 (z - 1)$

$\Leftrightarrow \quad z\bar{z}(z - \bar{z}) - (z - \bar{z})(z + \bar{z}) = 0$

$\Leftrightarrow \quad (z - \bar{z})(z\bar{z} - z - \bar{z}) = 0$

$\Rightarrow \quad z - \bar{z} = 0$ or $z\bar{z} - z - \bar{z} = 0$

$\Rightarrow \quad z$ lies on the real axis

or z lies on a circle through the origin.

Example 70: If $3^{49}(x + iy) = \left(\dfrac{3}{2}+\dfrac{i}{2}\sqrt{3}\right)^{100}$, $y \in \mathbf{N}$, and $x = ky$, then value of k is

(a) $\pm 1/3$	(b) $\pm 2\sqrt{2}$
(c) $\pm 1/\sqrt{3}$	(d) $\pm 1/\sqrt{3}$

Ans (b)

Solution: We have

$3^{49}\,|x + iy| = |3/2 + \sqrt{3}i/2|^{100}$

$\Rightarrow \quad 3^{49}\sqrt{x^2+y^2} = (9/4 + 3/4)^{50}$

$\Rightarrow \quad \sqrt{x^2+y^2} = 3 \Rightarrow (y)\sqrt{1+k^2} = 3$

$\Rightarrow \quad \sqrt{1+k^2} = 3,\ 3/2,\ 1,$ as $y \in \mathbf{N}$

$\Rightarrow \quad k = \pm\, 2\sqrt{2},\ \pm\sqrt{5}/2,\ 0$

Out of the given values, we have $k = \pm 2\sqrt{2}$.

Example 71: If $(4 + i)(z + \bar{z}) - (3 + i)(z - \bar{z}) + 26i = 0$, then the value of $|z|^2$ is

(a) 13	(b) 17
(c) 19	(d) 11

Ans (b)

Solution: Let $z = x + iy$, then

$2(4 + i)x - (3 + i)2iy + 26i = 0$

$\Rightarrow \quad 4x + y = 0,\ x - 3y + 13 = 0$

$\Rightarrow \quad x = -1,\ y = 4$

$\therefore \quad |z|^2 = 17$

Example 72: Let $z = a\left(\cos\dfrac{\pi}{5} + i\sin\dfrac{\pi}{5}\right)$, $a \in \mathbf{R}$, $|a| < 1$, then $S = z^{2015} + z^{2016} + z^{2017} + \ldots$ equals

(a) $\dfrac{a^{2015}}{z-1}$	(b) $\dfrac{a^{2015}}{1-z}$
(c) $\dfrac{z^{2015}}{1-a}$	(d) $\dfrac{z^{2015}}{a-1}$

Ans (a)

Solution: We have $|z| = |a| < 1$, thus

$$S = \frac{z^{2015}}{1-z}$$

But $\quad z^{2015} = a^{2015}[\cos(403\pi) + i\sin(403\pi)] = -a^{2015}$

$$\therefore \quad S = \frac{a^{2015}}{z-1}$$

Example 73: If $z = \sqrt{20i-21}+\sqrt{20i+21}$, than one of the possible value of $|\arg(z)|$ equals

(a) $\pi/4$	(b) $\pi/2$
(c) $3\pi/8$	(d) π

Ans (a)

Solution: $20i + 21 = (5 + 2i)^2$

and $\quad 20i - 21 = (2 - 5i)^2$

$\therefore \quad z = \pm(5 + 2i) \pm (2 + 5i)$

$\Rightarrow \quad z = 7(1 + i),\ 3(1 - i),\ 3(-1 + i),\ 7(-1 - i)$

$\Rightarrow \quad \arg(z) = \pi/4,\ -\pi/4,\ 3\pi/4,\ -3\pi/4$

Thus, one of the possible value of $|\arg(z)|$ is $\pi/4$.

Example 74: If $(a + bi)^{11} = x + iy$, where $a, b, x, y \in \mathbf{R}$, then $(b + ai)^{11}$ equals

(a) $y + ix$	(b) $-y - ix$
(c) $-x - iy$	(d) $x + iy$

Ans (b)

Solution: $\overline{(a+bi)^{11}} = \overline{x+iy}$

$\Rightarrow \quad (a - bi)^{11} = x - iy$

$\Rightarrow \quad [(-i)(b + ia)]^{11} = -i(y + ix)$

$\Rightarrow \quad (-i)^{11}(b + ia)^{11} = -i(y + ix)$

As $\quad (-i)^{11} = (-i)^8(-1)^3 i^3 = i$,

we get $\quad (b + ia)^{11} = -(y + ix) = -y - ix$

◉ **Example 75:** If $a, b, x, y \in \mathbf{R}$, $\omega \neq 1$, is a cube root of unity and $(a + b\omega)^7 = x + y\omega$, then $(b + a\omega)^7$ equals

(a) $y + x\omega$ (b) $-y - x\omega$

(c) $x + y\omega$ (d) $-x - y\omega$

Ans (a)

◎ **Solution:** Taking conjugate, we get

$$(a + b\omega^2)^7 = x + y\,\omega^2 \Rightarrow (a\omega^3 + b\omega^2)^7 = x\omega^3 + y\omega^2$$

$$\omega^{14}\,(a\omega + b)^7 = \omega^2\,(x\omega + y)$$

$$\Rightarrow \quad (a\omega + b)^7 = x\omega + y$$

Assertion-Reason Type Questions

◉ **Example 76:** Suppose z_1, z_2 are two distinct complex numbers and a, b are real numbers.

Statement-1: If $z_1 + z_2 = a$, $z_1 z_2 = b$, then $\arg(z_1 z_2) = 0$

Statement-2: If $z_1 + z_2 = a$, $z_1 z_2 = b$, then $\bar{z}_1 = z_2$

Ans. (c)

◎ **Solution:** Statement-2 is false. This can be seen by taking z_1 and z_2 to be distinct real numbers.

For statement-1, take $z_1 = \alpha_1 + i\beta_1$, $z_2 = \alpha_2 + i\beta_2$. We have

$$\beta_1 + \beta_2 = 0,\ \alpha_1\beta_2 + \alpha_2\beta_1 = 0$$

If $\beta_2 = 0$, then $\beta_1 = 0$, and statement-1 is true.

If $\beta_2 \neq 0$, then $\beta_1 = -\beta_2$ and $(\alpha_1 - \alpha_2)\beta_2 = 0$

$\Rightarrow \quad \alpha_1 - \alpha_2 = 0 \quad$ or $\quad \alpha_1 = \alpha_2$

Thus, $\quad \alpha_2 + i\beta_2 = \quad \alpha_1 - i\beta_1 \quad \Rightarrow \quad z_2 = \bar{z}_1$

In this case also $\arg(z_1 z_2) = \arg(z_1 \bar{z}_1)$

$= \arg(|z_1|^2) = 0$

◉ **Example 77:** Suppose z_1 and z_2 are two distinct non-zero complex numbers.

Statement-1: $|z_1 - z_2| = \left|\dfrac{1}{z_1} - \dfrac{1}{z_2}\right|$

$\Rightarrow \quad |z_1|\,|z_2| = 1$

Statement-2: $|z_1 - z_2| = \left|\dfrac{1}{z_1} - \dfrac{1}{z_2}\right|$

then both of z_1, z_2 have modulus 1

Ans (c)

◎ **Solution:** $|z_1 - z_2| = \left|\dfrac{1}{z_1} - \dfrac{1}{z_2}\right| = \dfrac{|z_2 - z_1|}{|z_2\, z_1|}$

As $z_1 \neq z_2$, we get $|z_1\, z_2| = 1$

$\Rightarrow \quad |z_1|\,|z_2| = 1$

$\therefore$ Statement-1 is true.

Statement-2 is false. For example take $z_1 = 3$, $z_2 = 1/3$.

◉ **Example 78:** Suppose $a, b, c \in \mathbf{R}$.

Statement-1: If $z = a + (b + ic)^{2017} + (b - ic)^{2017}$ then z is real.

Statement-2: If $z = \bar{z}$, then z is real

Ans (a)

◎ **Solution:** Statement-2 is true. See theory

We have

$$\bar{z} = a + (\overline{b + ic})^{2017} + (\overline{b - ic})^{2017}$$

$$= a + (b - ic)^{2017} + (b + ic)^{2017}$$

$$= z$$

$\Rightarrow \quad z$ is real

$\therefore$ Statement-1 is true and statement-2 is correct explanation for it.

◉ **Example 79:** Let $\omega \neq 1$, be a cube root of unity, and $a, b \in \mathbf{R}$.

Statement-1: $a^3 + b^3 = (a + b)\,(a\omega + b\omega^2)\,(a\omega^2 + b\omega)$

Statement-2: $x^3 - 1 = (x - 1)\,(x\omega^2 - \omega)\,(x\omega - \omega^2)$

for each $x \in \mathbf{R}$.

Ans (a)

◎ **Solution:** We have

$$(x\omega^2 - \omega)\,(x\omega - \omega^2)$$

$$= x^2\omega^3 - x\omega^2 - x\omega^4 + \omega^3$$

$$= x^2 - (\omega^2 + \omega)x + 1$$

$$= x^2 + x + 1 \qquad [\because\ \omega^2 + \omega = -1]$$

$\therefore \quad (x - 1)\,(x\omega^2 - \omega)\,(x\omega - \omega^2)$

$= (x - 1)\,(x^2 + x + 1) = x^3 - 1$

Thus, Statement-2 is true.

Replacing x by $-x$, we get

$$(-x)^3 - 1 = (-x - 1)\,(-x\,\omega^2 - \omega)\,(-x\omega - \omega^2)$$

$$\Rightarrow \quad x^3 + 1 = (x + 1)\,(x\,\omega^2 + \omega)\,(x\omega + \omega^2)$$

Taking conjugate of both the sides, we get

$$x^3 + 1 = (x + 1)\,(x\,\omega + \omega^2)\,(x\omega^2 + \omega)$$

$$[\because\ \omega = \omega^2]$$

If $b = 0$, statement-1 is clearly true. Suppose $b \neq 0$.

Replacing x by a/b we get

$$\left(\frac{a}{b}\right)^3 + 1 = \left(\frac{a}{b} + 1\right)\left(\frac{a}{b}w + w^2\right)\left(\frac{a}{b}w^2 + w\right)$$

$$\Rightarrow \quad a^3 + b^3 = (a + b)\,(aw + bw^2)\,(aw^2 + bw)$$

Thus, statement-1 is also true and statement-2 is a correct explanation for it.

Example 80: Let A, B, C be three set of complex numbers as defined below:

$$A = \{z : \text{Im } z \ge 1\}$$
$$B = \{z : |z - 2 - i| = 3\}$$
$$C = \{z : \text{Re }((1 - i)\, z)\} = \sqrt{2}\ \}$$

Statement-1: $|z + 1 - i|^2 + |z - 5 - i|^2 = 37$

$\forall\, z \in A \cap B \cap C$

Statement-2: $A \cap B \cap C$ consists of exactly one point.

Ans (d)

Solution: The set A consists of all points in the half plane $\text{Im }(z) \ge 1$, that is, all the points above and including the line through S and parallel to the real axis. The set B is the set of all points on the circle with centre at $2 + i$ and radius 3, and the set C consists of all the points on the line $x + y = \sqrt{2}$. The regions in A, B and C intersect in exactly one point *viz*. R. see Fig. 2.49.

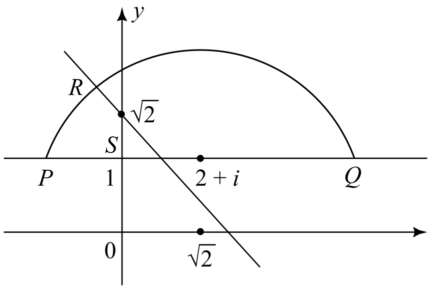

Fig. 2.49

$\therefore$ Statement-2 is true. Points $P\,(-1 + i)$ and $Q(5 + i)$ are the end points of diameter of the circle $|z - (2 + i)| = 3$

Now, $|z + 1 - i|^2 + |z - 5 - i|^2$

$$= PR^2 + QR^2 = PQ^2 = 36$$

$\therefore$ Statement-1 is false.

Example 81: Let z_1, z_2, z_3 be three distinct non-zero complex numbers such that $a = |z_1|$, $b = |z_2|$, $c = |z_3|$. and

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 0$$

Statement-1: If $z_1 + z_2 + z_3 = 0$, then triangle with vertices z_1, z_2 and z_3 is an equilateral triangle.

Statement-2: Area of triangle with vertices z_1, z_2, and z_3 is $\frac{\sqrt{3}}{4}|z_1 - z_2|^2$

Ans (c)

Solution: Applying $C_1 \to C_1 + C_2 + C_3$,

we get

$$\Delta = (a + b + c)\, \Delta_1 \text{ where}$$

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 0 & c - b & a - c \\ 0 & a - b & b - c \end{vmatrix}$$

$$= -(b - c)^2 - (a - b)\,(a - c)$$
$$= -[a^2 + b^2 + c^2 - bc - ca - ab]$$
$$= -\frac{1}{2}[(b - c)^2 + (c - a)^2 + (a - b)^2]$$

Now, $\Delta = 0$

$\Rightarrow\ (a + b + c)\,[(b - c)^2 + (c - a)^2 + (a - b)^2]$

As $a + b + c > 0$, we get

$$a = b = c$$

$$\Rightarrow\ |z_1| = |z_2| = |z_3|$$

$\Rightarrow$ z_1, z_2, z_3 lie on a circle with centre at the origin and radius equal to a.

If we take z_1, z_2 as opposite vertices of a diameter, then triangle is a right triangle with right angle at z_3, and its area is $\frac{1}{2}|z_3 - z_1|\,|z_3 - z_2|$

$\therefore$ Statement-2 is false.

If $z_1 + z_2 + z_3 = 0$, then $|z_1 - z_2|^2 + |z_3|^2$

$$= |z_1 - z_2|^2 + |-z_1 - z_2|^2$$
$$= 2|z_1|^2 + 2|z_2|^2 = 4a^2$$

$$\Rightarrow\ |z_1 - z_2| = \sqrt{3}a$$

Similarly, $|z_2 - z_3| = |z_3 - z_1| = \sqrt{3}a$

Thus, triangle is an equilateral triangle.

Example 82: **Statement-1:** If z_1, z_2, z_3 are such that $|z_1| = |z_2| = |z_3| = 1$, then maximum value of $|z_2 - z_3|^2 + |z_3 - z_1|^2 + |z_1 - z_2|^2$ is 9.

Statement-2: If z_1, z_2, z_3 are such that $|z_1| = |z_2| = |z_3| = 1$, then

$$\text{Re}(z_2\bar{z}_3 + z_3\bar{z}_1 + z_1\bar{z}_2) \ge -3/2$$

Ans. (a)

Solution: $0 \le |z_1 + z_2 + z_3|^2$

$$\Rightarrow\ 0 \le |z_1|^2 + |z_2|^2 + |z_3|^2 + 2\,\text{Re}(z_2\bar{z}_3 + z_3\bar{z}_1 + z_1\bar{z}_2)$$

$$\Rightarrow\ \text{Re}(z_2\bar{z}_3 + z_3\bar{z}_1 + z_1\bar{z}_2) \ge -3/2$$

$$[\because |z_1| = |z_2| = |z_3| = 1]$$

Therefore, statement-2 is true.

Next, $|z_2 - z_3|^2 + |z_3 - z_1|^2 + |z_1 - z_2|^2$

$$= 2(|z_1|^2 + |z_2|^2 + |z_3|^2) - 2\,\text{Re}(z_2\bar{z}_3 + z_3\bar{z}_1 + z_1\bar{z}_2)$$
$$\leq 2(1 + 1 + 1) + 2(3/2) = 9$$

Maximum value is obtained when $z_1 = 1$, $z_2 = \omega$, $z_3 = \omega^2$, where ω is a cube root of unity.

Statement-1 is also true and statement-2 is correct explanation for it.

◉ **Example 83: Statement-1:** If $\omega \neq 1$ is a cube root of unity and z is a complex number such that $|z| = 1$, then

$$\left|\frac{2 + 3\omega + 4z\,\omega^2}{4\omega + 3\omega^2\, z + 2z}\right| = 1.$$

Statement-2: If z_1, z_2 are two complex numbers, then $|z_1| = |z_2| \Leftrightarrow z_1 = \bar{z}_2$

Ans. (c)

◎ **Solution:** $\left|\dfrac{2 + 3\omega + 4z\,\omega^2}{4\omega + 3\omega^2\, z + 2z}\right| = \left|\dfrac{1}{z}\,\dfrac{2 + 3\omega + 4\omega^2 z}{2 + 3\omega^2 + 4\omega z^{-1}}\right|$

$$= \left|\frac{1}{z}\right|\left|\frac{2 + 3\omega + 4\omega^2\, z}{2 + 3\bar{\omega} + 4\bar{\omega}^2\bar{z}}\right| = \frac{1}{|\,z\,|} = 1$$

$$[\because\ \bar{\omega} = \omega^2,\ \bar{z} = 1/z]$$

Thus, Statement-1 is true.

Statement-2 is false as $|z_1| = |z_2|$ does not imply $z_1 = \bar{z}_2$. However, $z_1 = \bar{z}_2 \Rightarrow |z_1| = |z_2|$

◉ **Example 84: Statement-1:** If z is a root of the equation $x^7 + 2x + 3 = 0$, then $1 \leq |z| < 3/2$.

Statement-2: If z lies in the annular region $1 < |z| \leq 3/2$, then z satisfies the

$$\frac{1}{z - 1} + \frac{1}{z - \omega} + \frac{1}{z - \omega^2} = 1$$

where $\omega \neq 1$ is a cube root of unity.

Ans. (c)

◎ **Solution:** Suppose $|z| < 1$ and $z^7 + 2z + 3 = 0$, then

$$3 = |-3| = |z^7 + 2z| \leq |z^7| + 2|z|$$

$$\Rightarrow \qquad 3 \leq |z|^7 + 2|z| < 1 + 2(1) = 3.$$

A contradiction.

Next, suppose that $|z| \geq 3/2$ and $z^7 + 2z + 3 = 0$, then $\omega = 1/z$ satisfies the equation $1 + 2\omega^6 + 3\omega^7 = 0$. Now, $1 = |-1| = |2\omega^6 + 3\omega^7| \leq 2|\omega|^6 + 3|\omega^7|$

$$\Rightarrow \qquad 1 \leq 2\left(\frac{2}{3}\right)^6 + 3\left(\frac{2}{3}\right)^7 = \left(\frac{2}{3}\right)^6[2 + 2] = \frac{2^8}{3^6} < 1$$

A contradiction.

Thus, if z satisfies the equation $z^7 + 2z + 3 = 0$, then $1 \leq |z| < 3/2$.

Thus, Statement-1 is true.

Statement-2 is false, as the given relation implies $z^3 - 3z^2 + 1 = 0$ which is satisfied by just 3 values of z where as $1 < |z| \leq 3/2$ contains infinite number of points.

◉ **Example 85: Statement-1** If $\omega \neq 1$, is a cube root of unity, then $A^2 = O$, where

$$A = \begin{pmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{pmatrix}$$

Statement-2 If $\omega \neq 1$, is a cube root of unity, then

$$\Delta = \begin{vmatrix} x + 1 & \omega & \omega^2 \\ \omega & x + \omega^2 & 1 \\ \omega^2 & 1 & x + \omega \end{vmatrix} = x^3$$

Ans. (b)

◎ **Solution:** It is easy to show

$$A^2 = \begin{pmatrix} y & y & y \\ y & y & y \\ y & y & y \end{pmatrix} = O$$

where $\qquad y = 1 + \omega + \omega^2 = 0.$

$\therefore$ Statement-1 is true.

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = x\begin{vmatrix} 1 & \omega & \omega^2 \\ 1 & x + \omega^2 & 1 \\ 1 & 1 & x + \omega \end{vmatrix} = x\begin{vmatrix} 1 & \omega & \omega^2 \\ 0 & x + \omega^2 - \omega & 1 - \omega^2 \\ 0 & 1 - \omega & x + \omega - \omega^2 \end{vmatrix}$$

$$= x[(x + \omega^2 - \omega)(x + \omega - \omega^2) - (1 - \omega)(1 - \omega^2)]$$
$$= x[x^2 - (\omega - \omega^2)^2 - \{1 - \omega - \omega^2 + 1\}] = x^3$$

$\therefore$ Statement-2 is also true but is not the correct reason for the statement-1.

LEVEL 2

Straight Objective Type Questions

Example 86: Let $z = \cos\theta + i\sin\theta$. Then the value of $\sum_{m=1}^{15} \text{Im}\left(z^{2m-1}\right)$ at $\theta = 2°$ is

(a) $\frac{1}{\sin 2°}$ (b) $\frac{1}{3\sin 2°}$

(c) $\frac{1}{\sin 2°}$ (d) $\frac{1}{4\sin 2°}$

Ans. (d)

Solution: $\sum_{m=1}^{15} \text{Im}\left(z^{2m-1}\right) = \text{Im}\sum_{m=1}^{15}\left(z^{2m-1}\right)$

$$= \text{Im}\left[\frac{z\left(1-\left(z^2\right)^{15}\right)}{1-z^2}\right] = \text{Im}\left(\frac{1-z^{30}}{\bar{z}-z}\right)$$

$$= \text{Im}\left[\frac{1}{-2i\sin\theta}\{1-\cos(30\theta)-i\sin(30\theta)\}\right]$$

$$= \frac{1}{2\sin\theta}[1-\cos(30\theta)] = \frac{1}{2\sin 2°}[1-\cos(60°)]$$

$$= \frac{1}{4\sin 2°}$$

Example 87: Let $z = x + iy$ be a complex number where x and y are integers. Then the area of the rectangle whose vertices are the roots of the equation $z\bar{z}^3 + \bar{z}z^3 = 350$ is

(a) 48 (b) 32

(c) 40 (d) 80

Ans. (a)

Solution: $z\bar{z}^3 + \bar{z}z^3 = 350 \Rightarrow z\bar{z}\left(\bar{z}^2 + z^2\right) = 350$

$$\Rightarrow \left(x^2+y^2\right)\left[(x-iy)^2+(x+iy)^2\right]=350$$

$$\Rightarrow \left(x^2+y^2\right)\left(2x^2-2y^2\right) = 350$$

$$\Rightarrow x^4 - y^4 = 175$$

$$\Rightarrow x^4 \geq 175 \Rightarrow x^4 \geq 256$$

Let us try $x = \pm 4$

Thus, $y^4 = 256 - 175 = 81 \Rightarrow y = \pm 3$

$\therefore$ roots of $z\bar{z}^3 + \bar{z}z^3 = 350$ are $z = \pm 4 \pm 3i$

Area of rectangle whose vertices are $\pm 4 \pm 3i$ is (8) (6) = 48.

Example 88: Let z_1 and z_2 be two distinct complex numbers and let $z = (1 - t)\, z_1 + tz_2$ for some real number t with $0 < t < 1$. If Arg (w) denotes the principal argument of a nonzero complex number w, then which of the following is not true?

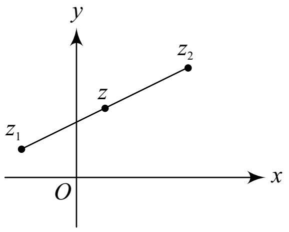

Fig. 2.50

(a) $|z-z_1|+|z-z_2|=|z_1-z_2|$

(b) Arg $(z - z_1)$ = Arg $(z - z_2)$

(c) $\begin{vmatrix} z-z_1 & \bar{z}-\bar{z}_1 \\ z_2-z_1 & \bar{z}_2-\bar{z}_1 \end{vmatrix} = 0$

(d) Arg $(z - z_1)$ = Arg $(z_2 - z_1)$

Ans. (b)

Solution: $z - z_1 = t\,(z_2 - z_1)$

$\Rightarrow$ $|z - z_1| = t|z_2 - z_1| = t|z_1 - z_2|$ (1)

[$\because$ $t > 0$]

and $z - z_2 = (1 - t)\,(z_1 - z_2)$

$\Rightarrow$ $|z - z_2| = (1 - \text{t})\,|z_1 - z_2| = (1 - t)\,|z_2 - z_1|$ (2)

[$\because$ $1 - t > 0$]

From (1) and (2), we get

$$|z - z_1| + |z - z_2| = |z_2 - z_1|$$

Next,

$$\begin{vmatrix} z-z_1 & \bar{z}-\bar{z}_1 \\ z_2-z_1 & \bar{z}_2-\bar{z}_1 \end{vmatrix} = \begin{vmatrix} t\left(z_2-z_1\right) & t\left(\bar{z}_2-\bar{z}_1\right) \\ z_2-z_1 & \left(\bar{z}_2-\bar{z}_1\right) \end{vmatrix} = 0$$

[$\because$ R_1 and R_2 are identical]

Also, Arg $(z - z_1)$ = Arg $(z_2 - z_1)$ since z_1, z and z_2 lie on the same straight line and on the same side of z_1.

Example 89: For complex numbers $z_1 = x_1 + iy$, and $z_2 = x_2 + iy_2$, we write $z_1 \cap z_2$ if $x_1 \leq x_2$ and $y_1 \leq y_2$. Let z be a complex number such that $1 \cap z$, then

(a) $\frac{1-z}{1+z} \cap -i$ (b) $1 \cap \frac{1-z}{1+z}$

(c) $\frac{1-z}{1+z} \cap 0$ (d) $\frac{1+z}{1-z} \cap 0$

Ans. (c)

Solution: Let $z = x + iy$. As $1 \cap z$, we get $1 \le x$ and $0 \le y$

Now, $$\frac{1-z}{1+z} = \frac{(1-x)-iy}{(1+x)+iy} = \frac{[(1-x)-iy][(1+x)-iy]}{(1+x)^2+y^2}$$

$$= \frac{(1-x^2)-y^2-iy\,(1+x+1-x)}{(1+x)^2+y^2}$$

$$= \frac{1-(x^2+y^2)-2iy}{(1+x)^2+y^2}$$

As $x \ge 1$, and $y \ge 0$, we get

$$\frac{1-(x^2+y^2)}{(1+x)^2+y^2} \le 0 \text{ and } \frac{-2y}{(1+x)^2+y^2} \le 0$$

Thus, $\frac{1-z}{1+z} \cap 0$

Example 90: The complex number z_1, z_2, z_3 are the vertices of an equilateral triangle. If z_0 is the circumcentre of the triangle, then $z_1^2 + z_2^2 + z_3^2$ is equal to

(a) z_0^2 (b) $3z_0^2$

(c) z_0^3 (d) $3z_0^3$

Ans. (b)

Solution: As the triangle with vertices z_1, z_2 and z_3 is an equilateral triangle, the circumcentre and the centroid of the triangle coincides. Thus,

$$z_0 = \frac{1}{3}\,(z_1 + z_2 + z_3)$$

$$\Rightarrow \quad (3z_0)^2 = z_1^2 + z_2^2 + z_3^2 + 2(z_2 z_3 + z_3 z_1 + z_1 z_2) \qquad (1)$$

As the triangle is an equilateral triangle,

$$z_2 z_3 + z_2 z_1 + z_1 z_3 = z_1^2 + z_2^2 + z_3^2 \qquad (2)$$

From (1) and (2) we get

$$9\,z_0^2 = z_1^2 + z_2^2 + z_3^2 + 2\,(z_1^2 + z_2^2 + z_3^3)$$

$$\Leftrightarrow \quad 3z_0^2 = z_1^2 + z_2^2 + z_3^2\,.$$

Example 91: If ω is an imaginary cube root of unity, then value of the expression

$1(2 - \omega)(2 - \omega^2) + 2(3 - \omega)(3 - \omega^2) + \ldots$
$+ (n - 1)(n - \omega)(n - \omega^2)$ is

(a) $\frac{1}{4}n^2(n+1)^2 - n$ (b) $\frac{1}{4}n^2(n+1)^2 + n$

(c) $\frac{1}{4}n^2(n+1) - n$ (d) $\frac{1}{4}n\,(n+1)^2 - n$

Ans. (a)

Solution: rth term of the given expression is $r\,(r + 1 - \omega)(r + 1 - \omega^2)$

$$= (r + 1 - 1)(r + 1 - \omega)(r + 1 - \omega^2)$$
$$= (r + 1)^3 - 1$$
$$[\therefore\ (x - 1)(x - \omega)(x - \omega^2) = x^3 - 1]$$

$$\therefore \quad S = \sum_{r=1}^{n-1}\left[(r+1)^3 - 1\right] = \sum_{r=0}^{n-1}\left[(r+1)^3 - 1\right]$$

$$= \sum_{r=0}^{n} r^3 - n = \frac{1}{4}n^2(n+1)^2 - n$$

Example 92: The number of complex numbers z such that $|z| < 1/3$, and $\sum_{r=1}^{n} a_r\, z^r = 1$ where $|a_r| < 2$, is

(a) 0 (b) 1

(c) 4 (d) infinite

Ans. (a)

Solution: We have

$$1 = \left|\sum_{r=1}^{n} a_r\, z^r\right| \le \sum_{r=1}^{n} |a_r|\,|z|^r$$

$$< \sum_{r=1}^{n} 2\left(\frac{1}{3}\right)^r < \sum_{r=1}^{\infty} 2\left(\frac{1}{3}\right)^r = \frac{2/3}{1-2/3} = 1$$

A contradiction.

Example 93: If a, b, c are integers, not all equal and $\omega(\neq 1)$ is a cube root of unity, then minimum value of $|a + b\omega + c\omega^2|$ is

(a) $\sqrt{3}$ (b) 1

(c) 2 (d) 3

Ans. (b)

Solution: $\left|a + b\omega + c\omega^2\right|^2$

$$= (a + b\omega + c\omega^2)(a + b\bar{\omega} + c\bar{\omega}^2)$$
$$= (a + b\omega + c\omega^2)(a + b\omega^2 + c\omega)$$
$$= a^2 + b^2 + c^2 + (bc + ca + ab)(\omega + \omega^2)$$
$$= a^2 + b^2 + c^2 - bc - ca - ab$$
$$= \frac{1}{2}\,[(b - c)^2 + (c - a)^2 + (a - b)^2]$$

As a, b, c are integers not all equal, at least two of $b - c$, $c - a$ and $a - b$ are of different from zero. Therefore minimum value of $(b - c)^2 + (c - a)^2 + (a - b^2)$ is 2.

Thus, $\left|a + b\omega + c\omega^2\right|^2 \ge 1 \quad \Rightarrow \quad |a + b\omega + c\omega^2| \ge 1$.

Example 94: The region of the argand plane defined by $|z - i| + |z + i| \le 4$ is

(a) interior of an ellipse
(b) exterior of a circle
(c) interior and boundary of an ellipse
(d) none of these

Ans. (c)

◎ **Solution:** Let A and B be the point $0 + i$ and $0 - i$ and $P(z)$ be any point satisfying $|z - i| + |z + i| \le 4$.

$\Rightarrow \quad PA + PB \le 4$

Thus, P lies in the interior or on the boundary on the ellipse with foci A and B and length of major axis = 4. See Fig. 2.51

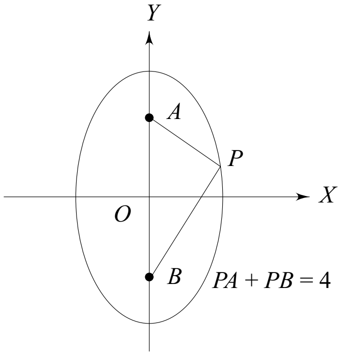

Fig. 2.51

◉ **Example 95:** If z_1 and z_2 are two non-zero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then $\arg(z_1) - \arg(z_2)$ is equal to

(a) $-\pi$ (b) $-\pi/2$
(c) $\pi/2$ (d) 0

Ans. (d)

◎ **Solution:** Let $z_1 = r_1(\cos\theta_1 + i\sin\theta_1)$ and $z_2 = r_2(\cos\theta_2 + i\sin\theta_2)$ where $r_1 = |z_1|$, $r_2 = |z_2|$, $\theta_1 = \arg(z_1)$ and $\theta_2 = \arg(z_2)$.

We have

$$|z_1 + z_2|^2 = r_1^2 + r_2^2 + 2r_1r_2\cos(\theta_1 - \theta_2)$$
$$= (r_1 + r_2)^2 + 2r_1r_2\{\cos(\theta_1 - \theta_2) - 1\}$$

Now, $|z_1 + z_2| = |z_1| + |z_2|$

$\Leftrightarrow \cos(\theta_1 - \theta_2) = 1 \Leftrightarrow \theta_1 - \theta_2 = 0 \Leftrightarrow \theta_1 = \theta_2$.

◉ **Example 96:** If $|z - 25i| \le 15$, then

|maximum arg (z) – minimum arg (z)| equals

(a) $2\cos^{-1}(3/5)$ (b) $2\cos^{-1}(4/5)$
(c) $\pi/2 + \cos^{-1}(3/5)$ (d) $\sin^{-1}(3/5) - \cos^{-1}(3/5)$

Ans. (b)

◎ **Solution:** If $|z - 25i| \le 15$, then z lies either in the interior and or on the boundary of the circle with centre at C $(25i)$ and radius equal to 15.

From Fig. 2.52 it is clear that least argument is for point A and the greatest argument is for point B.

From right ΔOAC, $\cos\left(\dfrac{\pi}{2} - \theta\right) = \dfrac{OA}{OC} = \dfrac{20}{25}$

$\Rightarrow \quad \pi/2 - \theta = \cos^{-1}(4/5)$

Now, for $|z - 25i| \le 15$

|maximum (arg z) – minimum (arg z)|

$= |\arg(B) - \arg(A)|$
$= \angle BOA = \angle BOX - \angle AOX$
$= \pi/2 + (\pi/2 - \theta) - \theta = \pi - 2\theta$
$= 2\cos^{-1}(4/5)$

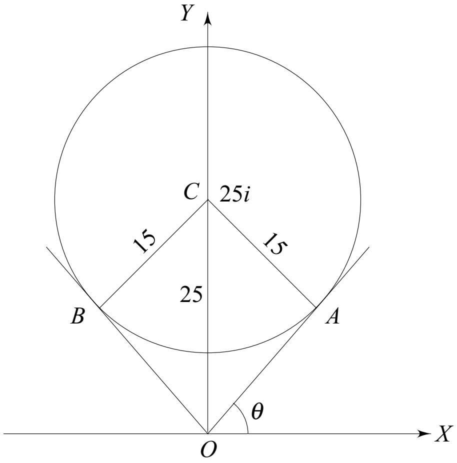

Fig. 2.52

◉ **Example 97:** If $|z| = 3$, the area of the triangle whose sides are z, ωz and $z + \omega z$ (where ω is a complex cube root of unity) is

(a) $9\sqrt{3}/4$ (b) $3\sqrt{3}/2$
(c) $5/2$ (d) $8\sqrt{3}/3$

Ans. (a)

◎ **Solution:** We have $|z| = 3$, $|\omega z| = |\omega|\,|z| = (1)(3) = 3$ and

$$|z + \omega z| = |(1 + \omega)z| = |(-\omega^2)z|$$
$$= |-\omega^2|\,|z| = (1)(3) = 3.$$

$\therefore$ The given triangle is equilateral and its area is

$$\frac{\sqrt{3}}{4}|z|^2 = \frac{9\sqrt{3}}{4}.$$

◉ **Example 98:** The greatest and the least value of $|z_1 + z_2|$ if $z_1 = 24 + 7i$ and $|z_2| = 6$ are respectively

(a) 31, 19 (b) 25, 19
(c) 31, 25 (d) none of these

Ans. (a)

◎ **Solution:** Note that $|z| = 6$ represents a circle. As $|z_2| = 6$, $|z_1 + z_2| = |z_2 - (-24 - 7i)|$ represent distance between a point on the circle $|z| = 6$ and the point $(-24 - 7i)$.

$|z_1 + z_2|$ will be greatest and least at points B and A which are the end points of the diameter of the circle through C. As $OC = 25$, $CA = OC - OA = 25 - 6 = 19$ and $CB = OC + OB = 25 + 6 = 31$. See Fig. 2.53

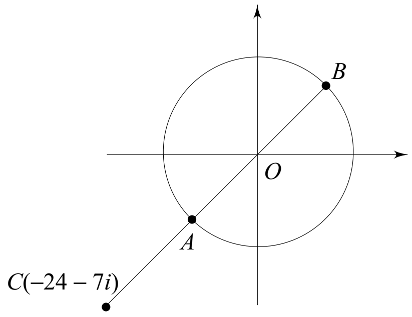

Fig. 2.53

Alternate Solution

$$|z_2| = 6 \Rightarrow z_2 = 6e^{i\theta} \text{ where } \theta \,\varepsilon\, \mathbf{R}.$$

$$\begin{aligned} \therefore \quad |z_1 + z_2|^2 &= |24 + 7i + 6(\cos\theta + i\sin\theta)|^2 \\ &= (24 + 6\cos\theta)^2 + (7 + 6\sin\theta)^2 \\ &= 576 + 36\cos^2\theta + 288\cos\theta + 49 + 36\sin^2\theta + 84\sin\theta \\ &= 625 + 36 + 12(24\cos\theta + 7\sin\theta) \\ &= 661 + 12(25)\sin(\theta + \alpha) \\ &\qquad [\text{put } 7 = r\cos\alpha \text{ and } 24 = r\sin\alpha] \\ &= 661 + 300\sin(\theta + \alpha) \end{aligned}$$

Thus, greatest possible value of $|z_1 + z_2|^2$ is 661 + 300 = 961 and the least possible value of $|z_1 + z_2|^2$ is 361.

$\therefore$ greatest and least possible values of $|z_1 + z_2|$ are 31 and 19 respectively.

Example 99: If α, β are the roots of $x^2 + px + q = 0$, and ω is a cube root of unity, then value of $(\omega\alpha + \omega^2\beta)(\omega^2\alpha + \omega\beta)$ is

(a) p^2 (b) $3q$
(c) $p^2 - 2q$ (d) $p^2 - 3q$

Ans. (d)

Solution: We have $\alpha + \beta = -p$, $\alpha\beta = q$

$$\begin{aligned} \text{Now} \quad & (\omega\alpha + \omega^2\beta)(\omega^2\alpha + \omega\beta) \\ &= \omega^3\alpha^2 + \omega^4\alpha\beta + \omega^2\alpha\beta + \omega^3\beta^2 \\ &= \alpha^2 + \beta^2 + (\omega + \omega^2)\alpha\beta = \alpha^2 + \beta^2 - \alpha\beta \\ &= (\alpha + \beta)^2 - 3\alpha\beta = p^2 - 3q \end{aligned}$$

Example 100: Maximum distance from the origin of the points z satisfying the relation $|z + 1/z| = 1$ is

(a) $(\sqrt{5} + 1)/2$ (b) $(\sqrt{5} - 1)/2$
(c) $3 - \sqrt{5}$ (d) $(3 + \sqrt{5})/2$

Ans. (a)

Solution: We may assume $|z| \geq \dfrac{1}{|z|}$ for otherwise, we may interchange z and $1/z$ in the given equation.

We have

$$|z| - \frac{1}{|z|} = \left||z| - \frac{1}{|z|}\right| = \left||z| - \left|-\frac{1}{z}\right|\right| \leq \left|z - \left(-\frac{1}{z}\right)\right| = \left|z + \frac{1}{z}\right| = 1$$

Thus, $|z| - \dfrac{1}{|z|} \leq 1 \Rightarrow |z|^2 - |z| - 1 \leq 0$

$\Rightarrow$ $|z|$ lies between the roots of $|z|^2 - |z| - 1 = 0$

$$\Rightarrow \quad \frac{1}{2}(1 - \sqrt{5}) \leq |z| \leq \frac{1}{2}(1 + \sqrt{5})$$

As $z \neq 0$, $|z| > 0$, therefore, $0 < |z| \leq \dfrac{1}{2}(\sqrt{5} + 1)$.

Taking $z = \dfrac{i}{2}(\sqrt{5} + 1)$, we get $\left|z + \dfrac{1}{z}\right| = 1$. Thus, maximum possible value of $|z|$ is $(\sqrt{5} + 1)/2$.

Example 101: If $|z_1| = |z_2| = |z_3| = 1$ and $z_1 + z_2 + z_3 = 0$, then area of the triangle whose vertices are z_1, z_2, z_3 is

(a) $3\sqrt{3}/4$ (b) $\sqrt{3}/4$
(c) 1 (d) 2

Ans. (a)

Solution: $|z_2 - z_3|^2 + |z_2 + z_3|^2 = 2|z_2|^2 + 2|z_3|^2$

$$\Rightarrow \quad |z_2 - z_3|^2 + |-z_1|^2 = 2(1) + 2(1)$$

$$[\because \quad z_1 + z_2 + z_3 = 0]$$

$$\Rightarrow \quad |z_2 - z_3| = \sqrt{3}$$

Similarly, $|z_3 - z_1| = |z_1 - z_2| = \sqrt{3}$

Thus, area of triangle with vertices z_1, z_2, z_3 is

$$\frac{\sqrt{3}}{4}\left(\sqrt{3}\right)^2 = \frac{3\sqrt{3}}{4}$$

Example 102: An equation of straight line joining the complex numbers a and ib (where $a, b \,\varepsilon\, \boldsymbol{R}$ and $a, b \neq 0$) is

(a) $z\left(\dfrac{1}{a} - \dfrac{i}{b}\right) + \bar{z}\left(\dfrac{1}{a} + \dfrac{i}{b}\right) = 2$

(b) $z(a - ib) + \bar{z}(a + ib) = 2(a^2 + b^2)$

(c) $z(a + ib) + \bar{z}(a - ib) = 2ab$

(d) none of these

Ans. (a)

Solution: An equation of straight line joining a and ib is

$$\begin{vmatrix} z & \bar{z} & 1 \\ a & a & 1 \\ ib & -ib & 1 \end{vmatrix} = 0$$

$$\Rightarrow z(a + ib) - \bar{z}(a - ib) - 2iab = 0$$

$$\Rightarrow z\left(\frac{1}{a} - \frac{i}{b}\right) + \bar{z}\left(\frac{1}{a} + \frac{i}{b}\right) = 2$$

Example 103: Two non-parallel lines meet the circle $|z| = r$ in the points a, b and c, d respectively. The point of intersection of these lines is

(a) $\dfrac{a^{-1}+b^{-1}+c^{-1}+d^{-1}}{a^{-1}b^{-1}+c^{-1}d^{-1}}$

(b) $\dfrac{ab+cd}{a+b+c+d}$

(c) $\dfrac{a^{-1}+b^{-1}-c^{-1}-d^{-1}}{a^{-1}b^{-1}-c^{-1}d^{-1}}$

(d) none of these

Ans. (c)

◎ **Solution:** An equation of straight line passing through $A(a)$ and $B(b)$ is

$$\begin{vmatrix} z & \bar{z} & 1 \\ a & \bar{a} & 1 \\ b & \bar{b} & 1 \end{vmatrix} = 0$$

$$\Rightarrow \qquad z(\bar{a} - \bar{b}) - \bar{z}(a-b) + a\bar{b} - \bar{a}b = 0 \qquad (1)$$

As a, b lie on $|z| = r$, we get

$$|a| = |b| = r \Rightarrow a\bar{a} = b\bar{b} = r^2.$$

Equation (1), now can be written as

$$z\left(\frac{r^2}{a} - \frac{r^2}{b}\right) - \bar{z}(a-b) + \frac{ar^2}{b} - \frac{br^2}{a} = 0$$

$$\Rightarrow \qquad \frac{zr^2}{ba}(b-a) + \bar{z}\,(b-a) = (b^2-a^2)\,\frac{r^2}{ab}$$

$$\Rightarrow \qquad za^{-1}b^{-1} + \frac{\bar{z}}{r^2} = a^{-1} + b^{-1} \qquad (2)$$

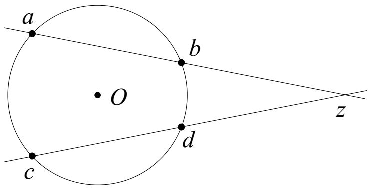

Fig. 2.54

Similarly, equation of straight line joining c and d is

$$zc^{-1}d^{-1} + \frac{\bar{z}}{r^2} = c^{-1} + d^{-1} \qquad (3)$$

Subtracting (3) from (2), we get

$$z(a^{-1}b^{-1} - c^{-1}d^{-1}) = a^{-1} + b^{-1} - c^{-1} - d^{-1}$$

$$\Rightarrow \qquad z = \frac{a^{-1}+b^{-1}-c^{-1}-d^{-1}}{a^{-1}b^{-1}-c^{-1}d^{-1}}$$

EXERCISE

Concept-based Straight Objective Type Questions

1. The number of complex numbers z such that $(1+i)z = i\,|z|$
   (a) 0 (b) 1
   (c) 2 (d) infinite

2. Suppose a, b, $c \in \mathbf{R}$ and $C < 0$. Let $z = a + (b + ic)^{2015} + (b - ic)^{2015}$, then
   (a) Re $(z) = 0$
   (b) Im $(z) = 0$
   (c) Re $(z) > 0$, Im $(z) < 0$
   (d) Re $(z) < 0$, Im $(z) > 0$

3. The number of solutions of $z^2 + |z| = 0$ is
   (a) 1 (b) 2
   (c) 3 (d) infinite

4. The equation $\left|\dfrac{(1+i)z-2}{(1+i)z+4}\right| = k$
   does not represent a circle when k is
   (a) 2 (b) π
   (c) e (d) 1

5. If $|z| \ge 5$, then least value of $\left|z - \dfrac{1}{z}\right|$ is
   (a) 5 (b) 24/5
   (c) 8 (d) 8/3

6. Principal argument of $z = \dfrac{i-1}{i\left(1-\cos\dfrac{2\pi}{7}\right)+\sin\dfrac{2\pi}{7}}$ is
   (a) $\dfrac{\pi}{28}$ (b) $\dfrac{3\pi}{28}$
   (c) $\dfrac{17\pi}{28}$ (d) $\dfrac{19\pi}{28}$

7. If $x + iy = \sqrt{\dfrac{a+ib}{c+id}}$, then $(x^2+y^2)^2\,(c^2+d^2)$ equals
   (a) a^2+b^2 (b) $\sqrt{a^2+b^2}$
   (c) $\dfrac{a^2+b^2}{c^2+d^2}$ (d) $\sqrt{\dfrac{a^2+b^2}{c^2+d^2}}$

8. Suppose z_1, z_2, z_3 are three complex numbers, and

$$\Delta = \frac{1}{4i}\begin{vmatrix} 1 & z_1 & \bar{z}_1 \\ 1 & z_2 & \bar{z}_2 \\ 1 & z_2 & \bar{z}_3 \end{vmatrix},$$

then

(a) $\text{Re}\,(\Delta) = 0$ (b) $\text{Im}\,(\Delta) = 0$

(c) $\text{Re}\,(\Delta) \geq 0$ (d) $\text{Im}\,(\Delta) \leq 0$

9. If $x, y, a, b \in \mathbf{R}$, $a \neq 0$ and
$(a + ib)(x + iy) = (a^2 + b^2)\, i$,
then (x, y) equals

(a) (a, b) (b) $(a, 0)$

(c) $(0, b)$ (d) (b, a)

10. If ω ($\neq 1$) is a cube root of unity, then the value of $\tan\,[(\omega^{2017} + \omega^{2225})\,\pi - \pi/3]$

(a) $-\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{3}}$

(c) $-\sqrt{3}$ (d) $\sqrt{3}$

11. If z is purely imaginary and $\text{Im}\,(z) < 0$, then $\arg\,(i\bar{z}) + \arg\,(z)$ is equal to

(a) π (b) 0

(c) $\pi/2$ (d) $-\pi/2$

12. The inequality $a + ib > c + id$ is true when

(a) $a > c, b > d > 0$ (b) $a > c, b = d = 0$

(c) $a > c, b = d > 0$ (d) none of these

13. Let $z \in \mathbf{C}$ be such that $\text{Re}(z^2) = 0$, then

(a) $|\text{Re}(z)| + \text{Im}\,(z) = 0$

(b) $|\text{Re}(z)| = |\text{Im}\,(z)|$

(c) $\text{Re}(z) + |\text{Im}\,(z)| = 0$

(d) $\text{Re}(z) = 0$ or $\text{Im}\,(z) = 0$

14. If z_1, z_2 and z_3, z_4 are two pairs of conjugate complex numbers, then $\arg\left(\frac{z_1}{z_4}\right) + \arg\left(\frac{z_2}{z_3}\right)$ equals

(a) $0, \pi$ (b) $\pi, -\pi$

(c) $\frac{\pi}{2}, \frac{3\pi}{2}$ (d) $0, 2\pi$

15. If $z = x + iy$ and $0 \leq \sin^{-1}\left(\frac{z-4}{2i}\right) \leq \frac{\pi}{2}$ then

(a) $x = 4, 0 \leq y \leq 2$ (b) $0 \leq x \leq 4, 0 \leq y \leq 2$

(c) $x = 0, 0 \leq y \leq 2$ (d) none of these

16. If $a > 0$ and $z|z| + az + 3i = 0$, then z is

(a) 0

(b) purely imaginary

(c) a positive real number

(d) a negative real number

17. If $z \neq 0$ is a complex number such that $\text{Re}(z) = 0$, then

(a) $\text{Re}\,(z^2) = 0$ (b) $\text{Im}\,(z^2) = 0$

(c) $\text{Re}\,(z^2) = \text{Im}\,(z^2)$ (d) $\text{Im}\,(z^2) < 0$

18. If $z_k = \cos\left(\frac{k\pi}{10}\right) + i\sin\left(\frac{k\pi}{10}\right)$, then $z_1 z_2 z_3 z_4$ is equal to

(a) -1 (b) 2

(c) -2 (d) 1

19. If $|z_1| = |z_2| = 1$, $z_1 z_2 \neq -1$ and $z = \frac{z_1 + z_2}{1 + z_1 z_2}$ then

(a) z is a purely real number

(b) z is a purely imaginary number

(c) $|z| = 1$

(d) none of these

20. If $z \in \mathbf{C}$, then $\text{Re}(\bar{z}^2) = k^2$, $k > 0$, represents

(a) an ellipse (b) a parabola

(c) a circle (d) a hyperbola

LEVEL 1

Straight Objective Type Questions

21. If $\omega \neq 1$ is a cube root of unity, then $1, \omega, \omega^2$

(a) are vertices of an equilateral triangle

(b) lie on a straight line

(c) lie on a circle of radius $\sqrt{3/2}$

(d) none of these

22. If α, β, γ are the cube roots of p, $p < 0$, then for any x, y and z which does not make denominator zero, the expression $\frac{x\alpha + y\beta + z\gamma}{x\beta + y\gamma + z\alpha}$ equals

(a) $\omega, 1$ (b) ω, ω^2

(c) $\omega^2, 1$ (d) $1, \omega, \omega^2$

23. *ABCD* is a rhombus, its diagonal *AC* and *BD* intersect at the point *M* and satisfy $BD = 2AC$. If the points *D* and *M* are the complex numbers $1 + i$ and $2 - i$ respectively, then *A* represent the complex number.

(a) $3-\frac{1}{2}i, 1+\frac{3}{2}i$
(b) $3+\frac{1}{2}i, 1+\frac{3}{2}i$
(c) $3-\frac{1}{2}i, 1-\frac{3}{2}i$
(d) $3+\frac{1}{2}i, 1-\frac{3}{2}i$

24. Let α and β be the roots of the equation $x^2 + x + 1 = 0$. The equation whose roots are α^{19}, β^7 is
(a) $x^2 - x - 1 = 0$
(b) $x^2 - x + 1 = 0$
(c) $x^2 + x - 1 = 0$
(d) $x^2 + x + 1 = 0$

25. If ω is an imaginary cube root of unity, then the value of

$$\sin\left\{(\omega^{10} + \omega^{23})\pi - \frac{\pi}{4}\right\}$$

is
(a) $-\frac{\sqrt{3}}{2}$
(b) $-\frac{1}{\sqrt{2}}$
(c) $\frac{1}{\sqrt{2}}$
(d) $\frac{\sqrt{3}}{2}$

26. If $\omega(\neq 1)$ is a cube root of unity and $(1 + \omega)^{2017} = A + B\omega$. Then A and B are respectively the numbers
(a) 0,1
(b) 1, 1
(c) 1, 0
(d) – 1, 1

27. If $\omega(\neq 1)$ is a cube root of unity, then

$$\begin{vmatrix} 1 & 1+i+\omega^2 & \omega^2 \\ 1-i & -1 & \omega^2-1 \\ -i & -i+\omega-1 & -1 \end{vmatrix}$$

equals
(a) 0
(b) 1
(c) i
(d) ω

28. If ω $(\neq 1)$, is a cube root of unity, then value of $(1 + \omega - \omega^2)^7$ equals
(a) 128ω
(b) -128ω
(c) $128\omega^2$
(d) $-128\omega^2$

29. If $\Delta = \begin{vmatrix} 6i & -3i & 1 \\ 4 & 3i & -1 \\ 20 & 3 & i \end{vmatrix} = x + iy$, then
(a) $x = 3$, $y = 1$
(b) $x = 1$, $y = 3$
(c) $x = 0$, $y = 3$
(d) $x = 0$, $y = 0$

30. If $\arg(z) < 0$, then $\arg(-z) - \arg(z)$ equals
(a) π
(b) $-\pi$
(c) $-\frac{\pi}{2}$
(d) $\frac{\pi}{2}$

31. If z_1, z_2, z_3 are complex numbers such that

$$|z_1| = |z_2| = |z_3| = \left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right| = 1,$$

then $|z_1 + z_2 + z_3|$ is
(a) equal to 1
(b) less than 1
(c) greater than 3
(d) equal to 3

32. Let z_1 and z_2 be nth roots of unity which subtend a right angle at the origin. Then n must be of the form
(a) $4k + 1$
(b) $4k + 2$
(c) $4k + 3$
(d) $4k$

33. The complex numbers z_1, z_2 and z_3 satisfying $\frac{z_1 - z_3}{z_2 - z_3} = \frac{1}{2}(1 - \sqrt{3}i)$ are vertices of a triangle which is
(a) of area zero
(b) right-angled isosceles
(c) equilateral
(d) obtuse-angle isosceles

34. Let $\omega = -\frac{1}{2} + \frac{\sqrt{3}}{2}i$. Then the value of the determinant

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & -1-\omega^2 & \omega^2 \\ 1 & \omega^2 & \omega^4 \end{vmatrix} \text{ is}$$

(a) 3ω
(b) $3\omega(\omega - 1)$
(c) $3\omega^2$
(d) $3\omega(1 - \omega)$

35. The inequality $|z - i| < |z + i|$ represents the region
(a) $\mathrm{Re}(z) > 0$
(b) $\mathrm{Re}(z) < 0$
(c) $\mathrm{Im}(z) > 0$
(d) $\mathrm{Im}(z) < 0$

36. If $iz^3 + z^2 - z + i = 0$, then
(a) $\mathrm{Re}\, z = 0$
(b) $\mathrm{Im}\, z = 0$
(c) $|z| = 1$
(d) none of these.

37. If $x + iy = \frac{1}{1 - \cos\theta + 2i\sin\theta}$, $\theta \neq 2n\pi$, $n \in \boldsymbol{I}$, then maximum value of x is
(a) 1
(b) 2
(c) $\frac{1}{2}$
(d) $\frac{1}{3}$

38. The equation $z^3 = \bar{z}$ has
(a) no solution
(b) two solutions
(c) five solutions
(d) infinite number of solutions

39. If $z = 5 + t + i\sqrt{25 - t^2}$, $(-5 \leq t \leq 5)$, then locus of z is a curve which passes through
(a) $5 + 0i$
(b) $-2 + 3i$
(c) $2 + 4i$
(d) $-2 - 3i$

40. If $\omega \neq 1$ is a cube root of unity and satisfies

$$\frac{1}{a+\omega} + \frac{1}{b+\omega} + \frac{1}{c+\omega} = 2\omega^2$$

and $\dfrac{1}{a+\omega^2}+\dfrac{1}{b+\omega^2}+\dfrac{1}{c+\omega^2} = 2\omega$,

then the value of $\dfrac{1}{a+1}+\dfrac{1}{b+1} + \dfrac{1}{c+1}$ is

(a) 2 (b) -2

(c) $-1 + \omega^2$ (d) none of these

41. If $|z - i\,\text{Re}(z)| = |z - \text{Im}(z)|$, then z lies on

(a) $\text{Re}(z) = 2$ (b) $\text{Im}(z) = 2$,

(c) $\text{Re}(z) + \text{Im}(z) = 2$ (d) none of these

42. If ω is a complex cube root of unity, then value of expression

$$\cos\left[\{(1-\omega)(1-\omega^2) + \ldots + (12-\omega)(12-\omega^2)\}\frac{\pi}{370}\right]$$

(a) -1 (b) 0

(c) 1 (d) $\sqrt{3}/2$

43. If roots of the equation $z^2 + az + b = 0$ are purely imaginary then

(a) $(b-\bar{b})^2 + (a+\bar{a})(\bar{a}b + a\bar{b}) = 0$

(b) $(b-\bar{b})^2 + (a-\bar{a})^2 = 0$

(c) $(b+\bar{b})^2 - (a-\bar{a})^2 = 0$

(d) none of these

44. The system of equations $|z + 1 - i| = \sqrt{2}$ and $|z| = 3$ has

(a) no solution

(b) one solution

(c) two solutions

(d) infinite number of solutions

45. If $8i\,z^3 + 12z^2 - 18z + 27i = 0$, then

(a) $|z| = \dfrac{3}{2}$ (b) $|z| = \dfrac{2}{3}$

(c) $|z| = 1$ (d) $|z| = \dfrac{3}{4}$

46. If the complex number z lies on the boundary of the circle of radius 5 and centre at 4, then the greatest value of $|z + 1|$

(a) 4 (b) 5

(c) 10 (d) 9

47. If $x + iy = \dfrac{3}{\cos\theta + i\sin\theta + 2}$, then $4x - x^2 - y^2$ reduces to

(a) 2 (b) 3

(c) 4 (d) 5

48. Suppose z_1, z_2, z_3 represent the vertices A, B, and C respectively of a ΔABC with centroid at G. If the mid point of AG is the origin, then

(a) $z_1 + z_2 + z_3 = 0$ (b) $2z_1 + z_2 + z_3 = 0$

(c) $z_1 + z_2 + 4z_3 = 0$ (d) $4z_1 + z_2 + z_3 = 0$

49. Suppose that three points z_1, z_2, z_3 are connected by the relation $az_1 + bz_2 + cz_3 = 0$, where $a + b + c = 0$, then the points are

(a) vertices of a right triangle

(b) vertices of an isosceles triangle

(c) vertices of an equilateral triangle

(d) collinear

50. If the complex number $\dfrac{z-1}{z+1}$ is purely imaginary, then

(a) $|z| = 1$ (b) $|z| < 1$

(c) $|z| > 1$ (d) $|z| \geq 2$

51. If z is a complex number such that $-\pi/2 \leq \arg z \leq \pi/2$, then which of the following inequality is true.

(a) $|z - \bar{z}| \leq |z|\,|\arg(z) - \arg(\bar{z})|$

(b) $|z - \bar{z}| \leq |\arg(z) - \arg(\bar{z})|$

(c) $|z - \bar{z}| > |z|\,|\arg(z) - \arg(\bar{z})|$

(d) none of these

52. If $|\omega| = 1$, then the set of points

$z = \omega + \dfrac{1}{\omega}$ is satisfies

(a) $|\text{Re}(z)| \leq 2$ (b) $|z| \leq 1$

(c) $|z| = 1$ (d) $|\text{Im}(z)| \geq 2$

53. Number of complex numbers satisfying $|z| = 1$ and $\left|\dfrac{z}{\bar{z}} + \dfrac{\bar{z}}{z}\right| = 1$, is

(a) 0 (b) 2

(c) 4 (d) 8

54. If z_1, z_2 are two complex numbers such that $|z_1| = |z_2| = \sqrt{2}$ and $|z_1 + z_2| = \sqrt{3}$, then $|z_1 - z_2|$ equals:

(a) $2\sqrt{2}$ (b) $\sqrt{5}$

(c) 3 (d) $2-\sqrt{2}$

55. Let z_1, z_2, z_3 be three non-zero complex numbers such that $z_1\bar{z}_2 = z_2\bar{z}_3 = z_3\bar{z}_1$, then z_1, z_2, z_3

(a) are vertices of an equilateral triangle

(b) are vertices of an isosceles triangle

(c) lie on a straight line

(d) none of these

56. If $|z_1| = |z_2| = |z_3| = 1$, then value of $|z_2 - z_3|^2 + |z_3 - z_1|^2 + |z_1 - z_2|^2$ cannot exceed

(a) 3 (b) 6

(c) 9 (d) 12

57. Let z_1, z_2, z_3 be three complex number such that $z_1 + z_2 + z_3 = 0$ and $|z_1| = |z_2| = |z_3| = 1$, then $\left|z_1^2 + 2z_2^2 + z_3^2\right|$ equals

(a) 1 (b) 2
(c) 3 (d) 4

58. Let z_1, z_2, z_3 be three complex numbers such that $|z_1| = |z_2| = |z_3| = 1$ and

$$z = (z_1 + z_2 + z_3)\left(\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right),$$ then $|z|$ cannot exceed

(a) 1 (b) 3
(c) 6 (d) 9

59. Suppose z is a complex number such that $z \neq -1$, $|z| = 1$, and $\arg(z) = \theta$. Let $\omega = \frac{z(1-\bar{z})}{\bar{z}(1+z)}$, then $\text{Re}(\omega)$ is equal to

(a) $1 + \cos(\theta/2)$ (b) $1 - \sin(\theta/2)$
(c) $-2\sin^2(\theta/2)$ (d) $2\cos^2(\theta/2)$

60. Let $a = \text{Im}\left(\frac{1+z^2}{2iz}\right)$, where z is any non-zero complex number. Then the set

$$A = \{a : |z| = 1 \quad \text{and} \quad z \neq \pm 1\}$$

is equal to

(a) $(-1, 1)$ (b) $[-1, 1]$
(c) $[0, 1)$ (d) $(-1, 0]$

61. Number of complex numbers such that

$|z| = 1$ and $z = 1 - 2\bar{z}$ is

(a) 0 (b) 1
(c) 2 (d) infinite

62. Let z_1, z_2 be two complex numbers such that $z_1 \neq 0$ and z_2/z_1 is purely real, then $\left|\frac{2iz_1 + 5z_2}{2iz_1 - 5z_2}\right|$ is equal to

(a) 3 (b) 2
(c) 1 (d) 0

63. If $z = i(1+\sqrt{3})$, then $z^4 + 2z^3 + 4z^2 + 5$ is equal to

(a) 5 (b) -5
(c) $2\sqrt{3}\,i$ (d) $-2\sqrt{3}\,i$

64. Suppose $a < 0$ and z_1, z_2, z_3, z_4 be the fourth roots of a. Then $z_1^2 + z_2^2 + z_3^2 + z_4^2$ is equal

(a) $-a^2$ (b) $|a| - a$
(c) $a + |a|$ (d) a^2

65. Suppose $\arg(z) = -5\pi/13$, then $\arg\left(\frac{z+\bar{z}}{1+z\bar{z}}\right)$ is

(a) $-5\pi/13$ (b) $5\pi/13$
(c) π (d) 0

66. The number of values of $\theta \in (0, \pi]$, such that $(\cos\theta + i\sin\theta)(\cos 3\theta + i\sin 3\theta)(\cos 5\theta + i\sin 5\theta)(\cos 7\theta + i\sin 7\theta)(\cos 9\theta + i\sin 9\theta) = -1$ is

(a) 11 (b) 13
(c) 14 (d) 16

67. If $z \in \mathbf{C} - \{0, -2\}$ is such that
$\log_{(1/7)}|z - 2| > \log_{(1/7)}|z|$
then

(a) $\text{Re}(z) > 1$ (b) $\text{Re}(z) < 1$
(c) $\text{Im}(z) > 1$ (d) $\text{Im}(z) < 1$

68. $\text{Im}\left(\frac{2z+1}{iz+1}\right) = 5$ represents

(a) a circle (b) a straight line
(c) a parabola (d) an ellipse

69. Let z_1, z_2 be two complex numbers such that $\text{Im}(z_1 + z_2) = 0$ and $\text{Im}(z_1 z_2) = 0$ then

(a) $z_1 = -\bar{z}_2$ (b) $z_1 = z_2$
(c) $z_1 = \bar{z}_2$ (d) none of these

70. If $n \in \mathbf{N}$, then $\frac{(1+i)^n}{(1-i)^{n-2}}$ is equal to

(a) i^{n+1} (b) $-2i^{n+1}$
(c) i^{n+2} (d) $-2i^{n+2}$

71. Let $\omega \neq 1$, be a cube root of unity, and $f : \mathbf{I} \to \mathbf{C}$ be defined by
$f(n) = 1 + \omega^n + \omega^{2n}$, then range of f is

(a) $\{0\}$ (b) $\{0, 3\}$
(c) $\{0, 1, 3\}$ (d) $\{0, 1\}$

72. If $z + \frac{1}{z} = 2\cos\theta$, $z \in \mathbf{C}$ then $z^{2n} - 2z^n \cos(n\theta)$ is equal to

(a) 1 (b) 0
(c) -1 (d) $-n$

73. If $\omega \neq 1$ is a cube root of unity, then

$$z = \sum_{k=1}^{60} \omega^k - \prod_{k=1}^{30} \omega^k \text{ is equal to}$$

(a) 0 (b) ω
(c) ω^2 (d) -1

74. Let $g(x)$ and $h(x)$ be two polynomials with real coefficients. If $P(x) = g(x^3) + xh(x^3)$ is divisible by $x^2 + x + 1$, then

(a) $g(1) = 0, h(1) = 1$
(b) $g(1) = 1, h(1) = 0$
(c) $g(1) = 0, h(1) = 0$
(d) $g(1) = 1, h(1) = 0$

75. If $x^2 - x + 1$ divides the polynomial $x^{n+1} - x^n + 1$, then n must be of the form

(a) $3k + 1$ (b) $6k + 1$
(c) $6k - 1$ (d) $3k - 1$

Assertion-Reason Type Questions

76. **Statement-1:** $z^2 + z\,|z - 1| + |z - 1|^2 = 0,\ z \in \mathbf{C}$ has no solution in C.

    Statement-2: $z^2 + az + a^2 = 0,\ z \in \mathbf{C},\ a > 0$ has no solution in C.

77. Let $z \in C$ satisfy the relations

    $|z| = 1$ and $z = 2i + \bar{z}$

    Statement-1: z is purely imaginary.

    Statement-2: $|\arg(z)| \le \pi/6$.

78. Let $\alpha = \cos\left(\frac{8\pi}{11}\right) + i\sin\left(\frac{3\pi}{11}\right)$

    Statement-1: $\text{Re}\,(\alpha + \alpha^2 + \alpha^3 + \alpha^4 + \alpha^5) = -\frac{1}{2}$

    Statement-2: $\sum_{k=0}^{10} \alpha^k = 0$

79. Let $z = \cos\theta + i\sin\theta.\ \theta \in (0, \pi),\ \alpha = \pi/60$

    and $f(\theta) = \sum_{k=1}^{15} \sin[(2k-1)\theta]$.

    Statement-1: $f(\alpha) = \dfrac{1}{2\sin\alpha}$

    Statement-2: $z + z^3 + \ldots + z^{29} = \dfrac{z(1-z^{30})}{1-z^2}$

80. Let $\omega \ne 1$ be a cube root of unity and S be the set of all non-singular matrices of the form

    $$\begin{bmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{bmatrix}$$

    where each of a, b and c is either ω or ω^2.

    Statement-1: S contains exactly two distinct matrices.

    Statement-2: A square matrix A with complex entries is non-singular if and only if $|A| \ne 0$

81. **Statement-1:** If $|z_1|\,|z_2| = 1$, then

    $$|z_1 - z_2| = \left|\frac{1}{z_1} - \frac{1}{z_2}\right|$$

    Statement-2: $|z| = |\bar{z}|\ \forall\ z \in C$.

82. Let $f(z)$ be a polynomial in z with complex coefficients. Suppose, when $f(z)$ is divided by $z - i$, the remainder is i and when $f(z)$ is divided by $z + i$, the remainder is $1 + i$.

    Statement-1: The remainder when $f(z)$ is divided by $z^2 + 1$ is $\frac{1}{2}(iz+1)+1$

    Statement-2: If $r(z)$ is remainder when $f(z)$ is divided by $p(z)$, then
    $r(z) = 0$ or $\deg(r(z)) < \deg(p(z))$.

83. Let $a, b \in \mathbf{C}$, $a \ne 0$. Suppose z_1, z_2, z_3 are the roots of the equation $(z + ab)^3 = a^3$.

    Statement-1: Length of a side of the triangle with vertices z_1, z_2 and z_3 is $\sqrt{3}\,|a|$

    Statement-2: Roots of $z^3 = a^3$ lie on a circle of radius $|a|$.

84. **Statement-1:** The equation $z^2 - z + \pi = 0$.

    has no solution in the unit disc $|z| < 1$.

    Statement-2: $|z_1 + z_2| \le |z_1| + |z_2|\ \forall\ z_1, z_2 \in \mathbf{C}$.

85. Let $z_1 = r_1e^{i\theta}$, $z_2 = r_2e^{i\varphi}$ where $\theta, \varphi \in (-\pi, \pi]$.

    Statement-1: $|z_1 - z_2|^2 \le (r_1 - r_2)^2 + (\theta - \phi)^2$

    Statement-2: $|\sin\theta| \le |\theta|\ \forall\ \theta \in \mathbf{R}$.

LEVEL 2

Straight Objective Type Questions

86. If the complex numbers z_1, z_2, z_3, are the vertices of a parallelogram $ABCD$, then the fourth vertex is

    (a) $\frac{1}{2}(z_1 + z_2)$ (b) $\frac{1}{4}(z_1 + z_2 - z_3 - z_4)$

    (c) $\frac{1}{3}(z_1 + z_2 + z_3)$ (d) $z_1 + z_3 - z_2$

87. If a, b and c are three integers such that at least two of them are unequal and ω ($\ne 1$) is a cube root of unity, then the least value of the expression $|a + b\omega + c\omega^2|$ is

    (a) 0 (b) 1

    (c) $\frac{\sqrt{3}}{2}$ (d) $\frac{1}{2}$

88. The shaded region in Fig. 2.55 is given by

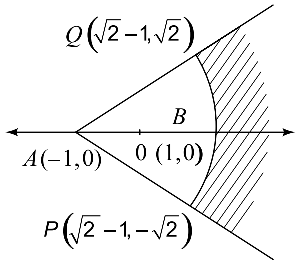

Fig. 2.55

(a) $\left\{z : |z-1| < 2, |\arg(z+1)| < \dfrac{\pi}{2}\right\}$

(b) $\left\{z : |z+1| < 2, |\arg(z+1)| < \dfrac{\pi}{2}\right\}$

(c) $\left\{z : |z-1| > 2, |\arg(z-1)| < \dfrac{\pi}{4}\right\}$

(d) $\left\{z : |z+1| > 2, |\arg(z+1)| < \dfrac{\pi}{4}\right\}$

89. Let $w = \alpha + i\beta$, $\beta \neq 0$ and $z \neq 1$. If $\dfrac{w - \bar{w}z}{1-z}$ is purely real, then the set of value of z is

(a) $\{z : |z| = 1\}$
(b) $\{z : \bar{z} = z\}$
(c) $\{z : |z| \neq 1\}$
(d) $\{z : |z| = 1, z \neq 1\}$

90. If z and w are non-zero complex numbers such that $zw = |z|^2$, then $|z - \bar{z}| + |w + \bar{w}| = 4$ represents a

(a) rectangle
(b) square
(c) rhombus
(d) trapezium

91. Let z be a complex number such that $z = 1 - t + i\sqrt{t^2 + t + 2}$, where $t \in \boldsymbol{R}$, then locus of z on the Argand plane is

(a) a parabola
(b) an ellipse
(c) a hyperbola
(d) a pair of straight line.

92. Let $z_1, z_2, \in \boldsymbol{C}$ and $a, b > 0$ be such that $a|z_1| = b|z_2|$, then $w = \dfrac{az_1 - bz_2}{az_1 + bz_2}$ lies

(a) in the 1st quadrant
(b) in the 3rd quadrant
(c) on the real axis
(d) on the imaginary axis

93. If $z \in \boldsymbol{C}$, then least value of the expression $|z| + |1 - z| + |z - 2|$ is

(a) 1
(b) 3/2
(c) 2
(d) cannot be determined

94. If $k > 0$, $k \neq 1$, and $z_1, z_2 \in \boldsymbol{C}$, then $\left|\dfrac{z - z_1}{z - z_2}\right| = k$ represents

(a) a circle
(b) an ellipse
(c) a parabola
(d) a hyperbola

95. If $z_1, z_2, z_3 \in \boldsymbol{C}$ are distinct and are such that $|z_1| = |z_2| = |z_3|$ and $z_1 + z_2 + z_3 = 0$, then z_1, z_2, z_3

(a) are vertices of a right triangle
(b) an equilateral triangle
(c) an obtuse angled triangle
(d) none of these

96. If $w = \cos(\pi/n) + i\sin(\pi/n)$, then value of $1 + w + w^2 + \cdots + w^{n-1}$ is

(a) $1 + i$
(b) $1 + i\tan(\pi/2n)$
(c) $1 + i\cot(\pi/2n)$
(d) none of these

97. Let z_1, z_2 be two non-zero complex numbers such that $|z_1 + z_2| = |z_1 - z_2|$, then $\dfrac{z_1}{\bar{z}_1} + \dfrac{z_2}{\bar{z}_2}$ equals

(a) 0
(b) 1
(c) − 1
(d) none of these

98. If $|z_1| = 2$ and $(1 - i)z_2 + (1 + i)\bar{z}_2 = 8\sqrt{2}$, then

(a) minimum value of $|z_1 - z_2|$ is 1
(b) minimum value of $|z_1 - z_2|$ is 2
(c) maximum value of $|z_1 - z_2|$ is 8
(d) maximum value of $|z_1 - z_2|$ is 4

99. If z_1 lies on $|z| = r$, then equation of tangent at z_1 is

(a) $\dfrac{z}{z_1} + \dfrac{\bar{z}}{\bar{z}_1} = 2$
(b) $\dfrac{z}{\bar{z}_1} + \dfrac{\bar{z}}{z_1} = r$
(c) $\dfrac{z}{\bar{z}_1} + \dfrac{\bar{z}}{z_1} = 2$
(d) $\dfrac{z}{z_1} + \dfrac{\bar{z}}{\bar{z}_1} = r$

100. If $z \in \boldsymbol{C}$, then minimum value of $|z - 2 + 3i| + |z - 1 + i|$ is

(a) $\sqrt{5}$
(b) $2\sqrt{5}$
(c) $\sqrt{13} - \sqrt{2}$
(d) 0

101. If $a > 0$ and $|z - a^2| + |z - 2a| = 3$ represents an ellipse then a lies in

(a) (0, 3)
(b) (0, ∞)
(c) (1, 3)
(d) (3, ∞)

102. If the points $A(z)$, $B(-z)$ and $C(1 - z)$ are the vertices of an equilateral triangle, then value of z is

(a) $1 \pm \dfrac{i\sqrt{3}}{2}$
(b) $\dfrac{1}{2}(1 \pm i)$
(c) $\dfrac{1}{4}(1 \pm \sqrt{3}i)$
(d) $\dfrac{1}{3}(1 \pm \sqrt{3}i)$

103. If $|z + 1| + |z - 3| \leq 10$, then the range of values of $|z - 7|$ is

(a) [0, 10]
(b) [3, 13]
(c) [2, 12]
(d) [7, 9]

104. If $\omega \neq 1$ is a cube root of unity and $|z-1|^2 + 2|z-\omega|^2 = 3|z-\omega^2|^2$ then z lies on
   (a) a straight line
   (b) a parabola
   (c) an ellipse
   (d) a rectangular hyperbola

105. If $x > 0$, the least value of $n \in N$ such that $\left(\frac{1+i}{1-i}\right)^n = \frac{2}{\pi}\sin^{-1}\left(\frac{1+x^2}{2x}\right)$ is
   (a) 2 (b) 4
   (c) 8 (d) 32

Previous Years' AIEEE/JEE Main Questions

1. z and w are two non-zero complex numbers such that $|z| = |w|$ and Arg z + Arg $w = \pi$, then z equals
   (a) $\overline{w}$ (b) $-\overline{w}$
   (c) w (d) $-w$ **[2002]**

2. If $|z-4| < |z-2|$, then
   (a) $\text{Re}(z) > 0$ (b) $\text{Re}(z) < 0$
   (c) $\text{Re}(z) > 3$ (d) $\text{Re}(z) > 2$ **[2002]**

3. The locus of the centre of a circle which touches the circles $|z - z_1| = a$ and $|z - z_2| = b$, $a \neq b$, externally is
   (a) an ellipse (b) a hyperbola
   (c) a circle (d) a pair of straight lines **[2002]**

4. If $\left(\frac{1+i}{1-i}\right)^x = 1$, then
   (a) $x = 2n$, where n is any positive integer
   (b) $x = 4n + 1$, where n is any positive integer
   (c) $x = 2n + 1$, where n is any positive integer
   (d) $x = 4n$, where n is any positive integer **[2003]**

5. If z and w are two non-zero complex numbers such that $|zw| = 1$, and $\text{Arg}(z) - \text{Arg}(w) = \frac{\pi}{2}$, then $\overline{z}\,w$ is equal to
   (a) -1 (b) i
   (c) $-$i (d) 1 **[2003]**

6. Let z_1 and z_2 be two roots of the equation $z^2 + az + b = 0$, z being complex. If the origin, z_1 and z_2 form an equilateral triangle, then
   (a) $a^2 = 2b$ (b) $a^2 = 3b$
   (c) $a^2 = 4b$ (d) $a^2 = b$ **[2003]**

7. Let z, w be two complex numbers such that $\overline{z} + i\overline{w} = 0$ and $\arg(zw) = \pi$, then $\arg(z)$ equals
   (a) $\frac{3\pi}{4}$ (b) $\frac{\pi}{2}$
   (c) $\frac{\pi}{4}$ (d) $\frac{5\pi}{4}$ **[2004]**

8. If $z = x - iy$ and $z^{1/3} = p + iq$, then
$$\frac{1}{p^2+q^2}\left(\frac{x}{p}+\frac{y}{q}\right)$$
   is equal to
   (a) 2 (b) -1
   (c) 1 (d) -2 **[2004]**

9. If $|z^2 - 1| = |z|^2 + 1$, then z lies on
   (a) a circle (b) the imaginary axis
   (c) the real axis (d) an ellipse **[2004]**

10. If the cube roots of unity 1, ω, ω^2, then the roots of the equation $(x-1)^3 + 8 = 0$, are
   (a) $-1, 1-2\omega, 1-2\omega^2$
   (b) $-1, 1+2\omega, 1+2\omega^2$
   (c) $-1, -1+2\omega, -1-2\omega^2$
   (d) $-1, -1, -1$ **[2005]**

11. If $w = \frac{z}{z - \frac{1}{3}i}$ and $|w| = 1$, then z lies on
   (a) straight line (b) a parabola
   (c) an ellipse (d) a circle **[2005]**

12. If z_1 and z_2 are two non-zero complex numbers such that $|z_1 + z_2| = |z_1| + |z_2|$, then arg z_1 − arg z_2 is equal to
   (a) 0 (b) $-\frac{\pi}{2}$
   (c) $\frac{\pi}{2}$ (d) π **[2005]**

13. The value of $\sum_{k=1}^{10}\left(\sin\frac{2k\pi}{11} + i\cos\frac{2k\pi}{11}\right)$ is
   (a) $-i$ (b) i
   (c) 1 (d) -1 **[2006]**

14. If $z^2 + z + 1 = 0$, where z is a complex number, then value of

$$\left(z+\frac{1}{z}\right)^2+\left(z^2+\frac{1}{z^2}\right)^2+\left(z^3+\frac{1}{z^3}\right)^2+\cdots+\left(z^6+\frac{1}{z^6}\right)^2$$ is

(a) 12 (b) 18
(c) 54 (d) 6 **[2006]**

15. If $|z + 4| \leq 3$, then the maximum value of $|z + 1|$ is

(a) 4 (b) 10
(c) 6 (d) 0 **[2007]**

16. The conjugate of a complex number is $\dfrac{1}{i-1}$. Then that number is

(a) $\dfrac{-1}{i-1}$ (b) $\dfrac{1}{i+1}$
(c) $\dfrac{-1}{i+1}$ (d) $\dfrac{1}{i-1}$ **[2008]**

17. If $\left|z-\dfrac{4}{z}\right| = 2$, then the maximum value of $|z|$ is equal to

(a) 1 (b) $2+\sqrt{2}$
(c) $\sqrt{3}+1$ (d) $\sqrt{5}+1$ **[2009]**

18. The number of complex numbers z such that $|z - 1| = |z + 1| = |z - i|$ equals

(a) 2 (b) ∞
(c) 0 (d) 1 **[2010]**

19. If $\omega(\neq 1)$ is a cube root of unity and $(1 + \omega)^7 = A + B\omega$, there (A, B)

(a) (−1, 1) (b) (0,1)
(c) (1, 1) (d) (1, 0) **[2011]**

20. Let α, β be real and z be a complex number. If $z^2 + \alpha z + \beta = 0$ has two distinct roots on the line Re $(z) = 1$, then it is necessary that

(a) $\beta \in (1, \infty)$ (b) $\beta \in (0, 1)$
(c) $\beta\,(-1, 0)$ (d) $|\beta| = 1$ **[2011]**

21. If $z \neq 1$ and $\dfrac{z^2}{z-1}$ is real, then the point represented by the complex number z lies:

(a) on a circle with centre at the origin.
(b) either on the real axis or on a circle not passing through the origin.
(c) on the imaginary-axis.
(d) either on the real axis or on a circle passing through the origin. **[2012]**

22. If z is a complex number of unit modulus and argument θ, then $\arg\left(\dfrac{1+z}{1+\overline{z}}\right)$ equals

(a) $\dfrac{\pi}{2}-\theta$ (b) θ
(c) $\pi-\theta$ (d) $-\theta$ **[2013]**

23. If $z_1 \neq 0$ and z_2 be two complex numbers such that z_2/z_1 is purely imaginary number, then $\left|\dfrac{2z_1+3z_2}{2z_1-3z_2}\right|$ is equal to:

(a) 2 (b) 5
(c) 3 (d) 1 **[2013, online]**

24. Let $a = \text{Im}\left(\dfrac{1+z^2}{2iz}\right)$, where z is any non-zero complex number. The set $A = \{a : |z| = 1 \text{ and } z \neq \pm 1\}$ is equal to:

(a) (−1, 1) (b) [−1, 1]
(c) [0, 1) (d) (−1, 0] **[2013, online]**

25†. Let $z \in \mathbf{C}$ satisfy $|z| = 1$ and $z = 1 - \overline{z}$.

Statement-1: z is a real number

Statement-2: Principal argument of z is $\pm\,\pi/3$. **[2013, online]**

26. If a complex number z satisfies $z + \sqrt{2}\,|z + 1| + i = 0$, then $|z|$ is equal to:

(a) 2 (b) $\sqrt{3}$
(c) $\sqrt{5}$ (d) 1 **[2013, online]**

27. If z is a complex number such that $|z| \geq 2$, then minimum value of $\left|z+\dfrac{1}{2}\right|$:

(a) is strictly greater than 5/2
(b) is strictly greater that 3/2 but less than 5/2
(c) is equal to 5/2
(d) lies in the interval (1, 2) **[2014]**

28. Let w (Im $w \neq 0$) be a complex number. Then the set of all complex numbers z satisfying the equation $w - \overline{w}z = k\,(1 - z)$, for some real number k, is:

(a) $\{z : |z| = 1\}$ (b) $\{z : z = \overline{z}\}$
(c) $\{z : z \neq 1\}$ (d) $\{z : |z| = 1, z \neq 1\}$ **[2014, online]**

29†. If z_1, z_2 and z_3, z_4 are 2 pairs of complex conjugate numbers and $z_1, z_3 \notin \mathbf{R}$, then

$\arg\left(\dfrac{z_1}{z_4}\right)+\arg\left(\dfrac{z_2}{z_3}\right)$ equals:

---

† Slightly modified version.

(a) 0 (b) $\frac{\pi}{2}$

(c) $\frac{3\pi}{2}$ (d) π **[2014, online]**

30. Let $z \neq -i$ be any complex number such that $\frac{z-i}{z+i}$ is a purely imaginary number. Then $z+\frac{1}{z}$ is:
   (a) 0
   (b) any non-zero real number other than 1
   (c) any non-zero real number
   (d) a purely imaginary number **[2014, online]**

31. For all complex numbers z of the form $1 + i\alpha$, $\alpha \in \mathbf{R}$ if $z^2 = x + iy$, then
   (a) $y^2 - 4x + 2 = 0$ (b) $y^2 + 4x - 4 = 0$
   (c) $y^2 - 4x + 4 = 0$ (d) $y^2 + 4x + 2 = 0$
   [2014, online]

32. A complex number z is said to be unimodular if $|z| = 1$. Suppose z_1 and z_2 are complex numbers such that $\frac{z_1 - 2z_2}{2 - z_1 z_2}$ is unimodular and z_2 is not unimodular. Then the point z_1 lies on a:
   (a) straight line parallel to the x-axis.
   (b) straight line parallel to the y-axis.
   (c) circle of radius 2.
   (d) circle of radius $\sqrt{2}$. **[2015]**

33. The largest value of r for which the region represented by the set $\{w \in \mathbf{C}: |w - 4 - i| \leq r\}$ is contained in the region represented by the set $\{z \in \mathbf{C}: |z - 1| \leq |z + i|\}$, is equal to:
   (a) $\sqrt{17}$ (b) $\sqrt{2}$
   (c) $\frac{3}{2}\sqrt{2}$ (d) $\frac{5}{2}\sqrt{2}$ **[2015, online]**

34. If z is a non-real complex number, then the minimum value of $\frac{\operatorname{Im} z^5}{(\operatorname{Im} z)^5}$ is:
   (a) – 1 (b) – 2
   (c) – 4 (d) – 5 **[2015, online]**

35. A value of θ for which $z = \frac{2+3i\sin\theta}{1-2i\sin\theta}$ is purely imaginary, is
   (a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$
   (c) $\sin^{-1}\left(\frac{\sqrt{3}}{4}\right)$ (d) $\sin^{-1}\left(\frac{1}{\sqrt{3}}\right)$ **[2016]**

36. The point represented by $2 + i$ in the Argand plane moves 1 unit eastwards, then 2 units northwards and finally from there $2\sqrt{2}$ units in the south-westwards direction. Then its new position in the Argand plane is at the point represented by:
   (a) $1 + i$ (b) $2 + 2i$
   (c) $-2- 2i$ (d) $-1 - i$ **[2016, online]**

37. Let $z = 1 + ai$ be a complex number, $a > 0$, such that z^3 is a real number. Then the sum $1 + z + z^2 + \ldots + z^{11}$ is equal to:
   (a) $1365\sqrt{3}\,i$ (b) $-1365\sqrt{3}\,i$
   (c) $-1250\sqrt{3}\,i$ (d) $1250\sqrt{3}\,i$
   [2016, online]

Previous Years' B-Architecture Entrance Examination Questions

1. $\frac{5+i\sin\theta}{5-3i\sin\theta}$ is a real number when
   (a) $\theta = \pi/4$ (b) $\theta = -\pi$
   (c) $\theta = -\pi/2$ (d) $\theta = \pi/2$ **[2006]**

2. Two points P and Q in the Argand diagram represent complex numbers z and $3z + 2 + i$. If P moves arround the circle with centre at the origin and radius 2, then Q moves on the circle, whose centre and radius are
   (a) $-2 - i$, 6 (b) $2 - i$, 3
   (c) $2 + i$, 6 (d) $2 + i$, 3 **[2007]**

3. Let z be a complex number such that $|z| = 2$, then maximum possible value of $\left|z+\frac{2}{z}\right|$ is
   (a) 1 (b) 2
   (c) 3 (d) 4 **[2008]**

4. If $i = \sqrt{-1}$, then $4+3\left(-\frac{1}{2}+i\frac{\sqrt{3}}{2}\right)^{127}+5\left(-\frac{1}{2}+i\frac{\sqrt{3}}{2}\right)^{124}$ is equal to
   (a) $4\sqrt{3}\,i$ (b) $2\sqrt{3}\,i$
   (c) $1-\sqrt{3}\,i$ (d) $1+\sqrt{3}\,i$ **[2009]**

5. The real part of a complex number z having minimum principal argument and satisfying $|z - 5i| \leq 1$ is
   (a) $\frac{2}{5}\sqrt{6}$ (b) 0
   (c) $\frac{2}{\sqrt{5}}$ (d) $-\frac{1}{5}\sqrt{6}$ **[2010]**

6. Area of a triangle with vertices given by z, iz, $z + iz$, where z is a complex number, is

(a) 0 (b) $\frac{1}{2}|z|^2$

(c) $|z|^2$ (d) $2|z|^2$ **[2011]**

7. Two circles in the complex plane are

$C_1 : |z - i| = 2$

$C_2 : |z - 1 - 2i| = 4$

then

(a) C_1 and C_2 touch each other

(b) C_1 and C_2 intersect at two distinct points

(c) C_1 lies within C_2

(d) C_2 lies within C_1 **[2012]**

8. If $z = i(i + \sqrt{2})$, then value of $z^4 + 4z^3 + 6z^2 + 4z$ is

(a) –5 (b) 3

(c) 6 (d) – 9 **[2013]**

9. Suppose z is a complex number such that $z \neq -1$, $|z| = 1$ and $\arg(z) = \theta$. Let $w = \frac{z(1-\bar{z})}{\bar{z}(1+z)}$, then Re($w$) is equal to

(a) $1+\cos\left(\frac{\theta}{2}\right)$ (b) $1-\sin\left(\frac{\theta}{2}\right)$

(c) $-2\sin^2\left(\frac{\theta}{2}\right)$ (d) $2\cos^2\left(\frac{\theta}{2}\right)$ **[2014]**

10. If $|z_1| = |z_2| = |z_3| = 1$

and $z_1 + z_2 + z_3 = \sqrt{2} + i$, then the number

$z_1\bar{z}_2 + z_2\bar{z}_3 + z_3\bar{z}_1$ is:

(a) a positive real number

(b) a negative real number

(c) always zero

(d) a purely imaginary number **[2015]**

11. Let $S = \{z \in \mathbf{C}: z(iz_1 - 1) = z_1 + 1, [z_1] < 1\}$. Then, for all $z \in S$, which one of the following is always true?

(a) Re z + Im z < 0 (b) Re z < 0

(c) Re z – Im z > 1 (d) Re z – Im z < 0 **[2016]**

Hints and Solutions

Concept-based

1. $|(1+i)z| = |\,i\,|z||$

$\Rightarrow \quad \sqrt{2}\,|z| = |z| \quad \Rightarrow \quad (\sqrt{2}-1)\,|z| = 0$

$\Rightarrow \quad |z| = 0 \quad \Rightarrow \quad z = 0$

2. $\bar{z} = \bar{a} + (\overline{b+ic})^{2015} + (\overline{b-ic})^{2015}$

$= a + (b-ic)^{2015} + (b+ic)^{2015} = z$

$\therefore \quad z$ is real and thus, $\operatorname{Im}(z) = 0$

3. $|z^2| = |-|z|| \quad \Rightarrow \quad |z|^2 = |z|$

$\Rightarrow \quad |z| = 0$ or $|z| = 1$

If $|z| = 0$, we get $z = 0$. If $|z| = 1$, we get $z^2 = -1 \Rightarrow z = \pm\, i$

4. We can write the equation as

$$\left|\frac{z-\dfrac{2}{(1+i)}}{z+\dfrac{4}{(1+i)}}\right| = k \qquad (1)$$

But $\dfrac{2}{1+i} = \dfrac{1^2-i^2}{1+i} = 1 - i$

and $\dfrac{4}{1+i} = 2(1-i)$

Therefore, (1) can be written as

$$\left|\frac{z-(1-i)}{z+2(1-i)}\right| = k \qquad (2)$$

This will not represent a circle if $k = 1$. When $k=1$, (2) represents perpendicular bisector of the segment joining $-2(1-i)$ and $1-i$.

5. As $|z| \geq 5$, $\left|\dfrac{1}{z}\right| \leq \dfrac{1}{5}$. Now

$$\left|z-\frac{1}{z}\right| \geq \left||z|-\frac{1}{|z|}\right| = |z|-\frac{1}{|z|} \geq 5-\frac{1}{5} = \frac{24}{5}$$

The least value is attained when $z = 5$.

6. $i\left(1-\cos\dfrac{2\pi}{7}\right)+\sin\dfrac{2\pi}{7}$

$$= 2i\sin^2\frac{\pi}{7}+2\sin\frac{\pi}{7}\cos\frac{\pi}{7}$$

$$= 2\sin\left(\frac{\pi}{7}\right)\left[\cos\frac{\pi}{7}+i\sin\frac{\pi}{7}\right]$$

Also, $i-1 = \sqrt{2}\left(-\dfrac{1}{\sqrt{2}}+\dfrac{i}{\sqrt{2}}\right)$

$$= \sqrt{2}\left(\cos\frac{3\pi}{4}+i\sin\frac{3\pi}{4}\right)$$

$$\therefore \quad z = \frac{\sqrt{2}}{2\sin\left(\dfrac{\pi}{7}\right)}\left[\cos\left(\frac{3\pi}{4}-\frac{\pi}{7}\right)+i\sin\left(\frac{3\pi}{4}-\frac{\pi}{7}\right)\right]$$

$$= \frac{\sqrt{2}}{2\sin\left(\dfrac{\pi}{7}\right)}\left[\cos\left(\frac{17\pi}{28}\right)+i\sin\left(\frac{17\pi}{28}\right)\right]$$

Thus, $\arg(z) = \dfrac{17\pi}{28}$

7. $(x+iy)^2\,(c+id) = a+ib$

$\Rightarrow |(x+iy)^2|\;|c+id| = |a+ib|$

$\Rightarrow |x+iy|^2\;|c+id| = |a+ib|$

$\Rightarrow (x^2+y^2)\,\sqrt{c^2+d^2} = \sqrt{a^2+b^2}$

8. $\bar{\Delta} = \dfrac{1}{-4i}\begin{vmatrix}1 & \bar{z}_1 & z_1\\ 1 & \bar{z}_2 & z_2\\ 1 & \bar{z}_3 & z_3\end{vmatrix} = \Delta$

$\Rightarrow \Delta$ is purely real $\Rightarrow \operatorname{Im}(\Delta) = 0$

9. $(a+ib)\,(x+iy) = (a+ib)\,(a-ib)\,i$

As $a \neq 0$

$x+iy = (a-ib)\,i = b+ia \Rightarrow (x, y) = (b, a)$

10. $\omega^{2017} = (\omega^3)^{672}\;\omega = \omega$

and $\omega^{2225} = (\omega^3)^{741}\;\omega^2 = \omega^2$

$\therefore \tan\,[(\omega^{2017}+\omega^{2225})\pi - \pi/3]$

$= \tan\,[(\omega+\omega^2)\pi - \pi/3]$

$= \tan\,(-\pi-\pi/3) = -\tan(\pi+\pi/3)$

$= -\tan\,(\pi/3) = -\sqrt{3}$

11. Let $z = -i\,t$ where $t > 0$, then

$i\bar{z} = i(i\,t) = -\,t$

$\therefore \arg(i\bar{z}) + \arg(z) = \pi - \pi/2 = \pi/2$

12. The inequality $a+ib < c+id$ is true if and only if $b = d = 0$ and $a > c$.

13. Let $z = x+iy$, then $z^2 = x^2-y^2+2ixy$

$\therefore \quad \operatorname{Re}(z^2) = 0 \quad \Rightarrow \quad x^2-y^2 = 0$

$\Rightarrow \quad |\operatorname{Re}(z)| = |\operatorname{Im}(z)|$

14. $\arg\left(\dfrac{z_1}{z_4}\right)+\arg\left(\dfrac{z_2}{z_3}\right)$

$$= \arg\left(\frac{z_1z_2}{z_4z_3}\right)+2k\pi = \arg\left(\frac{|z_1|^2}{|z_3|^2}\right)+2k\pi = 2k\pi$$

where $k = 0$ or 1

[$\because$ $z_1 = z_3 = i$, gives answer 2π and $z_1 = z_3 = 1$, gives answer 0]

15. $\dfrac{z-4}{2i} = \dfrac{x-4}{2i} + \dfrac{y}{2}$

For $0 \le \sin^{-1}\left(\dfrac{z-4}{2i}\right) \le \dfrac{\pi}{2}$, we must

$x - 4 = 0, \quad 0 \le \dfrac{y}{2} \le 1$

$\Rightarrow \quad x = 4, \quad 0 \le y \le 2.$

16. $z = \dfrac{-3i}{|z| + a} \quad \Rightarrow \quad z$ is purely imaginary.

17. Let $z = bi$, $b \in \mathbf{R}$, $\quad b \neq 0$,

Then $z^2 = -b^2 \in \mathbf{R}$,

Therefore $\text{Im}(z^2) = 0$

18. We have $z_k = \omega^k$ where

$\omega = \cos\left(\dfrac{\pi}{10}\right) + i \sin\left(\dfrac{\pi}{10}\right)$

Thus, $z_1\, z_2\, z_3\, z_4 = \omega . \omega^2 . \omega^3 . \omega^4 = \omega^{10}$

$= \cos\left(\dfrac{10\pi}{10}\right) + i \sin\left(\dfrac{10\pi}{10}\right)$

[by the De Movire's Theorem]

$= \cos\, \pi + i\, \sin\, \pi = -1.$

19. $\bar{z} = \dfrac{\bar{z}_1 + \bar{z}_2}{1 + \bar{z}_1\, \bar{z}_2} = \dfrac{1/z_1 + 1/z_2}{1 + 1/z_1\, z_2} = \dfrac{z_1 + z_2}{1 + z_1\, z_2} = z$

Thus, z is purely real.

20. Let $z = x + iy$, then $\bar{z}^2 = x^2 - y^2 - 2ixy$

$\therefore \quad \text{Re}(\bar{z}^2) = k^2 \Rightarrow \quad x^2 - y^2 = k^2$

which represents a hyperbola.

Level 1

21. $|1 - \omega| = |\omega - \omega^2| = |\omega^2 - 1|$

Alternatively plot the points on an argand diagram.

22. $x^3 = p = \left(p^{\frac{1}{3}}\right)^3 \Rightarrow x = p^{\frac{1}{3}},\ p^{\frac{1}{3}}\,\omega,\ p^{\frac{1}{3}}\,\omega^2.$

Let $\alpha = p^{\frac{1}{3}}$, $\beta = p^{\frac{1}{3}}\,\omega$, $\gamma = p^{\frac{1}{3}}\,\omega^2$.

$$\frac{x\alpha + y\beta + z\gamma}{x\beta + y\gamma + z\alpha} = \frac{x + y\omega + \omega^2 z}{x\omega + y\omega^2 + z} = \frac{1}{\omega} = \omega^2$$

If $\alpha = p^{\frac{1}{3}}\,\omega$, $\beta = p^{\frac{1}{3}}$, $\gamma = p^{\frac{1}{3}}\,\omega^2$, then

$$\frac{x\alpha + y\beta + z\gamma}{x\beta + y\gamma + z\alpha} = \frac{1}{\omega^2} = \omega.$$

23. $\dfrac{z - (2-i)}{1 + i - (2-i)} = \dfrac{AM}{MD}\, e^{\pm \pi i/2} \Rightarrow \dfrac{z - (2-i)}{-1 + 2i} = \dfrac{1}{2}(\pm\, i)$

$\Rightarrow z = (2 - i) + \dfrac{i}{2}(-\, 1 + 2i)$

or $z = (2 - i) - \dfrac{i}{2}(-\, 1 + 2i)$

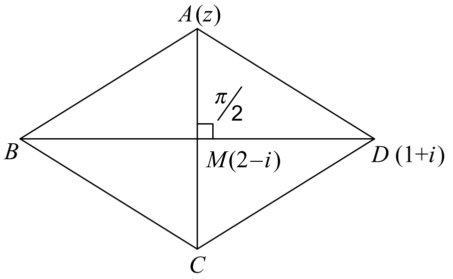

Fig. 2.56

$\Rightarrow z = 1 - \dfrac{3}{2}i$ or $z = 3 - \dfrac{1}{2}i$

24. Let $\quad \alpha = \omega$, $\beta = \omega^2$ so that $\alpha^{19} = \omega$ and $\beta^7 = \omega^2$.

$\therefore$ equation whose roots are α^{19}, β^7 is $x^2 + x + 1 = 0$.

25. Using $\omega^{10} = \omega$, $\omega^{23} = \omega^2$, we get

$$\sin\left\{\left(\omega^{10} + \omega^{23}\right)\pi - \frac{\pi}{4}\right\} = \sin\left(-\pi - \frac{\pi}{4}\right) = \sin\frac{\pi}{4} = \frac{1}{\sqrt{2}}$$

26. $(1 + \omega)^{2017} = (-\, \omega^2)^{2017} = -\, \omega^{4034} = -\, \omega^2$

$\therefore \quad A + B\omega = 1 + \omega \quad \Rightarrow \quad A = 1,\ B = 1.$

27. Use $\quad R_2 \to R_2 - R_1 - R_3$

28. $(1 + \omega - \omega^2)^7 = (-\, \omega^2 - \omega^2)^7 = -\, 2^7 \omega^{14} = -\, 128\omega^2$

29. Use $\quad C_2 \to C_2 + 3i\ C_3$.

30. Let $\alpha = \arg z < 0$, then $\arg(-z) = \pi + \alpha$,

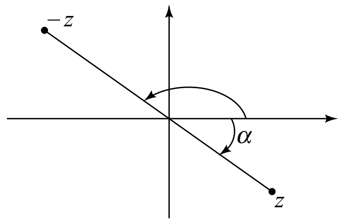

Fig. 2.57

31. $\quad |z_1| = |z_2| = |z_3| = 1$

$\Rightarrow \quad z_1\bar{z}_1 = z_2\bar{z}_2 = z_3\bar{z}_3 = 1$

$\therefore\ |z_1 + z_2 + z_3| = \left|\dfrac{1}{\bar{z}_1} + \dfrac{1}{\bar{z}_2} + \dfrac{1}{\bar{z}_3}\right| = \left|\dfrac{1}{z_1} + \dfrac{1}{z_2} + \dfrac{1}{z_3}\right| = 1$

32. nth roots of unity are given by

$$\cos\left(\frac{2m\pi}{n}\right) + i\, \sin\left(\frac{2m\pi}{n}\right) = e^{2m\pi i/n} \text{ for } m = 0, 1, 2, \cdots, n - 1.$$

Let $z_1 = e^{2m_1\pi i/n}$ and $z_2 = e^{2m_2\pi i/n}$

where $0 \le m_1,\ m_2 < n,\ m_1 \neq m_2$.

As the join of z_1 and z_2 subtend a right angle at the origin z_1/z_2 is purely imaginary we get

$$\frac{e^{2m_1\pi i/n}}{e^{2m_2\pi i/n}} = il \text{ for some real } l \Rightarrow \quad e^{2(m_1-m_2)\pi i/n} = il$$

$$\Rightarrow \cos\left[\frac{2(m_1-m_2)\pi}{n}\right] + i\sin\left[\frac{2(m_1-m_2)\pi}{n}\right] = il$$

$$\Rightarrow \cos\left[\frac{2(m_1-m_2)\pi}{n}\right] = 0 \Rightarrow \frac{2(m_1-m_2)\pi}{n} = \frac{\pi}{2}$$

$\Rightarrow n = 4(m_1 - m_2)$

Thus, n must be of the form $4k$.

33. $$\left|\frac{z_1-z_3}{z_2-z_3}\right| = \left|\frac{z_1-z_3}{z_2-z_3}\right| = \left|\frac{1-i\sqrt{3}}{2}\right|$$

$$= \sqrt{\frac{1}{4}(1+3)} = 1$$

$\Rightarrow \quad |z_1 - z_3| = |z_2 - z_3|$

Also, $\dfrac{z_1-z_3}{z_2-z_3} - 1 = \dfrac{1-i\sqrt{3}}{2} - 1$

$$\Rightarrow \quad \frac{z_1-z_2}{z_2-z_3} = \frac{-1-i\sqrt{3}}{2}$$

$$\Rightarrow \quad \frac{|z_1-z_2|}{|z_2-z_3|} = \sqrt{\frac{1}{4}(1+3)} = 1$$

$\Rightarrow \quad |z_1 - z_2| = |z_2 - z_3|$

Thus, $|z_1 - z_3| = |z_2 - z_3| = |z_2 - z_1|$

Hence, z_1, z_2 and z_3 are the vertices of an equilateral triangle.

34. Using $1 + \omega^2 = -\omega$, $\omega^4 = \omega$ and applying $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$ we get

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ 1 & \omega-1 & \omega^2-1 \\ 1 & \omega^2-1 & \omega-1 \end{vmatrix}$$

$$= (\omega - 1)^2 - (\omega^2 - 1)^2$$
$$= (\omega + \omega^2 - 2)(\omega - 1 - \omega^2 + 1)$$
$$= (-3)(\omega - \omega^2) = 3\omega(\omega - 1)$$

35. $|z - i| = |z + i|$ represents the real axis.
As $z = i$ satisfies $|z - i| < |z + i|$, we get
$|z - i| < |z + i|$, represents Im $(z) > 0$

36. $iz^3 + z^2 - z + i = 0 \quad \Rightarrow iz^3 - i^2z^2 - (z - i) = 0$
$\Rightarrow \quad iz^2(z - i) - (z - i) = 0$
$\Rightarrow \quad (iz^2 - 1)(z - i) = 0$
$\Rightarrow \quad z^2 = 1/i$ or $z = i$
In any case $|z| = 1$.

37. $$2x = (x + iy) + (x - iy) = \frac{2(1-\cos\theta)}{(1-\cos\theta)^2 + 4\sin^2\theta}$$

$$\Rightarrow \quad x = \frac{1}{5+3\cos\theta}$$

Thus, maximum value of x is 1/2. It is attained at $\theta = \pi$.

38. $z^3 = \bar{z} \Rightarrow |z^3| = |\bar{z}| \Rightarrow |z^3| = |\bar{z}|$
$\Rightarrow \quad |z| = 0$ or $|z| = 1 \Rightarrow z = 0$ or $\bar{z} = 1/z$.

$\therefore \quad z^3 = \bar{z} \Rightarrow z^3 = \dfrac{1}{z} \Rightarrow z^4 = 1$

$\Rightarrow \quad z = 1, -1, i, -i$.
Thus, solutions of $z^3 = \bar{z}$ are 0, 1, –1, i, $-i$

39. Let $\quad z = x + iy$ so that
$x = 5 + t, \quad y = \sqrt{25 - t^2}$
$\Rightarrow \quad (x - 5)^2 + y^2 = 25,$
This clearly passes through $2 + 4i$

40. Note that ω, ω^2 are roots of

$$\frac{1}{a+x} + \frac{1}{b+x} + \frac{1}{c+x} = \frac{2}{x}$$

$\Leftrightarrow \quad x[bc + ca + ab + 2(a + b + c)x + 3x^2]$
$= 2[abc + (bc + ca + ab)x + (a + b + c)x^2 + x^3]$
$\Leftrightarrow \quad x^3 - (bc + ca + ab)x - 2abc = 0.$
If α is the third root of this equation, then
$$\alpha + \omega + \omega^2 = 0 \quad \Rightarrow \quad \alpha = 1.$$

41. $z = x + iy$, $|z - i\text{Re}(z)| = |z - \text{Im}(z)|$
$\Rightarrow |x + iy - ix|^2 = |x + iy - y|^2$
$\Rightarrow x^2 + (y - x)^2 = (x - y)^2 + y^2$
$\Rightarrow x = \pm y$.

42. We have
$$(r - \omega)(r - \omega^2) = r^2 - (\omega + \omega^2)r + 1$$
$$= r^2 + r + 1 = (r + 1)^2 - r$$

$$\therefore \quad \sum_{r=1}^{12}(r-\omega)(r-\omega^2) = \sum_{r=1}^{12}\left[(r+1)^2 - r\right]$$

$$= \frac{1}{6}(13)(13+1)(26+1) - 1 - \frac{1}{2}(12)(13) = 740$$

43. Let ix ($x \in \boldsymbol{R}$) be root of $z^2 + az + b = 0$, then
$-x^2 + aix + b = 0 \qquad (1)$
$\Rightarrow \; -x^2 - \bar{a}ix + \bar{b} = 0$
Subtracting we get
$(a + \bar{a})ix + b - \bar{b} = 0$

$$\Rightarrow \quad x = -\frac{b-\bar{b}}{i(a+\bar{a})} = \frac{i(b-\bar{b})}{a+\bar{a}}$$

Putting this in (1), we get

$$\frac{(b-\bar{b})^2}{(a+\bar{a})^2} - \frac{a(b-\bar{b})}{a+\bar{a}} + b = 0$$

$\Rightarrow (b - \bar{b})^2 - a(b - \bar{b})(a + \bar{a}) + b(a + \bar{a})^2 = 0$
$\Rightarrow (b - \bar{b})^2 - (a + \bar{a})\{ab - a\bar{b} - ab - \bar{a}b\} = 0$
$\Rightarrow (b - \bar{b})^2 + (a + \bar{a})(a\bar{b} + \bar{a}b) = 0$

44. The circle $|z - (-1 + i)| = \sqrt{2}$ completely lies inside the circle $|z| = 3$.

45. $\quad 8iz^3 + 12z^2 - 18z + 27i = 0$
$\Rightarrow \quad 8iz^3 - 12i^2z^2 - 18z + 27i = 0$
$\Rightarrow \quad 4iz^2(2z - 3i) - 9(2z - 3i) = 0$

$\Rightarrow \quad (4iz^2 - 9)\ (2z - 3i) = 0$

$\Rightarrow \quad z^2 = \dfrac{9}{4i}$ or $z = \dfrac{3i}{2}$

In any case $|z| = 3/2$.

46. As – 1 lies on the circle $|z - 4| = 5$, the real number $|z + 1|$ is maximum when z is the other end point of the diameter.

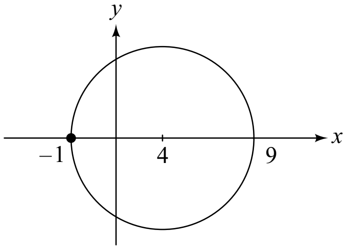

Fig. 2.58

47. $\dfrac{1}{x+iy} = \dfrac{\cos\theta+2}{3} + i\dfrac{\sin\theta}{3}$

$\Rightarrow \dfrac{x-iy}{x^2+y^2} = \dfrac{\cos\theta+2}{3} + i\dfrac{\sin\theta}{3}$

$\Rightarrow \dfrac{x}{x^2+y^2} = \dfrac{\cos\theta+2}{3}$

Also, $x^2+y^2 = \dfrac{9}{(2+\cos\theta)^2+\sin^2\theta} = \dfrac{9}{5+4\cos\theta}$

$\therefore\ 4x - (x^2 + y^2)$

$= \left(\dfrac{4(\cos\theta+2)}{3} - 1\right)(x^2+y^2)$

$= \dfrac{4\cos\theta+5}{3}\cdot\dfrac{9}{5+4\cos\theta} = 3$

48. Affix of G is $\frac{1}{3}(z_1+z_2+z_3)$.

As origin is the mid-point of AG,

$$0 = \frac{1}{2}\left[\frac{1}{3}(z_1+z_2+z_3)+z_1\right]$$

$\Rightarrow 4z_1 + z_2 + z_3 = 0.$

49. $z_3 = -\dfrac{1}{c}(az_1+bz_2) = \dfrac{az_1+bz_2}{a+b}$

50. $\dfrac{z-1}{z+1}$ = it where $t \in \mathbf{R}$. $\Rightarrow \dfrac{\bar z-1}{\bar z+1}$ = – it

$\Rightarrow \dfrac{z-1}{z+1} + \dfrac{\bar z-1}{\bar z+1} = 0$

$\Rightarrow (z - 1)(\bar z + 1) + (\bar z - 1)(z + 1) = 0$

$\Rightarrow 2(z\bar z - 1) = 0 \quad\Rightarrow\quad |z| = 1.$

51. $\left|\dfrac{z}{|z|} - \dfrac{\bar z}{|z|}\right| \le |\arg(z) - \arg(\bar z)|$

$\Rightarrow |z - \bar z| \le |z|\ |\arg(z) - \arg(\bar z)|$

52. As $|\omega| = 1 \Rightarrow |\omega|^2 = 1 \Rightarrow \omega\bar\omega = 1 \Rightarrow \dfrac{1}{\omega} = \bar\omega$.

Thus, $\quad z = \omega + 1/\omega = \omega + \bar\omega = 2\,\mathrm{Re}(\omega)$

Now, $\quad |\mathrm{Re}(z)| = |2\,\mathrm{Re}(\omega)| = |2\,\mathrm{Re}(\omega)| \le 2|\omega| = 2$

53. $|z| = 1 \Rightarrow z = \cos\theta + i\sin\theta$ for some $\theta \in [0, 2\pi)$

Now, $\quad |z| = 1 \Rightarrow |z|^2 = 1 \Rightarrow z\bar z = 1.$

Thus, $\dfrac{z}{\bar z} + \dfrac{\bar z}{z} = z^2 + \dfrac{1}{z^2}$

$= (\cos\theta + i\sin\theta)^2 + (\cos\theta - i\sin\theta)^2$

$= 2(\cos^2\theta + i^2\sin^2\theta) = 2(\cos 2\theta)$

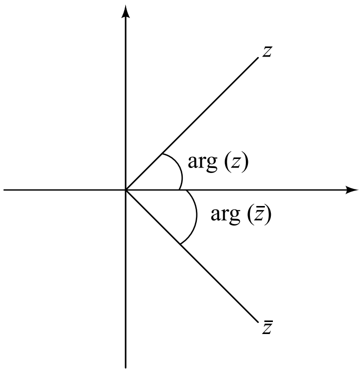

Fig. 2.59

$\therefore \quad \left|\dfrac{z}{\bar z} + \dfrac{\bar z}{z}\right| = 1 \Rightarrow |\cos 2\theta| = \dfrac{1}{2}$

$\Rightarrow \quad \cos 2\theta = \pm 1/2$

$\Rightarrow \quad 2\theta = \pi/3, 2\pi/3, 4\pi/3, 5\pi/3, 7\pi/3, 8\pi/3, 10\pi/3, 11\pi/3$

$\Rightarrow \quad \theta = \pi/6, \pi/3, 2\pi/3. 5\pi/6, 7\pi/6, 4\pi/3, 5\pi/3, 11\pi/6$

Hence, there are 8 values of z

54. $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2|z_1|^2 + 2|z_2|^2$

$\Rightarrow \quad 3 + |z_1 - z_2|^2 = 2(2) + 2(2)$

$\Rightarrow \quad |z_1 - z_2|^2 = 5 \Rightarrow |z_1 - z_2| = \sqrt{5}$.

55. $|z_1\bar z_2| = |z_2\bar z_3| = |z_3\bar z_1|$

$\Rightarrow \quad |z_1|\,|z_2| = |z_2|\,|z_3| = |z_3|\,|z_1| \Rightarrow |z_1| = |z_2| = |z_3| = r$(say)

[$\because z_1, z_2, z_3 \ne 0$]

Thus, $\quad z_1\bar z_1 = z_2\bar z_2 = z_3\bar z_3$

Now, $\quad z_1\bar z_2 = z_2\bar z_3 = z_3\bar z_1$

$\Rightarrow \quad \dfrac{z_1}{z_2} = \dfrac{z_2}{z_3} = \dfrac{z_3}{z_1}$

$\Rightarrow \quad z_1^2 = z_2z_3, \quad z_2^2 = z_3z_1,\ z_3^2 = z_1z_2$

Hence, $z_1^2 + z_2^2 + z_3^2 = z_2z_3 + z_3z_1 + z_1z_2$

$\Rightarrow z_1, z_2, z_3$ are vertices of an equilateral triangle.

56. $|z_1 + z_2 + z_3| \ge 0$

$\Rightarrow \quad |z_1|^2 + |z_2|^2 + |z_3|^2 + 2\mathrm{Re}\left(z_1\bar z_2 + z_2\bar z_3 + z_3\bar z_1\right) \ge 0$

$\Rightarrow \quad \mathrm{Re}\left(z_1\bar z_2 + z_2\bar z_3 + z_3\bar z_1\right) \ge -\dfrac{3}{2}$

Now, $\quad |z_2 - z_3|^2 + |z_3 - z_1|^2 + |z_1 - z_2|^2$

$= 6 - 2\mathrm{Re}\left(z_1\bar z_2 + z_2\bar z_3 + z_3\bar z_1\right)$

$\leq \; 6 - (-3) = 9$

57. $z_1 + z_2 + z_3 = 0 \Rightarrow \bar{z}_1 + \bar{z}_2 + \bar{z}_3 = 0$

$$\Rightarrow \frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} = 0 \qquad [\because\ z_1\bar{z}_1 = 1 \text{ etc.}]$$

Now, $0 = (z_1 + z_2 + z_3)^2 = z_1^2 + z_2^2 + z_3^2 + 2\,(z_2z_3 + z_3z_1 + z_1z_2)$

$$\Rightarrow \quad 0 = z_1^2 + z_2^2 + z_3^2 + 2z_1z_2z_3\left(\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right)$$

$$= z_1^2 + z_2^2 + z_3^2$$

Thus, $\left|z_1^2 + 2z_2^2 + z_3^2\right| = \left|z_1^2 + z_2^2 + z_3^2 + z_2^2\right|$

$$= \left|0 + z_2^2\right| = |z_2|^2 = 1$$

58. Note that $\dfrac{1}{z_1} = \bar{z}_1$ etc. Thus,

$z = (z_1 + z_2 + z_3)\ (\bar{z}_1 + \bar{z}_2 + \bar{z}_3)$

$= |z_1 + z_2 + z_3|^2 \leq (|z_1| + |z_2| + |z_3|)^2 = 9$

The maximum value is obtained when $z_1 = z_2 = z_3 = 1$.

59. $$\omega = \frac{z - z\bar{z}}{\bar{z} + \bar{z}\,z} = \frac{z-1}{1/z + 1} = \frac{(z-1)z}{z+1} \qquad [\because\ |z| = 1]$$

$$= \frac{z^2-1}{z+1} - \frac{z-1}{z+1} = z - 1 + \frac{1-z}{1+z}$$

$$\text{Re}(\omega) = \text{Re}(z) - 1 + \text{Re}\left(\frac{1-z}{1+z}\right)$$

But $$\text{Re}\left(\frac{1-z}{1+z}\right) = \frac{1}{2}\left(\frac{1-z}{1+z} + \frac{1-\bar{z}}{1+\bar{z}}\right)$$

$$= \frac{1}{2}\left(\frac{1-z}{1+z} + \frac{z-1}{z+1}\right) = 0$$

$\therefore \quad \text{Re}(\omega) = \cos\theta - 1 = -2\sin^2(\theta/2)$

60. Let $\omega = \dfrac{1+z^2}{2iz}$. $\text{Im}(\omega) = \dfrac{1}{2}(\omega - \bar{\omega})$

For $|z| = 1$, $$\bar{\omega} = \frac{1+\bar{z}^2}{-2i\bar{z}} = \frac{1+(1/z)^2}{-2i(1/z)}$$

$$= \frac{z^2+1}{-2iz} = -\omega$$

Thus, $\text{Im}(\omega) = \dfrac{1}{2i}(\omega + \omega) = -i\omega$

$$= -\frac{1}{2}\left(z + \frac{1}{z}\right) = -\frac{1}{2}(z + \bar{z})$$

$$= -\frac{1}{2}(2\cos\theta) = -\cos\theta$$

$[\because\ |z| = 1 \Rightarrow z = \cos\theta + i\sin\theta]$

As $z \neq 1$, $\theta \neq 0$ and as $z \neq -1$, $\theta \neq \pi$,

$\therefore \quad A = (-1, 1)$

61. $|z| = 1 \Rightarrow z\bar{z} = 1$. Therefore $z = 1 - 2\bar{z}$

$\Rightarrow \quad z = 1 - 2/z \quad \Rightarrow \quad z^2 - z + 2 = 0$

$\Rightarrow \quad z = \dfrac{1 \pm \sqrt{7}\,i}{2}$, but then $|z| \neq 1$.

62. Suppose $z_2/z_1 = a$, where $a \in \mathbf{R}$.

Now, $$\left|\frac{2iz_1 + 5z_2}{2iz_1 - 5z_2}\right| = \left|\frac{2i + 5(z_2/z_1)}{2i - 5(z_2/z_1)}\right| = \left|\frac{2i + 5a}{2i - 5a}\right| = 1$$

63. $z = i\left(1 + \sqrt{3}\right) = -1 + \sqrt{3}\,i = 2\omega$

where $\omega \neq 1$ is a cube root of unity.

$\therefore \quad z^4 + 2z^3 + 4z^2 + 5$

$= (2\omega)^4 + 2\,(2\omega)^3 + 4\,(2\omega)^2 + 5$

$= 16\omega^4 + 16\omega^3 + 16\omega^2 + 5$

$= 16\,(\omega + 1 + \omega^2) + 5 = 16\,(0) + 5 = 5$

64. Let $a = -\,b^4$ where $b > 0$.

Then $z^4 = a = b^4(-1)$

$$\Rightarrow z = b\left(\pm\cos\frac{\pi}{4} \pm i\sin\frac{\pi}{4}\right)$$

$\therefore \quad z_1^2 + z_2^2 + z_3^2 + z_4^2$

$$= 2b^2\left[\cos\left(\frac{\pi}{2}\right) - i\sin\left(\frac{\pi}{2}\right) + \cos\left(\frac{\pi}{2}\right) + i\sin\left(\frac{\pi}{2}\right)\right]$$

$= 0 = a + |a| \qquad [\because\ a < 0]$

65. As $\dfrac{z+\bar{z}}{1+z\bar{z}}$ is a positive real number,

$$\arg\left(\frac{z+\bar{z}}{1+z\bar{z}}\right) = 0.$$

66. Using $(\cos\alpha + i\sin\alpha)(\cos\beta + i\sin\beta)$

$= \cos(\alpha + \beta) + i\sin(\alpha + \beta)$,

we get

$\cos(25\theta) = -1, \quad \sin(25\theta) = 0$

$\Rightarrow \quad 25\theta = (2k + 1)\pi,\ k \in \mathbf{I}$.

Now, $0 < \dfrac{(2k+1)\pi}{25} \leq \pi$

$\Rightarrow \quad 1 \leq (2k + 1) \leq 25$

$\Rightarrow \quad k = 0, 1, 2, \ldots, 12$

67. $\log_{(1/7)}|z - 2| > \log_{(1/7)}|z|$

$\Rightarrow \quad |z - 2| < |z| \qquad (1)$

But $|z - 2| = |z|$ represents perpendicular bisector of the segment joining 0 and 2, that is, $|z - 2| = |z|$ represents the line $\text{Re}(z) = 1$. As 0 does not satisfy (1), we get (1) represents $\text{Re}(z) > 1$.

68. $$\frac{1}{2i}\left[\frac{2z+1}{iz+1} - \frac{2\bar{z}+1}{-i\bar{z}+1}\right] = 5$$

$\Rightarrow \quad (2z + 1)(i\bar{z} - 1) + (2\bar{z} + 1)(iz + 1)$

$\quad = 10\, i\,(iz + 1)(i\bar{z} - 1)$

$\Rightarrow \quad 4iz\bar{z} + (-2 + i)z + (2 + i)\bar{z}$

$\quad = 10\, i\,(-z\bar{z} - iz + i\bar{z} - 1)$

$\Rightarrow \quad 14iz\bar{z} + (8 + i)z + (-8 + i)\bar{z} - 10\,i = 0$

$\Rightarrow \quad z\bar{z} + \frac{1}{14}(1 - 8i)z + \frac{1}{14}(1 + 8i)\bar{z} - \frac{5}{7} = 0$

This represents a circle.

69. Take z_1 and z_2 as two real numbers.

70. $\frac{(1+i)^n}{(1-i)^{n-2}} = \left(\frac{1+i}{1-i}\right)^{n-2}(1+i)^2 = \left(\frac{-i^2+i}{1-i}\right)^{n-2}(2i)$

$\quad = i^{n-2}(2i) = 2i^{n-1} = -2i^{n+1}$

71. If $n = 3k$, $k \in \mathbf{I}$, then $f(n) = 1 + 1 + 1 = 3$

If $n = 3k + 1$, $k \in \mathbf{I}$, then $f(n) = 1 + \omega + \omega^2 = 0$

If $n = 3k + 2$ $k \in \mathbf{I}$, then $f(n) = 1 + \omega^2 + \omega = 0$

Thus, range of f is $\{0, 3\}$.

72. $z + \frac{1}{z} = 2\cos\theta \Rightarrow z^2 - 2z\cos\theta + 1 = 0$

$\Rightarrow \quad z = \cos\theta \pm i\sin\theta$

Now, $z^{2n} - 2z^n\cos(n\theta)$

$\quad = z^n[z^n - 2\cos(n\theta)]$

$\quad = z^n[\cos(n\theta) \pm i\sin(n\theta) - 2\cos(n\theta)]$

$\quad = -z^n\bar{z}^n = -1$

73. Using $\omega^k + \omega^{k+1} + \omega^{k+2} = 0\ \forall\ k \in \mathbf{I}$,

we get $\sum_{k=1}^{60}\omega^k = 0$

Next, $\prod_{k=1}^{30}\omega^k = \omega^m =$ where

$m = 1 + 2 + \ldots + 30 = \frac{1}{2}(30)(31) = 465$

$\therefore \quad \prod_{k=1}^{30}\omega^k = \omega^{465} = 1$

74. $x^2 + x + 1 = (x - \omega)(x - \omega^2)$

Therefore, ω, ω^2 are zeros of $P(x)$

$0 = g(1) + \omega h(1)$ and $0 = g(1) + \omega^2 h(1)$

$\Rightarrow g(1) = 0,\ h(1) = 0.$

75. $x^2 - x + 1 = (x + \omega)(x + \omega^2)$

Therefore, $-\omega$, $-\omega^2$ must be zeros of $x^{n+1} - x^n + 1$. Now,

$(-\omega)^{n+1} - (-\omega)^n + 1 = (-1)^{n+1}\omega^n(\omega + 1) + 1$

$\quad = (-1)^{n+1}\omega^n(-\omega^2) + 1$

$\quad = (-1)^{n+2}\omega^{n+2} + 1$

$\quad = 0$ if $n = 6k + 1$

76. Clearly $z \neq 0, 1$. We can write the given equation as $t^2 + t + 1 = 0$ where

$t = z/|z - 1|$

$\Rightarrow \quad t = \omega, \omega^2$ where $\omega \neq 1$ is a cube root of unity.

Thus, $\frac{z}{|z-1|} = \omega$

$\Rightarrow \quad |z| = |z - 1|\,|\omega| = |z - 1|$

$\Rightarrow$ z lies on the perpendicular bisector of the segment joining $z = 0$ and $z = 1$, that is, z lies on $\text{Re}(z) = 1/2$. Let $z = 1/2 + ai$ where $a \in \mathbf{R}$.

Note that $a \neq 0$ since $z = 1/2$ does not satisfy $z^2 + z|z - 1| + |z - 1|^2 = 0$

Putting $z = 1/2 + ai$ in $z^2 + z|z - 1| + |z - 1|^2 = 0$ and equating imaginary parts of both sides, we get

$a + a|z - 1| = 0 \Rightarrow |z - 1| = -1.$

A contradiction.

Thus $z^2 + z\,|z - 1| - |z + 1|^2 = 0$ has no solution in C, that is, statement-1 is true.

Statement-2 is false as $a\omega$, $a\omega^2$ are solutions of $z^2 + az + a^2 = 0$.

77. $z = 2i + \bar{z} \quad \Rightarrow \quad z - \bar{z} = 2i$

$\Rightarrow \quad 2i\,\text{Im}(z) = 2i \quad \Rightarrow \quad \text{Im}(z) = 1$

As $|z| = 1$, we get $z = \pm\, i$

Thus, statement-1 is true.

As $\arg(i) = \pi/2$ and $\arg(-i) = -\pi/2$,

$\therefore$ Statement-2 is false.

78. Note that

$\alpha = \cos\left(\frac{8\pi}{11}\right) + i\sin\left(\pi - \frac{8\pi}{11}\right)$

$\quad = \cos\left(\frac{8\pi}{11}\right) + i\sin\left(\frac{8\pi}{11}\right)$

$\therefore\ \alpha^{11} = \cos(8\pi) + i\sin(8\pi) = 1$

[De Moivre's Theorem]

Now, $\sum_{k=0}^{10}\alpha^k = \frac{1 - \alpha^{11}}{1 - \alpha} = 0$

$\therefore$ Statement-2 is true

We have $\bar{\alpha} = \frac{\alpha\bar{\alpha}}{\alpha} = \frac{1}{\alpha} = \alpha^{10}$ etc.

Thus,

$\text{Re}\,(\alpha + \alpha^2 + \alpha^3 + \alpha^4 + \alpha^5)$

$$= \frac{1}{2}(\alpha+\alpha^2+\alpha^3+\alpha^4+\alpha^5+\bar{\alpha}+\bar{\alpha}^2+\bar{\alpha}^3+\bar{\alpha}^4+\bar{\alpha}^5)$$

$$= \frac{1}{2}\sum_{k=1}^{10}\alpha^k = \frac{1}{2}(-1) = -\frac{1}{2} \qquad \text{[Use statement-2]}$$

∴ Statement-1 is also correct and Statement-2 is a correct explanation for it.

Statement-2 is true as it is formula for sun of a G.P.

79. $z^k = \cos(k\theta) + i\sin(k\theta)$

$$f(\theta) = \sum_{k=1}^{15}\operatorname{Im}(z^{2k-1})$$

$$= \operatorname{Im}\left(\sum_{k=1}^{15} z^{2k-1}\right)$$

$$= \operatorname{Im}\left(\frac{z(1-z^{30})}{1-z^2}\right)$$

But $z^{30} = \cos(30\ \theta) + i\sin(30\ \theta)$

When $\theta = \alpha = \pi/60$, $z^{30} = 0 + i = i$

$$\therefore f(\alpha) = \operatorname{Im}\left(\frac{z(1-z^{30})}{1-z^2}\right)$$

$$= \operatorname{Im}\left(\frac{1-i}{1/z-z}\right)$$

$$= \operatorname{Im}\left(\frac{1-i}{-2i\sin\alpha}\right)$$

$$= \frac{1}{2\sin\alpha}\operatorname{Im}(1+i) = \frac{1}{2\sin\alpha}$$

80. Statement-2 is true. See theory of chapter 5 on matrices.

Let $A = \begin{bmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{bmatrix}$,

$$|A| = 1\begin{vmatrix} 1 & c \\ \omega & 1 \end{vmatrix} - a\begin{vmatrix} \omega & c \\ \omega^2 & 1 \end{vmatrix} + b\begin{vmatrix} \omega & 1 \\ \omega^2 & \omega \end{vmatrix}$$

$= 1 - c\omega - a(\omega - c\omega^2)$

$= (1 - a\omega)(1 - c\omega)$

Note that $|A| = 0$ if $a = \omega^2$ or $c = \omega^2$

Thus, $|A| \neq 0$ if $a = c = \omega$ and $b = \omega$ or ω^2

∴ S contains exactly two distinct elements.

81. $|z_1 - z_2| - \left|\frac{1}{z_1} - \frac{1}{z_2}\right|$

$$= |z_1 - z_2| - \frac{|z_2 - z_1|}{|z_1||z_2|}$$

$$= |z_1 - z_2| - |z_2 - z_1| = 0$$

∴ Statement-1 is true.

Statement-2 is also true but a correct explanation for truth of statement-1.

82. Statement-2 is a true statement.
Suppose $f(z) = (z^2 + 1)\,q(z) + r(z)$.
If $r(z) \neq 0$, then $r(z) = az + b$
where $a, b \in \mathbf{C}$.
We have

$$i = f(i) = (i^2 + i)\,q(i) + ai + b$$

$\Rightarrow \quad ai + b = i$

Also, $1 + i = f(-i) = ((-i)^2 + 1)\,q(-i) - ai + b$

$\Rightarrow \quad -ai + b = 1 + i$

$\therefore \quad b = \frac{1}{2} + i, \ a = \frac{1}{2}i$

Thus, $az + b = \frac{1}{2}(iz + 1) + i$

83. Statement-2 is true, as $z^3 = a^3 \Rightarrow |z|^3 = |a|^3$
$\Rightarrow |z| = |a|$
Next,
$(z + ab)^3 = a^3$
$\Rightarrow \quad z + ab = a, aw, aw^2$
Let $z_1 = a - ab$, $z_2 = aw - ab$
and $z_3 = aw^2 - ab$

We gave $|z_2 - z_1| = |a||w - 1| = \sqrt{3}a$,

$|z_3 - z_2| = \sqrt{3}a$, $|z_1 - z_3| = \sqrt{3}a$

Thus, statement-1 is also true, but statement-2 is not a correct explanation of statement-1.

84. Statement-2 is true. See Theory. Let α be a root of $z^2 - z + \pi = 0$ and suppose $|\alpha| < 1$. We have

$$\pi = |\pi| = |\alpha - \alpha^2| \leq |\alpha| + |\alpha|^2 < 2$$

A contradiction.

Thus, statement-1 is also true and statement-2 is a correct explanation for it.

85. We know that $|\sin\theta| \leq \theta \quad \forall\ \theta \geq 0$.

If $\theta < 0$, then $|\sin(-\theta)| \leq -\theta \Rightarrow |\sin\theta| \leq |\theta|$

Thus, $|\sin\theta| \leq |\theta|\ \forall\ \theta \in \mathbf{R}$ and statement-2 is true.

Now, $|z_1 - z_2|^2 = (r_1\cos\theta - r_2\cos\varphi)^2 + (r_1\sin\theta - r_2\sin\varphi)^2$

$$= r_1^2 + r_2^2 - 2r_1r_2\cos(\theta - \varphi)$$

$$= (r_1 - r_2)^2 + 4r_1r_2\sin^2\left(\frac{\theta - \varphi}{2}\right)$$

$$\leq (r_1 - r_2)^2 + 4(1)(1)\left(\frac{\theta - \phi}{2}\right)^2$$

Thus, Statement-1 is also true and Statement-2 is a correct explanation for it.

Level 2

86. As $ABCD$ is a parallelogram,

mid point of AC = mid point of BD

$$\Rightarrow \frac{1}{2}(z_1+z_3) = \frac{1}{2}(z_2+z_4)$$

$\Rightarrow z_4 = z_1 + z_3 - z_2$

87. $|a + b\omega + c\omega^2|^2 = (a + b\omega + c\bar{\omega})\ (a + b\bar{\omega} + c\omega)$

$= a^2 + b^2 + c^2 - bc - ca - ab$

$= \frac{1}{2}\left[(b-c)^2+(c-a)^2+(a-b)^2\right]$

As a, b, c are integers and at least two of them are unequal, we get,

$(b - c)^2 + (c - a)^2 + (a - b) \geq 2.$

Thus, $|a + b\omega + c\omega^2|^2 \geq 1 \Rightarrow |a + b\omega + c\omega^2| \geq 1$

Least value 1 is attained when $a = 2$, $b = 1$, $c = 1$.

88. We have $AP = AB = AQ = 2$

Thus, for the shaded region $|z + 1| > 2$

Also, $\angle BAQ = \tan^{-1}\left(\frac{\sqrt{2}}{\sqrt{2}-1+1}\right) = \frac{\pi}{4}$

and $\angle BAP = -\pi/4$

Hence, for the shaded region

$|z + 1| > 2$ and $|\arg(z + 1)| < \pi/4$

89. As $\frac{w-\bar{w}z}{1-z}$ is purely real,

$$\frac{w-\bar{w}z}{1-z} = \frac{\bar{w}-w\bar{z}}{1-\bar{z}}$$

$\Rightarrow (1 - \bar{z})\ (w - \bar{w}z) = (1 - z)\ (\bar{w} - w\bar{z})$

$\Rightarrow (w - \bar{w})\ (1 - z\bar{z}) = 0$

As $w \neq \bar{w}$, we get $z\bar{z} = 1$

Thus, set of values of z is

$\{z: |z| = 1, z \neq 1\}$.

90. $zw = |z|^2 \Rightarrow zw = z\bar{z} \Rightarrow w = \bar{z}$

Thus, $|z - \bar{z}| + |w + \bar{w}| = 4$

$\Rightarrow |z - \bar{z}| + |\bar{z} + z| = 4$

$\Rightarrow |2iy| + |2x| = 4$

$\Rightarrow |x| + |y| = 2$

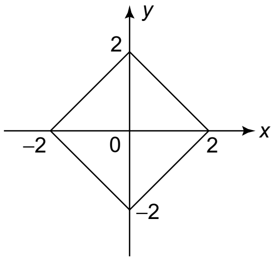

Fig. 2.60

This represents a square. See Fig. 2.60.

91. Let $z = x + iy$, then

$x = 1 - t,\ y = \sqrt{t^2+t+2}$

$\Rightarrow t = 1 - x$ and $y^2 = t^2 + t + 2 = (t + 1/2)^2 + 7/4$

$\Rightarrow y^2 = (x - 3/2)^2 + 7/4.$

This represents a hyperbola.

92. $w+\bar{w} = \frac{az_1-bz_2}{az_1+bz_2} + \frac{a\bar{z}_1-b\bar{z}_2}{a\bar{z}_1+b\bar{z}_2}$

$$= \frac{(az_1-bz_2)(a\bar{z}_1+b\bar{z}_2)+(a\bar{z}_1-b\bar{z}_2)(az_1+bz_2)}{|az_1+bz_2|^2}$$

$$= \frac{a^2\ z_1\ \bar{z}_1 - b^2\ z_2\ \bar{z}_2}{|az_1+bz_2|^2} = 0\ [\because\ a\ |z_1| = b\ |z_2|]$$

$\Rightarrow w$ lies on the imaginary axis.

93. $|z| + |1 - z| + |z - 2|$

$\geq \max\ \{|z|, |(1 - z) + (z - 2)|, |z + (1 - z)| + |z - 2|, |1 - z| + |z - (z - 2)|\} = 2$

The value 2 is attained when $z = 1$

94. See Theory.

95. $|z_2 - z_3|^2 + |z_1|^2 = |z_2 - z_3|^2 + |-z_2 - z_3|^2$

$\Rightarrow |z_2 - z_3|^2 + 1 = 2|(|z_2|^2 + |z_3|^2) = 4$

$\Rightarrow |z_2 - z_3| = \sqrt{3}$

Similarly, $|z_3 - z_1| = |z_1 - z_2| = \sqrt{3}$

Thus, z_1, z_2, z_3 are vertices of an equilateral triangle.

96. $1 + w + w^2 + \ldots + w^{n-1}$

$$= \frac{1-w^n}{1-w} = \frac{1-\cos\pi+i\sin\pi}{1-\cos(\pi/n)-i\sin(\pi/n)}$$

$$= \frac{2}{2\sin^2(\pi/2n) - 2i\sin(\pi/2n)\cos(\pi/2n)}$$

$$= \frac{2}{-2i\sin(\pi/2n)\left[\cos(\pi/2n)+i\sin(\pi/2n)\right]}$$

$$= \frac{\cos(\pi/2n) - i\sin(\pi/2n)}{-i\sin(\pi/2n)} = 1 + i\cot\left(\frac{\pi}{2n}\right)$$

97. $|z_1 + z_2|^2 = |z_1 - z_2|^2$

$\Rightarrow |z_1|^2 + |z_2|^2 + z_1\bar{z}_2 + \bar{z}_1 z_2$

$= |z_1|^2 + |z_2|^2 - z_1\bar{z}_2 - \bar{z}_1 z_2$

$\Rightarrow 2(z_1\bar{z}_2 + \bar{z}_1 z_2) = 0 \Rightarrow \frac{z_1}{\bar{z}_1} + \frac{z_2}{\bar{z}_2} = 0$

98. z_1 lies on the circle $|z| = 2$ and z_2 lies on the line $x + y = 4\sqrt{2}$

Distance of $x + y = 4\sqrt{2}$ from (0, 0) is 4

Thus, minimum distance between z_1 and z_2 is 2.

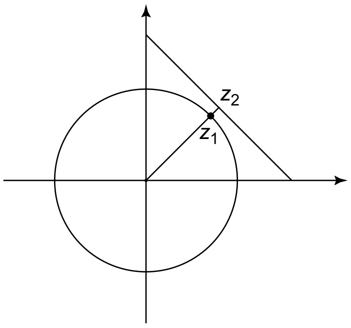

Fig. 2.61

Alternative Solution

Distance of $z_1 = 2(\cos\theta + i\sin\theta)$ from $x + y = 4\sqrt{2}$, is

$$\frac{\left|2\cos\theta + 2\sin\theta - 4\sqrt{2}\right|}{\sqrt{2}}$$

$= \sqrt{2}\ (2\sqrt{2} - (\cos\theta + \sin\theta))$

Maximum possible value of $\cos\theta + \sin\theta$ is $\sqrt{2}$.

99. Let $z_1 = r(\cos\theta + i\sin\theta)$.

Equation of tanget to $x^2 + y^2 = r^2$ at $(r\cos\theta, r\sin\theta)$ is $x\cos\theta + y\sin\theta = r$

$$\Rightarrow \left(\frac{z+\bar{z}}{2}\right)\left(\frac{z_1+\bar{z}_1}{2}\right) + \left(\frac{z-\bar{z}}{2i}\right)\left(\frac{z_1-\bar{z}_1}{2i}\right) = r^2$$

$\Rightarrow z\bar{z}_1 + \bar{z}z_1 = 2r^2$

$\Rightarrow \frac{z}{z_1} + \frac{\bar{z}}{\bar{z}_1} = 2.$

100. Using $|z_1| + |z_2| \ge |z_1 - z_2|$, we get

$|z - 2 + 3i| + |z - 1 + i| \ge |-1 + 2i| = \sqrt{5}$

101. $|z - a^2| + |z - 2a| = 3$ will represent an ellipse if

$|a^2 - 2a| < 3$

$\Leftrightarrow -3 < a^2 - 2a < 3$

$\Leftrightarrow -2 < (a - 1)^2 < 4$

$\Leftrightarrow (a - 1)^2 < 4 \Leftrightarrow -1 < a < 3 \Leftrightarrow a \in (0, 3)$

102. As $AB = BC = CA$, we get

$2|z| = |1| = |1 - 2z|$

$\Rightarrow |z| = \frac{1}{2}$ and $|z - \frac{1}{2}| = \frac{1}{2}$

$\Rightarrow z$ is the point of intersection of circles

$|z| = 1/2$ and $|z - 1/2| = 1/2$

$\Rightarrow z = \frac{1}{4}\left(1 \pm \sqrt{3}i\right)$

103. $|z + 1| + |z - 3| \le 10$ represents the ellipse with focii at (–1, 0), and (3, 0) and length of major axis 10. Its centre is (1, 0), and its equation is

$$\frac{(x-1)^2}{25} + \frac{y^2}{21} = 1$$

Any point on the ellipse is $P(1 + 5\cos\theta, \sqrt{21}\sin\theta)$.

Its distance from A (7, 0) is given by

$AP^2 = (5\cos\theta + 8)^2 + 21\sin^2\theta$

$= (2\cos\theta + 20)^2 - 20^2 + 85$

$\Rightarrow 18^2 - 20^2 + 85 \le AP^2 \le 22^2 - 20^2 + 85$

$\Rightarrow 9 \le AP^2 \le 169$

$\Rightarrow 3 \le AP \le 13$

104. $|z - 1|^2 + 2|z - w|^2 = 3|z - w^2|^2$

$\Rightarrow |z|^2 + 1 - z - \bar{z} + 2[|z|^2 + 1 - z\bar{w} - \bar{z}w]$

$= 3[|z|^2 + 1 - z\bar{w}^2 - \bar{z}w^2]$

$\Rightarrow (3w - 2w^2 - 1)z + (3w^2 - 2w - 1)\bar{z} = 0$

which represents a straight line.

105. As R.H.S is real, L.H.S must be real.

Also, $\left(\frac{1+i}{1-i}\right) = \left(\frac{i-i^2}{1-i}\right)^n = i^n$ is real when n is even.

As $x > 0$ and $\frac{1+x^2}{2x} = \frac{1}{2}\left(x + \frac{1}{x}\right) > 1$ for $x \ne 1$.

Thus, we get only possible value of x is 1.

$\therefore$ RHS = 1, thus, least value of n is 4.

Previous Years' AIEEE/JEE Main Questions

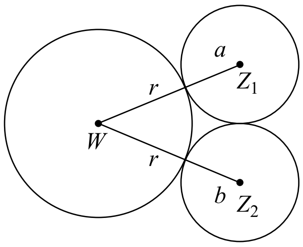
1. Let $|z| = |w| = r$ and Arg $(w) = \theta$,
   so that Arg $(z) = \pi - \theta$. We have
   $$z = r[\cos(\pi - \theta) + i\sin(\pi - \theta)]$$
   $$= r[-\cos\theta + i\sin\theta]$$
   $$= -r(\cos\theta - i\sin\theta) = -\bar{w}$$

2. 
   If z satisfies $|z - 4| = |z - 2|$, then z lies on the perpendicular bisector of the segment joining $z = 2$ and $z = 4$.
   i.e., $|z - 4| = |z - 2| \Rightarrow \text{Re}(z) = 3$.

   As $z = 0$ does not satisfy $|z - 4| < |z - 2|$, we get $|z - 4| < |z - 2|$ represents the region $\text{Re}(z) > 3$.

3. Suppose $|z - w| = r$ touches $|z - z_1| = a$ and $|z - z_2| = b$ externally.

   Then $|w - z_1| = a + r$, $|w - z_2| = b + r$
   $\Rightarrow$ $|w - z_1| - |w - z_2| = a - b$
   $\Rightarrow$ w lies on a hyperbola with foci at z_1 and z_2



4. As $1 = -i^2$,
   $$1 = \left(\frac{1+i}{1-i}\right)^x = \left(\frac{-i^2+i}{1-i}\right)^x = \left(\frac{i(1-i)}{1-i}\right)^x = i^x$$
   $\Rightarrow x = 4n$ for some $n \in \mathbf{N}$.

5. $|\bar{z}w| = |\bar{z}||w| = |z||w| = |zw| = 1$
   $$\text{Arg}(\bar{z}w) = \arg(w) + \arg(\bar{z})$$
   $$= \arg(w) - \arg(z) = -\pi/2$$
   $$\therefore\ \bar{z}w = |\bar{z}w|[\cos(-\pi/2) + i\sin(-\pi/2)] = -i$$

6. $z_1 + z_2 = -a$, $z_1z_2 = b$
   As 0, z_1, z_2 for an equilateral triangle,
   $$0^2 + z_1^2 + z_2^2 = 0(z_1) + 0(z_2) + z_1z_2$$
   $$\Rightarrow\quad (z_1 + z_2)^2 = 3z_1z_2 \Rightarrow a^2 = 3b.$$

7. $\bar{z} + i\bar{w} = 0 \Rightarrow \overline{\bar{z} + i\bar{w}} = \bar{0} \Rightarrow z - iw = 0$
   Now, $\arg(zw) = \pi$
   $$\Rightarrow\quad \arg\left(\frac{z^2}{i}\right) = \pi$$
   $$\Rightarrow \arg(z^2) - \arg(i) = \pi$$
   $$\Rightarrow\ 2\arg(z) - \pi/2 = \pi$$
   $$\Rightarrow\quad \arg(z) = 3\pi/4$$

8. $z^{1/3} = p + iq$
   $$\Rightarrow\ x - iy = (p + iq)^3$$
   $$\Rightarrow\quad = p^3 + 3p^2(iq) + 3p(iq)^2 + (iq)^3$$
   $$\Rightarrow\quad x = p^3 - 3pq^2 \text{ and } -y = 3p^2q - q^3$$
   $$\Rightarrow\quad \frac{x}{p} = p^2 - 3q^2 \text{ and } \frac{-y}{q} = 3p^2 - q^2$$
   $$\Rightarrow\ \frac{x}{p} + \frac{y}{q} = -2(p^2 + q^2)$$
   $$\therefore\ \left(\frac{x}{p} + \frac{y}{q}\right)\Big/\left(p^2 + q^2\right) = -2$$

9. $|z^2 - 1| = |z|^2 + 1$ can be written as $|z^2 + (-1)| = |z^2| + |-1|$
   $$\Leftrightarrow\ \frac{z^2}{-1} \text{ is a non-negative real number.}$$
   $\Leftrightarrow$ z^2 is a non-positive real number.
   $\Leftrightarrow$ z lies on the imaginary axis.

   Alternative solution

   Let $z = x + iy$ then $|z^2 - 1| = |z|^2 + 1$, we get
   $$|(x^2 - y^2 - 1) + 2ixy| = x^2 + y^2 + 1$$
   $$\Rightarrow\ \sqrt{(x^2 - y^2 - 1)^2 + 4x^2y^2} = x^2 + y^2 + 1$$
   $$\Rightarrow\ (x^2 - y^2)^2 + 1 - 2(x^2 - y^2) + 4x^2y^2 = (x^2 + y^2 + 1)^2$$
   $$\Rightarrow\ (x^2 + y^2)^2 + 1 - 2(x^2 - y^2) = (x^2 + y^2)^2 + 1 + 2(x^2 + y^2)$$
   $$\Rightarrow\ -4x^2 = 0 \Rightarrow x = 0$$
   $\therefore$ z lies on the imaginary axis.

10. $(x - 1)^3 = -8$
    $$\Rightarrow\ \left(-\frac{x-1}{2}\right)^3 = 1$$
    $$\Rightarrow\ -\frac{x-1}{2} = 1, \omega, \omega^2$$

$\Rightarrow\ x = -1,\ 1 - 2\omega,\ 1 - 2\omega^2$

11. $|w| = 1 \Rightarrow |z| = \left|z - \frac{1}{3}i\right|$

$\Rightarrow$ z is equidistant from $z = 0$ and $z = \frac{1}{3}i$. Thus, z lies on the perpendicular bisector of the segment joining $z = 0$ and $z = i/3$. Therefore, z lies on a straight line.

12. $|z_1 + z_2| = |z_1| + |z_2|$

$\Leftrightarrow$ z_1, z_2 lie on a ray through the origin O and same side of the origin

$\Leftrightarrow$ $\arg(z_1) = \arg(z_2)$

13. $\sin\frac{2k\pi}{11} + i\cos\frac{2k\pi}{11}$

$= i\left(\cos\frac{2k\pi}{11} - i\sin\frac{2k\pi}{11}\right)$

$= i\omega^k$

where $\omega = \cos\frac{2\pi}{11} - i\sin\frac{2\pi}{11}$

Thus, $S = \sum_{k=1}^{10}\left(\sin\frac{2k\pi}{11} + i\cos\frac{2k\pi}{11}\right)$

$= i\sum_{k=1}^{10}\omega^k = i\left(\frac{\omega - \omega^{11}}{1-\omega}\right)$

But $\omega^{11} = \cos 2\pi - i\sin 2\pi = 1$

$\therefore\ S = -i$

14. $z^2 + z + 1 = 0 \Rightarrow z = \omega$ or ω^2

where ω is complex cube root of unity.

Let $z = \omega$, so that $\frac{1}{z} = \omega^2$

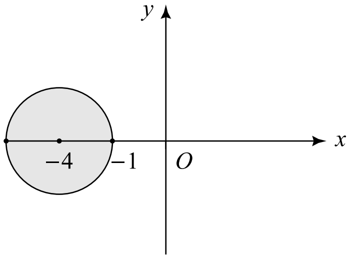
Thus,

$$\left(z + \frac{1}{z}\right)^2 + \left(z^2 + \frac{1}{z^2}\right)^2 + \left(z^3 + \frac{1}{z^3}\right)^2 + \cdots + \left(z^6 + \frac{1}{z^6}\right)^2$$

$= (-1)^2 + (-1)^2 + (2)^2 + (-1)^2 + (-1)^2 + (2)^2$

$= 12.$

15. $|z + 4| \le 3$ represents the interior and boundary of the circle with centre at $(-4, 0)$ and radius $= 3$. See Figure.



As -1 is an end point of a diameter of the circle, maximum possible value of $|z + 1|$ is 6 which is attained when $z = -7$

16. $\bar{z} = \frac{1}{i-1} \Rightarrow z = \frac{1}{\bar{i} - 1} = \frac{1}{-i-1} = \frac{-1}{i+1}$

17. $|z| - \frac{4}{|z|} \le \left||z| - \frac{4}{|z|}\right| \le \left|z - \frac{4}{z}\right| = 2$

$\Rightarrow\ |z|^2 - 2|z| - 4 \le 0$

$\Rightarrow\ (|z| - 1)^2 \le 5 \Rightarrow |z| \le \sqrt{5} + 1$

18. z is equidistant from $A(1 + 0i)$, $B(-1 + 0i)$ and $C(0 + i)$. Thus, z is circumcentre of ΔABC, that is, there is exaclty one such z.

19. $(1 + \omega)^7 = (-\omega^2)^7 = (-\omega^2)^6(-\omega^2) = -\omega^2$

$= 1 + \omega$

$\therefore\ A = 1,\ B = 1$

20. As $\alpha, \beta \in \mathbf{R}$, the roots of $z^2 + \alpha z + \beta = 0$ are of the form

$1 + ia$, $1 - ia$, where $a \in \mathbf{R}$, $a \ne 0$.

Now, $\beta = (1 + ia)(1 - ia) = 1 + a^2 > 1$

$\Rightarrow \beta \in (1, \infty)$

21. As $\frac{z^2}{z-1}$ is real, we get

$\frac{z^2}{z-1} = \frac{\bar{z}^2}{\bar{z}-1}$

$\Leftrightarrow\ z^2(\bar{z} - 1) = \bar{z}^2(z - 1)$

$\Leftrightarrow\ z\bar{z}(z - \bar{z}) - (z - \bar{z})(z + \bar{z}) = 0$

$\Leftrightarrow\ (z - \bar{z})(z\bar{z} - z - \bar{z}) = 0$

$\Leftrightarrow\ z - \bar{z} = 0$ or $z\bar{z} - z - \bar{z} = 0$

$\Rightarrow$ z lies on the real axis

or z lies on a circle through the origin.

22. $|z| = 1 \Rightarrow z\bar{z} = 1$

$\arg\left(\frac{1+z}{1+\bar{z}}\right) = \arg\left(\frac{1+z}{1+1/z}\right)$

$= \arg(z) = \theta$

23. Let $z_2/z_1 = ik$ where k is a real number.

$$\left|\frac{2z_1 + 3z_2}{2z_1 - 3z_2}\right| = \left|\frac{2/3 + z_2/z_1}{2/3 - z_2/z_1}\right| = \left|\frac{2/3 + ik}{2/3 - ik}\right| = 1$$

24. Let $\omega = \frac{1+z^2}{2iz}$. $\operatorname{Im}(\omega) = \frac{1}{2}(\omega - \bar{\omega})$

For $|z| = 1$, $\bar{\omega} = \frac{1+\bar{z}^2}{-2i\bar{z}} = \frac{1+(1/z)^2}{-2i(1/z)}$

$= \frac{z^2+1}{-2iz} = -\omega$

Thus, Im(ω) = $\frac{1}{2i}(\omega+\omega)=-i\omega$

$= -\frac{1}{2}\left(z+\frac{1}{z}\right)=-\frac{1}{2}(z+\bar{z})$

$=-\frac{1}{2}(2\cos\theta)=-\cos\theta$

[$\because$ $|z| = 1 \Rightarrow z = \cos\theta + i\sin\theta$]

As $z \neq 1$, $\theta \neq 0$ and as $z \neq -1$, $\theta \neq \pi$

$\therefore$ $a \in (-1, 1)$

25. $z=1-\bar{z} \quad \Rightarrow \quad z+\bar{z}=1$

$\Rightarrow$ 2 Re(z) = 1 $\Rightarrow$ Re (z) $=\frac{1}{2}=\cos\frac{\pi}{3}$

As $|z| = 1$, Re(z) = cos(π/3),

Im (z) = ± sin (π/3)

Thus, arg (z) = ± π/3

$\therefore$ statement-1 is false and statement-2 is true .

26. Im(z) + 1 = 0 Im(z) = –1

Let $z = a - i$

Now, $z+\sqrt{2}\,|z+1|+i=0$

$\Rightarrow a-i+\sqrt{2}\sqrt{(a+1)^2+1}+i=0$

$\Rightarrow a^2 = 2\,(a^2 + 2a + 2)$

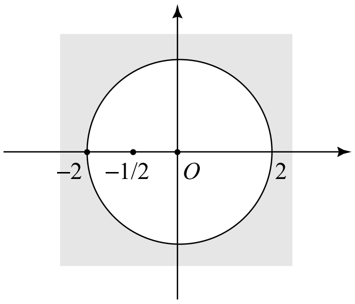
$\Rightarrow a^2 + 4a + 4 = 0 \quad \Rightarrow \quad (a + 2)^2 = 0$

$\therefore$ $a = -2$

Thus, $z = -2 - i \Rightarrow |z| = \sqrt{5}$

27. $\left|z+\frac{1}{2}\right|\geq|z|-\frac{1}{2}\geq\frac{3}{2}$

Minimum value 3/2 of $|z + 1/2|$ is attained when $z = -2$, and $3/2 \in (1, 2)$.



28. $w-\bar{w}z = k(1 - z)$

$\Rightarrow \quad w - k = z(\bar{w}-k)$

$\Rightarrow \quad |w - k| = |z||\bar{w}-k|$

$= |z||w - k|$

As Im (w) ≠ 0, $|w - k| \neq 0$

$\therefore$ $|z| = 1$

Also, $z \neq 1$ for otherwise $w=\bar{w}$

$\Rightarrow$ Im(w) = 0

29. arg $\left(\frac{z_1}{z_4}\right)$ + arg $\left(\frac{z_2}{z_3}\right)$

$=$ arg $\left(\frac{z_1z_2}{z_4z_3}\right)$ = arg $\left(\frac{|z_1|^2}{|z_3|^2}\right)$ = 0

30. Let $\frac{z-i}{z+i}=ik$, where $k \in \mathbf{R}$.

$\Rightarrow \quad z - i = ikz - k$

$\Rightarrow \quad z(1 - ik) = -k + i$

$\Rightarrow \quad z = \frac{-k+i}{1-ik}$

Note that $|z|^2=\frac{k^2+1}{1+k^2}=1$

$\Rightarrow \quad z\bar{z}=1 \quad \Rightarrow \quad \bar{z}=1/z$

Thus, $z+\frac{1}{z}=z+\bar{z}$, which is a real number.

Also, $z+\bar{z}=0$

$\Rightarrow$ 2Re(z) = 0 $\Rightarrow$ Re(z) = 0

$\Rightarrow$ $z = ai$ for some $a \in \mathbf{R}$.

But in this case

$\frac{z-i}{z+i}$ is a real number

Therefore, $z+\bar{z}\neq 0$.

31. $(1+ \alpha i)^2 = x + iy$

$\Rightarrow \quad 1 - \alpha^2 + 2\alpha i = x + iy$

$\Rightarrow \quad 1 - \alpha^2 = x, \quad 2\alpha = y$

$\Rightarrow \quad 1-(y/2)^2 = x$

$\Rightarrow \quad 4 - y^2 = 4x$

$\Rightarrow \quad y^2 + 4x - 4 = 0$

32. $\left|\frac{z_1-2z_2}{2-z_1\bar{z}_2}\right|=1$

$\Leftrightarrow |z_1-2z_2|^2=|2-z_1\bar{z}_2|^2$

$\Leftrightarrow |z_1|^2+4|z_2|^2-2\bar{z}_1z_2-2z_1\bar{z}_2$

$= 4 + |z_1|^2|\bar{z}_2|^2-2z_1\bar{z}_2-2\bar{z}_1z_2$

$\Leftrightarrow |z_1|^2\,|z_2|^2 - |z_1|^2 - 4|z_2|^2 + 4 = 0$

$\Leftrightarrow (|z_1|^2 - 4)\,(|z_1|^2 - 1) = 0$

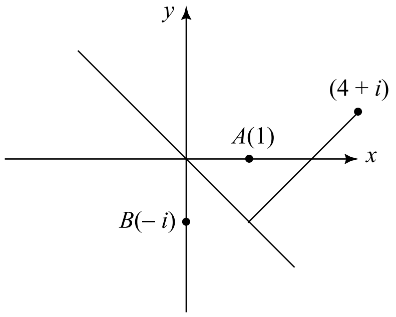
As $|z_2| \neq 1$, $|z_1|^2 - 4 = 0 \Rightarrow |z_1| = 2$

$\Rightarrow z_1$ lies on a circle of radius 2.

33. $|z - 1| = |z + i|$

$\Rightarrow$ z is equidistant from $A(1)$ and $B(-i)$

$\Rightarrow$ z lies on the line $y = -x$



As $z = 1$ satisfies the inequality

$|z - 1| \le |z + i|$,

we get $|z - 1| \le |z + i|$ represents the region lying above the line $x + y = 0$

Largest value of r is length of perpendicular from (4, 1) to the line $x + y = 0$, that is,

largest $r = \frac{|4+1|}{\sqrt{1+1}} = \frac{5}{\sqrt{2}} = \frac{5}{2}\sqrt{2}$.

34. Let $z = r(\cos\theta + i\sin\theta)$, so that

$\Rightarrow$ As z is non-real complex number, $\text{Im}(z) \ne 0$

$z^5 = r^5 [\cos(5\theta) + i\sin(5\theta)]$

$\Rightarrow \quad (\text{Im}(z))^5 = r^5 \cos^5\theta$

and $\quad \text{Im}(z^5) = r^5 \cos(5\theta)$

Thus, $\frac{\text{Im}(z^5)}{(\text{Im}(z))^5} = \frac{\cos(5\theta)}{\cos^5\theta}$

But $\cos(5\theta) = 16\cos^5\theta - 20\cos^3\theta + 5\cos\theta$

$$\Rightarrow \quad \frac{\cos(5\theta)}{\cos^5\theta} = 16 - 20\sec^2\theta + 5\sec^4\theta$$
$$= 5(\sec^4\theta - 4\sec^2\theta + 4) - 4$$
$$= 5(\sec^2\theta - 2)^2 - 4 \ge -4$$

Thus, least value of

$\frac{\cos(5\theta)}{\cos^5\theta}$ is – 4 which is attained when $\theta = \pi/4$.

35. As $z = \frac{2+3i\sin\theta}{1-2i\sin\theta}$ is purely imaginary, $\text{Re}(z) = 0$

that is, $z + \bar{z} = 0$

$$\Rightarrow \frac{2+3i\sin\theta}{1-2i\sin\theta} + \frac{2-3i\sin\theta}{1+2i\sin\theta} = 0$$

$\Rightarrow (2 + 3i\sin\theta)(1 + 2i\sin\theta) + (2 - 3i\sin\theta)(1 - 2i\sin\theta)$

$= 0$

$\Rightarrow 2(2 - 6\sin^2\theta) = 0 \Rightarrow \sin\theta = \pm\frac{1}{\sqrt{3}}$

Thus, a value of θ for which z is purely imaginary is $\sin^{-1}\left(\frac{1}{\sqrt{3}}\right)$

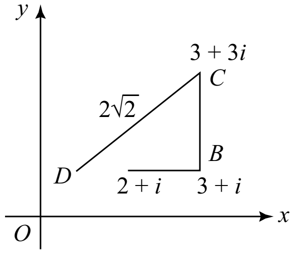
36. Refer figure

Coordinates of A are (2, 1) that of B are (3, 1) and C are (3, 3).

Coordinates of D are $(3 + 2\sqrt{2}\cos(5\pi/4), 3 + 2\sqrt{2}\sin(5\pi/4))$

$= (3 - 2, 3 - 2) = (1, 1)$

Thus, D is represented by $1 + i$



37. $z^3 = (1 + ai)^3$

$= 1 + 3ai - 3a^2 - ia^3$

As z^3 is real $3a - a^3 = 0$

$\Rightarrow a(\sqrt{3} - a)(a + \sqrt{3}) = 0$

$\Rightarrow a = \sqrt{3}$

Thus, $z = 1 + \sqrt{3}i = 2\left(\cos\frac{\pi}{3} + i\sin\frac{\pi}{3}\right)$

We have $S = 1 + z + z^2 + \ldots + z^{11}$

$$= \frac{1-z^{12}}{1-z}$$

But $z^{12} = 2^{12}(\cos(4\pi) + i\sin(4\pi))$

$= 2^{12}(1 + i0) = 2^{12}$

and $1 - z = -\sqrt{3}i$

Thus, $S = \frac{1-2^{12}}{-\sqrt{3}i}$

$$= \frac{4095}{\sqrt{3}}i = 1365\sqrt{3}i$$

Previous Years' B-Architecture Entrance Examination Questions

1. $\frac{5+i\sin\theta}{5-3i\sin\theta}$ is a real number

$$\Leftrightarrow \quad \frac{5+i\sin\theta}{5-3i\sin\theta} = \frac{5-i\sin\theta}{5+3i\sin\theta}$$

$\Leftrightarrow \quad (5 + i\sin\theta)(5 + 3i\sin\theta)$

$\quad = (5 - 3\,i\sin\theta)(5 - i\sin\theta)$

$\Leftrightarrow \quad 25 + 20\,i\sin\theta - 3\sin^2\theta$

$\quad = 25 - 20\,i\sin\theta - 3\sin^2\theta$

$\Leftrightarrow 40\,i\sin\theta = 0 \Leftrightarrow \sin\theta = 0$

This is possible when $\theta = -\pi$.

TIP Amongst the choices given, $-\pi$ is the only value which makes imaginary part of the numerator and denominator 0.

2. $|z| = 2$

Let $w = 3z + 2 + i$, then $z = (w - (2 + i))/3$

$|z| = 2 \quad \Rightarrow \quad |w - (2 + i)| = 6$

$\Rightarrow$ w lies on a circle with centre at $(2 + i)$ and radius 6.

3. Let $z = 2(\cos\theta + i\sin\theta)$. Now

$z + \frac{2}{z} = 2(\cos\theta + i\sin\theta) + (\cos\theta - i\sin\theta)$

$\quad = 3\cos\theta + i\sin\theta$

$\Rightarrow \quad \left|z + \frac{2}{z}\right|^2 = 9\cos^2\theta + \sin^2\theta$

$= 1 + 4(1 + \cos 2\theta) \le 9$

$\therefore$ maximum possible value of $\left|z + \frac{2}{z}\right|$ is 3 which is attained when $z = 1$

4. Let $\omega = -\frac{1}{2} + i\frac{\sqrt{3}}{2}$ then $\omega^3 = 1$

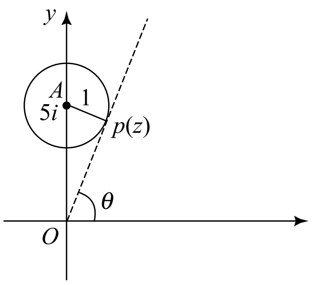
$z = 4 + 3\omega^{127} + 5\omega^{124}$

$\quad = 4 + 3(\omega^3)^{42}\omega + 5(\omega^3)^{41}\omega$

$\quad = 4 + 3\omega + 5\omega = 4 + 8\omega$

$\quad = 4 - 4 + 4\sqrt{3}i = 4\sqrt{3}i$

5. Principal argument is least at point P.



$\sin(\pi/2 - \theta) = \frac{AP}{OA}$

$\Rightarrow \quad \cos\theta = 1/5$

$\Rightarrow \quad \sin\theta = \sqrt{24}/5$

Now, $z = \sqrt{24}(\cos\theta + i\sin\theta)$

$\Rightarrow \quad \text{Re}(z) = \frac{\sqrt{24}}{5} = \frac{2}{5}\sqrt{6}$

6. Area of triangle is

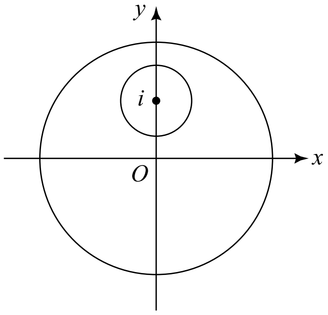
$$\Delta = \frac{1}{4}\left|\begin{vmatrix} z & \bar{z} & 1 \\ iz & -i\bar{z} & 1 \\ z + iz & \bar{z} - i\bar{z} & 1 \end{vmatrix}\right|$$

Using $R_3 \to R_3 - R_1 - R_2$, we get

$$\Delta = \frac{1}{4}\left|\begin{vmatrix} z & \bar{z} & 1 \\ iz & -i\bar{z} & 1 \\ 0 & 0 & -1 \end{vmatrix}\right|$$

$$= \frac{1}{4}|-iz\bar{z} - iz\bar{z}| = \frac{1}{2}|z|^2$$

7. As $|i - (1 + 2i)| = \sqrt{2} < |4 - 2| = 2$, C_1 lies inside C_2



8. $z = i\left(i + \sqrt{2}\right) = -1 + \sqrt{2}i$

$\Rightarrow \quad (z + 1)^2 = -2 \quad \Rightarrow z^2 + 2z + 3 = 0$

We now divide

$z^4 + 4z^3 + 6z^2 + 4z$ by $z^2 + 2z + 3$.

$$\begin{array}{r|l} z^2 + 2z + 3 & z^4 + 4z^3 + 6z^2 + 4z \; \big| \; z^2 + 2z - 1 \\ & \underline{\overset{\ominus}{z^4} + \overset{\ominus}{2z^3} + \overset{\ominus}{3z^2}} \\ & \qquad 2z^3 + 3z^2 + 4z \\ & \qquad \underline{\overset{\ominus}{2z^3} + \overset{\ominus}{4z^2} + \overset{\ominus}{6z}} \\ & \qquad\qquad -z^2 - 2z \\ & \qquad\qquad \underline{\overset{\oplus}{-z^2} \overset{\oplus}{-2z} \overset{\oplus}{-3}} \\ & \qquad\qquad\qquad 3 \end{array}$$

$\therefore \quad z^4 + 4z^3 + 6z^2 + 4z$

$\quad = (z^2 + 2z + 3)(z^2 + 2z - 1) + 3$

$\quad = 0 + 3 = 3$

9. $|z| = 1$, $\arg(z) = \theta$

$\Rightarrow z = \cos\theta + i\sin\theta$

Now, $w = \frac{z(1 - \bar{z})}{\bar{z}(1 + z)} = \frac{z - z\bar{z}}{z + z\bar{z}}$

$$= \frac{z-1}{\bar{z}+1}$$

$$\bar{w} = \frac{\bar{z}-1}{z+1}$$

Now, $2\text{Re}(w) = w + \bar{w} = \dfrac{z-1}{\bar{z}+1} + \dfrac{\bar{z}-1}{z+1}$

$$= \frac{z^2 - 1 + \bar{z}^2 - 1}{(z+1)(\bar{z}+1)}$$

$$= \frac{2\cos 2\theta - 2}{z\bar{z} + z + \bar{z} + 1}$$

$$= \frac{2(\cos 2\theta - 1)}{2(\cos\theta + 1)}$$

$$= \frac{-2\sin^2(\theta)}{2\cos^2(\theta/2)} = -4\sin^2\left(\frac{\theta}{2}\right)$$

$\Rightarrow$ $\text{Re}(w) = -2\sin^2\left(\dfrac{\theta}{2}\right)$

10. $\left|\sqrt{2} + i\right|^2 = |z_1 + z_2 + z_3|^2$

$\Rightarrow 3 = |z_1|^2 + |z_2|^2 + |z_3|^2 + 2\text{Re}\,(z_1\bar{z}_2 + z_2\bar{z}_3 + z_3\bar{z}_1)$

$\Rightarrow 3 = 1 + 1 + 1 + 2\ \text{Re}\,(z_1\bar{z}_2 + z_2\bar{z}_3 + z_3\bar{z}_1)$

$\Rightarrow \text{Re}\,(z_1\bar{z}_2 + z_2\bar{z}_3 + z_3\bar{z}_1) = 0$

11. $z\ (iz_1 - 1) = z_1 + 1$

$\Rightarrow z_1(iz - 1) = 1 + z$

$\Rightarrow z_1 = \dfrac{1+z}{iz-1}$

$\Rightarrow \left|\dfrac{1+z}{iz-1}\right| = |z_1| < 1$

$\Rightarrow |1 + z|^2 < |1 - iz|^2$

$\Rightarrow 1 + z + \bar{z} + z\bar{z} < 1 - iz + i\bar{z} + z\bar{z}$

$\Rightarrow 2\ \text{Re}(z) < -\ i(2i\ \text{Im}(z))$

$\Rightarrow \text{Re}(z) - \text{Im}(z) < 0$

CHAPTER THREE

Quadratic Equations

QUADRATIC EQUATIONS

An equation of the form

$$ax^2 + bx + c = 0 \tag{1}$$

where $a \neq 0$, $a, b, c \in \mathbf{C}$, the set of complex numbers, is called a *quadratic equation*.

A *root* of the quadratic equation (1) is a complex number α such that

$$a\alpha^2 + b\alpha + c = 0$$

The quantity $D = b^2 - 4ac$ is known as the *discriminant* of the equation (1).

The roots of equation (1) are given by the *quadratic formula*

$$x = \frac{-b \pm \sqrt{D}}{2a}$$

NATURE OF ROOTS

1. If $a, b, c \in \mathbf{R}$ and $a \neq 0$. Then the followings hold good:
   - (a) The equation (1) has real and distinct roots if and only if $D > 0$.
   - (b) The equation (1) has real and equal roots if and only if $D = 0$.
   - (c) The equation (1) has complex roots with non-zero imaginary parts if and only if $D < 0$.
   - (d) $p + iq$ $(p, q \in \mathbf{R}, q \neq 0)$ is a root of equation (1) if and only if $p - iq$ is a root of equation (1).
2. If $a, b, c \in \mathbf{Q}$ and D is a perfect square of a rational number, then equation (1) has rational roots.
3. If $a, b, c \in \mathbf{Q}$ and $p + \sqrt{q}$ $(p, q \in \mathbf{Q})$ is an irrational root of equation (1) then $p - \sqrt{q}$ is also a root of equation (1).
4. If $a = 1$, $b, c \in \mathbf{I}$, the set of integers, and the roots of equation (1) are rational numbers, then these roots must be integers.
5. If equation (1) is satisfied by more than two distinct complex numbers, then equation (1) becomes an identity, that is $a = b = c = 0$.

RELATION BETWEEN ROOTS AND COEFFICIENTS

If α and β are the roots of the quadratic equation (1), then

$$\alpha + \beta = -\frac{b}{a} \quad \text{and} \quad \alpha\beta = \frac{c}{a}$$

Note that a quadratic equation whose roots are α and β is given by

$$(x - \alpha)(x - \beta) = 0$$

QUADRATIC EXPRESSION AND ITS GRAPH

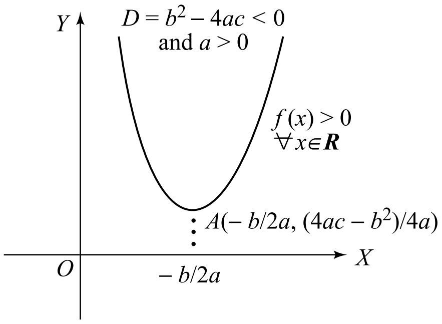
Let $f(x) = ax^2 + bx + c$, where $a, b, c \in \mathbf{R}$ and $a \neq 0$.

We have

$$\begin{aligned} f(x) &= a\left[x^2 + \frac{b}{a}x + \frac{c}{a}\right] \\ &= a\left[x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} + \frac{c}{a} - \frac{b^2}{4a^2}\right] \\ &= a\left[\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a^2}\right] \end{aligned} \tag{2}$$

When is a Quadratic Expression always positive Or always negative?

It follows from (2) that $f(x) > 0$ (< 0) $\forall x \in \mathbf{R}$ if and only if $a > 0$ (< 0) and $D = b^2 - 4ac < 0$. See Fig. 3.1 and (Fig. 3.2). Also, it follows from (2) that $f(x) \geq 0$ (≤ 0) $\forall x \in \mathbf{R}$ if and only if $a > 0$ (< 0) and $D = b^2 - 4ac = 0$. In this case $f(x) > 0$ (< 0) for each $x \in \mathbf{R}$, $x \neq -b/2a$. Also, in this case the graph of $y = f(x)$ will touch the x-axis at $x = -b/2a$.



Y

$D = b^2 - 4ac < 0$
and $a < 0$

Fig. 3.2

Sign of a Quadratic Expression

If $D = b^2 - 4ac > 0$, then (2) can be written as

$$f(x) = a\left[\left(x + \frac{b}{2a}\right)^2 - \left(\frac{\sqrt{b^2 - 4ac}}{2a}\right)^2\right]$$

$$= a\left[\left(x + \frac{b + \sqrt{b^2 - 4ac}}{2a}\right)\left(x + \frac{b - \sqrt{b^2 - 4ac}}{2a}\right)\right]$$

$$= a\,(x - \alpha)\,(x - \beta)$$

where $\alpha = \dfrac{-b - \sqrt{b^2 - 4ac}}{2a}$ and $\beta = \dfrac{-b + \sqrt{b^2 - 4ac}}{2a}$

If $D = b^2 - 4ac > 0$ and $a > 0$ then

$$f(x)\begin{cases} > 0 & \text{for } x < \alpha \text{ or } x > \beta \\ < 0 & \text{for } \alpha < x < \beta \\ = 0 & \text{for } x = \alpha, \beta \end{cases}$$

$y = f(x)$
$D = b^2 - 4ac > 0$
and $a < 0$

Fig. 3.4

Note that if $a > 0$, then $f(x)$ attains the least value at $x = -b/2a$. This least value is given by

$$f\left(-\frac{b}{2a}\right) = \frac{4ac - b^2}{4a}$$

If $a < 0$, then $f(x)$ attains the a greatest value at $x = -b/2a$. This greatest value is given by

$$f\left(-\frac{b}{2a}\right) = \frac{4ac - b^2}{4a}$$

POSITION OF ROOTS OF A QUADRATIC EQUATION

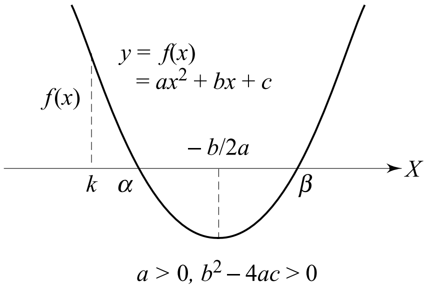
Let $f(x) = ax^2 + bx + c$, where $a, b, c \in \mathbf{R}$ be a quadratic expression and let k be a real number.

Conditions for Both the Roots to be more than a Real Number *k*.

If $a > 0$ and $b^2 - 4ac > 0$ then the parabola $y = ax^2 + bx + c$ opens upwards and intersect the x-axis in α and β where

$$\alpha, \beta = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

In this case both the roots α and β will be more than k if k lies to left of both α and β. See Fig. 3.5



$y = f(x)$
$= ax^2 + bx + c$
$f(x)$
$-b/2a$
X
k
α
β
$a > 0,\ b^2 - 4ac > 0$

Fig. 3.5

From the Fig. 3.5, we note that both the roots are more than k if and only if

(i) $D > 0$ (ii) $k < \frac{-b}{2a}$ (iii) $f(k) > 0$

In case $a < 0$, both the roots will be more than k (see Fig. 3.6) if and only if

(i) $D > 0$ (ii) $k < \frac{-b}{2a}$ (iii) $f(k) < 0$

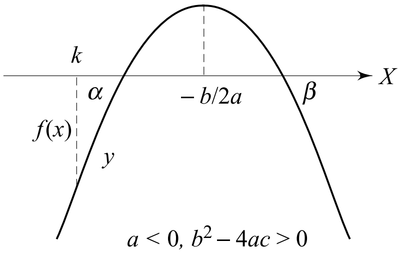


Fig. 3.6

Combining the above two sets, we get both the roots of $ax^2 + bx + c = 0$ are more than a real number k if only if

(i) $D > 0$ (ii) $k < \frac{-b}{2a}$ (iii) $af(k) > 0$

Conditions for Both the Roots to be less than a Real Number *k*

Both the roots of $ax^2 + bx + c = 0$ are less than a real number k if and only if

(i) $D > 0$ (ii) $k > \frac{-b}{2a}$ (iii) $af(k) > 0$

Note

1. Both the roots of $ax^2 + bx + c = 0$ are **positive** if and only if

   $D \geq 0$, $-\frac{b}{a} > 0$ and $\frac{c}{a} > 0$
2. Both the roots of $ax^2 + bx + c = 0$ are negative if and only if

   $D \geq 0$, $-\frac{b}{a} < 0$ and $\frac{c}{a} > 0$

CONDITIONS FOR A NUMBER *k* TO LIE BETWEEN THE ROOTS OF A QUADRATIC EQUATION

The real number k lies between the roots of the quadratic equation $f(x) = ax^2 + bx + c = 0$ if and only if a and $f(k)$ are of opposite signs, that is, if and only if

(i) $a > 0$ (ii) $D > 0$ (iii) $f(k) < 0$ [See Fig. 3.7]

or

(i) $a < 0$ (ii) $D > 0$ (iii) $f(k) > 0$ [See Fig. 3.8]

Combining, we may say k lies between the roots of $f(x) = ax^2 + bx + c = 0$ if and only if

(i) $D > 0$ (ii) $af(k) < 0$

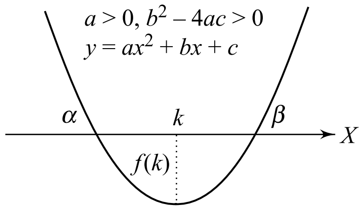

Fig. 3.7

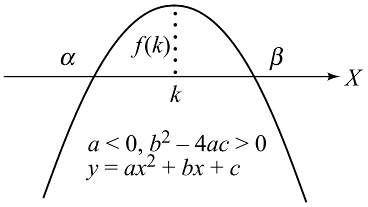

Fig. 3.8

CONDITIONS FOR EXACTLY ONE ROOT OF A QUADRATIC EQUATION TO LIE IN THE INTERVAL (k_1, k_2) WHERE $k_1 < k_2$

If $a > 0$, then exactly one root of $f(x) = ax^2 + bx + c = 0$ lies in the interval (k_1, k_2) if and only if $f(k_1) > 0$ and $f(k_2) < 0$. Also, exactly one root lies in the interval (k_1, k_2) if and only if $f(k_1) < 0$ and $f(k_2) > 0$. See Fig. 3.9. Thus, if $a > 0$, exactly one root of $f(x) = ax^2 + bx + c = 0$ lies in the interval (k_1, k_2) if and only if $f(k_1)\,f(k_2) < 0$.

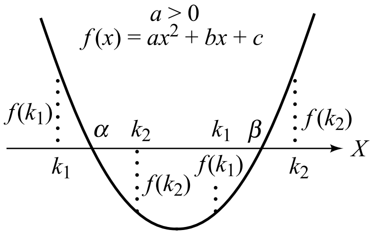

Fig. 3.9

Similarly, if $a < 0$, exactly one of the roots of $f(x) = ax^2 + bx + c = 0$ lies in the interval (k_1, k_2) if $f(k_1)\,f(k_2) < 0$.

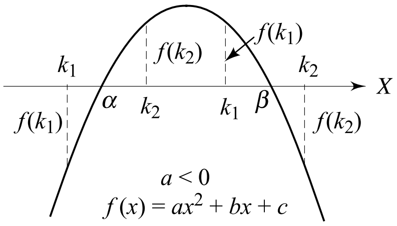

Fig. 3.10

Hence, if $f(k_1)\,f(k_2) < 0$, then exactly one root of $f(x) = 0$ lies in the interval (k_1, k_2).

CONDITIONS FOR BOTH THE ROOTS OF A QUADRATIC EQUATION TO LIE IN THE INTERVAL (k_1, k_2) WHERE $k_1 < k_2$.

If $a > 0$, both the roots of $f(x) = ax^2 + bx + c = 0$ lie in the interval (k_1, k_2) if and only if

(i) $D > 0$ (ii) $k_1 < -\dfrac{b}{2a} < k_2$

(iii) $f(k_1) > 0$ and $f(k_2) > 0$

See Fig. 3.11

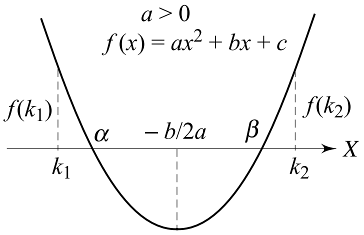

Fig. 3.11

In case $a < 0$, the conditions read as

(i) $D > 0$ (ii) $k_1 < -\dfrac{b}{2a} < k_2$

(iii) $f(k_1) < 0$ and $f(k_2) < 0$

See Fig. 3.12

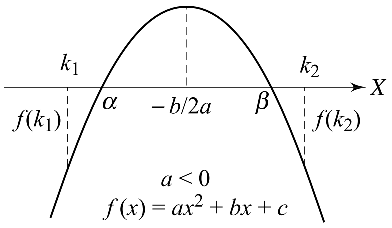

Fig. 3.12

Some Useful Tips

Let quadratic equation be

$$f(x) = ax^2 + bx + c = 0 \qquad (1)$$

where $a, b, c \in \mathbf{R}$, $a \neq 0$.

Let roots of (1) be α, β, and $D = b^2 - 4ac$.

1. Both the roots are positive

   $\Leftrightarrow D \geq 0,\ -\dfrac{b}{2a} = \alpha + \beta > 0,\ \dfrac{c}{a} = \alpha\beta > 0$
2. Both the roots are negative

   $\Leftrightarrow D \geq 0,\ -\dfrac{b}{2a} = \alpha + \beta < 0,\ \dfrac{c}{a} = \alpha\beta > 0$
3. Both the roots lie in the interval (p, q).

   $\Leftrightarrow D \geq 0, p < -\dfrac{b}{2a} < q, af(p) > 0, af(q) > 0$
4. If one of α, β is real, then other must be real.
5. If sum of the coefficients of a quadratic equation is 0, then 1 is a root of the quadratic equation.

Illustration 1

1 is a root of $(b - c)x^2 + (c - a)x + a - b = 0$ as $(b - c) + (c - a) + (a - b) = 0$.

Finding Range of a Rational Function

Let $f(x) = ax^2 + bx + c$, $g(x) = px^2 + qx + r$

where $a, b, c, p, q, r \in \mathbf{R}$ and one of $a, p \neq 0$.

To find range of

$$R(x) = \frac{f(x)}{g(x)},\ x \in \mathbf{R}, \text{ put}$$

$$y = \frac{ax^2 + bx + c}{px^2 + qx + r},$$

$\Rightarrow$ $(a - py)x^2 + (b - qy)x + (c - ry) = 0$.

Since x is real,

$(b - qy)^2 - 4(a - py)(c - ry) \geq 0$

We use this inequality to obtain range of $R(x)$.

Illustration 2

Find range of

$$y = \frac{x^2 - 2x + 5}{x^2 + 2x + 7}$$

$\Rightarrow$ $(x^2 + 2x + 7)y = x^2 - 2x + 5$

$\Rightarrow$ $(y - 1)x^2 + 2x(y + 1) + 7y - 5 = 0$

As x is real,

$4(y + 1)^2 - 4(y - 1)(7y - 5) \geq 0$

$\Rightarrow$ $(y^2 + 2y + 1) - (7y^2 - 12y + 5) \geq 0$

$\Rightarrow$ $3y^2 - 7y + 2 \leq 0$

$\Rightarrow$ $(3y - 1)(y - 2) \leq 0$

$\Rightarrow$ $1/3 \leq y \leq 2$

Some Useful Tips

Suppose range of $\dfrac{ax^2 + bx + c}{px^2 + qx + r}$ is the set S and $h(x)$ takes all real values, then range of $\dfrac{a(h(x))^2 + b(h(x)) + c}{p(h(x))^2 + q(h(x)) + r}$ is also S.

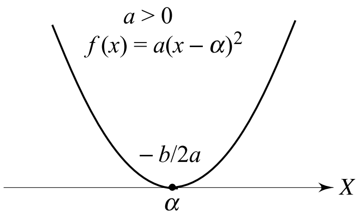
Illustration 3

Range of $\dfrac{\tan^2 x - 2\tan x + 5}{\tan^2 x + 2\tan x + 7}$ is $\dfrac{1}{3} \leq y \leq 2$.

However, range of $\dfrac{\sin^2 x - 2\sin x + 5}{\sin^2 x + 2\sin x + 7}$ is **not** [1/3, 2] as $-1 \leq \sin x < 1$ will curtail its range. For instance try $y = 2$.

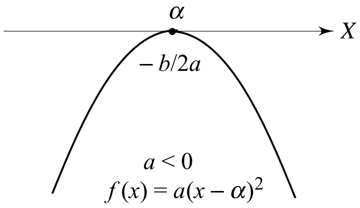
CONDITIONS FOR A QUADRATIC EQUATION TO HAVE A REPEATED ROOT

The quadratic equation $f(x) = ax^2 + bx + c = 0$, $a \neq 0$ has α as a repeated if and only if $f(\alpha) = 0$ and $f'(\alpha) = 0$. In this case $f(x) = a(x - \alpha)^2$. In fact $\alpha = -b/2a$. See Fig. 3.13 and Fig. 3.14.



$f(\alpha) = 0, \; f'(\alpha) = 0$

Fig. 3.13



$f(\alpha) = 0, \; f'(\alpha) = 0$

Fig. 3.14

CONDITION FOR TWO QUADRATIC EQUATIONS TO HAVE A COMMON ROOT

Suppose that the quadratic equations $ax^2 + bx + c = 0$ and $a'x^2 + b'x + c' = 0$ (where $a, a' \neq 0$ and $ab' - a'b \neq 0$) have a common root. Let this common root be α. Then

$$a\alpha^2 + b\alpha + c = 0 \quad \text{and} \quad a'\alpha^2 + b'\alpha + c' = 0$$

Solving the above equations, we get

$$\frac{\alpha^2}{bc' - b'c} = \frac{\alpha}{a'c - ac'} = \frac{1}{ab' - a'b}$$

$$\Rightarrow \qquad \alpha^2 = \frac{bc' - b'c}{ab' - a'b} \quad \text{and } \alpha = \frac{a'c - ac'}{ab' - a'b}$$

Eliminating α we get

$$\frac{(a'c - ac')^2}{(ab' - a'b)^2} = \frac{bc' - b'c}{ab' - a'b}$$

$$\Rightarrow \qquad (a'c - ac')^2 = (bc' - b'c)(ab' - a'b)$$

This is the required condition for two quadratic equation to have a common root. See Fig. 3.15

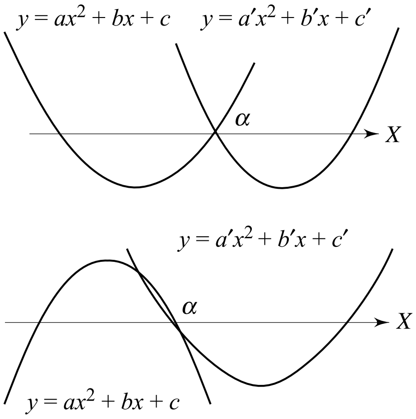


Fig. 3.15

TIP

How to Obtain the Common Root?

Make coefficients of x^2 in both the equations same and subtract one equation from the other to obtain a linear equation in x. Solve it for x to obtain the common root.

CONDITION FOR TWO QUADRATIC EQUATIONS TO HAVE THE SAME ROOTS

Two quadratic equations $ax^2 + bx + c = 0$. and $a'x^2 + b'x + c' = 0$ have the same roots if and only if

$$\frac{a}{a'} = \frac{b}{b'} = \frac{c}{c'}$$

EQUATIONS OF HIGHER DEGREE

The equation

$$f(x) = a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_{n-1}x + a_n = 0$$

where $a_0, a_1, \ldots, a_{n-1}, a_n \in \mathbf{C}$, the set of complex numbers, and $a_0 \neq 0$, is said to be an equation of degree n. An equation of degree n has exactly n roots. Let $\alpha_1, \alpha_2, \ldots, \alpha_n \in \mathbf{C}$ be the n roots of (1). Then

$$f(x) = a_0(x - \alpha_1)(x - \alpha_2) \ldots (x - \alpha_n)$$

Also $\qquad \alpha_1 + \alpha_2 + \ldots + \alpha_n = -\dfrac{a_1}{a_0}$

and $\qquad \alpha_1\alpha_2 \ldots \alpha_n = (-1)^n \dfrac{a_n}{a_0}$.

CUBIC AND BIQUADRATIC EQUATIONS

If α, β, γ are the roots of $ax^3 + bx^2 + cx + d = 0$, then

$$\alpha + \beta + \gamma = -\frac{b}{a}, \; \beta\gamma + \gamma\alpha + \alpha\beta = \frac{c}{a} \text{ and } \alpha\beta\gamma = -\frac{d}{a}.$$

Also, if $\alpha, \beta, \gamma, \delta$ are the roots of the equation $ax^4 + bx^3 + cx^2 + dx + e = 0$, then

$$\alpha + \beta + \gamma + \delta = \frac{-b}{a}, (\alpha + \beta)(\gamma + \delta) + \alpha\beta + \gamma\delta = \frac{c}{a}$$

$$\alpha\beta(\gamma + \delta) + \gamma\delta(\alpha + \beta) = \frac{-d}{a}, \alpha\beta\gamma\delta = \frac{e}{a}.$$

TRANSFORMATION OF EQUATIONS

We now list some of the rules to form an equation whose roots are given in terms of the roots of another equation. Let given equation be

$$a_0 x^n + a_1 x^{n-1} + \ldots + a_{n-1} x + a_n = 0 \qquad (1)$$

Rule 1: To form an equation whose roots are $k(\neq 0)$ times roots of the equations in (1), replace x by $\frac{x}{k}$ in (1).

Rule 2: To form an equation whose roots are the negatives of the roots in equation (1), replace x by $-x$ in (1). Alternatively, change the sign of the coefficients of $x^{n-1}, x^{n-3}, x^{n-5}, \ldots$ etc. in (1).

Rule 3: To form an equation whose roots are k more than the roots of equation in (1), replace x by $x - k$ in (1).

Rule 4: To form an equation whose roots are reciprocals of the roots in equation (1), replace x by $\frac{1}{x}$ in (1) and then multiply both the sides by x^n.

Rule 5: To form an equation whose roots are square of the roots of the equation in (1) proceed as follows:

Step 1 Replace x by $\sqrt{x}$ in (1)

Step 2 Collect all the terms involving $\sqrt{x}$ on one side.

Step 3 Square both the sides and simplify.

For instance, to form an equation whose roots are squares of the roots of $x^3 + 2x^2 - x + 2 = 0$, replace x by $\sqrt{x}$ to obtain

$$x\sqrt{x} + 2x - \sqrt{x} + 2 = 0$$

$$\Rightarrow \qquad \sqrt{x}(x - 1) = -2(x + 1)$$

Squaring we get

$$x(x - 1)^2 = 4(x + 1)^2$$

or

$$x^3 - 6x^2 - 7x - 4 = 0$$

Rule 6: To form an equation whose roots are cubes of the roots of the equation in (1) proceed as follows:

Step 1 Replace x by $x^{1/3}$.

Step 2 Collect all the terms involving $x^{1/3}$ and $x^{2/3}$ on one side.

Step 3 Cube both the sides and simplify.

DESCARTES RULE OF SIGNS FOR THE ROOTS OF A POLYNOMIAL

Rule 1: The maximum number of positive real roots of a polynomial equation

$$f(x) = a_0 x^n + a_1 x^{n-1} + a_2 x^{n-2} + \ldots + a_{n-1} x + a_n = 0$$

is the number of changes of the signs of coefficients from positive to negative and negative to positive. For instance, in the equation $x^3 + 3x^2 + 7x - 11 = 0$ the signs of coefficients are

$$+ + + -$$

As there is just one change of sign, the number of positive roots of $x^3 + 3x^2 + 7x - 11 = 0$ is at most 1.

Rule 2: The maximum number of negative roots of the polynomial equation $f(x) = 0$ is the number of changes from positive to negative and negative to positive in the signs of coefficients of the equation $f(-x) = 0$.

SOME HINTS FOR SOLVING POLYNOMIAL EQUATIONS

1. To solve an equation of the form $(x - a)^4 + (x - b)^4 = A$
   put $\quad y = x - \frac{a+b}{2}$
   In general to solve an equation of the form
   $$(x - a)^{2n} + (x - b)^{2n} = A$$
   where n is a positive integer, we put $y = x - \frac{a+b}{2}$.
2. To solve an equation of the form
   $$a_0 f(x)^{2n} + a_1 (f(x))^n + a_2 = 0 \qquad (1)$$
   we put $(f(x))^n = y$ and solve $a_0 y^2 + a_1 y + a_2 = 0$ to obtain its roots y_1 and y_2.
   Finally, to obtain solutions of (1) we solve,
   $$(f(x))^n = y_1$$
   and $\quad (f(x))^n = y_2$
3. An equation of the form
   $$(ax^2 + bx + c_1)(ax^2 + bx + c_2) \ldots (ax^2 + bx + c_n) = A$$
   where $c_1, c_2, \ldots, c_n, A \in \mathbf{R}$, can be solved by putting $ax^2 + bx = y$.
4. An equation of the form
   $$(x - a)(x - b)(x - c)(x - d) = Ax^2$$
   where $ab = cd$, can be reduced to a product of two quadratic polynomials by putting $y = x + \frac{ab}{2}$.
5. An equation of the form
   $$(x - a)(x - b)(x - c)(x - d) = A$$
   where $a < b < c < d$, $b - a = d - c$
   can be solved by change of variable
   $$y = \frac{(x-a) + (x-b) + (x-c) + (x-d)}{4}$$
   $$= x - \frac{1}{4}(a + b + c + d)$$
6. A polynomial $f(x, y)$ is said to be symmetric if $f(x, y) = f(y, x) \;\forall\; x, y$.
   A symmetric polynomials can be represented as a function of $x + y$ and xy.

Equations Reducible to Quadratic

1. To solve an equation of the type $ax^4 + bx^2 + c = 0$, put $x^2 = y$.
2. To solve an equation of the type $a\,(p(x))^2 + bp(x) + c = 0$ (where $p(x)$ is an expression in x) put $p(x) = y$.
3. To solve an equation of the type
$$ap(x) + \frac{b}{p(x)} + c = 0$$
where $p(x)$ is an expression in x, put $p(x) = y$. This reduces the equation to
$$ay^2 + cy + b = 0.$$
4. To solve an equation of the form
$$a\left(x^2 + \frac{1}{x^2}\right) + b\left(x + \frac{1}{x}\right) + c = 0$$
put $\quad x + \dfrac{1}{x} = y$
and to solve
$$a\left(x^2 + \frac{1}{x^2}\right) + b\left(x - \frac{1}{x}\right) + c = 0$$
put $\quad x - \dfrac{1}{x} = y$
5. To solve reciprocal equation of the type
$$ax^4 + bx^3 + cx^2 + bx + a = 0, a \neq 0$$
we divide the equation by x^2, to obtain
$$a\left(x^2 + \frac{1}{x^2}\right) + b\left(x + \frac{1}{x}\right) + c = 0$$
and then put $\quad x + \dfrac{1}{x} = y.$
6. To solve equation of the type
$$(x + a)(x + b)(x + c)(x + d) + k = 0$$
where $a + b = c + d$, put $x^2 + (a + b)x = y$
7. To solve equation of the type
$$\sqrt{ax+b} = cx + d$$
or
$$\sqrt{ax^2+bx+c} = dx + e$$
square both the sides and solve for x.
8. To solve equation of the type
$$\sqrt{ax+b} \pm \sqrt{cx+d} = e$$
proceed as follows.

Step 1 Transfer one of the radical to the other side and square both the sides.

Step 2 Keep the expression with radical sign on one side and transfer the remaining expression on the other side.

Step 3 Now solve as in 7 above.

USE OF CONTINUITY AND DIFFERENTIABILITY TO FIND ROOTS OF A POLYNOMIAL EQUATION

Let $f(x) = a_0 x^n + a_1 x^{n-1} + a_2x^{n-2} + \dots + a_{n-1} x + a_n$, then f is continuous on **R**.

Since f is continuous on **R**, we may use the intermediate value theorem to find whether or not f has a real root in an interval (a, b).

If there exist a and b such that $a < b$ and $f(a) f(b) < 0$, then there exists at least one $c \in (a, b)$ such that $f(c) = 0$.

Also, if $\lim\limits_{x\to-\infty} f(x)$ and $f(a)$ are of opposite signs, then at least one root of $f(x) = 0$ lies in the interval $(-\infty, a)$. Also, if $f(a)$ and $\lim\limits_{x\to\infty} f(x)$ are of opposite signs, then at least one root of $f(x) = 0$ lies in the interval (a, ∞).

Result 1 If $f(x) = 0$ has a root α of multiplicity r (where $r > 1$), then we can write
$$f(x) = (x - \alpha)^r g(x)$$
where $g(\alpha) \neq 0$.

Also, $f'(x) = 0$ has α as a root with multiplicity $r - 1$.

Result 2 If $f(x) = 0$ has n real roots, then $f'(x) = 0$ has $(n - 1)$ real roots.

It follows immediately using Result 1 and Rolle's Theorem.

Result 3 If $f(x) = 0$ has n distinct real roots, we can write
$$f(x) = a_0 (x - \alpha_1)(x - \alpha_2) \dots (x - \alpha_n)$$
where $\alpha_1, \alpha_2, \dots \alpha_n$ are n distinct roots of $f(x) = 0$.

We also have
$$\frac{f'(x)}{f(x)} = \sum_{k=1}^{n} \frac{1}{x - \alpha_k}$$

SOLVED EXAMPLES

Concept-based

Straight Objective Type Questions

Example 1: Solution set of
$\sqrt{3-x} = -x^2 - x - 1, x \in$ **R** is

(a) $(-1, \infty)$ (b) $(0, 1)$
(c) $(-1, 3/4)$ (d) ϕ

Ans. (d)

Solution: Note that LHS $= \sqrt{3-x} \geq 0 \ \forall \ x \leq 3$.

$$\text{and RHS} = -\left(x - \frac{1}{2}\right)^2 - \frac{5}{4} < 0 \ \forall \ x.$$

Thus, the given equation has no solution.

Example 2: Number of solutions of

$$x - \frac{5}{x-2} = 2 - \frac{5}{x-2} \qquad (1)$$

is

(a) 0 (b) 1
(c) 2 (d) infinite

Ans. (a)

Solution: The equation (1) is defined when $x \neq 2$. But when $x \neq 2$. We can cancel $5/(x-2)$ from both the sides of (1) to obtain $x = 2$
Thus, (1) has no solution.

Example 3: The number of real solutions of $x^2 + 5|x| + 4 = 0$ is

(a) 0 (b) 1
(c) 2 (d) 4

Ans. (a)

Solution: If $x \in \mathbf{R}$, then $x^2 + 5|x| + 4 \geq 4$.
Thus, the given equation has no solution.

Example 4: If $\frac{1}{3-4i}$ is a root of $ax^2 + bx + c = 0$, $(a, b, c \in \mathbf{R}, a \neq 0)$, then

(a) $b + 6c = 0$ (b) $b = 6c$
(c) $a + 25c = 0$ (d) $b^2 = 6c$

Ans. (a)

Solution: TIP: As $a, b, c \in \mathbf{R}$, the other root must $\frac{1}{3+4i}$.

$$\text{Thus, } \frac{1}{3-4i} + \frac{1}{3+4i} = -\frac{b}{a},$$

$$\text{and } \frac{1}{3-4i} \cdot \frac{1}{3+4i} = \frac{c}{a}$$

$$\Rightarrow \quad \frac{6}{25} = -\frac{b}{a} \text{ and } \frac{1}{25} = \frac{c}{a}$$

$$\text{Now, } \quad 6\left(\frac{c}{a}\right) = -\frac{b}{a} \Rightarrow b + 6c = 0.$$

Also, $a - 25c = 0$

Example 5: If $1 - p$ is a root of the quadratic equation $x^2 + px + 1 - p = 0$, then its roots are

(a) 0, 1 (b) –1, 1
(c) 0, – 1 (d) –2, 1

Ans. (c)

Solution: $(1 - p)^2 + p(1 - p) + (1 - p) = 0$
$\Rightarrow \quad (1 - p)[1 - p + p + 1] = 0 \Rightarrow 2(1 - p) = 0$
$\Rightarrow \quad p = 1$
Thus, equation becomes $x^2 + x = 0$
$\Rightarrow \quad x = 0$ or -1

Example 6: Suppose $p \in \mathbf{R}$. If the roots of $3x^2 + 2x + p(1 - p) = 0$ are of opposite signs, then p must lie in the interval

(a) $(-\infty, 0)$ (b) $(0, 1)$
(c) $(1, \infty)$ (d) $(2, \infty)$

Ans. (b)

Solution: We must have $\frac{1}{3}p(1-p) < 0$

$\Rightarrow \quad p(1 - p) < 0 \Rightarrow 0 < p < 1.$

Example 7: If α, β are the roots of $(x - a)(x - b) + c = 0$, $c \neq 0$, then roots of $(\alpha\beta - c)x^2 + (\alpha + \beta)x + 1 = 0$ are

(a) $1/a, 1/b$ (b) $-1/a, -1/b$
(c) $1/a, -1/b$ (d) $-1/a, 1/b$

Ans. (b)

Solution: α, β are roots of $x^2 - (a + b)x + ab + c = 0$.
$\therefore \quad \alpha + \beta = a + b, \ \alpha\beta = ab + c$
The equation

$$(\alpha\beta - c)x^2 + (\alpha + \beta)x + 1 = 0$$

becomes

$$abx^2 + (a + b)x + 1 = 0$$

$\Rightarrow \quad (ax + 1)(bx + 1) = 0$
$\Rightarrow \quad x = -1/a, -1/b$

Example 8: If α, β are roots $x^2 + px + q = 0$, then value of $\alpha^3 + \beta^3$ is

(a) $3pq + p^3$ (b) $3pq - p^3$
(c) $3pq$ (d) $p^3 - 3pq$

Ans. (b)

Solution: $\alpha + \beta = -p, \ \alpha\beta = q$.
Now, $\alpha^3 + \beta^3 = (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta)$
$\qquad = -p^3 + 3pq = 3pq - p^3$

Example 9: If $a \in \mathbf{R}$ and both the roots of $x^2 - 6ax + 9a^2 + 2a - 2 = 0$ exceed 3, then a lies in the interval

(a) $(1, \infty)$ (b) $(2, \infty)$
(c) $(11/9, \infty)$ (d) ϕ

Ans. (d)

Solution: Given equation can be written as $(x - 3a)^2 = 2(1 - a)$
We must have $1 - a \geq 0$ or $a \leq 1$.
Also, $\quad x = 3a \pm \sqrt{2}\sqrt{1-a}$.
Both the roots will exceed 3, if smaller of the two roots viz $3a - \sqrt{2}\sqrt{1-a}$ exceeds 3, that is, $3a - \sqrt{2}\sqrt{1-a} > 3$

$$\Rightarrow \quad 3(a - 1) > \sqrt{2}\sqrt{1-a}. \qquad (1)$$

For $a = 1$, this is not possible. For $a < 1$, we can write (1) as

$$-3\left(\sqrt{1-a}\right)^2 > \sqrt{2}\sqrt{1-a}$$

which is no possible

Thus, there is not real value of a.

Example 10: If $x = \sqrt{7 - 4\sqrt{3}}$, then $x + \frac{1}{x}$ is equal to:

(a) 2 (b) $3\sqrt{7}$

(c) 4 (d) $4\sqrt{7}$

Ans. (c)

Solution: $7 - 4\sqrt{3} = 2^2 + (\sqrt{3})^2 - 4\sqrt{3}$

$$= (2 - \sqrt{3})^2$$

$$\therefore \quad x = \sqrt{7 - 4\sqrt{3}} = 2 - \sqrt{3}$$

$$\text{and} \quad \frac{1}{x} = \frac{1}{2 - \sqrt{3}} = 2 + \sqrt{3}$$

Thus, $x + \frac{1}{x} = 4$

Example 11: Suppose α, β are roots of $ax^2 + bx + c = 0$ then roots of $a(x-2)^2 - b(x-2)(x-3) + c(x-3)^2 = 0$ are

(a) $\frac{2+\alpha}{1+\beta}, \frac{2+\beta}{1+\alpha}$ (b) $\frac{2+\alpha}{3+\beta}, \frac{3+\alpha}{2+\beta}$

(c) $\frac{2+3\alpha}{2+\alpha}, \frac{2+3\beta}{2+\beta}$ (d) $\frac{2+3\alpha}{1+\alpha}, \frac{2+3\beta}{1+\beta}$

Ans. (d)

Solution: Write the equation as

$$a\left(-\frac{x-2}{x-3}\right)^2 + b\left(-\frac{x-2}{x-3}\right) + c = 0$$

Now, $-\frac{x-2}{x-3} = \alpha, \beta$

$$\Rightarrow \quad x = \frac{2+3\alpha}{1+\alpha}, \frac{2+3\beta}{1+\beta}$$

Example 12: If $x, y, z \in \mathbf{R}$ then the least value of the expression $E = 3x^2 + 5y^2 + 4z^2 - 6x + 20y - 8z - 3$ is:

(a) – 15 (b) – 30

(c) – 45 (d) – 60

Ans. (b)

Solution: We can write

$$\begin{aligned} E &= 3(x^2 - 2x + 1) + 5(y^2 + 4y + 4) \\ &\quad + 4(z^2 - 2z + 1) - 30 \\ &= 3(x-1)^2 + 5(y+2)^2 + 4(z-1)^2 - 30 \geq -30 \end{aligned}$$

The least value is attained when

$$x = 1, y = -2, z = 1.$$

Example 13: The number real of roots of $\sqrt{x-3}\,(x^2 + 7x + 10) = 0$, where $x \in \mathbf{R}$ is

(a) 0 (b) 1

(c) 2 (d) 3

Ans. (b)

Solution: For the equation to be defined, $x \geq 3$, and $x^2 + 7x + 10 \geq 40 \ \forall \ x \geq 3$. Therefore, the given equation has exactly one root, *viz.* 3.

Example 14: Suppose $a \in \mathbf{R}$. If $3x^2 + 2(a^2 + 1)x + (a^2 - 3a + 2) = 0$ possesses roots of opposite signs, then a lies in the interval:

(a) $(-\infty, -1)$ (b) $(-1, 1)$

(c) $(1, 2)$ (d) $(2, 3)$

Ans. (c)

Solution: As the roots are of opposite signs, the product of roots must be negative, that is,

$$\frac{a^2 - 3a + 2}{3} < 0 \Rightarrow (a-1)(a-2) < 0$$

$$\Rightarrow \quad a \in (1, 2)$$

Example 15: Suppose $a^2 = 5a - 8$ and $b^2 = 5b - 8$, then equation whose roots are $\frac{a}{b}$ and $\frac{b}{a}$ is

(a) $6x^2 - 5x + 6 = 0$ (b) $8x^2 - 9x + 8 = 0$

(c) $9x^2 - 8x + 9 = 0$ (d) $8x^2 + 9x + 8 = 0$

Ans. (b)

Solution: a, b are roots of $x^2 - 5x + 8 = 0$.

$$\therefore \quad a + b = 5, ab = 8$$

$$\text{Now,} \quad \frac{a}{b} + \frac{b}{a} = \frac{a^2 + b^2}{ab} = \frac{(a+b)^2 - 2ab}{ab}$$

$$= \frac{25}{8} - 2 = \frac{9}{8}$$

$\therefore$ required equation is

$$x^2 - (9/8)x + 1 = 0 \text{ or } 8x^2 - 9x + 8 = 0$$

Example 16: Sum of the roots of the equation $x^2 + |2x - 3| - 4 = 0$ is

(a) 2 (b) –2

(c) $\sqrt{2}$ (d) $-\sqrt{2}$

Ans. (c)

Solution: **Case 1:** When $x < 3/2$

In this case the equation becomes

$$x^2 - (2x - 3) - 4 = 0$$

$$\Rightarrow \quad x^2 - 2x + 1 = 2$$

$$\Rightarrow \quad (x-1)^2 = 2 \Rightarrow x - 1 = \pm\sqrt{2}$$

$$\Rightarrow \quad x = 1 \pm \sqrt{2}$$

As $x < 3/2$, we take, $x = 1 - \sqrt{2}$

Case 2: When $x \geq 3/2$

In this case the equation becomes

$$x^2 + (2x - 3) - 4 = 0$$

$$\Rightarrow \quad (x+1)^2 = 8 \Rightarrow x + 1 \pm 2\sqrt{2}$$

As $x \geq 3/2$, $x = -1 + 2\sqrt{2}$

Sum of the roots is

$$(1-\sqrt{2})+(-1+2\sqrt{2})=\sqrt{2}$$

Example 17: If the quadratic equation $a(b-c)x^2+b(c-a)x+c(a-b)=0$, where a, b, c are distinct real numbers and $abc \neq 0$, has equal roots, then a, b, c are in

(a) A.P. (b) G.P.
(c) H.P. (d) A.G.P.

Ans. (c)

Solution:

TIP

If sum of the coefficients of a polynomial equation is zero, then 1 is a root of the equaiton.

As 1 is a root of the equation and equation has equal roots, the other root must be 1. Thus we have

$$1 = \text{product of roots} = \frac{c(a-b)}{a(b-c)}$$

$$\Rightarrow \quad a(b-c)=c(a-b)$$

$$\Rightarrow \quad b=\frac{2ac}{a+c}$$

$\Rightarrow$ a, b, c are in H.P.

Example 18: Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$, and $(a+c)^2 < b^2$. Then the quadratic equation $ax^2+bx+c=0$ has

(a) real and distinct roots (b) real and equal roots
(c) purely imaginary roots (d) none of these

Ans. (a)

Solution:

TIP

Suppose $f(x)=ax^2+bx+c$, $a, b, c \in \mathbf{R}$, $a \neq 0$. If $f(\alpha)f(\beta) < 0$, then exactly one root of the equation $f(x)=0$ lies between α and β and the equation $f(x)=0$ has real roots.

Let $f(x)=ax^2+bx+c$.
Then $f(1)=a+b+c$, $f(-1)=a-b+c$.
We have $f(1)f(-1)=(a+c)^2-b^2<0$

Thus, $f(x)=0$ has exactly one root in $(-1, 1)$. Hence, $ax^2+bx+c=0$ has real and distinct roots.

Example 19: If both the roots of the quadratic equation $x^2+2(a+2)x+9a-1=0$ are negative, then a lies in the set

(a) $[1, \infty)$ (b) $(1/9, 1] \cup [4, \infty)$
(c) $(-2, 4) \cup (6, \infty)$ (d) ϕ

Ans. (b)

Solution: TIP: Both the roots are negative, if and only if $D \geq 0$, sum of roots < 0 and product of roots > 0

Thus, $4(a+2)^2-4(9a-1) \geq 0$,

$$-2(a+2)<0,\ 9a-1>0$$

$$\Rightarrow \quad a^2-5a+4 \geq 0,\ a>-2,\ a>1/9$$

$$\Rightarrow \quad (a-1)(a-4) \geq 0,\ a>1/9$$

$$\Rightarrow \quad a \leq 1 \text{ or } a \geq 4 \text{ and } a>1/9$$

$$\Rightarrow \quad a \in (1/9, 1] \cup [4, \infty)$$

Example 20: Suppose $p \in \mathbf{R}$ and α, β are roots of $x^2-px+\frac{1}{2p^2}=0$, then the minimum value of $\alpha^4+\beta^4$ is

(a) $\sqrt{2}$ (b) $2-\sqrt{2}$
(c) $\sqrt{2}-2$ (d) -2

Ans. (c)

Solution: $\alpha+\beta=p$, $\alpha\beta=1/2p^2$

$$\Rightarrow \quad \alpha^2+\beta^2=(\alpha+\beta)^2-2\alpha\beta=p^2-1/p^2$$

$$\therefore \quad \alpha^4+\beta^4=(\alpha^2+\beta^2)^2-2\alpha^2\beta^2=\left(p^2-\frac{1}{p^2}\right)^2-\frac{1}{2p^4}$$

$$=p^4+\frac{1}{p^4}-2-\frac{1}{2p^4}$$

$$=p^4+\frac{1}{2p^4}-2$$

$$\geq 2\left(p^4\cdot\frac{1}{2p^4}\right)^{1/2}-2=\sqrt{2}-2$$

$[\because \text{AM} \geq \text{GM}]$

Thus, minimum possible value of $\alpha^4+\beta^4$ is $\sqrt{2}-2$, which is attained when $p=1$

LEVEL 1

Straight Objective Type Questions

Example 21: The number of real solutions of

$$x+\sqrt{x}+\sqrt{x-2}=3 \qquad (1)$$

is:

(a) 0 (b) 1
(c) 2 (d) 4

Ans. (a)

Solution: For $\sqrt{x}$, $\sqrt{x-2}$ to be defined $x \geq 0$, $x-2 \geq 0$

$\Rightarrow$ $x \geq 2$. But for $x \geq 2$

$$x+\sqrt{x}+\sqrt{x-2} \geq 2+\sqrt{2}>3$$

Thus, (1) has no real solution.

◉ **Example 22:** In Fig. 3.16 graph of $y = ax^2 + bx + c$ is given. Which one of the following is not true?

(a) $a < 0$ (b) $c > 0$

(c) $b^2 - 4ac > 0$ (d) $b < 0$

Ans. (d)

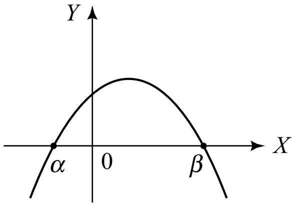

Fig. 3.16

◎ **Solution:** The given parabola opens downwards, $a < 0$. Also, $y(0) = c > 0$.
As roots of $ax^2 + bx + c = 0$ are distinct, $b^2 - 4ac > 0$.
However nothing can be said about b. It can be positive, zero or negative. For instance, consider equations $-x^2 - 5x + 6 = 0$, $-x^2 + 3x + 4 = 0$ and $-x^2 + 9 = 0$.

◉ **Example 23:** Let α and β be the roots of $px^2 + qx + r = 0$, $p \neq 0$. If p, q, r are in A.P. and $\frac{1}{\alpha} + \frac{1}{\beta} = 4$, then value of $|\alpha - \beta|$ is

(a) $\frac{1}{9}\sqrt{61}$ (b) $\frac{2}{9}\sqrt{17}$

(c) $\frac{1}{9}\sqrt{34}$ (d) $\frac{2}{9}\sqrt{13}$

Ans. (d)

◎ **Solution:** $4 = \dfrac{\alpha + \beta}{\alpha\beta} = \dfrac{-q/p}{r/p} = -\dfrac{q}{r}$

$\Rightarrow \quad q + 4r = 0$

Also, $\quad 2q = p + r \qquad [\because p, q, r \text{ are in A.P.}]$

Thus, $\quad p = -9r,\ q = -4r$

$$|\alpha - \beta|^2 = (\alpha + \beta)^2 - 4\alpha\beta$$

$$= \left(\frac{-q}{p}\right)^2 - \frac{4r}{p}$$

$$= \frac{16}{81} - 4\left(-\frac{1}{9}\right) = \frac{52}{81}$$

$\Rightarrow \quad |\alpha - \beta| = \frac{2}{9}\sqrt{13}$

◉ **Example 24:** If tan 25° and tan 20° are roots of the quadratic equation $x^2 + 2px + q = 0$, then $2p - q$ is equal to

(a) -2 (b) -1

(c) 0 (d) 1

Ans. (b)

◎ **Solution:** We have
$\tan 25° + \tan 20° = -2p$
and $\tan 25° \tan 20° = q$

Now, $\quad 1 = \tan 45° = \tan(25° + 20°)$

$$= \frac{\tan(25°) + \tan(20°)}{1 - \tan(25°)\tan(20°)} = \frac{-2p}{1 - q}$$

$\Rightarrow \quad 1 - q = -2p \Rightarrow 2p - q = -1$

◉ **Example 25:** Suppose $0 < \alpha < \beta$, and $2\alpha + \beta = \pi/2$. If $\tan\alpha$, $\tan\beta$ are roots of $ax^2 + bx + c = 0$, then

(a) $\tan\alpha = \dfrac{c - a}{b}$ (b) $\tan\beta = \dfrac{c + a}{b}$

(c) $\tan\alpha = \dfrac{b}{c - a}$ (d) $\tan\beta = -\dfrac{b}{c + a}$

Ans. (a)

◎ **Solution:** $\tan\alpha + \tan\beta = -b/a$ and $\tan\alpha \tan\beta = c/a$.

Now, $\quad \tan(\alpha + \beta) = \dfrac{\tan\alpha + \tan\beta}{1 - \tan\alpha \tan\beta}$

$\Rightarrow \quad \tan(\pi/2 - \alpha) = \dfrac{-b/a}{1 - c/a}$

$\Rightarrow \quad \cot\alpha = \dfrac{-b}{a - c}$

Thus, $\quad \tan\alpha = \dfrac{c - a}{b}$.

◉ **Example 26:** The value of a for which one root of the equation $x^2 - (a + 1)x + a^2 + a - 8 = 0$ exceeds 2 and other is less than 2, are given by

(a) $3 < a < 10$ (b) $a \geq 10$

(c) $-2 < a < 3$ (d) $a \leq -2$

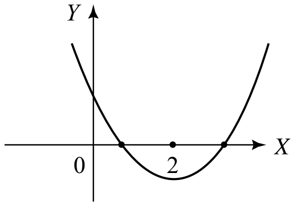
Ans. (c)

◎ **Solution:** As the roots are real and distinct

$$(a + 1)^2 - 4(a^2 + a - 8) > 0$$

$$3a^2 + 2a - 33 < 0$$

$\Rightarrow \quad (3a + 11)(a - 3) < 0 \Rightarrow -\dfrac{11}{3} < a < 3 \quad (1)$



Also, for

$$2^2 - 2(a + 1) + a^2 + a - 8 < 0$$

$\Rightarrow \quad a^2 - a - 6 < 0 \Rightarrow (a - 3)(a + 2) < 0$

$\Rightarrow \quad -2 < a < 3 \quad (2)$

From (1) and (2), we get $-2 < a < 3$.

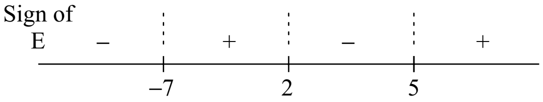
Example 27: The least integral value α of x such that $\dfrac{x-5}{x^2+5x-14} > 0$, satisfies the relation:

(a) $\alpha^2 + 3\alpha - 4 = 0$ (b) $\alpha^2 - 5\alpha + 4 = 0$
(c) $\alpha^2 - 7\alpha + 6 = 0$ (d) $\alpha^2 + 5\alpha - 6 = 0$

Ans. (d)

Solution: $0 < \dfrac{x-5}{x^2+5x-14} = \dfrac{x-5}{(x+7)(x-2)} = \text{E(say)}$

Sign of E in different intervals are shown below



Thus, $\dfrac{x-5}{(x+7)(x-2)} > 0$

$\Rightarrow \qquad -7 < x < 2 \text{ or } x > 5.$

Therefore the least integral value α of x is -6. This value of α satisfies the relation $\alpha^2 + 5\alpha - 6 = 0$.

Example 28: Let p and q be two non-zero real numbers and α, β are two numbers such that $\alpha^3 + \beta^3 = -p$, $\alpha\beta = q$, then the quadratic equation whose roots are α^2/β and β^2/α is

(a) $px^2 - qx + p^2 = 0$ (b) $qx^2 + px + q^2 = 0$
(c) $px^2 + qx + p^2 = 0$ (d) $qx^2 - px + q^2 = 0$

Ans. (b)

Solution: $\dfrac{\alpha^2}{\beta} + \dfrac{\beta^2}{\alpha} = \dfrac{\alpha^3+\beta^3}{\alpha\beta} = \dfrac{-p}{q}$

and $\left(\dfrac{\alpha^2}{\beta}\right)\left(\dfrac{\beta^2}{\alpha}\right) = \alpha\beta = q$

Thus, required equation is

$$x^2 - \left(-\frac{p}{q}\right)x + q = 0$$

or $\qquad qx^2 + px + q^2 = 0.$

Example 29: The set of values of α for which the quadratic equation

$$(\alpha+2)\,x^2 - 2\alpha x - \alpha = 0$$

has two roots on the number line symmetrically placed about the point 1 is

(a) $\{-1, 0\}$ (b) $\{0, 2\}$
(c) ϕ (d) $\{0, 1\}$

Ans. (c)

Solution: Let roots of the equation be

$1 - k$ and $1 + k$, where $k > 0$

Then $\qquad 2 = (1-k) + (1+k) = \dfrac{2\alpha}{\alpha+2} \Rightarrow 1 = \dfrac{\alpha}{\alpha+2}$

This is not possible for any value of α.

Example 30: Suppose $k \in \mathbf{R}$ and the quadratic equation $x^2 - (k-3)x + k = 0$ has at least one positive roots, then k lies in the set:

(a) $(-\infty, 0) \cup [9, 16]$ (b) $(-\infty, 0) \cup [16, 8)$
(c) $(-\infty, 0) \cup [9, \infty)$ (d) $(-\infty, 0) \cup (1, \infty)$

Ans. (c)

Solution: Both the roots α, β will be non-positive if

$D \geq 0,\ \alpha + \beta \leq 0,\ \alpha\beta \geq 0$

$\Rightarrow \qquad (k-3)^2 - 4k \geq 0,\ (k-3) \leq 0,\ k \geq 0$

$\Rightarrow \qquad (k-1)(k-9) \geq 0,\ k \leq 3,\ k \geq 0$

$\Rightarrow \qquad 0 \leq k \leq 1.$

Thus, quadratic equation will have at least one positive root if $k < 0$ or $k > 1$ and ($k \leq 1$ or $k \geq 9$)

$\Rightarrow \qquad k \in (-\infty, 0) \cup [9, \infty)$

Example 31: Two non-integer roots of the equation

$$(x^2+3x)^2 - (x^2+3x) - 6 = 0 \qquad (1)$$

are

(a) $\frac{1}{2}(-3+\sqrt{11}), \frac{1}{2}(-3-\sqrt{11})$

(b) $\frac{1}{2}(-3+\sqrt{7}), \frac{1}{2}(-3-\sqrt{7})$

(c) $\frac{1}{2}(-3+\sqrt{21}), \frac{1}{2}(-3-\sqrt{21})$

(d) none of these

Ans. (c)

Solution: TIP: It is an equation which is reducible to quadratic. Put $x^2 + 3x = y$.

The equation (1) becomes

$$y^2 - y - 6 = 0 \quad \Rightarrow \quad (y+2)(y-3) = 0$$

$\Rightarrow \qquad y = -2, y = 3$

When $\qquad y = 2,$

$$x^2 + 3x = -2 \quad \Rightarrow \quad x^2 + 3x + 2 = 0$$

$\Rightarrow \quad (x+1)(x+2) = 0 \quad \Rightarrow \quad x = -1, -2$

When $\qquad y = 3,\ x^2 + 3x = 3 \quad \Rightarrow \quad x^2 + 3x - 3 = 0$

$\Rightarrow \qquad x = \dfrac{1}{2}(-3 \pm \sqrt{9+12}) = \dfrac{1}{2}(-3 \pm \sqrt{21})$

Example 32: Two non-integer roots of

$$\left(\frac{3x-1}{2x+3}\right)^4 - 5\left(\frac{3x-1}{2x+3}\right)^2 + 4 = 0 \qquad (1)$$

are

(a) $-5/7, -2/5$ (b) $-2/5, 7/5$
(c) $5/7, 7/5$ (d) $-2/5, 3/5$

Ans. (a)

Solution: TIP: It is an equation which is reducible to quadratic. Put $\left(\dfrac{3x-1}{2x+3}\right)^2 = y$. The equation (1) becomes

$$y^2 - 5y + 4 = 0 \Rightarrow (y - 1)(y - 4) = 0 \Rightarrow y = 1, 4$$

When $y = 1, \left(\dfrac{3x-1}{2x+3}\right)^2 = 1 \Rightarrow \dfrac{3x-1}{2x+3} = \pm 1$

$\Rightarrow \quad x = 4, -2/5$

When $y = 4, \left(\dfrac{3x-1}{2x+3}\right)^2 = 4 \Rightarrow \dfrac{3x-1}{2x+3} = \pm 2$

$\Rightarrow \quad x = -7, -5/7$

Thus, required roots are – 2/5, – 5/7.

Example 33: Sum of the roots of the equation

is $$4^x - 3(2^{x+3}) + 128 = 0 \qquad (1)$$

(a) 5 (b) 6
(c) 7 (d) 8

Ans. (c)

Solution: Put $2^x = y$. Equation (1) becomes

$$y^2 - 3(8y) + 128 = 0 \quad \Rightarrow \quad y^2 - 24y + 128 = 0$$

$\Rightarrow \quad (y - 8)(y - 16) = 0 \quad \Rightarrow \quad y = 16, 8$

$\Rightarrow \quad 2^x = 16, 8 \quad \Rightarrow \quad x = 4, 3$

$\therefore$ Sum of the roots is 7.

Example 34: The only real value of x satisfying the equation is

$$6\sqrt{\frac{x}{x+4}} - 2\sqrt{\frac{x+4}{x}} = 11 \qquad (1)$$

where $x \in \mathbf{R}$

(a) 4/35 (b) – 4/35
(c) 16/3 (d) none of these.

Ans. (d)

Solution: For (1) to be defined either $x < -4$ or $x > 0$.

Put $\sqrt{\dfrac{x}{x+4}} = y$. Equation (1) becomes

$$6y - 2/y = 11 \quad \Rightarrow \quad 6y^2 - 11y - 2 = 0$$

$\Rightarrow \quad (6y + 1)(y - 2) = 0 \quad \Rightarrow \quad y = -1/6, y = 2.$

As $y = \sqrt{\dfrac{x}{x+4}} \geq 0$, we reject $y = -\dfrac{1}{6}$.

Thus, $y = 2 \quad \Rightarrow \quad \dfrac{x}{x+4} = y^2 = 4$

$\Rightarrow \quad x = 4x + 16 \quad \Rightarrow \quad x = -16/3 < -4$

Example 35: The number of real values of x satisfying the equation

$$2\left(x^2 + \frac{1}{x^2}\right) - 9\left(x + \frac{1}{x}\right) + 14 = 0 \qquad (1)$$

is

(a) 1 (b) 2
(c) 3 (d) 4

Ans. (c)

Solution: Put $x + \dfrac{1}{x} = y$, so that $x^2 + \dfrac{1}{x} = y^2 - 2$. Then equation (1) becomes

$$2(y^2 - 2) - 9y + 14 = 0$$

$\Rightarrow \quad 2y^2 - 9y + 10 = 0 \quad \Rightarrow \quad (2y - 5)(y - 2) = 0$

$\Rightarrow \quad y = 5/2, 2$

When $x + \dfrac{1}{x} = \dfrac{5}{2}$, we get $x = 2, \dfrac{1}{2}$

When $x + \dfrac{1}{x} = 2$, we get $x = 1$.

Example 36: The non-integral roots of

$$x^4 - 3x^3 - 2x^2 + 3x + 1 = 0 \qquad (1)$$

are

(a) $\frac{1}{2}(3 + \sqrt{13}), \frac{1}{2}(3 - \sqrt{13})$

(b) $\frac{1}{2}(3 - \sqrt{13}), \frac{1}{2}(-3 - \sqrt{13})$

(c) $\frac{1}{2}(3 + \sqrt{17}), \frac{1}{2}(3 - \sqrt{17})$

(d) none of these.

Ans. (a)

Solution: Dividing (1) by x^2, we get

$$x^2 - 3x - 2 + \frac{3}{x} + \frac{1}{x^2} = 0$$

or $$\left(x^2 + \frac{1}{x^2}\right) - 3\left(x - \frac{1}{x}\right) - 2 = 0 \qquad (2)$$

Put $x - 1/x = y$, so that

$$x^2 + \frac{1}{x^2} - 2 = y^2 \text{ or } x^2 + \frac{1}{x^2} = y^2 + 2$$

Equation (2) now becomes

$$y^2 + 2 - 3y - 2 = 0 \quad \Rightarrow \quad y^2 - 3y = 0$$

$\Rightarrow \quad y(y - 3) = 0 \quad \Rightarrow \quad y = 0 \quad \text{or} \quad y = 3$

When $y = 0$, we get $x - \dfrac{1}{x} = 0 \quad \Rightarrow \quad x = \pm 1$

When $y = 3$, we get $x - \dfrac{1}{x} = 3$

$\Rightarrow \quad x^2 - 3x - 1 = 0 \quad \Rightarrow \quad x = \dfrac{1}{2}(3 \pm \sqrt{13})$

Example 37: Suppose $a, b, c \in \mathbf{R}$ and $b \neq c$. If α, β are roots of $x^2 + ax + b = 0$ and γ, δ are roots of $x^2 + ax + c = 0$, then value of

$$\frac{(\alpha - \gamma)(\alpha - \delta)}{(\beta - \gamma)(\beta - \delta)} \text{ is independent of:}$$

(a) a, b (b) b, c
(c) c, a (d) a, b, c

Ans. (d)

Solution: $x^2 + ax + c = (x - \gamma)(x - \delta)$

Thus,

$$\begin{aligned}\frac{(\alpha-\gamma)(\alpha-\delta)}{(\beta-\gamma)(\beta-\delta)} &= \frac{\alpha^2+a\alpha+c}{\beta^2+a\beta+c}\\ &= \frac{-b+c}{-b+c} = 1\end{aligned}$$

[∵ α, β are roots of $x^2 + ax + b = 0$]

Example 38: Number of real solutions of

$$(x-1)(x+1)(2x+1)(2x-3) = 15 \qquad (1)$$

is

(a) 0
(b) 2
(c) 3
(d) 4

Ans. (b)

Solution: We write (1) as

$$\begin{aligned} (x-1)(2x+1)(x+1)(2x-3) &= 15\\ \Rightarrow \quad (2x^2-x-1)(2x^2-x-3) &= 15 \qquad (2)\end{aligned}$$

Put $2x^2 - x = y$, so that (2) becomes

$$\begin{aligned} (y-1)(y-3) &= 15 \;\Rightarrow\; y^2-4y+3 = 15\\ \Rightarrow \quad y^2-4y-12 &= 0 \;\Rightarrow\; (y-6)(y+2) = 0\\ \Rightarrow \quad y &= 6, -2.\end{aligned}$$

When $y = 6$, $2x^2 - x = 6 \;\Rightarrow\; 2x^2 - x - 6 = 0$

$$\begin{aligned}\Rightarrow \quad 2x^2-4x+3x-6 = 0 \;&\Rightarrow\; (2x+3)(x-2) = 0\\ \Rightarrow \quad x &= -3/2, 2\end{aligned}$$

When $y = -2$, $2x^2 - x = -2$

or $\qquad 2x^2 - x + 2 = 0$

As $D = 1 - 4(2)(2) = -15 < 0$, we get $2x^2 - x + 2 = 0$ does not have real roots.

Example 39: If $p, q \in \mathbf{R}$ and $2 + \sqrt{3}i$ a root of $x^2 + px + q = 0$, then

(a) $p = -2, q = \sqrt{3}$
(b) $p = -4, q = 7$
(c) $p = 3, q = 2$
(d) $p = -4, q = 2$

Ans. (b)

Solution: Other root of the equation is $2 - \sqrt{3}i$. Thus

$$-p = \left(2+\sqrt{3}i\right)+\left(2-\sqrt{3}i\right) \qquad (2)$$

and $\qquad q = \left(2+\sqrt{3}i\right)\left(2-\sqrt{3}i\right)$

$\Rightarrow \qquad p = -4, q = 7$

Example 40: The number of solutions of

$$\sqrt{3x^2+x+5} = x - 3, \text{ where } x \in \mathbf{R} \qquad (1)$$

is:

(a) 0
(b) 1
(c) 2
(d) 4

Ans. (a)

Solution: Note that we must have $3x^2 + x + 5 \geq 0$ and $x - 3 \geq 0$ or $x \geq 3$. Squaring both sides of (1), we get

$$\begin{aligned} 3x^2+x+5 &= x^2-6x+9\\ \Rightarrow \quad 2x^2+7x-4 &= 0 \;\Rightarrow\; (2x-1)(x+4) = 0\\ \Rightarrow \quad x &= 1/2, -4\end{aligned}$$

None of these satisfy the inequality $x \geq 3$. Thus, (1) has no solution.

Example 41: The number of solutions of

$$\sqrt{4-x} + \sqrt{x+9} = 5 \qquad (1)$$

is:

(a) 0
(b) 1
(c) 2
(d) 3

Ans. (c)

Solution: Note that $4 - x \geq 0$ and $x + 9 \geq 0 \Rightarrow -9 \leq x \leq 4$.

We can write (1) as $\sqrt{x+9} = 5 - \sqrt{4-x}$

Squaring both the sides we get

$$\begin{aligned} x+9 &= 25 - 10\sqrt{4-x} + 4 - x\\ \Rightarrow \quad 10\sqrt{4-x} &= 20 - 2x \;\Rightarrow\; 5\sqrt{4-x} = 10 - x\end{aligned}$$

Squaring both the sides we get

$$\begin{aligned} 25(4-x) &= 100 - 20x + x^2 \;\Rightarrow\; x^2 + 5x = 0\\ \Rightarrow \quad x(x+5) &= 0 \;\Rightarrow\; x = 0 \text{ or } x = -5\end{aligned}$$

Both $x = 0$ and $x = -5$ satisfy (1).

Example 42: Suppose $a \in \mathbf{R}$ and α, β are roots of $x^2 - 4ax + 5a^2 - 6a = 0$. The maximum possible distance between α and β is

(a) 6
(b) 5
(c) 3
(d) 1

Ans. (a)

Solution:
$$\begin{aligned}(\alpha-\beta)^2 &= (\alpha+\beta)^2 - 4\alpha\beta\\ &= 16a^2 - 4(5a^2 - 6a)\\ &= 4(6a - a^2)\\ &= 4[9 - (3-a)^2]\end{aligned}$$

As $a \in \mathbf{R}$, $(\alpha - \beta)^2$ is maximum when $a = 3$. Thus, maximum possible distance between α and β is 6.

Example 43: The value of a for which one root of the quadratic equation.

$$(a^2-5a+3)x^2 + (3a-1)x + 2 = 0 \qquad (1)$$

is twice the other, is

(a) $-2/3$
(b) $1/3$
(c) $-1/3$
(d) $2/3$

Ans. (d)

Solution: Let α and 2α be the roots of (1), then

$$(a^2-5a+3)\alpha^2 + (3a-1)\alpha + 2 = 0 \qquad (2)$$

and $\quad (a^2-5a+3)(4\alpha^2) + (3a-1)(2\alpha) + 2 = 0 \qquad (3)$

Multiplying (2) by 4 and subtracting it form (3) we get

$$(3a-1)(2\alpha)+6=0$$

Clearly $a \neq 1/3$. Therefore, $\alpha = -3/(3a-1)$

Putting this value in (2) we get

$$(a^2-5a+3)(9)-(3a-1)^2(3)+2(3a-1)^2=0$$

$$\Rightarrow \quad 9a^2-45a+27-(9a^2-6a+1)=0$$

$$\Rightarrow \quad -39a+26=0$$

$$\Rightarrow \quad a=2/3.$$

For $a = 2/3$, the equation becomes $x^2 + 9x + 18 = 0$, whose roots are $-3, -6$.

Example 44: Range of function $f(x) = \dfrac{x^2+x+2}{x^2+x+1}$, $x \in \mathbf{R}$ is

(a) $(1, \infty)$ (b) $(1, 3/2)$

(c) $(1, 7/3]$ (d) $(1, 7/5]$

Ans. (c)

Solution: Let $y = \dfrac{x^2+x+2}{x^2+x+1} = 1 + \dfrac{1}{x^2+x+1}$

$$= 1 + \frac{1}{(x+1/2)^2+3/4} > 1$$

$$\Rightarrow \quad \frac{1}{y-1} = x^2+x+1 = \left(x+\frac{1}{2}\right)^2+\frac{3}{4} \geq \frac{3}{4}$$

Thus, $y > 1$ and $y - 1 \leq 4/3 \Rightarrow y \leq 7/3$

$\therefore \quad 1 < y \leq 7/3$

Example 45: If $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ are such that $\min f(x) > \max g(x)$, then relation between b and c, is:

(a) no relation (b) $0 < c < b/2$

(c) $|c| < \dfrac{|b|}{\sqrt{2}}$ (d) $|c| > \sqrt{2}\ |b|$.

Ans. (d)

Solution: $f(x) = (x + b)^2 + 2c^2 - b^2$

$\Rightarrow \quad \min f(x) = 2c^2 - b^2$

Also $\quad g(x) = -x^2 - 2cx + b^2 = b^2 + c^2 - (x + c)^2$

$\Rightarrow \quad \max g(x) = b^2 + c^2$

As $\min f(x) > \max g(x)$, we get $2c^2 - b^2 > b^2 + c^2$

$\Rightarrow \quad c^2 > 2b^2 \Rightarrow |c| > \sqrt{2}\ |b|$

Example 46: If a, b are the roots of $x^2 + px + 1 = 0$, and c, d are the roots of $x^2 + qx + 1 = 0$, then the value of

$$E = (a-c)(b-c)(a+d)(b+d)$$

is:

(a) $p^2 - q^2$ (b) $q^2 - p^2$

(c) $q^2 + p^2$ (d) none of these

Ans. (b)

Solution: We have

$$x^2 + px + 1 = (x-a)(x-b)$$

Thus,

$$E = (c-a)(c-b)(-d-a)(-d-b)$$

$$= (c^2+pc+1)[(-d)^2-pd+1]$$

$[\because\ a + b = -p]$

$$= (c^2+pc+1)(d^2-pd+1)$$

But $c^2 + qc + 1 = 0$ and $d^2 + qd + 1 = 0$

$$\therefore \quad E = (-qc+pc)(-qd-pd)$$

$$= cd(q-p)(q+p)$$

$$= cd(q^2-p^2) = q^2-p^2 \qquad [\because\ cd = 1]$$

Example 47: If $4^x - 3^{x-1/2} = 3^{x+1/2} - 2^{2x-1}$, then value of x is equal to

(a) 5/2 (b) 2

(c) 3/2 (d) 1

Ans. (c)

Solution: $4^x - 3^{x-1/2} = 3^{x+1/2} - 2^{2x-1}$

$$\Rightarrow \quad 4^x + 2^{2x-1} = 3^{x+1/2} + 3^{x-1/2}$$

$$\Rightarrow \quad 4^x + \frac{4^x}{2} = 3^x\sqrt{3} + \frac{3^x}{\sqrt{3}}$$

$$\Rightarrow \quad \left(\frac{3}{2}\right)4^x = \left(\frac{4}{\sqrt{3}}\right)3^x$$

$$\Rightarrow \quad \left(\frac{4}{3}\right)^x = \frac{2}{3}\times\frac{4}{\sqrt{3}} = \frac{8}{3\sqrt{3}} = \left(\frac{2}{3^{1/2}}\right)^3 = \left(\frac{4}{3}\right)^{3/2}$$

$$\Rightarrow \quad x = 3/2$$

Example 48: If $x^2 + 2ax + 10 - 3a > 0$ for each $x \in \mathbf{R}$, then

(a) $a < -5$ (b) $-5 < a < 2$

(c) $a > 5$ (d) $2 < a < 5$

Ans. (b)

Solution: $x^2 + 2ax + 10 - 3a > 0 \ \forall\ x \in \mathbf{R}$

$$\Rightarrow \quad (x+a)^2 - (a^2+10-3a) > 0 \ \forall\ x \in \mathbf{R}$$

$$\Rightarrow \quad a^2 + 3a - 10 < 0$$

$$\Rightarrow \quad (a+5)(a-2) < 0$$

$$\Rightarrow \quad -5 < a < 2$$

Example 49: The number of solutions of

$$\sqrt{x+1} - \sqrt{x-1} = 1 \qquad (x \in \mathbf{R})$$

is

(a) 1 (b) 2

(c) 4 (d) infinite

Ans. (a)

Solution: For the equation to make sense we must have $x + 1 \geq 0$ and $x - 1 \geq 0 \Rightarrow x \geq -1, x \geq 1$ i.e. $x \geq 1$.

We rewrite equation as

$$\sqrt{x+1} = 1 + \sqrt{x-1}$$

and square both the sides to obtain

$$x + 1 = 1 + x - 1 + 2\sqrt{x-1}$$

$$\Rightarrow \quad \frac{1}{2} = \sqrt{x-1} \Rightarrow \frac{1}{4} = x - 1 \text{ or } x = \frac{5}{4}$$

Also, $x = 5/4$ satisfies the given equation.

Example 50: If a, b, c are real and $a \neq b$, then the roots of the equation

$$2(a-b)x^2 - 11(a+b+c)x - 3(a-b) = 0 \qquad (1)$$

are

(a) real and equal (b) real and unequal
(c) purely imaginary (d) none of these

Ans. (b)

Solution: The discriminant D of the quadratic equation (1) is given by

$$D = 121(a+b+c)^2 + 24(a-b)^2$$

As a, b, c are real, $121(a+b+c)^2 \geq 0$

Also, as $a \neq b$, $(a-b)^2 > 0$

Thus, $D > 0$.

Therefore, equation (1) has real and unequal roots.

Example 51: Let $a > 0$, $b > 0$ and $c > 0$. Then both the roots of the equation

$$2ax^2 + 3bx + 5c = 0 \qquad (1)$$

(a) are real and negative
(b) have negative real parts
(c) have positive real parts
(d) none of these

Ans. (b)

Solution: The discriminant D of the equation (1) is given by

$$D = (3b)^2 - 4(2a)(5c) = 9b^2 - 40ac$$

If $D \geq 0$, then both the roots of (1) are real.

Also, since $ac > 0$, $D < 9b^2$.

$$\Rightarrow \quad \sqrt{D} < 3b \quad [\because b > 0]$$

Therefore, in this case both the roots $\dfrac{-3b-\sqrt{D}}{4a}$ and $\dfrac{-3b+\sqrt{D}}{4a}$ are negative.

If $D < 0$, both the roots of (1) are imaginary and are given by

$$x = \frac{-3b \pm i\sqrt{40ac - 9b^2}}{2}$$

Both these roots have negative real parts.

Example 52: If a, b, c are real, then both the roots of the equation

$$(x-b)(x-c) + (x-c)(x-a) + (x-a)(x-b) = 0 \qquad (1)$$

are always

(a) positive (b) negative
(c) real (d) none of these

Ans. (c)

Solution: We can write (1) as

$$3x^2 - 2(a+b+c)x + bc + ca + ab = 0 \qquad (2)$$

The discriminant D of (2) is given by

$$\begin{aligned} D &= 4(a+b+c)^2 - 4 \times 3(bc+ca+ab) \\ &= 4[a^2 + b^2 + c^2 + 2bc + 2ca + 2ab - 3bc - 3ca - 3ab] \\ &= 4[a^2 + b^2 + c^2 - bc - ca - ab] \\ &= 2[(b^2 + c^2 - 2bc) + (c^2 + a^2 - 2ca) + (a^2 + b^2 - 2ab)] \\ &= 2[(b-c)^2 + (c-a)^2 + (a-b)^2] \end{aligned}$$

As a, b, c are real, we get $D \geq 0$. Thus, roots of (1) are real.

Example 53: If the roots of the equation $(4a - a^2 - 5)x^2 - (2a-1)x + 3a = 0$, $a \in \mathbf{R}$, are real and lie on opposite sides of unity, then the a lies in the interval:

(a) $(1, 5)$ (b) $(1, 4)$
(c) $(3, \infty)$ (d) $(-\infty, 4)$

Ans. (b)

Solution: **TIP:** If roots of a quadratic equation $f(x) = 0$ are on the opposite sides of a real number p, then $f(x + p) = 0$ has roots of opposite sings.

Put $\quad y = x - 1$, so that $x = y + 1$

The equation now becomes:

$$\begin{aligned} & (4a - a^2 - 5)(y+1)^2 - (2a-1)(y+1) + 3a = 0 \\ \Rightarrow \quad & (4a - a^2 - 5)y^2 + (8a - 2a^2 - 10 - 2a + 1)y \\ & + (4a - a^2 - 5 - 2a + 1 + 3a) = 0 \\ \Rightarrow \quad & (4a - a^2 - 5)y^2 + (6a - 2a^2 - 9)y \\ & + (5a - a^2 - 4) = 0 \end{aligned}$$

This equation must have roots of opposite signs. This is possible if and only if

$$\frac{5a - a^2 - 4}{4a - a^2 - 5} < 0 \text{ or } \frac{a^2 - 5a + 4}{a^2 - 4a + 5} < 0$$

As $a^2 - 4a + 5 = (a-2)^2 + 1 > 0 \ \forall \ a$,
we get $(a-1)(a-4) < 0 \Rightarrow 1 < a < 4$.

Example 54: If α, β are roots of $ax^2 + bx + c = 0$, then roots of

$$a^3x^2 + abcx + c^3 = 0 \text{ are}$$

(a) $\alpha\beta, \alpha + \beta$ (b) $\alpha^2\beta, \alpha\beta^2$
(c) $\alpha\beta, \alpha^2\beta^2$ (d) α^3, β^3

Ans. (b)

Solution: $\alpha + \beta = \dfrac{-b}{a}$, $\alpha\beta = \dfrac{c}{a}$.

Write $\quad a^3x^2 + abcx + c^3 = 0 \quad$ as

$$\begin{aligned} & x^2 + \frac{bc}{a^2}x + \left(\frac{c}{a}\right)^3 = 0 \\ \Rightarrow \quad & x^2 - (\alpha + \beta)\,\alpha\beta x + \alpha^3\beta^3 = 0 \\ \Rightarrow \quad & x^2 - (\alpha^2\beta + \alpha\beta^2)x + (\alpha^2\beta)(\alpha\beta^2) = 0 \\ \Rightarrow \quad & (x - \alpha^2\beta)(x - \alpha\beta^2) = 0 \\ \Rightarrow \quad & x = \alpha^2\beta, \alpha\beta^2 \end{aligned}$$

Example 55: If $P(x) = ax^2 + bx + c$ and $Q(x) = -ax^2 + dx + c$, where $a, b, c \in \mathbf{R}$, then $P(x)\,Q(x) = 0$ has

(a) no real root
(b) exactly two real roots
(c) at least two real roots
(d) none of these

Ans. (c)

Solution: Let $D_1 = b^2 - 4ac$ and $D_2 = d^2 + 4ac$
We have $D_1 + D_2 = b^2 + d^2 \geq 0$
$\Rightarrow$ at least one of $D_1, D_2 \geq 0$
$\Rightarrow$ one of $P(x) = 0$ or $Q(x) = 0$
has real roots. Thus, $P(x)\,Q(x) = 0$
has at least two real roots.

Example 56: If the product of the roots of the equation $x^2 - 5kx + 2e^{4\ln k} - 1 = 0$ is 31, then sum of the root is

(a) – 10 (b) 5
(c) – 8 (d) 10

Ans. (d)

Solution: We have product of the roots

$$= 2e^{4\ln k} - 1 = 31 \text{ (given)}$$

$$\Rightarrow \quad e^{4\ln k} = 16$$

$$\Rightarrow \quad k^4 = 16 \Rightarrow k^4 - 16 = 0$$

$$\Rightarrow \quad (k - 2)(k + 2)(k^2 + 4) = 0$$

$$\Rightarrow \quad k = 2, -2$$

As $k > 0$, we get $k = 2$.
Sum of the roots $= 5k = 10$

Example 57: Let α, β be the roots of the equation $x^2 - px + r = 0$ and $\frac{\alpha}{2}, 2\beta$ be the roots of the equation $x^2 - qx + r = 0$. Then the value of r is :

(a) $\frac{2}{9}(p - q)(2q - p)$ (b) $\frac{2}{9}(q - p)(2p - q)$
(c) $\frac{2}{9}(q - 2p)(2q - p)$ (d) $\frac{2}{9}(2p - q)(2q - p)$

Ans. (d)

Solution: $\alpha + \beta = p$, $\alpha\beta = r$

and $\quad \frac{\alpha}{2} + 2\beta = q.$

But $\quad \alpha + \beta = p$ and $\alpha + 4\beta = 2q$

$$\Rightarrow \quad \beta = \frac{1}{3}(2q - p) \text{ and } \alpha = \frac{2}{3}(2p - q)$$

Thus, $\quad \alpha\beta = r$

$$\Rightarrow \quad \frac{2}{9}(2p - q)(2q - p) = r$$

Example 58: Sum of all the values of x satisfying the equation

$$\log_{17}\log_{11}\left(\sqrt{x+11} + \sqrt{x}\right) = 0 \qquad (1)$$

is:

(a) 25 (b) 36
(c) 171 (d) 0

Ans. (a)

Solution: Equation (1) is defined if $x \geq 0$.
We can rewrite (1) as

$$\log_{11}\left(\sqrt{x+11} + \sqrt{x}\right) = 17^0 = 1$$

$$\Rightarrow \quad \sqrt{x+11} + \sqrt{x} = 11^1 = 11$$

$$\Rightarrow \quad \sqrt{x+11} = 11 - \sqrt{x}$$

Squaring both the sides we get

$$x + 11 = 121 - 22\sqrt{x} + x$$

$$\Rightarrow \quad 22\sqrt{x} = 110 \Rightarrow \sqrt{x} = 5 \text{ or } x = 25$$

This clearly satisfies (1).
Thus, sum of all the values satisfying (1) is 25.

Example 59: If $\frac{1}{\sqrt{\alpha}}$ and $\frac{1}{\sqrt{\beta}}$ are the roots of the equation $ax^2 + bx + 1 = 0$ ($a \neq 0, a, b, \in \mathbf{R}$), then the equation, $x(x + b^3) + (a^3 - 3abx) = 0$ has roots:

(a) $\alpha^{3/2}$ and $\beta^{3/2}$ (b) $\alpha\beta^{-3/2}$ and $\alpha^{1/2}\beta$
(c) $\sqrt{\alpha\beta}$ and $\alpha\beta$ (d) $\alpha^{-3/2}$ and $\beta^{-3/2}$

Ans. (a)

Solution: The equation $x(x + b^3) + (a^3 - 3abx) = 0$ can be written as

$$x^2 + (b^3 - 3ab)x + a^3 = 0$$

We have

$$\frac{1}{\sqrt{\alpha}} + \frac{1}{\sqrt{\beta}} = -\frac{b}{a}, \frac{1}{\sqrt{\alpha}\sqrt{\beta}} = \frac{1}{a}$$

$$\sqrt{\alpha} + \sqrt{\beta} = -b, \sqrt{\alpha}\sqrt{\beta} = a$$

Now

$$-(b^3 - 3ab) = (-b)^3 - 3a(-b)$$

$$= \left(\sqrt{\alpha} + \sqrt{\beta}\right)^3 - 3\left(\sqrt{\alpha} + \sqrt{\beta}\right)\sqrt{\alpha}\sqrt{\beta}$$

$$= \left(\sqrt{\alpha}\right)^3 + \left(\sqrt{\beta}\right)^3 = \alpha^{3/2} + \beta^{3/2}$$

and $a^3 = \alpha^{3/2}\beta^{3/2}$
$\therefore$ The roots of the equation

$$x^2 + (b^2 - 3ab)x + a^3 = 0 \text{ are } \alpha^{3/2}, \beta^{3/2}$$

Example 60: If p, q are roots of $x^2 + px + q = 0$, then

(a) $p = 1$ (b) $p = 1$ or 0
(c) $p = -2$ (d) $p = -2$ or 0

Ans. (b)

Solution: We have $p + q = -p$, $pq = q$
As $\quad pq = q,$
we get $\quad q(p - 1) = 0$
$\Rightarrow \quad q = 0$ or $p = 1$
If $q = 0$, we get $p = 0$
If $p = 1$, we get $p + q = -p \Rightarrow q = -2$.
Thus, $p = 1$ or $p = 0$.

Example 61: The equation

$$\sqrt{x+1} - \sqrt{x-1} = \sqrt{4x-1}, \ (x \in \mathbf{R})$$

(a) no solution
(b) one solution
(c) two solutions
(d) more than two solutions

Ans. (a)

Solution: The given equation is valid if $x + 1 \geq 0$, $x - 1 \geq 0$ and $4x - 1 \geq 0$ i.e. if $x \geq 1$.

Squaring both the sides we get

$$x + 1 + x - 1 - 2\sqrt{(x+1)(x-1)} = 4x - 1$$

$$\Rightarrow \quad 1 - 2x = 2\sqrt{(x+1)(x-1)}$$

Squaring again, we get

$$1 - 4x + 4x^2 = 4(x^2 - 1)$$

$$\Rightarrow \quad 4x = 5 \text{ or } x = 5/4.$$

Putting this value of x in the given equation, we get

$$\sqrt{\frac{5}{4}+1} - \sqrt{\frac{5}{4}-1} = \sqrt{4\left(\frac{5}{4}\right)-1}$$

$$\Rightarrow \quad \frac{3}{2} - \frac{1}{2} = 2 \text{ or } 1 = 2$$

which is not true.

Thus, the given equation has no solution.

Example 62: The sum of all the real roots of the equation

$$|x - 2|^2 + |x - 2| - 2 = 0 \qquad (1)$$

is

(a) 7 (b) 4
(c) 1 (d) none of these

Ans. (b)

Solution: Putting $y = |x - 2|$, we can rewrite (1) as

$$y^2 + y - 2 = 0 \text{ or } y^2 + 2y - y - 2 = 0$$

$$\Rightarrow \quad y(y + 2) - (y + 2) = 0 \Rightarrow (y - 1)(y + 2) = 0$$

As $\quad y = |x - 2| \geq 0,\ y + 2 \geq 2$

$$\therefore \quad y - 1 = 0 \Rightarrow y = 1$$

$$\Rightarrow \quad |x - 2| = 1 \Rightarrow x - 2 = \pm 1$$

$$\Rightarrow \quad x = 2 \pm 1 \Rightarrow x = 3 \text{ or } 1$$

$\therefore$ Sum of the roots = 4

Example 63: Let p and q be the roots of $x^2 - 2x + A = 0$ and let r and s be the roots of $x^2 - 18x + B = 0$. If $p < q < r < s$ are in A.P. then ordered pair (A, B) is equal to

(a) $(-3, 77)$ (b) $(77, -3)$
(c) $(-3, -77)$ (d) none of these

Ans. (a)

Solution: We have $p + q = 2$, $pq = A$ (1)

and $\quad r + s = 18$, $rs = B$ (2)

As p, q, r, s are in AP, we take

$$p = a - 3d,\ q = a - d,\ r = a + d,\ s = a + 3d.$$

As $p < q < r < s$, we have $d > 0$

Now, $\quad 2 = p + q = 2a - 4d$

and $\quad 18 = r + s = 2a + 4d$

Solving above equations, we get $a = 5$ and $d = 2$

$$\therefore \quad p = -1,\ q = 3,\ r = 7 \text{ and } s = 11$$

Thus, $\quad A = pq = -3$ and $B = rs = 77$.

Example 64: In a triangle PQR, $\angle R = \pi/2$. If $\tan(P/2)$ and $\tan(Q/2)$ are the roots of the equation $ax^2 + bx + c = 0$ where $a \neq 0$, then

(a) $a + b = c$ (b) $b + c = a$
(c) $a + c = b$ (d) $b = c$

Ans. (a)

Solution: We have

$$\tan\left(\frac{P}{2}\right) + \tan\left(\frac{Q}{2}\right) = \frac{-b}{a}$$

and
$$\tan\left(\frac{P}{2}\right)\tan\left(\frac{Q}{2}\right) = \frac{c}{a}$$

Now, $\quad P + Q = \dfrac{\pi}{2} \Rightarrow 1 = \tan\left(\dfrac{\pi}{4}\right) = \tan\left(\dfrac{P}{2} + \dfrac{Q}{2}\right)$

$$= \frac{\tan(P/2) + \tan(Q/2)}{1 - \tan(P/2)\tan(Q/2)}$$

$$\Rightarrow \quad 1 = \frac{-b/a}{1 - c/a} = \frac{-b}{a - c}$$

$$\Rightarrow \quad a - c = -b \Rightarrow c = a + b$$

Example 65: If α and β $(\alpha < \beta)$, are the roots of the equation $x^2 + bx + c = 0$ where $c < 0 < b$, then

(a) $0 < \alpha < \beta$ (b) $\alpha < 0 < \beta < |\alpha|$
(c) $\alpha < \beta < 0$ (d) $\alpha < 0 < |\alpha| < \beta$

Ans. (b)

Solution: We have $\alpha + \beta = -b$, $\alpha\beta = c$

As $c < 0$, $b > 0$, we get $\alpha < 0 < \beta$

Also, $\quad \beta = -b - \alpha < -\alpha = |\alpha|$

Thus, $\quad \alpha < 0 < \beta < |\alpha|$

Example 66: For the equation $3x^2 + px + 3 = 0$, $p > 0$, if one of the roots is square of the other, than p is equal to

(a) 1/3 (b) 1
(c) 3 (d) 2/3

Ans. (c)

Solution: Let α, α^2 be the roots of $3x^2 + px + 3 = 0$.

Then $\alpha + \alpha^2 = -p/3$ and $\alpha \cdot \alpha^2 = 1$

As $\quad \alpha^3 = 1$, we get $\alpha = 1$, ω or ω^2.

If $\quad \alpha = 1$, then $p = -3(\alpha + \alpha^2) = -6 < 0$.

Not possible as $p > 0$.

Thus, $\alpha \neq 1$.

We take $\alpha = \omega$ and $\alpha^2 = \omega^2$, so that $\dfrac{-p}{3} = \omega + \omega^2 = -1$

$$\Rightarrow \quad p = 3$$

Example 67: Let α, β be roots of $ax^2 + bx + c = 0$, where $ac \neq 0$. Roots of $cx^2 - bx + a = 0$ are

(a) $1/\alpha, 1/\beta$ (b) $-1/\alpha, -1/\beta$

(c) $1/\sqrt{\alpha}, 1/\sqrt{\beta}$ (d) $-1/\sqrt{\alpha}, -1/\sqrt{\beta}$

Ans. (b)

◎ **Solution:** $\alpha + \beta = -b/a$, $\alpha\beta = c/a$.

Now, $$\frac{b}{c} = -\frac{b/a}{c/a} = -\frac{\alpha+\beta}{\alpha\beta}$$

$$= \left(-\frac{1}{\alpha}\right) + \left(-\frac{1}{\beta}\right)$$

And $$\frac{a}{c} = \frac{1}{\alpha\beta} = \left(-\frac{1}{\alpha}\right)\left(-\frac{1}{\beta}\right)$$

Thus, roots of $cx^2 - bx + a = 0$ are $-1/\alpha, -1/\beta$.

◉ **Example 68:** If $b > a$, then the equation $(x - a)(x - b) - 1 = 0$ has

(a) both roots in $[a, b]$

(b) both roots in $(-\infty, a)$

(c) both roots in (b, ∞)

(d) one root in $(-\infty, a)$ and other in (b, ∞).

Ans. (d)

◎ **Solution:** Graph of $y = (x - a)(x - b) - 1$ is given in Fig. 3.17.

It is a parabola which open upwards. Also, $y < 0$ for $x = a$ and $x = b$.

$\therefore$ $y = (x - a)(x - b) - 1$ meets the x-axis at two points once in $(-\infty, a)$ and once in (b, ∞). Thus, one root lies in $(-\infty, a)$ and one in (b, ∞).

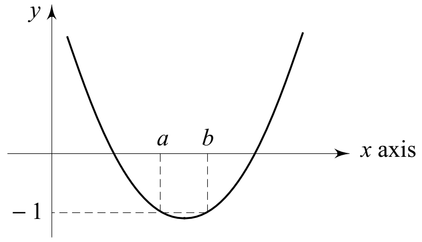


Fig. 3.17

◉ **Example 69:** Let α, β be the roots of $x^2 - x + p = 0$ and γ, δ be the roots of $x^2 - 4x + q = 0$. If $\alpha, \beta, \gamma, \delta$ are in G.P. then the integral values of p and q respectively, are

(a) – 2, – 32 (b) – 2, 3

(c) – 6, 3 (d) – 6, – 32

Ans. (a)

◎ **Solution:** We have

$$\alpha + \beta = 1,\ \alpha\beta = p,$$

$$\gamma + \delta = 4,\ \gamma\delta = q$$

Let r be the common ratio of the GP $\alpha, \beta, \gamma, \delta$. Then

$$\alpha + \beta = 1 \Rightarrow \alpha + \alpha r = 1 \Rightarrow \alpha(1 + r) = 1$$

$$\gamma + \delta = 4 \Rightarrow \alpha r^2 + \alpha r^3 = 4$$

$\Rightarrow$ $$\alpha r^2(1 + r) = 4$$

Thus, $\dfrac{\alpha r^2(1+r)}{\alpha(1+r)} = 4 \Rightarrow r^2 = 4 \Rightarrow r = \pm 2$

When $r = 2$,

we get $\alpha(1 + r) = 1 \Rightarrow \alpha = 1/3$

In this case $p = \alpha\beta = \alpha(\alpha r) = \alpha^2 r$

$$= \frac{1}{9}(2) = \frac{2}{9}$$

which is not an integer.

Thus, $r = -2$. In this case, $\alpha(1 + r) = 1 \Rightarrow \alpha = -1$.

$\therefore$ $p = \alpha^2 r = (-1)^2(-2) = -2$

and $q = \gamma\delta = (\alpha r^2)(\alpha r^3) = \alpha^2 r^5 = -32$

Hence, $p = -2$, $q = -32$.

◉ **Example 70:** If a, b, and c are not all equal and α and β be the roots of the equation $ax^2 + bx + c = 0$, then value of $(1 + \alpha + \alpha^2)(1 + \beta + \beta^2)$ is

(a) 0 (b) positive

(c) negative (d) non-negative

Ans. (d)

◎ **Solution:** We have $\alpha + \beta = -b/a$, $\alpha\beta = c/a$

Now, $(1 + \alpha + \alpha^2)(1 + \beta + \beta^2)$

$$= 1 + \alpha + \beta + \alpha^2 + \beta^2 + \alpha\beta + \alpha^2\beta + \alpha\beta^2 + \alpha^2\beta^2$$

$$= 1 + (\alpha + \beta) + (\alpha + \beta)^2 - 2\alpha\beta + \alpha\beta[1 + \alpha + \beta + \alpha\beta]$$

$$= 1 - \frac{b}{a} + \frac{b^2}{a^2} - \frac{2c}{a} + \frac{c}{a} + \frac{c}{a}\left(-\frac{b}{a}\right) + \frac{c^2}{a^2}$$

$$= \frac{1}{a^2}\{a^2 + b^2 + c^2 - bc - ca - ab\}$$

$$= \frac{1}{2a^2}[(b - c)^2 + (c - a)^2 + (a - b)^2] \geq 0$$

◉ **Example 71:** If a, b, c are in A.P. and if the equations

$$(b - c)x^2 + (c - a)x + (a - b) = 0 \quad (1)$$

and $$2(c + a)x^2 + (b + c)x = 0 \quad (2)$$

have a common root, then

(a) a^2, b^2, c^2 are in A.P.

(b) a^2, c^2, b^2 are in A.P.

(c) c^2, a^2, b^2 are in A.P.

(d) none of these

Ans. (b)

◎ **Solution:** Clearly $x = 1$ is a root of (1). If α is the other root of (1), then

$$\alpha = 1 \cdot \alpha = \frac{a-b}{b-c} \text{ [product of roots]}$$

$$= 1 \ [\because a, b, c \text{ are in A. P.}]$$

Thus, the roots of (1) are 1, 1. Now, (1) and (2) will have a common root if 1 is also a root of (2).

$\Rightarrow \quad 2(c + a) + b + c = 0$

$\Rightarrow \quad 2(2b) + b + c = 0 \Rightarrow c = -5b \quad [\because a, b, c \text{ are in AP}]$

Also, $\quad a + c = 2b$

$\Rightarrow \quad a = 2b - c = 2b + 5b = 7b$

$\therefore \quad a^2 = 49b^2, c^2 = 25b^2$

This, show that a^2, c^2, b^2 are in A.P.

Example 72: Value of

$$x = \sqrt{6 + \sqrt{6 + \sqrt{6 + \cdots \text{ up to } \infty}}} \qquad (1)$$

is

(a) 3 (b) 2
(c) 1 (d) none of these

Ans. (a)

Solution: We can write (1) as

$$x = \sqrt{6 + x} \Rightarrow x^2 = 6 + x$$

$\Rightarrow \quad x^2 - x - 6 = 0 \Rightarrow (x - 3)(x + 2) = 0$

$\Rightarrow \quad x = 3, -2$

As $x > 0$, we take $x = 3$

Example 73: Two complex numbers α and β are such that $\alpha + \beta = 2$ and $\alpha^4 + \beta^4 = 272$, then the quadratic equation whose roots are α and β can be

(a) $x^2 - 2x - 16 = 0$ (b) $x^2 - 2x + 12 = 0$
(c) $x^2 - 2x - 8 = 0$ (d) none of these

Ans. (c)

Solution: $\alpha + \beta = 2 \Rightarrow \alpha^2 + \beta^2 + 2\alpha\beta = 4$

$\Rightarrow \quad \alpha^2 + \beta^2 = 4 - 2\alpha\beta \Rightarrow (\alpha^2 + \beta^2)^2 = 16 - 16\alpha\beta + 4\alpha^2\beta^2$

$\Rightarrow \quad \alpha^4 + \beta^4 + 2\alpha^2\beta^2 = 16 - 16\alpha\beta + 4\alpha^2\beta^2$

$\Rightarrow \quad 272 + 2(\alpha\beta)^2 = 16 - 16\alpha\beta + 4(\alpha\beta)^2$

$\Rightarrow \quad 2(\alpha\beta)^2 - 16(\alpha\beta) - 256 = 0$

$\Rightarrow \quad (\alpha\beta)^2 - 8(\alpha\beta) - 128 = 0$

$\Rightarrow \quad (\alpha\beta - 16)(\alpha\beta + 8) = 0$

$\Rightarrow \quad \alpha\beta = 16 \text{ or } \alpha\beta = -8$

Thus, required equation is either

$$x^2 - 2x + 16 = 0$$

or $\quad x^2 - 2x - 8 = 0$

$\therefore$ Required answer is (c).

Example 74: If $\alpha \neq \beta$ and $\alpha^2 = 5\alpha - 3$, $\beta^2 = 5\beta - 3$, then the equation whose roots are $\dfrac{\alpha}{\beta}$ and $\dfrac{\beta}{\alpha}$ is

(a) $3x^2 - 25x + 3 = 0$ (b) $x^2 - 5x + 3 = 0$
(c) $x^2 + 5x - 3 = 0$ (d) $3x^2 - 19x + 3 = 0$

Ans. (d)

Solution: α, β are roots of $x^2 = 5x - 3$ or $x^2 - 5x + 3 = 0$. Thus,

$$\alpha + \beta = 5, \ \alpha\beta = 3.$$

Next, $\quad \dfrac{\alpha}{\beta} + \dfrac{\beta}{\alpha} = \dfrac{\alpha^2 + \beta^2}{\alpha\beta} = \dfrac{(\alpha + \beta)^2}{\alpha\beta} - 2$

$$= \frac{25}{3} - 2 = \frac{19}{3}$$

and $\quad \left(\dfrac{\alpha}{\beta}\right)\left(\dfrac{\beta}{\alpha}\right) = 1.$

Thus, the quadratic equation whose roots are $\dfrac{\alpha}{\beta}, \dfrac{\beta}{\alpha}$ is

$$x^2 - \frac{19}{3}x + 1 = 0 \text{ or } 3x^2 - 19x + 3 = 0.$$

Example 75: If $a \neq b$ and difference between the roots of the equations $x^2 + ax + b = 0$ and $x^2 + bx + a = 0$ is the same, then

(a) $a + b + 4 = 0$ (b) $a + b - 4 = 0$
(c) $a - b + 4 = 0$ (d) $a - b - 4 = 0$

Ans. (a)

Solution: Let α, β be the roots of $x^2 + ax + b = 0$ and γ, δ be the roots of $x^2 + bx + a = 0$.

We are given

$$|\alpha - \beta| = |\gamma - \delta|$$

$\Rightarrow \quad |\alpha - \beta|^2 = |\gamma - \delta|^2$

$\Rightarrow \quad (\alpha + \beta)^2 - 4\alpha\beta = (\gamma + \delta)^2 - 4\gamma\delta$

$\Rightarrow \quad a^2 - 4b = b^2 - 4a$

$\Rightarrow \quad a^2 - b^2 + 4(a - b) = 0$

$\Rightarrow \quad (a - b)(a + b + 4) = 0$

As $\quad a \neq b, a + b + 4 = 0.$

Example 76: Product of real roots of the equation

$t^2x^2 + |x| + 9 = 0.\ t \in \mathbf{R}$ is always

(a) positive (b) negative
(c) zero (d) does not exist.

Ans. (d)

Solution: Note that $t^2x^2 + |x| + 9 \geq 0 + 9 > 9 \ \forall \ x \in \mathbf{R}$,
Thus, $t^2x^2 + |x| + 9 = 0$ does not have real roots.

Example 77: Let $f(x) = \dfrac{x^2 - 2x + 4}{x^2 + 2x + 4}$, $x \in \mathbf{R}$. The range of $f(x)$ is

(a) $[0, \infty)$ (b) $[1/3, 3]$
(c) $[3, \infty)$ (d) $[0, 3]$

Ans. (b)

Solution: Let $y = \dfrac{x^2 - 2x + 4}{x^2 + 2x + 4} = \dfrac{(x-1)^2 + 3}{(x+1)^2 + 3} > 0$ for each $x \in \mathbf{R}$.

$\Rightarrow \quad (y - 1)x^2 + 2(y + 1)x + 4(y - 1) = 0$

As x is real,

$$4(y + 1)^2 - 16(y - 1)^2 \geq 0$$

$\Rightarrow (y + 1 + 2y - 2)\,(y + 1 - 2y + 2) \ge 0$

$\Rightarrow 3(y - 1/3)\,(y - 3) \le 0$

$\Rightarrow 1/3 \le y \le 3.$

● **Example 78:** The values of $a \in \mathbf{R}$ for which one root of the equation $f(x) = x^2 - (a + 1)x + a^2 + a - 8 = 0$ exceeds 2 and the other is less than 2 are given by

(a) $3 < a < 10$ (b) $a > 0$
(c) $-2 < a < 3$ (d) $a \le -2$

Ans. (c)

TIP: If $f(x) = ax^2 + bx + c$, $a, b, c \in \mathbf{R}$ with $a > 0$ and $f(\alpha) < 0$ for some $\alpha \in \mathbf{R}$ then $D = b^2 - 4ac > 0$, and hence $f(x) = 0$ has real and distinct roots.

◎ **Solution:** As one of the roots is less than 2 and other is more than 2, $f(2) < 0$.

$$\Rightarrow \quad 2^2 - (a + 1)(2) + a^2 + a - 8 < 0$$
$$\Rightarrow \quad a^2 - a - 6 < 0 \Rightarrow (a + 2)(a - 3) < 0$$
$$\Rightarrow \quad -2 < a < 3.$$

● **Example 79:** If one root of the equation $x^2 + px + 12 = 0$ is 4, while equation $x^2 + px + q = 0$ has equal roots, then the value of q is

(a) 3 (b) 12
(c) $\frac{49}{4}$ (d) 4

Ans. (c)

◎ **Solution:** $4^2 + 4p + 12 = 0 \quad \Rightarrow \quad p = -7$

Since $x^2 - 7x + q = 0$ has equal roots, we get $49 - 4q = 0$ $\Rightarrow q = \frac{49}{4}$

● **Example 80:** Suppose a is an integer and x_1 and x_2 are positive real roots of $x^2 + (2a - 1)x + a^2 = 0$, then value of $\left|\sqrt{x_1} - \sqrt{x_2}\right|$ is

(a) 1 (b) 2
(c) a (d) $1 - 4a$

Ans.(a)

◎ **Solution:** Two real roots are positive implies $2a - 1 \le 0$, that is, $a \le 1/2$. As a is an integer, we get $a \le 0$. Now,

$$\left|\sqrt{x_1} - \sqrt{x_2}\right|^2 = \left(\sqrt{x_1} - \sqrt{x_2}\right)^2$$
$$= x_1 + x_2 - 2\sqrt{x_1 x_2}$$
$$= (1 - 2a) - 2\sqrt{a^2} = 1 - 2a - 2\,|a|$$
$$= 1 - 2(a + |a|) = 1$$
$$\Rightarrow \quad \left|\sqrt{x_1} - \sqrt{x_2}\right| = 1$$

● **Example 81:** If a, b are two real number satisfying the relations $2a^2 - 3a - 1 = 0$ and $b^2 + 3b - 2 = 0$ and $ab \ne 1$, then value of $\frac{ab + a + 1}{b}$ is

(a) -1 (b) 0
(c) 1 (d) 2

Ans. (c)

◎ **Solution:** $b^2 + 3b - 2 = 0 \Rightarrow 1 + \frac{3}{b} - \frac{2}{b^2} = 0$

$$\Rightarrow \quad \frac{2}{b^2} - \frac{3}{b} - 1 = 0$$

Thus, a and $1/b$ are roots of $2x^2 - 3x - 1 = 0$

$$\therefore \quad a + \frac{1}{b} = \frac{3}{2} \text{ and } \frac{a}{b} = \frac{-1}{2}$$

$$\text{Now,} \quad \frac{ab + a + 1}{b} = a + \frac{1}{b} + \frac{a}{b} = \frac{3}{2} - \frac{1}{2} = 1$$

● **Example 82:** If α, β are roots of $x^2 - 2x - 1 = 0$, then value of $5\alpha^4 + 12\beta^3$ is

(a) 153 (b) 169
(c) 183 (d) none of these

Ans. (b)

◎ **Solution:** We have $\alpha^2 = 2\alpha + 1$

$$\Rightarrow \quad \alpha^4 = (2\alpha + 1)^2 = 4\alpha^2 + 4\alpha + 1$$
$$= 4(2\alpha + 1) + 4\alpha + 1 = 12\alpha + 5, \text{ and}$$
$$\beta^2 = 2\beta + 1 \Rightarrow \quad \beta^3 = 2\beta^2 + \beta = 2(2\beta + 1) + \beta$$
$$= 5\beta + 2$$

$$\text{Thus,} \quad 5\alpha^4 + 12\beta^3 = (60\alpha + 25) + (60\beta + 24)$$
$$= 60(\alpha + \beta) + 49 = 60\,(2) + 44 = 169$$

● **Example 83:** Suppose a, b, c are the lengths of three sides of a ΔABC, $a > b > c$, $2b = a + c$ and b is a positive integer. If $a^2 + b^2 + c^2 = 84$, then value of b is

(a) 7 (b) 6
(c) 5 (d) 4

Ans. (c)

◎ **Solution:** We have

$$ac = \frac{1}{2}\,[(a + c)^2 - (a^2 + c^2)] = \frac{1}{2}\,[4b^2 - (84 - b^2)]$$
$$= 5b^2/2 - 42$$

Thus, a and c are the roots of the equation

$$x^2 - 2bx + (5b^2/2 - 42) = 0$$

As a and c are distinct real numbers the discriminant of the above must be positive, that is, $4b^2 - 4(5b^2/2 - 42) > 0$

$$\Rightarrow \quad 6b^2 < 168 \text{ or } b^2 < 28.$$

$$\text{Also,} \quad ac > 0 \Rightarrow 5b^2 > 84.$$

$$\therefore \quad 84/5 < b^2 < 28.$$

As b is a positive integer, we get $b = 5$.

● **Example 84:** Suppose $a, b \in \mathbf{R}$, $a \ne 0$ and $2a + b \ne 0$. A root of the equation

$(a + b)(ax + b)(a - bx) = (a^2x - b^2)(a + bx)$ is

(a) $\frac{a + 2b}{2a + b}$ (b) $\frac{2a + b}{a + 2b}$

(c) $-\dfrac{a-2b}{a+2b}$ (d) $-\dfrac{a+2b}{2a+b}$

Ans. (d)

◎ **Solution:** We can write the quation as

$$[a^2b + (a + b)\,ab]x^2 + [(a^3 - b^3) - (a + b)\,(a^2 - b^2)]x - ab^2 - ab(a + b) = 0$$

$$\Rightarrow (2a + b)x^2 - (a - b)x - (a + 2b) = 0$$

Since the sum of coefficients is 0 one of the roots is 1 and the other root is $-\dfrac{a+2b}{2a+b}$.

◉ **Example 85:** Let p and q be real numbers such that $p \neq 0$, $p^3 \neq q$ and $p^3 \neq -q$. If α and β are nonzero complex numbers satisfying $\alpha + \beta = -p$ and $\alpha^3 + \beta^3 = q$, then a quadratic equation having $\dfrac{\alpha}{\beta}$ and $\dfrac{\beta}{\alpha}$ as its roots is

(a) $(p^3 + q)x^2 - (p^3 + 2q)x + (p^3 + q) = 0$
(b) $(p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$
(c) $(p^3 - q)x^2 - (5p^3 - 2q)x + (p^3 - q) = 0$
(d) $(p^3 - q)x^2 - (5p^3 + 2q)x + (p^3 - q) = 0$

Ans. (b)

◎ **Solution:** $q = \alpha^3 + \beta^3 = (\alpha + \beta)^3 - 3\alpha\beta\,(\alpha + \beta)$
$= -p^3 + 3\alpha\beta p$

$$\Rightarrow \quad \alpha\beta = \frac{p^3 + q}{3p}$$

We have

$$\frac{\alpha}{\beta} + \frac{\beta}{\alpha} = \frac{\alpha^2 + \beta^2}{\alpha\beta} = \frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta} = \frac{(\alpha + \beta)^2}{\alpha\beta} - 2 = \frac{p^2}{(p^3 + q)/3p} - 2 = \frac{3p^3 - 2p^3 - 2q}{p^3 + q} = \frac{p^3 - 2q}{p^3 + q}$$

and $\quad \dfrac{\alpha}{\beta} \cdot \dfrac{\beta}{\alpha} = 1$

Thus, required quadratic equation is

$$x^2 - \frac{(p^3 - 2q)}{p^3 + q}\,x + 1 = 0$$

or $\quad (p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$

◉ **Example 86:** Suppose $a, b \in \mathbf{R}$. If the roots of $x^2 - ax + b = 0$ are real and distinct and differ by at most 1, then $4b$ lies in the interval

(a) $(a^2 - 1, a^2)$ (b) $[a^2 - 1, a^2)$
(c) $(a^2 - 1, \infty)$ (d) (a^2, ∞)

Ans. (b)

◎ **Solution:** As roots of $x^2 - ax + b = 0$ are real and distinct, $a^2 - 4b > 0 \Rightarrow 4b < a^2$.

If α, β are roots of $x^2 - ax + b = 0$, then

$$|\alpha - \beta| \le 1 \Rightarrow (\alpha - \beta)^2 \le 1$$
$$\Rightarrow \quad (\alpha + \beta)^2 - 4\alpha\beta \le 1$$
$$\Rightarrow \quad a^2 - 4b \le 1 \Rightarrow a^2 - 1 \le 4b.$$

Thus, $a^2 - 1 \le 4b < a^2$.

◉ **Example 87:** If a is the minimum root of the equation $x^2 - 3|x| - 2 = 0$, then value of $-1/a$ is

(a) $\left(\sqrt{17} - 3\right)/4$ (b) $\left(\sqrt{17} + 3\right)/4$
(c) 2 (d) -3

Ans. (a)

◎ **Solution:** $x^2 - 3|x| - 2 = 0$ can be written as $|x|^2 - 3|x| - 2 = 0$

$$\Rightarrow \quad |x| = \frac{1}{2}\left(3 \pm \sqrt{17}\right)$$

As $\quad |x| \ge 0$, we get $|x| = \dfrac{1}{2}\left(3 + \sqrt{17}\right)$

$$\Rightarrow \quad x = \pm\frac{1}{2}\left(3 + \sqrt{17}\right)$$

$$\therefore \quad a = -\frac{1}{2}\left(3 + \sqrt{17}\right) \Rightarrow -\frac{1}{a} = \frac{2}{\sqrt{17} + 3} = \frac{\sqrt{17} - 3}{4}$$

◉ **Example 88:** Let $f(x) = \dfrac{x^2 - 2x + 3}{x^2 - 2x - 8}$, $x \in \mathbf{R} - \{-2, 4\}$

The range of f is

(a) $\left(\dfrac{-2}{9}, 1\right]$ (b) $\mathbf{R} - \left(\dfrac{-2}{9}, 1\right)$
(c) $\left(-\infty, \dfrac{-2}{9}\right]$ (d) $\mathbf{R} - \left(\dfrac{-2}{9}, 1\right]$

Ans. (d)

◎ **Solution:** Let $y = \dfrac{x^2 - 2x + 3}{x^2 - 2x - 8}$, $x \in \mathbf{R} - \{-2, 4\}$

Note that $y \neq 1$.

Now,

$$(y - 1)x^2 - 2x(y - 1) - (8y + 3) = 0$$

As x is real

$$4(y - 1)^2 + 4(y - 1)\,(8y + 3) \ge 0$$
$$\Rightarrow \quad (y - 1)\,[y - 1 + 8y + 3] \ge 0.$$
$$\Rightarrow \quad (y - 1)\,(y + 2/9) \ge 0$$
$$\Rightarrow \quad y \le -2/9 \text{ or } y > 1. \; [\because y \neq 1]$$

Thus, $\quad y \in \mathbf{R} - (-2/9, 1]$.

◉ **Example 89:** Suppose a, b, c are three non-zero real numbers. The equation

$$x^2 + (a + b + c)x + (a^2 + b^2 + c^2) = 0 \qquad (1)$$

has

(a) two negative real roots,
(b) two positive real roots,
(c) two real roots with opposite signs,
(d) no real roots

Ans. (d)

◎ **Solution:** Discriminant D of (1) is given by

$$D = (a + b + c)^2 - 4(a^2 + b^2 + c^2)$$

$$= -\{(b^2 + c^2 - 2bc) + (c^2 + a^2 - 2ca) + (a^2 + b^2 - 2ab) + (a^2 + b^2 + c^2)\}$$

$$= -[(b - c)^2 + (c - a)^2 + (a - b)^2 + (a^2 + b^2 + c^2)] < 0$$

Thus, (1) cannot have real roots.

◉ **Example 90:** Suppose $a, b \in \mathbf{R}$. If the equation

$$x^2 - (2a + b)x + (2a^2 + b^2 - b + 1/2) = 0 \qquad (1)$$

has two real roots, then

(a) $a = \frac{1}{2}, b = -1$ (b) $a = -\frac{1}{2}, b = 1$
(c) $a = 2, b = 1$ (d) $a = -2, b = -1$

Ans. (a)

◎ **Solution:** As (1) has real roots,

$$(2a + b)^2 - 4\,(2a^2 + b^2 - b + 1/2) \geq 0$$

$$\Rightarrow \qquad 4a^2 + 3b^2 - 4ab - 4b + 2 \leq 0$$

$$\Rightarrow \qquad (2a - b)^2 + 2(b - 1)^2 \leq 0 \;\Rightarrow\; b = 1, a = \frac{1}{2}$$

◉ **Example 91:** The equation $e^{\sin x} - e^{-\sin x} = 4$ has:

(a) no real roots
(b) exactly one real root
(c) exactly four real roots
(d) infinite number of real roots.

Ans. (a)

◎ **Solution:** Put $e^{\sin x} = y$. Note that $1/e \leq y \leq e$.

Also, the given equation can be written as

$$y - 1/y = 4 \quad \text{or} \quad y^2 - 4y - 1 = 0$$

$$\Rightarrow \qquad y = 2 \pm \sqrt{5}.$$

As $1/e \leq y \leq e$, none of the two values of y is possible.

◉ **Example 92:** If $x^2 - 3x + 2$ is a factor of $x^4 - ax^2 + b$ then the equation whose roots are a and b is

(a) $x^2 - 9x - 20 = 0$ (b) $x^2 - 9x + 20 = 0$
(c) $x^2 + 9x - 20 = 0$ (c) $x^2 + 9x + 20 = 0$.

Ans. (b)

◎ **Solution:** As $x^2 - 3x + 2 = (x - 1)(x - 2)$ is a factor of $x^4 - ax^2 + b$, $x = 1$ and $x = 2$ are zeros of $x^4 - ax^2 + b$, therefore,

$$1 - a + b = 0, \quad 16 - 4a + b = 0$$

$$\Rightarrow \qquad a = 5, b = 4.$$

Thus, equation whose roots a and b is $x^2 - 9x + 20 = 0$.

◉ **Example 93:** Let for $a, a_1 \neq 0, a \neq a_1$

$$f(x) = ax^2 + bx + \mathrm{c}, \quad g(x) = a_1x^2 + b_1x + c_1$$

and $\quad p(x) = f(x) - g(x)$. If $p(x) = 0$ only for $x = -1$

and $\quad p(-2) = 2$, then the value of $p(2)$ is

(a) 3 (b) 9
(c) 6 (d) 18

Ans. (d)

◎ **Solution:** As $a \neq a_1$, $p(x) = f(x) - g(x)$ is a quadratic polynomial.

As $\quad p(x) = 0$ only for $x = -1$, we get

$$p(x) = k(x + 1)^2 \quad \text{where } k = a - a_1$$

As $\quad p(-2) = 2$, we get $2 = k(-2 + 1)^2 = k$.

Thus, $\quad p(2) = 2(2 + 1)^2 = 18$

◉ **Example 94:** If a, b, c are non-zero rational numbers such that $a + b + c = 0$, then the roots of the equation

$$(b + c - a)\,x^2 + (c + a - b)\,x + (a + b - c) = 0$$

are

(a) both rational
(b) both irrational
(c) both purely imaginary
(d) one rational and one irrational

Ans. (a)

◎ **Solution:** As $a + b + c = 0$, we can write the equation

$$2ax^2 + 2bx + 2c = 0$$

or

$$ax^2 + bx + c = 0.$$

Note that $x = 1$ satisfies this equation and its other root is c/a.

◉ **Example 95:** If α and β are the roots of the equation $ax^2 + bx + c = 0$, then roots of

$$ax^2 - bx(x - 1) + c(x - 1)^2 = 0 \qquad (1)$$

are

(a) $\frac{1}{\alpha}, \frac{1}{\beta}$ (b) $\frac{1}{\alpha}, \beta$
(c) $\frac{\alpha}{1+\alpha}, \frac{\beta}{1+\beta}$ (d) $\alpha, \frac{1}{\beta}$

Ans. (c)

◎ **Solution:** We can write (1) as

$$a\left(-\frac{x}{x-1}\right)^2 + b\left(\frac{-x}{x-1}\right) + c = 0$$

$$\Rightarrow \qquad \frac{-x}{x-1} = \alpha, \beta \quad \Rightarrow \quad x = \frac{\alpha}{1+\alpha}, \frac{\beta}{1+\beta}$$

◉ **Example 96:** If $3p^2 = 5p + 2$ and $3q^2 = 5q + 2$ then the equation whose roots $3p - 2q$ and $3q - 2p$ is

(a) $x^2 - 5x + 100 = 0$ (b) $3x^2 - 5x - 100 = 0$
(c) $3x^2 + 5x + 100 = 0$ (d) $5x^2 - x + 7 = 0$

Ans. (b)

Solution: Note that p, q are roots of

$$3x^2 = 5x + 2 \quad \text{or} \quad 3x^2 - 5x - 2 = 0$$

$$p + q = 5/3, \; pq = -2/3.$$

Let $\alpha = 3p - 2q, \; \beta = 3q - 2p,$

then $\alpha + \beta = p + q = 5/3$

and $\alpha\beta = (3p - 2q)(3q - 2p)$

$$= -6(p^2 + q^2) + 13pq$$

$$= -6(p + q)^2 + 25pq = -100/3.$$

Thus, required quadratic equation is

$$x^2 - (5/3)x - 100/3 = 0$$

$$\Rightarrow \quad 3x^2 - 5x - 100 = 0$$

Example 97: The number of distinct real roots of the equation

$$(x + 3)^4 + (x + 5)^4 = 16 \qquad (1)$$

is

(a) 1 (b) 2

(c) 3 (d) 4

Ans. (b)

Solution: Put $x + 4 = t$, so that (1) becomes

$$(t - 1)^4 + (t + 1)^4 = 16$$

$$\Rightarrow \quad 2(t^4 + 6t^2 + 1) = 16$$

$$\Rightarrow \quad t^4 + 6t^2 - 7 = 0$$

$$\Rightarrow \quad t^2 = 1, -7 \quad \Rightarrow \quad t = \pm 1, \sqrt{7}i$$

Thus, the equation (1) has two real roots.

Example 98: If $a, b, c, \in$ **R** and the equation $x^2 + (a + b)x + c = 0$ has no real roots, then $c(a + b + c)$ more than

(a) 2 (b) – 2

(c) 0 (d) none of these.

Ans. (c)

Solution: We have $f(x) = x^2 + (a + b)x + c > 0 \; \forall \; x \in \mathbf{R}$

Thus, $f(0) > 0, f(1) > 0$

$\Rightarrow c(a + b + c) > 0$

Example 99: The value of

$$y = 6 + \log_{3/2}\left[\frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\,....,}}}\right]$$

is

(a) 2 (b) 3

(c) 4 (d) 8

Ans. (c)

Solution: Let $x =$

$$\frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\sqrt{4 - \frac{1}{3\sqrt{2}}\,....,}}}$$

then $x = \dfrac{1}{3\sqrt{2}}\sqrt{4 - x}$

$$\Rightarrow \quad 18x^2 + x - 4 = 0$$

$$\Rightarrow \quad (9x - 4)(2x + 1) = 0$$

$$\Rightarrow \quad x = 4/9, -1/2$$

As $x > 0$, we get $x = 4/9$.

Thus, $y = 6 + \log_{3/2}(4/9)$

$$= 6 + \log_{3/2}(3/2)^{-2} = 4$$

Example 100: The sum of the roots of the equation

$$x + 1 - 2\log_2(2^x + 3) + 2\log_4(10 - 2^{-x}) = 0 \qquad (1)$$

is

(a) $\log_2 11$ (b) $\log_2 12$

(c) $\log_2 13$ (d) $\log_2 14$

Ans. (a)

Solution: Put $2^x = t$, then (1) can be written as

$$1 + \log_2 t - 2\log_2(t + 3) + \frac{2}{2}\log_2\left(10 - \frac{1}{t}\right) = 0$$

$$\Rightarrow \quad 1 + \log_2 t - \log_2(t + 3)^2 + \log_2(10t - 1) - \log_2 t = 0$$

$$\Rightarrow \quad \log_2(10t - 1)/(t + 3)^2 = -1$$

$$\Rightarrow \quad 10t - 1 = \frac{1}{2}(t + 3)^2$$

$$\Rightarrow \quad t^2 - 14t + 11 = 0 \qquad (2)$$

If $t_1 = 2^{x_1}, t_2 = 2^{x_2}$ are roots of (2),

then, $t_1 t_2 = 2^{x_1} . 2^{x_2} = 11$

$$\Rightarrow \quad x_1 + x_2 = \log_2 11$$

Assertion-Reason Type Questions

Example 101: Suppose $a, b, c, p \in$ **R** $a \neq 0, c \neq 0$ and $b^2 - 4ac > 0$.

Statement-1: If the Roots of $f(x) = ax^2 + bx + c = 0$ are symmetrically placed on the real line about the point p, then $p = b/2a$ and $a(ap^2 + bp + c) < 0$

Statement-2: If the roots of $ax^2 + bx + c = 0$ are equal in magnitude but opposite in signs, then $b = 0$ and $ac < 0$.

Ans. (a)

Solution: If $\alpha, -\alpha$ are roots of $ax^2 + bx + c = 0$,

then $0 = \alpha + (-\alpha) = -b/a \Rightarrow b = 0$

Also, $\alpha(-\alpha) = c/a$.

As $c \neq 0, -\alpha \neq 0$ and therefore $c/a = -\alpha^2 < 0 \Rightarrow ac < 0$.

Thus, Statement-2 is true.

If $p - \alpha$ and $p + \alpha$ are roots of $f(x) = ax^2 + bx + c = 0$, then $\alpha, -\alpha$ are roots of $f(x + p) = a(x + p)^2 + b(x + p) + c = 0$, that is, $\alpha, -\alpha$ are roots of

$$ax^2 + (2ap + b)x + ap^2 + bp + c = 0.$$

By Statement-2: $2ap + b = 0 \Rightarrow p = -b/2a$ and $a(ap^2 + bp + c) < 0$.

Example 102: Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$, $b^2 - 4ac > 0$.
Statement-1: If α, β are roots of $f(x) = ax^2 + bx + c = 0$, such that $\alpha < -1$ and $\beta > 1$, then $a + |b| + c < 0$.
Statement-2: If α, β are roots of $f(x) = ax^2 + bx + c = 0$ such that $\alpha < -1$, $\beta > 1$, then $ac < 0$.
Ans. (d)

Solution: If $\alpha < -1$, $\beta > 1$, then $\alpha < 0$, $\beta > 0$

$$\Rightarrow \qquad \alpha\beta < 0 \Leftrightarrow \frac{c}{a} < 0 \Leftrightarrow ac < 0.$$

Thus, Statement-2 is true.

As $ax^2 + bx + c = 0$ and $x^2 + \frac{b}{a}x + \frac{c}{a} = 0$ have the same roots, roots of

$$x^2 + \frac{b}{a}x + \frac{c}{a} = 0 \text{ are } \alpha, \beta.$$

$$\therefore \qquad g(x) = x^2 + \frac{b}{a}x + \frac{c}{a} = (x - \alpha)(x - \beta).$$

Note that $g(x) < 0$ for $\alpha < x <$ and $\alpha < -1 < 1 < \beta$

$$\therefore \qquad g(-1) < 0, g(1) < 0$$

$$\Rightarrow \qquad 1 - \frac{b}{a} + \frac{c}{a} < 0, 1 + \frac{b}{a} + \frac{c}{a} < 0$$

$$\Rightarrow \qquad 1 + \left|\frac{b}{a}\right| + \frac{c}{a} < 0.$$

We cannot conclude $a + |b| + c < 0$ unless $a > 0$.

Example 103: Suppose $a, b, c \in \mathbf{R}$
Statement-1: If $a > 0$, $b^2 - 4ac < 0$, and $f(x) = \sqrt{a + bx + cx^2}$ then domain of f is $\mathbf{R}$
Statement-2: $ax^2 + bx + c > 0 \ \forall\, x \in \mathbf{R}$ if $a > 0$ and $b^2 - 4ac > 0$.
Ans. (a)

Solution: Statement-2 is true. See Theory.
As $ax^2 + bx + c > 0 \ \forall\, x \in \mathbf{R}$, we get $c = a(0)^2 + b(0) + c > 0$.
Thus, $cx^2 + bx + a > 0 \ \forall\, x \in \mathbf{R}$.
Therefore, domain of f is **R.**
Hence, Statement-1 is true and
Statement-2 is a correct explanation for it.

Example 104: Suppose $a, b, c, d \in \mathbf{R}$.
Statement-1: If $a < b < c < d$, then the quadratic equation $(x - a)(x - c) + 2(x - b)(x - d) = 0$ has real and distinct roots.
Statement-2: Let $f(x) = ax^2 + bx + c$:
If $f(\alpha) f(\beta) < 0$ for some $\alpha, \beta \in \mathbf{R}$, then $f(x) = 0$ has real and distinct roots.
Ans. (a)

Solution: As $f(x) = ax^2 + bx + c$ is a continuous function and $f(\alpha) f(\beta) < 0$, there is at least one $\gamma \in \mathbf{R}$ lying between α and β such that $f(\gamma) = 0$. As $a, b, c \in \mathbf{R}$ and one root of $f(x) = 0$ is real, other must be real. Also, roots are distinct. Therefore, Statement-2 is true.
Now, let $f(x) = (x - a)(x - c) + 2(x - b)(x - d)$,
then $f(a) = 2(a - b)(a - d) > 0$,

$$f(b) = (b - a)(b - c) > 0$$

Thus, $f(x) = 0$ has a real root lying in the interval (a, b). As coefficients are real and one of the roots is real, the quadratic equation must have real and distinct roots.

Example 105: Suppose $a, b, c\ \alpha \in \mathbf{R}$
Statement-1: The quadratic equation
$(x - \sin\alpha)(x - \cos\alpha) + \sqrt{3} = 0$ has imaginary roots.
Statement-2: If $a > 0$ and $b^2 - 4ac < 0$, then the graph of $y = ax^2 + bx + c$ lies above the x-axis.
Ans. (a)

Solution: For truth of Statement-2, see Theory.
We can write
$(x - \sin\alpha)(x - \cos\alpha) - \sqrt{3} = 0$
as $\qquad f(x) = 0$
where $\qquad f(x) = x^2 - (\sin\alpha + \cos\alpha) + \sin\alpha\cos\alpha + \sqrt{3}$
coefficient of $x^2 = 1 > 0$, and

$$\begin{aligned} b^2 - 4ac &= (\sin\alpha + \cos\alpha)^2 - 4(\sin\alpha\cos\alpha + \sqrt{3}) \\ &= (\sin\alpha - \cos\alpha)^2 - 4\sqrt{3} \\ &\leq (\sqrt{2})^2 - 4\sqrt{3} < 0 \end{aligned}$$

as maximum possible value of $\sin\alpha - \cos\alpha$ is $\sqrt{2}$.
Thus graph of $y = f(x)$ lies above the x-axis and hence $f(x) = 0$ has imaginary roots.

Example 106: Suppose $a, b, c \in \mathbf{R}$ and $a \neq 0$.
Statement-1 If $ac > 0$, $ab < 0$, $b^2 - 4ac > 0$ the equation $ax^4 + bx^2 + c = 0$ has four distinct roots.
Statement-2 If $ac > 0$, $ab < 0$, then the equation $ax^2 + bx + c = 0$ has distinct positive roots.
Ans. (c)

Solution: Statement-2 is false as $x^2 - x + 1 = 0$ satisfies the condition $ac > 0$ and $ab < 0$ but $x^2 - x + 1 = 0$ does not have positive roots.
Statement-1 is true. Put $x^2 = y$, so that $ay^2 + by + c = 0$.
As $b^2 - 4ac > 0$. This equation has two distinct roots.

As $-\frac{b}{a} = -\frac{ab}{a^2} > 0$ and $\frac{c}{a} = \frac{ac}{a^2} > 0$ both the roots of $ay^2 + by + c = 0$ are positive. If the roots are $\alpha, \beta > 0$, then $x^2 = \alpha, \beta$
$\Rightarrow x = \pm\sqrt{\alpha}, \pm\sqrt{\beta}$.

Thus, $ax^4 + bx^2 + c = 0$ has four distinct roots.

Example 107: Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$, and let $f(x) = ax^2 + bx + c$.

Statement-1: If $f(x) = 0$ has imaginary roots and $a + c > 0$, then $f(x) > 0\ \forall\ x \in \mathbf{R}$.

Statement-2: If $f(x) > 0\ \forall\ x \in \mathbf{R}$, then $g(x) = f(x) + f'(x) + f''(x) > 0\ \forall\ x \in \mathbf{R}$.

Ans. (b)

Solution: $f(x) > 0\ \forall\ x \in \mathbf{R}$,

$$\Leftrightarrow \qquad a > 0,\ b^2 - 4ac < 0.$$

We have
$$g(x) = ax^2 + bx + c + (2ax + b) + 2a$$
$$= ax^2 + (b + 2a)x + c + b + 2a$$

Note that
$$(b + 2a)^2 - 4a\,(c + b + 2a)$$
$$= (b^2 - 4ac) - 4a^2 < 0$$

and $a > 0$, thus $g(x) > 0\ \forall\ x \in \mathbf{R}$

$\therefore$ Statement-2 is true.

As $f(x) = 0$ has imaginary roots, $f(x) > 0\ \forall \in \mathbf{R}$ or $f(x) < 0\ \forall\ x \in \mathbf{R}$

We have $f(1) + f(-1) = 2(a + c) > 0$,

therefore $f(x) > 0\ \forall\ x \in \mathbf{R}$.

Thus, statement-1 is true but statement-2 is not a correct explanation for it.

Example 108: Suppose $a, b, c \in \mathbf{R}$ are three distinct real numbers.

Statement-1:

$$a\frac{(x-b)(x-c)}{(a-b)(a-c)} + b\frac{(x-c)(x-a)}{(b-c)(b-a)}$$
$$+\ c\frac{(x-a)(x-b)}{(c-a)(c-b)} = x\ \forall\ x \in \mathbf{R}.$$

Statement-2: If $Ax^2 + Bx + C = 0$ for $x = a, b, c$, then $A = B = C = 0$.

Ans. (a)

Solution: If three distinct values of x satisfy a quadratic equation, then it is identically equal to zero. Thus, Statement-2 is true.

Let

$$f(x) = a\frac{(x-b)(x-c)}{(a-b)(a-c)} + b\frac{(x-c)(x-a)}{(b-c)(b-a)}$$
$$+\ c\frac{(x-a)(x-b)}{(c-a)(c-b)} - x.$$

Then $f(x) = 0$ is a quadratic and $f(a) = f(b) = f(c) = 0$.

Thus, $f(x) \equiv 0$.

Therefore, Statement-1 is true and statement-2 is a correct reason for it.

Example 109: Suppose $a, b, c \in \mathbf{I}$, $a \neq 0$ and $f(x) = ax^2 + bx + c$.

Statement-1: If $f(x) = 0$ has no rational roots, then $\left|f\left(\frac{p}{q}\right)\right| \geq \frac{1}{q^2}\ \forall\ p, q \in \mathbf{I}$, $q \neq 0$ and

Statement-2: If $\alpha + \sqrt{\beta}$, $\alpha, \beta \in \mathbf{Q}$ and $\beta \neq 0$ is a zero of $f(x)$, then its other zero must be $\alpha - \sqrt{\beta}$.

Ans. (b)

Solution: Statement-2 is true. (See Theory)

Let $\quad x = p/q$, $p, q \in \mathbf{I}$ and $q \neq 0$.

Then
$$f\left(\frac{p}{q}\right) = \frac{1}{q^2}\,(ap^2 + bpq + cq^2)$$

As $\quad f(x)= 0$ has no rational roots, $f(p/q) \neq 0$
$$\Rightarrow ap^2 + bpq + cq^2 \neq 0$$

As $ap^2 + bpq + cq^2$ is an integer, we get $|ap^2 + bpq + cq^2| \geq 1$.

Thus, $q^2\left|f\left(\frac{b}{q}\right)\right| \geq 1 \Rightarrow \left|f\left(\frac{p}{q}\right)\right| \geq \frac{1}{q^2}$.

Example 110: Suppose $a, b, c \in \mathbf{R}$ and $a < b < c$.

Let $f : \mathbf{R} \to \mathbf{R}$ be defined by

$$f(x) = \begin{cases} \dfrac{(x-a)(x-c)}{x-b} & \text{if } x \neq b \\ 0 & \text{if } x = b \end{cases}$$

Statement-1: Range of f is $\mathbf{R}$.

Statemetnt-2: For each $y \in \mathbf{R}$, $y = f(x)$ has exactly two distinct solutions.

Ans. (c)

Solution: Statement-2 is false as $f(a) = f(b) = f(c) = 0$

$\Rightarrow \qquad f(x) = 0$ has three distinct solutions.

Note that Statement-1, put $t = x - b$, so that

$$f(x) = \frac{(t + b - a)(t + b - c)}{t}$$
$$= t - (a + c - 2b) + \frac{(a-b)(c-b)}{t}$$
$$= x - (a + c - b) + \frac{(a-b)(c-b)}{x-b}$$

note that f is continuous on $(-\infty, b)$. Also, $\lim\limits_{x \to -\infty} f(x) = -\infty$

and $\lim\limits_{x \to b-} f(x) = \infty$

Thus, range of f is $(-\infty, \infty) = \mathbf{R}$.

$\therefore$ Statement-1 is true.

LEVEL 2

Straight Objective Type Questions

Example 111: Suppose $a, b, c, d \in \mathbf{R}$ and $2ac = b + d$. Consider the quadratic equations $x^2 + 2ax + b = 0$ and $x^2 + 2cx + d = 0$. Then

(a) none of these equations have real roots
(b) both the equations have real roots
(c) exactly one of the equation has real roots
(d) at least one of the equation has real roots

Ans. (d)

Solution: Let D_1 be the discriminant of $x^2 + 2ax + b = 0$ and D_2 be the discriminant of $x^2 + 2cx + d = 0$

Then

$$\begin{aligned} D_1 + D_2 &= 4(a^2 - b) + 4(c^2 - d) \\ &= 4(a^2 + c^2) - 8ac \\ &= 4(a - c)^2 \geq 0 \end{aligned}$$

$\Rightarrow$ at least one of D_1, D_2 is non-negative. Thus, at least one of the equations has real roots.

Example 112: If the roots of the equation

$$\frac{1}{x+a} + \frac{1}{x+b} = \frac{1}{c} \qquad (1)$$

are equal in magnitude but opposite in sign, then their product is

(a) $\frac{1}{2}(a^2 + b^2)$ (b) $-\frac{1}{2}(a^2 + b^2)$
(c) $\frac{1}{2}ab$ (d) $-\frac{1}{2}ab$

Ans. (b)

Solution: The equation (1) can be written as

$$c(x + b + x + a) = (x + a)(x + b)$$

or $$x^2 + (a + b - 2c)x + ab - ac - bc = 0 \qquad (2)$$

Let α and $-\alpha$ be the roots of (2) then

$$0 = \alpha + (-\alpha) = a + b - 2c \Rightarrow c = \frac{1}{2}(a + b)$$

Also, $$\begin{aligned} 2\alpha(-\alpha) &= 2ab - 2(a + b)c = 2ab - (a + b)^2 \\ &= -(a^2 + b^2) \end{aligned}$$

$$\Rightarrow \quad \alpha(-\alpha) = -\frac{1}{2}(a^2 + b^2)$$

Example 113: If c, d are roots of $x^2 - 10ax - 11b = 0$ and a, b are root of $x^2 - 10cx - 11d = 0$, then value of $a + b + c + d$ is

(a) 1210 (b) – 1
(c) 2530 (d) – 11

Ans. (a)

Solution: $$c + d = 10a \qquad (1)$$
$$a + b = 10c \qquad (2)$$

Subtracting (1) from (2) we get

$$(a - c) + (b - d) = 10(c - a)$$
$$\Rightarrow \quad b - d = 11(c - a) \qquad (3)$$

As c is a root of $x^2 - 10ax - 11b = 0$,
we get

$$c^2 - 10ac - 11b = 0 \qquad (3)$$

Similarly, $$a^2 - 10ac - 11d = 0 \qquad (4)$$

Subtracting (4) from (3), we get

$$c^2 - a^2 = 11(b - d)$$
$$\Rightarrow \quad (c - a)(c + a) = (11)11(c - a)$$
$$\Rightarrow \quad c + a = 121$$
$$\therefore \quad a + b + c + d = 10(a + c) \qquad \text{[from (1) and (2)]}$$
$$= 10(121) = 1210$$

Example 114: If α, β are the roots of the equation $ax^2 + bx + c = 0$, then the value of $\alpha^3 + \beta^3$ is

(a) $\dfrac{3abc + b^3}{a^3}$ (b) $\dfrac{a^3 + b^3}{3abc}$
(c) $\dfrac{3abc - b^3}{a^3}$ (d) $\dfrac{-(3abc + b^3)}{a^3}$

Ans. (c)

Solution: We have

$$\alpha + \beta = \frac{-b}{a}, \ \alpha\beta = \frac{c}{a}$$

Now, $$\begin{aligned} \alpha^3 + \beta^3 &= (\alpha + \beta)^3 - 3\alpha\beta(\alpha + \beta) \\ &= \left(\frac{-b}{a}\right)^3 - \frac{3c}{a}\left(\frac{-b}{a}\right) = \frac{3abc - b^3}{a^3} \end{aligned}$$

Example 115: Suppose $a \in \mathbf{I}$ and the equation $(x - a)(x - 5) = 3$ has integral roots, then the set of values which a can take is:

(a) ϕ (b) $\{-11, -13\}$
(c) $\{3, 7\}$ (d) $\{-3, -7\}$

Ans. (c)

Solution: Let $m \in \mathbf{I}$ be a roots of $(x - a)(x - 5) = 3$, then

$$(m - a)(m - 5) = 3$$

As $m - a$ and $m - 5$ are integers, $m - 5 = \pm 1$ or $m - 5 = \pm 3$
$\Rightarrow m = 2, 4, 6, 8.$
Thus, $a = 3, 7$.

Example 116: If the ratio of the roots of the equation $x^2 + bx + c = 0$ is the same as that of the ratio of the roots of $x^2 + qx + r = 0$, then

(a) $br^2 = qc^2$ (b) $cq^2 = rb^2$
(c) $q^2c^2 = b^2r^2$ (d) $bq = rc$

Ans. (b)

Solution: Let α, β be the roots of the equation $x^2 + bx + c = 0$ and γ, δ be the roots of the equation $x^2 + qx + r = 0$. We are given

$$\frac{\alpha}{\beta} = \frac{\gamma}{\delta} \Rightarrow \frac{\alpha-\beta}{\alpha+\beta} = \frac{\gamma-\delta}{\gamma+\delta}$$

$$\Rightarrow \quad \left(\frac{\alpha-\beta}{\alpha+\beta}\right)^2 = \left(\frac{\gamma-\delta}{\gamma+\delta}\right)^2$$

$$\Rightarrow \quad \frac{(\alpha+\beta)^2 - 4\alpha\beta}{(\alpha+\beta)^2} = \frac{(\gamma+\delta)^2 - 4\gamma\delta}{(\gamma+\delta)^2}$$

$$\Rightarrow \quad \frac{\alpha\beta}{(\alpha+\beta)^2} = \frac{\gamma\delta}{(\gamma+\delta)^2}$$

$$\Rightarrow \quad \frac{c}{(-b)^2} = \frac{r}{(-q)^2} \Rightarrow cq^2 = rb^2$$

Example 117: If a and b are the non-zero distinct roots of $x^2 + ax + b = 0$, then the least value of $x^2 + ax + b$ is

(a) 2/3 (b) 9/4
(c) – 9/4 (d) 1

Ans. (c)

Solution: We have $a + b = -a$, $ab = b$

As $b \neq 0$, we get $a = 1$

$\therefore$ $1 + b = -1 \Rightarrow b = -2$

Thus, $x^2 + ax + b = x^2 + x - 2$

$$= \left(x + \frac{1}{2}\right)^2 - \frac{9}{4} \geq -\frac{9}{4}$$

$\therefore$ least value of $x^2 + ax + b$ is $-9/4$ which is attained at $x = -1/2$.

Example 118: If $a + b + c = 0$, then the quadratic equation $3ax^2 + 2bx + c = 0$ has

(a) at least one root in [0, 1]
(b) one root in [2, 3] and other is [– 2, – 1]
(c) imaginary roots
(d) none of these

Ans. (a)

Solution: Let $f(x) = ax^3 + bx^2 + cx$, $x \in [0, 1]$. Since f is a polynomial function, f is differentiable on the whole real line and in particular on [0, 1].

Also, $f(0) = 0$ and $f(1) = a + b + c = 0$.

Thus, all the conditions in the hypothesis of the Rolle's theorem are satisfied. By the Rolle's theorem there exists at least one $\alpha \in (0, 1)$ such that

$$f'(\alpha) = 0$$

But $f'(x) = 3ax^2 + 2bx + c$

Hence, $3ax^2 + 2bx + c = 0$ has a root in [0, 1].

Example 119: If $a < b < c < d$, then the equation

$3(x - a)(x - c) + 5(x - b)(x - d) = 0$

has

(a) real and distinct roots
(b) real and equal roots
(c) purely imaginary roots
(d) none of these

Ans. (a)

Solution: Let $f(x) = 3(x - a)(x - c) + 5(x - b)(x - d)$

Since f is a polynomial, f is continuous on **R**. Also, since $a < b < c < d$,

$$f(a) = 5(a - b)(a - d) > 0$$
$$f(b) = 3(b - a)(b - c) < 0$$
$$f(c) = 5(c - b)(c - d) < 0$$
$$f(d) = 3(d - a)(d - c) > 0$$

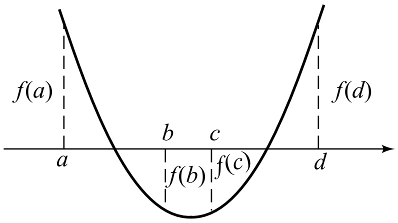

Fig. 3.18

As f is continuous on ***R***, $y = f(x)$ crosses x-axis at least once between a and b and once between c and d. See Fig. 3.18.

Thus, f has two distinct real roots, one lying between a and b and one lying between c and d.

Example 120: For real x, the function $\dfrac{(x-a)(x-c)}{x-b}$ will assume all real values provided

(a) $a < b < c$ (b) $b < c < a$
(c) $c < a < b$ (d) none of these

Ans. (a)

Solution: Let $y = \dfrac{(x-a)(x-c)}{x-b} = \dfrac{x^2 - (a+c)x + ac}{x-b}$

$$\Rightarrow \quad y(x - b) = x^2 - (a + c)x + ac$$

$$\Rightarrow \quad x^2 - (a + c + y)x + ac + by = 0 \qquad (1)$$

Since x is real, the discriminant of (1)

$$(a + c + y)^2 - 4(ac + by) \geq 0$$

$$\Rightarrow \quad y^2 + 2(a + c)y + (a + c)^2 - 4ac - 4by \geq 0$$

$$\Rightarrow \quad y^2 + 2(a + c - 2b)y + (a - c)^2 \geq 0 \qquad (2)$$

Since y takes all real values, (2) is possible if and only if

$$4(a + c - 2b)^2 - 4(a - c)^2 < 0$$

[$\because$ coeff. of $y^2 = 1 > 0$]

$$\Leftrightarrow \quad (a + c - 2b + a - c)(a + c - 2b - a + c) < 0$$

$$\Leftrightarrow \quad (2a-2b)(2c-2b) < 0$$

$$\Leftrightarrow \quad (a-b)(c-b) < 0$$

$\Leftrightarrow$ b lies between a and c. Thus, one of the possibilities $a < b < c$.

Example 121: Let $a, b, c \in \boldsymbol{R}$ and $a \neq 0$. If α is a root of $a^2x^2 + bx + c = 0$, β is a root of $a^2x^2 - bx - c = 0$ and $0 < \alpha < \beta$, then the equation $a^2x^2 + 2bx + 2c = 0$ has a root γ that always satisfies

(a) $\gamma = \frac{1}{2}(\alpha + \beta)$ (b) $\gamma = \alpha + \frac{1}{2}\beta$

(c) $\gamma = \alpha + \beta$ (d) $\alpha < \gamma < \beta$

Ans. (d)

Solution: By the hypothesis,

$$a^2\alpha^2 + b\alpha + c = 0 \qquad (1)$$

and $$a^2\beta^2 - b\beta - c = 0 \qquad (2)$$

where $0 < \alpha < \beta$, and $a \neq 0$.

Let $f(x) = a^2x^2 + 2bx + 2c$

Since f is a polynomial function, f is continuous on $\boldsymbol{R}$ and hence on $[\alpha, \beta]$. Also,

$$\begin{aligned} f(\alpha) &= a^2\alpha^2 + 2b\alpha + 2c \\ &= 2(a^2\alpha^2 + b\alpha + c) - a^2\alpha^2 \\ &= 2(0) - a^2\alpha^2 = -a^2\alpha^2 < 0 \qquad \text{[using (1)]} \end{aligned}$$

and $$\begin{aligned} f(\beta) &= a^2\beta^2 + 2b\beta + 2c \\ &= 3a^2\beta^2 - 2(a^2\beta^2 - b\beta - c) \\ &= 3a^2\beta^2 - 2(0) = 3a^2\beta^2 > 0 \quad \text{[using (2)]} \end{aligned}$$

Since f is continuous on $[\alpha, \beta]$ and $f(\alpha) < 0$, $f(\beta) > 0$, f must vanish at least once in (α, β).

Example 122: Suppose $p, q, r, s \in \boldsymbol{R}$ and α, β be the roots of $x^2 + px + q = 0$ and α^4, β^4 be the roots of $x^2 - rx + s = 0$, then the equation $x^2 - 4qx + 2q^2 - r = 0$ has always

(a) two imaginary roots
(b) two positive roots
(c) two negative roots
(d) one positive and one negative root

Ans. (d)

Solution: We have

$$\alpha + \beta = -p,\ \alpha\beta = q,\ \alpha^4 + \beta^4 = r,\ \alpha^4\beta^4 = s$$

Discriminant D of the equation

$$x^2 - 4qx + 2q^2 - r = 0 \qquad (1)$$

is given by $$\begin{aligned} D &= 16q^2 - 4(2q^2 - r) = 8q^2 + 4r = 4[2q^2 + r] \\ &= 4[2\alpha^2\beta^2 + \alpha^4 + \beta^4] = 4(\alpha^2 + \beta^2)^2 \geq 0 \end{aligned}$$

Thus, the equation (1) has real roots.

The roots of (1) are given by

$$\begin{aligned} x &= \frac{4q \pm \sqrt{D}}{2} = 2\alpha\beta \pm (\alpha^2 + \beta^2) \\ &= (\alpha + \beta)^2, -(\alpha - \beta)^2 \end{aligned}$$

Hence, (1) has one positive and one negative root.

Example 123: The equation

$$x^{(3/4)(\log_2 x)^2 + \log_2 x - 5/4} = \sqrt{2} \qquad (1)$$

has

(a) exactly two real roots
(b) no real root
(c) one irrational root
(d) none of these

Ans. (c)

Solution: Taking log of the sides in (1), we get

$$\left[\frac{3}{4}(\log_2 x)^2 + \log_2 x - \frac{5}{4}\right]\log_2 x = \log_2(\sqrt{2})$$

$$\Rightarrow \quad \left(\frac{3}{4}y^2 + y - \frac{5}{4}\right)y = \frac{1}{2}\log_2 2 \text{ where } y = \log_2 x$$

$$\Rightarrow \quad 3y^3 + 4y^2 - 5y - 2 = 0$$

$$\Rightarrow \quad 3y^3 - 3y^2 + 7y^2 - 7y + 2y - 2 = 0$$

$$\Rightarrow \quad (y-1)(3y^2 + 7y + 2) = 0$$

$$\Rightarrow \quad (y-1)[3y^2 + 6y + y + 2] = 0$$

$$\Rightarrow \quad (y-1)(y+2)(3y+1) = 0$$

$$\Rightarrow \quad y = 1, -2, -1/3$$

$$\Rightarrow \quad \log_2 x = 1, -2, -1/3 \Rightarrow x = 2, \frac{1}{4}, 2^{-1/3}$$

Thus, (1) has one irrational root viz. $2^{-1/3}$.

Example 124: Let $f(x)$ be a quadratic expression which is positive for all x. If $g(x) = f(x) + f'(x) + f''(x)$ then for all real x,

(a) $g(x) < 0$ (b) $g(x) > 0$

(c) $g(x) = 0$ (d) $g(x) \geq 0$

Ans. (b)

Solution: Let $f(x) = ax^2 + bx + c$

As $f(x) > 0\ \forall\ x \in \boldsymbol{R}$, we must have $a > 0$ and $b^2 - 4ac < 0$.

Also, $f'(x) = 2ax + b$ and $f''(x) = 2a$

Thus, $g(x) = ax^2 + (2a + b)x + 2a + b + c$.

Since $a > 0$ and discriminant

$$\begin{aligned} &(2a + b)^2 - 4a(2a + b + c) \\ &= 4a^2 + 4ab + b^2 - 8a^2 - 4ab - 4ac \\ &= -4a^2 + (b^2 - 4ac) < 0 \qquad [\because b^2 - 4ac < 0] \end{aligned}$$

we get $$g(x) > 0\ \forall\ x \in \mathbf{R}$$

Example 125: If α, β are the roots of the quadratic equation $ax^2 + bx + c = 0$, then the quadratic equation whose roots are α^3, β^3 is

(a) $a^3y^2 + (b^3 - 3abc)y + c^3 = 0$
(b) $a^3y^2 + (3abc - b^3)y - c^3 = 0$
(c) $a^2y^2 + 2aby + c^2 = 0$
(d) none of these

Ans. (a)

Solution: Put $y = \alpha^3 \Rightarrow \alpha = y^{1/3}$.

As α is a root of $ax^2 + bx + c = 0$, we get

$$ay^{2/3} + by^{1/3} + c = 0 \Rightarrow y^{1/3}(ay^{1/3} + b) = -c \qquad (1)$$

Cubing both the side, we get

$$y(ay^{1/3}+b)^3 = -c^3$$

$$\Rightarrow \quad y[a^3y + b^3 + 3aby^{1/3}(ay^{1/3}+b)] = -c^3$$

$$\Rightarrow \quad y[a^3y + b^3 + 3ab(-c)] = -c^3 \quad \text{[using (1)]}$$

$$\Rightarrow \quad a^3y^2 + (b^3 - 3abc)y + c^3 = 0$$

◉ **Example 126:** If $a, b, c \in \mathbf{R}$ and the equations $ax^2 + bx + c = 0$ and $x^3 + 3x^2 + 3x + 2 = 0$ have two common roots, then

(a) $a = b = -c$ (b) $a = -b = c$

(c) $a = b = c$ (d) none of these

Ans. (c)

◎ **Solution:** $x^3 + 3x^2 + 3x + 2 = 0$

$$\Rightarrow \quad (x+1)^3 = -1$$

$$\Rightarrow \quad x + 1 = -1, -\omega, -\omega^2$$

$$\Rightarrow \quad x = -2, -1, -\omega, -1-\omega^2$$

As $a, b, c \in \mathbf{R}$, the roots of $ax^2 + bx + c = 0$ are both real or both imaginary.

$\therefore$ roots of $ax^2 + bx + c = 0$ must be $-1-\omega, -1-\omega^2$.

Thus, $$-1-\omega-1-\omega^2 = -\frac{b}{a}$$

and $$(-1-\omega)(-1-\omega^2) = \frac{c}{a}$$

$$\Rightarrow \quad 1 = \frac{b}{a} \text{ and } 1 = \frac{c}{a}$$

$$\Rightarrow \quad a = b = c$$

◉ **Example 127:** Let a, b, c be non-zero real number such that

$$\int_0^1 (1+\cos^8 x)(ax^2+bx+c)\,dx = \int_0^2 (1+\cos^8 x)(ax^2+bx+c)\,dx$$

Then the quadratic equation $ax^2 + bx + c = 0$ has

(a) no root in (0, 2)

(b) at least one root in (1, 2)

(c) a double root (0, 2)

(d) none of these

Ans. (b)

◎ **Solution:** Let $f(x) = (1 + \cos^8 x)(ax^2 + bx + c)$

We are given

$$\int_0^1 f(x)\,dx = \int_0^2 f(x)\,dx$$

$$\Rightarrow \quad \int_0^1 f(x)\,dx = \int_0^1 f(x)\,dx + \int_1^2 f(x)\,dx$$

$$\Rightarrow \quad \int_1^2 f(x)\,dx = 0$$

If $f(x) > 0\ (f(x) < 0)\ \forall\ x \in [1, 2]$,

then $$\int_1^2 f(x)\,dx > 0 \left(\int_1^2 f(x)\,dx < 0\right)$$

But $$\int_1^2 f(x)\,dx = 0$$

$\therefore$ $f(x)$ is partly positive and partly negative on [1, 2].

$\Rightarrow$ there exist $\alpha, \beta \in [1, 2]$ such that

$$f(\alpha) > 0 \text{ and } f(\beta) < 0.$$

As f is continuous on [1, 2] there exists γ lying between α and β (and hence between 1 and 2) such that $f(\gamma) = 0$

$$\Rightarrow \quad (1 + \cos^8 \gamma)(a\gamma^2 + b\gamma + c) = 0$$

$$\Rightarrow \quad a\gamma^2 + b\gamma + c = 0 \qquad [\because\ 1 + \cos^8 \gamma \geq 1]$$

Thus, $ax^2 + bx + c = 0$ has at least one root in [1, 2].

◉ **Example 128:** The number of real solutions of the equation

$$27^{1/x} + 12^{1/x} = 2(8^{1/x}) \qquad (1)$$

is

(a) 0 (b) 1

(c) infinite (d) none of these

Ans. (a)

◎ **Solution:** We can write (1) as

$$\left(\frac{27}{8}\right)^{1/x} + \left(\frac{12}{8}\right)^{1/x} = 2$$

or $$\left(\frac{3}{2}\right)^{3/x} + \left(\frac{3}{2}\right)^{1/x} = 2 \qquad (1)$$

As $3/2 > 1$, $(3/2)^t > 1$ if $t > 0$

and $(3/2)^t < 1$ if $t < 0$.

Thus, $$\left(\frac{3}{2}\right)^{3/x} + \left(\frac{3}{2}\right)^{1/x} < 2 \text{ if } x < 0$$

and $$\left(\frac{3}{2}\right)^{3/x} + \left(\frac{3}{2}\right)^{1/x} > 2 \text{ if } x > 0.$$

Therefore, (1) is possible if $1/x = 0$.

But this is not true for any real value of x.

◉ **Example 129:** If $0 < a < b < c < d$, then the quadratic equation

$$ax^2 + \{1 - a(b+c)\}x + abc - d = 0 \qquad (1)$$

has

(a) real and distinct roots out of which one lies between c and d.

(b) real and distinct roots out of which one lies between a and b

(c) real and distinct roots out of which one lies between b and c

(d) non-real roots

Ans. (a)

◎ **Solution:** We can rewrite (1) as

$$ax^2 - a(b+c)x + abc + x - d = 0$$

or $$a(x-b)(x-c) + x - d = 0$$

Let $f(x) = a(x-b)(x-c) + x - d$.

As $a > 0$, $y = f(x)$ represents a parabola which open upwards. See Fig. 3.19.

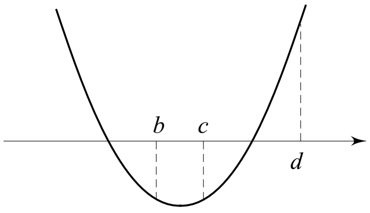

Fig. 3.19

Also, $f(b) = b - d < 0$

$f(c) = c - d < 0$, and $f(d) = a(d - b)(d - c) > 0$

Thus, $f(x) = 0$ has a root between $-\infty$ and b and a root between c and d.

Example 130: If $ax^2 + 2bx - 3c = 0$ has no real roots and $c < \frac{4}{3}(a + b)$, then range of c is

(a) (0, b) (b) $(-1, b)$
(c) $(-\infty, -b^2/3a)$ (d) $(-\infty, -b/12a)$

Ans. (c)

Solution: As $f(x) = ax^2 + 2bx - 3c = 0$ has no real roots, $f(x) > 0\ \forall\ x \in \mathbf{R}$ or $f(x) < 0\ \forall\ x \in \mathbf{R}$

Since $4a + 4b - 3c > 0, f(2) > 0.$

$\therefore \quad f(x) = ax^2 + 2bx - 3c > 0$

$\Rightarrow \quad f(0) = -3c > 0 \Rightarrow c < 0$

Also, $a > 0$ and $b^2 + 3ca < 0$

$\Rightarrow \quad c < -b^2/3a \Rightarrow c \in (-\infty, -b^2/3a)$

Example 131: Suppose $a, b, c \in \mathbf{R}$ and $a \neq b$. If $ax + \frac{b}{x} + c$, $x \in \mathbf{R} - \{0\}$, assume all real values, then a and b satisfy the relation

(a) $ab \leq 0$ (b) $ab \geq 0$
(c) $ab \geq 1$ (d) $ab \leq 1$

Ans. (a)

Solution: Let $y = ax + \frac{b}{x} + c$, then

$$ax^2 + (c - y)x + b = 0.$$

As x is real, $(c - y)^2 - 4ab \geq 0$
This is true for each $y \in \mathbf{R}$ if $ab \leq 0$

EXERCISE

Concept-based Straight Objective Type Questions

1. The number of real solutions of $x^2 - 2x + 2 + |x - 1| = 0$ is:
(a) 0 (b) 1
(c) 2 (d) infinite

2. If roots of $7x^2 - 11x + k = 0$, $k \neq 0$ are reciprocal of each other, then k is equal to
(a) –1 (b) 7/11
(c) 7 (d) 11/7

3. If $a + b \neq 0$ and the roots of $x^2 - px + q = 0$ differ by –1, then $p^2 - 4q$ equals:
(a) –1 (b) 0
(c) 1 (d) 2

4. If the equations $x^2 - ax + b = 0$ and $x^2 + bx - a = 0$ have a common root then
(a) $a = b$ (b) $a + b = -1$
(c) $a - b = -1$ (d) $a - b = 1$

5. If both the roots of $x^2 + x + a = 0$ exceed a, then a belongs to:
(a) $(-\infty, -1)$ (b) $(-\infty, -2)$
(c) (0, 1) (d) $(1, \infty)$

6. The number of real solutions of $x^2 - 4|x| - 2 = 0$ is
(a) 1 (b) 2
(c) 3 (d) 4

7. Suppose α and β are roots of the equation $x^2 + px + \frac{3}{4}p = 0$. If $|\alpha - \beta| = \sqrt{10}$, then p belongs to the set
(a) $\{-2, 5\}$ (b) $\{-3, 2\}$
(c) $\{2, -5\}$ (d) $\{3, -5\}$

8. The number of solutions of $\sqrt{5 + x} + \sqrt{x} = 2$ is
(a) 0 (b) 1
(c) 2 (d) infinite

9. Suppose $a \in \mathbf{R}$. The set of values of a for which the quadratic equation $x^2 - 2(a + 1)x + a^2 - 4a + 3 = 0$ has two negative roots is
(a) $(-\infty, -1)$ (b) (1, 3)
(c) $(-\infty, 1) \cup (3, \infty)$ (d) ϕ

10. Suppose $\alpha > 0$, $\beta > 0$ and $\alpha + \beta = \pi/4$. If $\tan \alpha$, $\tan \beta$ are roots of $x^2 - ax + b = 0$, then

(a) $a + b = 1$ (b) $a + b = 1, 0 < b < 1$
(c) $a = b$ (d) $0 < a + b < 2$

11. If $b > a$, and $c > 0$ then the equation $(x - a)(x - b) - c = 0$ has:
    (a) both roots in $(-\infty, a)$
    (b) both roots in $(a, b]$
    (c) one root in $(-\infty, a)$ and other root in (b, ∞)
    (d) one root in $(-\infty, a)$ and other root in $[a, b]$

12. If the quadratic equation $x^2 + 2(k + 1)x + 9k - 5 = 0$ has exactly one positive root, then k lies in the set
    (a) $[5/9, \infty)$ (b) $(-\infty, 1) \cup (6, \infty)$
    (c) $(-\infty, 5/9]$ (d) $[1, 6]$

13. If $k \in \mathbf{R}$ lies between the roots of $ax^2 + 2bx + c = 0$, then
    (a) $ak^2 + 2bk + c < 0$
    (b) $a^2k^2 + 2abk + ac < 0$
    (c) $a^2k^2 + 2abk + ac > 0$
    (d) $ak^2 + 2bk + c > 0$

14. If both the roots of the quadratic equation $x^2 - 4ax + 2a^2 - 3a + 5$ are less than 2, then a lies in the set
    (a) $(9/2, \infty)$
    (b) $(-\infty, 9/2)$
    (c) $(-1, \infty)$
    (d) $(2, \infty)$

15. Fig. 3.20 Shows graph of $y = ax^2 + bx + c$. Then which one of the following is not true.
    (a) $a > 0$
    (b) $c < 0$
    (c) $b^2 - 4ac > 0$
    (d) $b > 0$

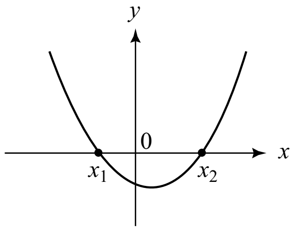

Fig. 3.20

16. Greatest value of the expression $\dfrac{8}{9x^2 - 6x + 5}$ is
    (a) 2 (b) 5
    (c) $8\frac{1}{3}$ (d) 9.2

17. If $a, b \in \{1, 2, 3, 4\}$ the number of quadratic equation of the form $ax^2 + bx + c = 0$ which have non-real complex roots is:
    (a) 27 (b) 35
    (c) 52 (d) 56

18. The number of real roots of the equation $(x - 1)^2 + (x - 2)^2 + (x - 3)^2 = 0$ is
    (a) 0 (b) 2
    (c) 3 (d) infinite

19. Suppose $0 < a < b < c$. If the roots α, β of $ax^2 + bx + c = 0$ are imaginary, then
    (a) $|\alpha| = \sqrt{\dfrac{c}{a}}$ (b) $|\beta| = \sqrt{\dfrac{a}{c}}$
    (c) $\alpha + \beta = 0$ (d) $\alpha - \beta = -b/2a$

20. If $a > 0$ and both the roots of $ax^2 + bx + c = 0$ are more than 1, then
    (a) $a + b + c > 0$ (b) $a + b + 4c = 0$
    (c) $a + b + c < 0$ (d) $a + 4b + c = 0$

LEVEL 1

Straight Objective Type Questions

21. In Fig. 3.21 graph of $y = ax^2 + 2bx + c$ is given. Which one of the following is not true?

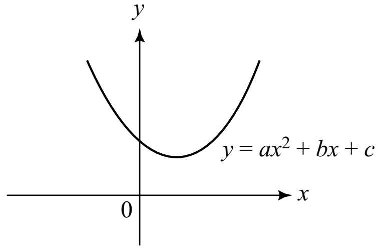

Fig. 3.21

    (a) $a > 0$ (b) $b > 0$
    (c) $c > 0$ (d) $b^2 < ac$

22. If $ax^2 + 2bx + c = 0$ and $ax^2 + 2cx + b = 0$, $b \neq c$ have a common root, then $\dfrac{a + b + c}{a}$ is equal to
    (a) -2 (b) -1
    (c) $3/4$ (d) $-1/4$

23. Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$ and $4a - 6b + 9c < 0$. If $ax^2 + bx + c = 0$ does not have real roots, then $\dfrac{b + c}{a}$ is less than
    (a) 0 (b) 1
    (c) -1 (d) -2

24. Suppose α, β are roots of $4x^2 - 16x + c = 0$, where $c \in \mathbf{N}$, the set of natural numbers. The number of values of c for which $1 < \alpha < 2 < \beta < 3$ is

(a) 2
(b) 3
(c) 4
(d) 9

25. Suppose $a, b \in \mathbf{R}$, $ab \neq 0$. If all the three quadratic equations $x^2 + ax + 12 = 0$, $x^2 + bx + 15 = 0$ and $x^2 + (a + b)x + 36 = 0$ have a common negative root, then (a, b) is equal to

(a) $(-7, -8)$
(b) $(-8, -7)$
(c) $(7, 8)$
(d) $(8, 7)$

26. Suppose $a, b \in \mathbf{R}$. If the equation $\frac{a}{x} = \frac{1}{x-b} + \frac{1}{x+b}$ is not satisfied by any real value of x, then

(a) $0 < a < b < 2$
(b) $0 < a < 2$
(c) $0 < b < 2$
(d) $0 < b < a < 2$

27. Suppose $a \in \mathbf{R}$, $a \neq -1/2$. Let α, β be roots of $(2a + 1)x^2 - ax + a - 2 = 0$ If $\alpha < 1 < \beta$, then

(a) $\frac{1}{7}\left(6 - 2\sqrt{23}\right) < a < 1$
(b) $\frac{1}{7}\left(6 - 2\sqrt{23}\right) < a < \frac{1}{2}$
(c) $\frac{1}{2} < a < \frac{1}{7}\left(6 + 2\sqrt{23}\right)$
(d) none of these

28. Suppose α, β are roots of $8x^2 - 10x + 3 = 0$, then $\sum_{n=0}^{\infty}\left(\alpha^n + \beta^n\right)$ is

(a) 7/4
(b) 3/7
(c) 6
(d) 7

29. Suppose $a, b, c \in \mathbf{R}$ $a \neq 0$. If $a + |b| + 2c = 0$, then roots of $ax^2 + bx + c = 0$ are

(a) real and distinct
(b) real and equal
(c) purely imaginary
(d) non-real complex numbers

30. Suppose $0 < b < c$ and $f(x) = \frac{x^2 - bc}{2x - (b + c)}$, $x \in \mathbf{R}$, then $f(x)$ cannot lie in

(a) (b, c)
(b) $(-\infty, b)$
(c) (c, ∞)
(d) $(0, b) \cup (b, c)$

31. If α, β are the roots of $x^2 + px + q = 0$ and γ, δ are the roots of $x^2 + rx + s = 0$, then value of $(\alpha - \gamma)(\alpha - \delta)(\beta - \gamma)(\beta - \delta)$ is

(a) $(r - p)^2 - (q - s)^2$
(b) $(r - p)^2 + (q - s)^2$
(c) $(r - p)^2 + (q - s)^2 - 2rp(r - p)(q - s)$
(d) none of these

32. The number of real solutions of $x^2 + 5|x| + 4 = 0$ is

(a) 4
(b) 2
(c) 1
(d) 0

33. The number of real solutions of $x^2 - 3|x| + 2 = 0$ is

(a) 4
(b) 2
(c) 1
(d) 0

34. If $2 + \sqrt{5}\,i$ is a root of $x^2 - px + q = 0$ where p and q are real, then the ordered pair (p, q) is equal to

(a) $(4, 9)$
(b) $(9, 4)$
(c) $(3, 3)$
(d) $(2, 3)$

35. If the quadratic equation $2x^2 + ax + b = 0$ and $2x^2 + bx + a = 0$, $(a \neq b)$ have a common root, the value of $a + b$ is

(a) -3
(b) -2
(c) -1
(d) 0

36. If a, b, c, d and p are distinct real numbers such that

$(a^2 + b^2 + c^2)p^2 + 2(ab + bc + cd)p + (b^2 + c^2 + d^2) \leq 0$,

then a, b, c, d

(a) are in A.P.
(b) are in G.P.
(c) are in H.P.
(d) none of these

37. The number of real roots of the equation $\sin(e^x) = 5^x + 5^{-x}$ is

(a) 0
(b) 1
(c) 2
(d) infinitely many

38. The value of a for which the equations $x^3 + ax + 1 = 0$ and $x^4 + ax^2 + 1 = 0$ have a common root is

(a) 2
(b) -2
(c) 0
(d) none of these

39. The roots of the equation $|x^2 - x - 6| = x + 2$ are

(a) $-2, 1, 4$
(b) $0, 2, 4$
(c) $0, 1, 4$
(d) $-2, 2, 4$

40. The number of real roots of the equation

$x^2 - 3|x| + 2 = 0$

(a) 4
(b) 1
(c) 2
(d) infinite

41. The least value of $n \in \mathbf{N}$ for which $(n - 4)x^2 + 8x + n + 2 > 0$ $\forall$ $x \in \mathbf{R}$, is

(a) 11
(b) 10
(c) 8
(d) 7

42. Let $f(x)$ be a quadratic expression such that $f(x) < 0$ $\forall$ $x \in \boldsymbol{R}$. If $g(x) = f(x) + f'(x) + f''(x)$ then for $x \in \boldsymbol{R}$.

(a) $g(x) < 0$
(b) $g(x) \leq 0$
(c) $g(x) > 0$
(d) $g(x) \geq 0$

43. If $x + 1$ is a factor of $x^4 + (p - 3)x^3 - (3p - 5)x^2 + (2p + 9)x + 12$, then value of p is

(a) -2 (b) 2
(c) 1 (d) -1

44. If both the roots of $x^2 - (p - 4)x + 2e^{2\log p} - 4 = 0$ are negative, then p belongs to

(a) $(-\sqrt{2}, 4)$ (b) $(\sqrt{2}, 4)$
(c) $(4, \infty)$ (d) none of these

45. Let f and g be two real valued functions and $S = \{x|f(x) = 0\}$ and $T = \{x|g(x) = 0\}$, then $S \cap T$ represent the set of roots of

(a) $f(x)\, g(x) = 0$ (b) $f(x)^2 + g(x)^2 = 0$
(c) $f(x) + g(x) = 0$ (d) $\dfrac{f(x)}{g(x)} = 0$

46. If domain of $f(x) = \sqrt{x^2 + bx + 4}$ is $\mathbf{R}$, then maximum possible integral value of b is

(a) 2 (b) 3
(c) 4 (d) 5

47. If $p \in (-1, 1)$, then roots of the quadratic equation $(p - 1)x^2 + px + \sqrt{1 - p^2} = 0$ are

(a) purely imaginary
(b) non-real complex numbers
(c) real and equal
(d) real and distinct.

48. If a, b, c are positive real numbers, then the number of positive real roots of the equation $ax^2 + bx + c = 0$ is

(a) 0 (b) 1
(c) 2 (d) infinite

49. If the roots of the equation $x^2 + p^2 = 8x + 6p$ are real, then p belongs to the interval

(a) $[2, 8]$ (b) $[-8, 2]$
(c) $[-2, 8]$ (d) $[-8, -2]$

50. If sum of the roots of the equation $(a + 1)x^2 + (2a + 3)x + (3a + 4) = 0$ is -3, then the product of the roots is

(a) 1 (b) 4
(c) 2 (d) -2

51. If $3 - 4i$ is a root of $x^2 - px + q = 0$ where $p, q \in \boldsymbol{R}$, then value $\dfrac{2p - q}{p + q}$ is

(a) $-12/31$ (b) $-13/31$
(c) $-15/31$ (d) none of these

52. If $x = 1 + i$ is a root of $x^3 - ix + 1 - i = 0$, then the quadratic equation whose roots are the remaining two roots of $x^3 - ix + 1 - i = 0$ is

(a) $x^2 + (1 + i)x + 1 + i = 0$
(b) $x^2 + (1 + i)x + i = 0$
(c) $x^2 + 2(1 + i)x - 2 = 0$
(d) none of these

53. If α and β be the roots of the equation $x^2 + px - \dfrac{1}{2p^2} = 0$, where $p \in \boldsymbol{R}$. Then the minimum possible value of $\alpha^2 + \beta^2$ is

(a) 2 (b) $2\sqrt{2}$
(c) $2 + \sqrt{2}$ (d) none of these

54. The equation $\sqrt{x + 3 - 4\sqrt{x - 1}} + \sqrt{x + 8 - 6\sqrt{x - 1}} = 1$ has

(a) no solution
(b) exactly one solution
(c) exactly two solutions
(d) more than two solution

55. The equation $|x - x^2 - 1| = |2x - 3 - x^2|$ has

(a) no solution
(b) exactly one solution
(c) exactly two solutions
(d) more than two solutions

56. If $\sin \alpha$, $\cos \alpha$ are the roots of the equation $ax^2 + bx + c = 0$, $(a \neq 0)$, then

(a) $a^2 - b^2 + 2ac = 0$
(b) $a^2 + b^2 - 2ac = 0$
(c) $(a - c)^2 = b^2 + c^2$
(d) none of these

57. If $x \in \boldsymbol{R}$, and $k = \dfrac{x^2 - x + 1}{x^2 + x + 1}$, then

(a) $1/3 \leq k \leq 3$ (b) $k \geq 5$
(c) $k \leq 0$ (d) none of these

58. If the equation $x^2 + bx + ca = 0$ and $x^2 + cx + ab = 0$ have a common root and $b \neq c$, then their other roots will satisfy the equation

(a) $x^2 + (b + c)x + bc = 0$ (b) $x^2 - ax + bc = 0$
(c) $x^2 + ax + bc = 0$ (d) none of these

59. If the inequality $\dfrac{mx^2 + 3x + 4}{x^2 + 2x + 2} < 5$

is satisfied for all $x \in \boldsymbol{R}$, then
(a) $m < 5$ (b) $m > 5$
(c) $m < 71/24$ (d) $m > 71/24$

60. If a, b, c are distinct real numbers, then the quadratic expression

$$\frac{(x-b)(x-c)}{(a-b)(a-c)} + \frac{(x-c)(x-a)}{(b-c)(b-a)} + \frac{(x-a)(x-b)}{(c-a)(c-b)}$$

is identically equal to

(a) 1 (b) x
(c) x^2 (d) none of these

61. If $ax^2 + bx + c$, $a, b, c \in \boldsymbol{R}$, $a \neq 0$ has no real zero and $a - b + c < 0$, then value of ac is

(a) positive (b) zero
(c) negative (d) non-negative

62. Suppose $p \in \mathbf{R}$. Let α, β be roots of $x^2 - 2x - (p^2 - 1) = 0$ and γ, δ $(\gamma < \delta)$ be roots of $x^2 - 2(p + 1)x + p(p - 1) = 0$. If $\alpha, \beta \in (\gamma, \delta)$, then p lies in the interval

(a) $(-1/4, 1)$ (b) $(-1, 1)$
(c) $(0, \infty)$ (d) $(\sqrt{2}, \infty)$

63. If α, β are the roots of the equation $ax^2 + 2bx + c = 0$ and $\alpha + h, \beta + h$ are the roots of the equation $Ax^2 + 2Bx + C = 0$, then

(a) $\dfrac{b^2 - ac}{B^2 - AC} = \dfrac{a}{A}$ (b) $b^2 - ac = B^2 - AC$
(c) $h = \dfrac{bA - aB}{2Aa}$ (d) $h = \dfrac{Ac + aC}{Aa + Bb}$

64. The quadratic equation $x^2 + 7x = 14(q^2 + 1)$, where q is an integer has

(a) real and distinct roots
(b) integral roots
(c) imaginary roots
(d) none of these

65. Let $a, b, c \in \boldsymbol{R}$ and $a > 0$. If the quadratic equation $ax^2 + bx + c = 0$ has two real roots α and β such that $\alpha < -1$ and $\beta > 1$, then value of $\dfrac{c}{a} + \left|\dfrac{b}{a}\right|$ is

(a) less than 2 (b) less than 1
(c) less than 0 (d) less than -1

66. Let $a, b, c \in \boldsymbol{R}$ and $a \neq 0$ be such that $(a + c)^2 < b^2$, then the quadratic equation $ax^2 + bx + c = 0$ has

(a) imaginary roots
(b) real roots
(c) two real roots lying between $(-1, 1)$
(d) none of these

67. The integral values of a for which the quadratic equation

$(x - a)(x - 10) + 1 = 0$ has integeral roots are
(a) $-1, 3$ (b) $2, 3$
(c) $12, 8$ (d) $-8, -12$

68. The number of real solution of $4^{x + 1.5} + 9^{x + 0.5} = (10)(6^x)$ is

(a) zero (b) one
(c) two (d) infinite

69. The number of real solution of $2^{\sin^2 x} + 5(2^{\cos^2 x}) = 7$ is

(a) zero (b) 1
(c) finitely many (d) infinitely many

70. The number of values of k for which the equation $x^2 - 2x + k = 0$ has two distinct roots lying in the interval $(0, 1)$ is

(a) 0 (b) 1
(c) 2 (d) infinitely many

71. If roots of the quadratic equation $ax^2 + bx + c = 0$ are real and are of the form $\dfrac{\alpha}{\alpha - 1}, \dfrac{\alpha + 1}{\alpha}$, then value of $(a + b + c)^2$ is

(a) $4ac - b^2$ (b) $b^2 - 4ac$
(c) $c^2 + a^2 - 2b^2$ (d) none of these

72. Let x be an integer and $x^2 + x + 1$ is divisible by 3. When x is divided by 3, it leaves remainder

(a) 0 (b) 1
(c) 2 (d) any of (a), (b) and (c)

73. If α, β are the roots of the equation $x^2 + ax + b = 0$, then maximum value of $-x^2 + ax + b + \dfrac{1}{4}(\alpha - \beta)^2$ is

(a) $\dfrac{1}{4}(a^2 - 4b)$ (b) $\dfrac{1}{4}(b^2 - 4a)$
(c) $\dfrac{a^2}{2}$ (d) none of these

74. If both the roots of the equation $x^2 + bx + c = 0$ lie in the interval $(0, 1)$, then

(a) $b = -1, c = 2$ (b) $b > -2, c < 1$
(c) $b = -5, c < 2$ (d) none of these

75. Let $a, b, c \in \mathbf{R}$ be such that $a + b + c < 0$, $a - b + c < 0$ and $c > 0$. If α and β are roots of the equation $ax^2 + bx + c = 0$, then value of $[\alpha] + [\beta]$ is

(a) 2 (b) 1
(c) -1 (d) 0

76. If roots of the equation $x^2 - 2mx + m^2 - 1 = 0$ lie in the interval $(-2, 4)$, then

(a) $-1 < m < 3$ (b) $1 < m < 5$
(c) $1 < m < 3$ (d) $-1 < m < 5$

77. The value of $\sqrt{8 + 2\sqrt{8 + 2\sqrt{8 + 2\sqrt{8 + \cdots}}}}$ is

(a) 10 (b) 6
(c) 8 (d) none of these

78. The number of solutions of the equation

$$\sin\left(\frac{\pi x}{2\sqrt{3}}\right) = x^2 - 2\sqrt{3}\,x + 4 \text{ is}$$

(a) 1 (b) 2
(c) 0 (d) infinite

79. The number of solutions of $|x + 2| = 2(3 - x)$ is
(a) 1 (b) 2
(c) 3 (d) 0

80. If the equation $ax^2 + bx + c = 0$, $a > 0$ has two distinct roots α and β such that $\alpha < -2$ and $\beta > 3$, then
(a) $c > 0$ (b) $c = 0$
(c) $c < 0$ (d) $c = a - b$

81. Two non-integer roots of
$$(x^2 - 5x)^2 - 7(x^2 - 5x) + 6 = 0$$
are
(a) $\frac{1}{2}(5+\sqrt{29}), \frac{1}{2}(5-\sqrt{29})$
(b) $\frac{1}{2}(-5+\sqrt{29}), \frac{1}{2}(-5+\sqrt{29})$
(c) $\frac{1}{2}(-5+\sqrt{14}), \frac{1}{2}(-5-\sqrt{41})$
(d) none of these

82. The number of real roots of
$$\left(\frac{x-1}{x+1}\right)^4 - 13\left(\frac{x-1}{x+1}\right)^2 + 36 = 0, x \neq -1$$
is
(a) 0 (b) 2
(c) 3 (d) 4

83. The number of negative roots of
$$9^{x+2} - 6(3^{x+1}) + 1 = 0$$
is
(a) 0 (b) 1
(c) 2 (d) 4

84. The number of rational roots of
$$81\left(\frac{2x-5}{3x+1}\right)^4 - 45\left(\frac{2x-5}{3x+1}\right)^2 + 4 = 0,\ x \neq 1/3$$
is
(a) 1 (b) 2
(c) 3 (d) 4

85. The number irrational roots of
$$(x^2 + 3x + 2)^2 - 8(x^2 + 3x) - 4 = 0$$
is
(a) 0 (b) 2
(c) 3 (d) 4

86. The number of roots of the equation
$$\sqrt{\frac{x}{x-3}} + \sqrt{\frac{x-3}{x}} = \frac{5}{2}, x \neq 0, x \neq 3$$
is
(a) 0 (b) 2
(c) 3 (d) 4

87. The number of irrational roots of the equation
$$4\left(x-\frac{1}{x}\right)^2 + 8\left(x+\frac{1}{x}\right) = 29$$
is
(a) 0 (b) 2
(c) 4 (d) infinite

88. Irrational roots of the equation
$$2x^4 + 9x^3 + 8x^2 + 9x + 2 = 0$$
are
(a) $-2-\sqrt{3}, 2+\sqrt{3}$ (b) $2-\sqrt{3}, 2+\sqrt{3}$
(c) $-2+\sqrt{3}, -2-\sqrt{3}$ (d) none of these

89. Sum of the roots of the equation
$$4\left(x-\frac{1}{x}\right)^2 - 4\left(x-\frac{1}{x}\right) + 1 = 0$$
is
(a) 5 (b) 1
(c) $-5/2$ (d) -1

90. The number of irrational roots of the equation
$$(x - 1)(x - 2)(3x - 2)(3x + 1) = 21$$
is
(a) 0 (b) 2
(c) 3 (d) 4

91. Product of roots of the equation
$$x - \sqrt{3x-6} = 2$$
is
(a) 2 (b) 5
(c) 7 (d) 10

92. The number of real roots of
$$2\sqrt{2x+1} = 2x - 1$$
is
(a) 1 (b) 2
(c) 3 (d) 4

93. Product of roots of the equation
$$\sqrt{13-x^2} = x + 5$$
is
(a) -6 (b) 7
(c) 6 (d) -7

94. The number of roots of the equation
$$\sqrt{x^2-4} - (x-2) = \sqrt{x^2-5x+6} \text{ is}$$
(a) 0 (b) 1
(c) 2 (d) 3

95. The product of the roots of the equation

$\sqrt{x^2-4x+3}+\sqrt{x^2-7x+12} = 3\sqrt{x-3}$ is

(a) 15 (b) – 15
(c) 20 (d) – 20

96. Suppose a and b satisfy the equations $18a^2 + 77a + 2 = 0$ and $2b^2 + 77b + 18 = 0$ then value of $\dfrac{ab+a+1}{b}$ is

(a) – 25 (b) – 25/6
(c) 6/25 (d) – 1/25

97. Suppose α, β are roots of $x^2 - 7x + 8 = 0$, with $\alpha > \beta$, then value of $\dfrac{16}{\alpha}+3\beta^2-19\beta$ is

(a) – 10 (b) 10
(c) – 23 (d) 17

98. If α is a root of $x^4 + x^2 - 1 = 0$, the value of $(\alpha^6 + 2\alpha^4)^{2012}$ is

(a) 0 (b) – 1
(c) 1 (d) none of these

99. Sum and product of all the roots of the equation $(x^2 - x - 1)(x^2 - x - 2)(x^2 - x - 3) \ldots (x^2 - x - 2012) = 0$ is

(a) 2012, 2012! (b) – 2012, 2012!
(c) – 2012, – 2012! (d) 2012, – 2012!

100. Suppose three distinct non-zero real numbers satisfy $a^2(a + k) = b^2(b + k) = c^2(c + k)$, where k is some real number, then value of $\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}$ is

(a) 0 (b) k
(c) $-k$ (d) $2k$

Assertion-Reason Type Questions

101. Suppose $a, b, c, \alpha, \beta \in \mathbf{R}$ $a \neq 0$ and $0 < \alpha < \beta$. Let $f(x) = a^2x^2 + bx + c$, $g(x) = a^2x^2 - bx - c$

Statement-1: If α is a root of $f(x) = 0$ and β is a root of $g(x) = 0$, then there exists $\gamma \in (\alpha, \beta)$ such that γ is a root of $a^2x^2 + 2bx + 2c = 0$.

Statement-2: If a function $h : [\alpha, \beta] \to \mathbf{R}$ is continuous on $[\alpha, \beta]$ and $h(\alpha)\, h(\beta) < 0$, then there exists $\gamma \in (\alpha, \beta)$ such that $h(\gamma) = 0$.

102. Suppose $p \in \mathbf{R}$ and $f(x) = x^2 + 2px + p$

Statement-1: If $f(x) < 0\ \forall\ x \in [1, 2]$ then $p \in (-\infty, -4/5)$.

Statement-2: a lies between the roots of $f(x) = 0$, if and only if $f(a) < 0$.

103. Suppose $a \in \mathbf{R}$.

Statement-1: The equation $\sqrt{a\left(2^x-2\right)+1} = 1 - 2^x$ has a real solution for all $a \in (0, 1]$.

Statement-2: $ax^2 + bx + c = 0$, $a \neq 0$ has two positive roots if $ab > 0$ and $ac > 0$.

104 Suppose $a, b, c \in \mathbf{R}$ and $f(x) = 2(a-x)\left(x+\sqrt{x^2+b^2}\right)$ $x \in \mathbf{R}$.

Statement-1: Maximum value of $f(x)$ is $a^2 + b^2$.

Statement-2: If $a < 0$, the maximum value of $f(x) = ax^2 + bx + c$ is $(b^2 - 4ac)/4a$.

105. Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$.

Statement-1: If $ax^2 + bx + c = x$ does not have real roots, then

$a(ax^2 + bx + c)^2 + b(ax^2 + bx + c) + c = x$ has two real and two imaginary roots.

Statement-2: If $\alpha + i\beta$, where $\alpha, \beta \in \mathbf{R}$, $\beta \neq 0$ is a root of $ax^2 + bx + c = x$, then its other root must be $\alpha - i\beta$

106. Suppose $a, b, c \in \mathbf{R}$, $a \neq 0$ and $a - b + c < 0$.

Statement-1: If $ax^2 + bx + c = 0$ has imaginary roots, and

$$\left|a\left(x^2+\frac{y}{a}\right)+(b+1)\,x+c\right| = \left|ax^2+bx+c\right|+\left|x+y\right|$$

then (x, y) lies in the half plane $\{(x, y) |\ x + y \leq 0\}$

Statement-2: $|a + b| = |a| + |b| \Leftrightarrow ab \geq 0$

107. $a, b, c \in \mathbf{R}$ and $c < \min\{a, b\}$.

Let $f(x) = \dfrac{(x+a)(x+b)}{x+c}$, $x > -c$.

Statement-1: Minimum value of f is $\left(\sqrt{a-c}+\sqrt{b-c}\right)^2$

Statement-2: If $a < 0$, then $ax^2 + bx + c$ has no minimum value.

108. Suppose $a, b, c, p, q, r \in \mathbf{R}$, $a, p \neq 0$.

Let $f(x) = ax^2 + bx + c$ and $g(x) = px^2 + qx + r$

Statement-1: If $f(x) = g(x)$ for three distinct real values of x then $a = p$, $b = q$ and $c = r$.

Statement-2: If $a \neq p$, then $f(x) - g(x) = 0$ has two real roots.

109. Suppose $p \in \mathbf{R}$.

Statement-1: If $\sin^4 x + p\sin^2 + 1 = 0$ has a solution, then $p \in (-\infty, -2]$

Statement-2: $y + \dfrac{1}{y} \geq 2 \ \ \forall \ y > 0$.

110. Suppose $a, b, c \in \mathbf{R}$ $a \neq 0$ and $c > 0$.

Let $f(x) = ax^2 + bx + c$.

Statement-1: If $f(x) = 0$, does not have real roots, then

$a > \max \left\{\dfrac{b^2}{4c}, b - c\right\}$

Statement-2: If $b^2 - 4ac < 0$ then $f(x) > 0 \ \forall \ x \in \mathbf{R}$.

LEVEL 2

Straight Objective Type Questions

111. If $\alpha \in (0, \pi/2)$, then the expression

$$\sqrt{x^2 + x} + \frac{\tan^2 \alpha}{\sqrt{x^2 + x}}$$

is always greater than or equal to

(a) $2 \tan \alpha$ (b) 2
(c) 1 (d) $\sec^2 \alpha$

112. If $a, b \in \mathbf{R}$, and the equation

$$x^2 + (a - b)x - a - b + 1 = 0$$

has real roots for all $b \in \mathbf{R}$, then a lies in the interval

(a) $(1, \infty)$ (b) $(0, \infty)$
(c) $(-\infty, 1)$ (d) $(-1, 1)$

113. If α and β $(\alpha < \beta)$ are the roots of the equation $x^2 + bx + c = 0$, where $c < 0 < b$, then

(a) $0 < \alpha < \beta$ (b) $\alpha < 0 < \beta < |\alpha|$
(c) $\alpha < \beta < 0$ (d) none of these.

114. Suppose $a, b, c \in \mathbf{R}$ and the equation $x^2 + (a + b)x + c = 0$ has no real roots, then which one of the following is **not** true.

(a) $c + c(a + b + c) > 0$
(b) $c - c(a + b - c) > 0$
(c) $(a + b)^2 - 4c < 0$
(d) $c(a + b + c) < 0$

115. If $[x]$ denotes the greatest integer $\leq x$, then number of solutions of the equation $x^2 - 2 - 2[x] = 0$ is

(a) 4 (b) 2
(c) 3 (d) none of these

116. If $[x]$ denotes the greatest integer $\leq x$, and a, b are two odd integers, then number of solutions of $[x]^2 + a[x] + b = 0$ is

(a) 1 (b) 0
(c) 2 (d) infinite

117. Let α, β, γ be distinct real numbers lying in $(0, \pi/2)$, then the equation

$$\frac{1}{x - \sin\alpha} + \frac{1}{x - \sin\beta} + \frac{1}{x - \sin\gamma} = 0, \text{ has}$$

(a) two distinct real roots
(b) two equal roots
(c) two imaginary roots
(d) one real and one imaginary root.

118. If roots of the equation $x^2 + ax + b = 0$ are α, β, then the roots of $x^2 + (2\alpha + a)x + \alpha^2 + a\alpha + b = 0$ are

(a) $1, \beta - \alpha$ (b) $0, \alpha - \beta$
(c) $0, \beta - \alpha$ (d) $0, 1$.

119. Let a, b, c be the sides of a triangle with $a \neq c$ and $\lambda \in \boldsymbol{R}$. If the roots of $x^2 + 2(a + b + c)x + 3\lambda\,(ab + bc + ca) = 0$ are real, then λ lies in

(a) $(-\infty, 4/3)$ (b) $(5/3, \infty)$
(c) $(1/3, 5/3)$ (c) $(4/3, 5{,}3)$

120. If $\tan\theta$ and $\cot\theta$ are roots of $x^2 + 2ax + b = 0$, then least value of $|a|$ is

(a) $\dfrac{1}{2}$ (b) 1
(c) 2 (d) cannot be found.

121. Let α, β, γ be the roots of $x^3 + x^2 - 5x - 1 = 0$, then value of $[\alpha] + [\beta] + [\gamma]$, where $[x]$ denotes the greatest integer $\leq x$, is

(a) 1 (b) 2
(c) -2 (d) -3.

[**Hint:** Show that $f(-3) < 0$, $f(-2) > 0$, $f(-1) > 0$, $f(0) < 0$, $f(1) < 0$, $f(2) > 0$]

122. If tan A and tan B are roots of the quadratic equation $x^2 - px + q = 0$, then the value of $\sin^2$ (A + B) is

(a) $\dfrac{p^2}{p^2 + q^2}$ (b) $\dfrac{p^2}{(q + p)^2}$

(c) $\dfrac{p^2}{(1 - q)^2 + p^2}$ (d) $1 - \dfrac{p^2}{(1 - q)^2}$

123. The equation

$$\sqrt{x+3+4\sqrt{x-1}}+\sqrt{x+8+6\sqrt{x-1}}=1 \text{ has}$$

(a) no solution
(b) only one solution
(c) only two solutions
(d) infinite number of solutions

124. The number of irrational solutions of the equation

$$\sqrt{x^2+\sqrt{x^2+11}}+\sqrt{x^2-\sqrt{x^2+11}}=4 \text{ is}$$

(a) 0 (b) 2
(c) 4 (d) infinite

125. Let a, b, c, p, q be five different non-zero real numbers and x, y, z be three numbers satisfying the system of equations

$$\frac{x}{a}+\frac{y}{a-p}+\frac{z}{a-q}=1$$

$$\frac{x}{b}+\frac{y}{b-p}+\frac{z}{b-q}=1$$

and $$\frac{x}{c}+\frac{y}{c-p}+\frac{z}{c-q}=1$$

then x equals

(a) $\frac{abc}{pq}$ (b) $\frac{pq}{abc}$
(c) $\frac{abc}{p+q}$ (d) none of these.

126. Let $f(x) = ax^2 + bx + c$, where $a, b, c \in \mathbf{R}$. Suppose $|f(x)| \le 1\ \forall\ x \in [0, 1]$, then $|a|$ cannot exceed

(a) 5 (b) 6
(c) 7 (d) 8

127. If $a(p + q)^2 + 2bpq + c = 0$ and
$a(p + r)^2 + 2bpr + c = 0$,
then $|q - r|$ equals

(a) $\frac{2}{|a|}\sqrt{(2a+b)bp^2-ac}$ (b) $\frac{2}{|a|}\sqrt{p^2-4ac}$
(c) $p^2+\frac{c}{a}$ (d) none of these.

128. Let $a, b, c \in \mathbf{R}$ be such that $b^2 \ge 4ac$. All the four roots of the equation $ax^4 + bx^2 + c = 0$ will be real if

(a) $a > 0, b < 0, c > 0$ or $a < 0, b > 0, c < 0$
(b) $a > 0, b > 0, c > 0$ or $a < 0, b < 0, c < 0$
(c) $a > 0, b < 0, c > 0$ or $a > 0, b > 0, c < 0$
(d) none of these.

129. If the equations
$x^2 + mx + 1 = 0$ and
$(b - c)x^2 + (c - a)x + (a - b) = 0$ have *a* common root, then

(a) $m = -2$ (b) $m = -1$
(c) $m = 0$ (d) $m = 1$

130. If $x, y, z \in \mathbf{R}$, $x + y + z = 4$ and $x^2 + y^2 + z^2 = 6$, then the maximum possible value of z is

(a) 1 (b) 2
(c) $\frac{3}{2}$ (d) $\frac{4}{3}$

Previous Years' AIEEE/JEE Main Questions

1. If $\alpha \ne \beta$ and $\alpha^2 = 5\alpha - 3$, $\beta^2 = 5\beta - 3$, then the equation whose roots are $\frac{\alpha}{\beta}$ and $\frac{\beta}{\alpha}$ is

(a) $3x^2 - 25x + 3 = 0$ (b) $x^2 - 5x + 3 = 0$
(c) $x^2 + 5x - 3 = 0$ (d) $3x^2 - 19x + 3 = 0$

[2002]

2. If $a \ne b$ and differences between the roots of the equations $x^2 + ax + b = 0$ and $x^2 + bx + a = 0$ is the same, then

(a) $a + b + 4 = 0$ (b) $a + b - 4 = 0$
(c) $a - b + 4 = 0$ (d) $a - b - 4 = 0$

[2002]

3. If $a, b, c \in \mathbf{R}$ and $2a + 3b + 6c = 0$, then the equation $ax^2 + bx + c = 0$ has

(a) at least one root in [0, 1]
(b) at least one root in [2, 3]
(c) at least one root in [– 1, 0]
(d) at least one root in (– ∞, 1) **[2002]**

4. Product of real roots of the equation $t^2x^2 + |x| + 9 = 0$, $t \in \mathbf{R}$ is always

(a) positive (b) negative
(c) zero (d) does not exit **[2002]**

5. The value of a for which one root of the quadratic equation

$$(a^2 - 5a + 3)x^2 + (3a - 1)x + 2 = 0$$

is twice as large as the other is

(a) $-\frac{2}{3}$ (b) $\frac{1}{3}$
(c) $-\frac{1}{3}$ (d) $\frac{2}{3}$ **[2003]**

6. If sum of the roots of the quadratic equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, then $\frac{a}{c}$, $\frac{b}{a}$ and $\frac{c}{b}$ are in
(a) G.P. (b) H.P.
(c) A.G.P. (d) A.P. **[2003]**

7. The number of real solution of the equation $x^2 - 3|x| + 2 = 0$ is
(a) 4 (b) 1
(c) 3 (d) 2 **[2004]**

8. Let two numbers have arithmetic mean 9 and geometric mean 4. Then these numbers are roots of the quadratic equation
(a) $x^2 + 18x - 16 = 0$ (b) $x^2 - 18x + 16 = 0$
(c) $x^2 + 18x + 16 = 0$ (d) $x^2 - 18x - 16 = 0$
[2004]

9. If $1 - p$ is a root of quadratic equation $x^2 + px + 1 - p = 0$, then its roots are
(a) $0, -1$ (b) $-1, 1$
(c) $0, 1$ (d) $-1, 2$ **[2004]**

10. If one root of the equation $x^2 + px + 12 = 0$ is 4, while equation $x^2 + px + q = 0$ has equal roots, then the value of q is
(a) 3 (b) 12
(c) $\frac{49}{4}$ (d) 4 **[2004]**

11. If $2a + 3b + 6c = 0$, then at least one root of the equation $ax^2 + bx + c = 0$ lies in the interval
(a) (2, 3) (b) (1, 2)
(c) (0, 1) (d) (1, 3) **[2004]**

12. In a triangle PQR, $\angle R = \frac{\pi}{2}$. If $\tan\left(\frac{P}{2}\right)$ and $\tan\left(\frac{Q}{2}\right)$ are the roots of $ax^2 + bx + c = 0$, $a \neq 0$, then
(a) $b = c$ (b) $b = a + c$
(c) $a = b + c$ (d) $c = a + b$ **[2005]**

13. The value of a for which sum of the squares of the roots of the equation of the roots of the equation
$$x^2 - (a - 2)x - a - 1 = 0$$
assume least value is
(a) 3 (b) 2
(c) 1 (d) 0 **[2005]**

14. If the roots of the equation $x^2 - bx + c = 0$ be two consecutive integers then $b^2 - 4c$ equals
(a) 2 (b) 1
(c) -2 (d) 3 **[2005]**

15. If both the roots of the quadratic equation $x^2 - 2kx + k^2 + k - 5 = 0$ are less than 5, then k lies in the interval
(a) $(-\infty, 4)$ (b) $[4, 5]$
(c) $(5, 6)$ (d) $(6, \infty)$ **[2005]**

16. If the equation $a_n x^n + a_{n-1}x^{n-1} + \ldots + a_1 x = 0$, $a_1 \neq 0$, $n \geq 2$ has a positive root $x = \alpha$, then the equation
$n\, a_n x^{n-1} + (n - 1)\, a_{n-1} x^{n-2} + \ldots + a_1 = 0$
has a positive root, which is
(a) greater than or equal to α
(b) equal to α
(c) greater than α
(d) smaller than α **[2005]**

17. If the roots of the quadratic equation $x^2 + px + q = 0$ are tan 30° and tan 15° respectively, then the value of $2 + q - p$ is
(a) 1 (b) 2
(c) 3 (d) 0 **[2006]**

18. All the values of m for which both the roots of the equation $x^2 - 2mx + m^2 - 1 = 0$ are greater than -2 but less than 4, lie in the interval
(a) $1 < m < 4$ (b) $-2 < m < 0$
(c) $m > 3$ (d) $-1 < m < 3$ **[2006]**

19. If x is real, the maximum value of $\frac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$ is
(a) $\frac{17}{7}$ (b) $\frac{1}{4}$
(c) 41 (d) 1 **[2006]**

20. If the difference between the roots of $x^2 + ax + 1 = 0$ is less than $\sqrt{5}$, then set of possible values of a lie in the interval
(a) $(-3, 3)$ (b) $(-3, \infty)$
(c) $(3, \infty)$ (d) $(-\infty, -3)$ **[2007]**

21. The quadratic equations $x^2 - 6x + a = 0$ and $x^2 - cx + 6 = 0$ have one common root. The other roots of first and second equation are integers in the ratio 4 : 3. Then common root is
(a) 1 (b) 4
(c) 3 (d) 2 **[2008]**

22. If the roots of the equation $bx^2 + cx + a = 0$ be imaginary, then for all real values of x, the expression $3b^2x^2 + 6bcx + 2c^2$ is
(a) greater then $-4ab$ (b) less then $-4ab$
(c) greater than $4ab$ (d) less than $4ab$
[2009]

23. If α and β are the roots of the equation $x^2 - x + 1 = 0$, then $\alpha^{2009} + \beta^{2009}$ equals
(a) 1 (b) 2
(c) -2 (d) -1 **[2010]**

24. Let for $a, a_1 \neq 0$, $a \neq a_1$
$f(x) = ax^2 + bx + c$, $g(x) = a_1x^2 + b_1x + c_1$ and
$p(x) = f(x) - g(x)$.
If $p(x) = 0$ only for $x = -1$ and $p(-2) = 2$, then value of $p(2)$ is:
(a) 3 (b) 9
(c) 6 (d) 18 **[2011]**

25. The equation $e^{\sin x} - e^{-\sin x} = 4$ has
    (a) no real roots
    (b) exactly one real root
    (c) exactly four real roots
    (d) infinite number of real roots. **[2012]**

26. If the equations $x^2 + 2x + 3 = 0$ and $ax^2 + bx + c = 0$, $a, b, c \in \mathbf{R}$ have a common root, then $a : b : c$ is
    (a) 3 : 2 : 1 (b) 1 : 3 : 2
    (c) 3 : 1 : 2 (d) 1 : 2 : 3 **[2013]**

27. If α and β are the roots of the equation $x^2 + px + \frac{3}{4}p = 0$, such that $|\alpha - \beta| = \sqrt{10}$, then p belongs to the set
    (a) $\{2, -5\}$ (b) $\{-3, 2\}$
    (c) $\{-2, 5\}$ (d) $\{-3, 5\}$ **[2013, online]**

28. If p and q are non-zero real number such that $\alpha^3 + \beta^3 = -p$ and $\alpha\beta = q$, then a quadratic equation whose roots are $\frac{\alpha^2}{\beta}$ and $\frac{\beta^2}{\alpha}$ is
    (a) $px^2 - qx + p^2 = 0$
    (b) $qx^2 + px + q^2 = 0$
    (c) $px^2 + qx + p^2 = 0$
    (d) $qx^2 - px + q^2 = 0$ **[2013, online]**

29. The values of a for which one root of the equation $x^2 - (a + 1)x + a^2 + a - 8 = 0$ exceeds 2 and the other is less than 2 are given by
    (a) $3 < a < 10$ (b) $a > 10$
    (c) $-2 < a < 3$ (d) $a \le -2$ **[2013, online]**

30. The least integral value α of x such that $\frac{x-5}{x^2+5x-14} > 0$, satisfies
    (a) $\alpha^2 + 3\alpha - 4 = 0$ (b) $\alpha^2 - 5\alpha + 4 = 0$
    (c) $\alpha^2 - 7\alpha + 6 = 0$ (d) $\alpha^2 + 5\alpha - 6 = 0$
    [2013, online]

31. Let α and β be the roots of the equation $px^2 + qx + r = 0$, $p \ne 0$. If p, q, r are in A.P. and $\frac{1}{\alpha} + \frac{1}{\beta} = 4$, then value of $|\alpha - \beta|$ is
    (a) $\frac{1}{9}\sqrt{61}$ (b) $\frac{2}{9}\sqrt{17}$
    (c) $\frac{1}{9}\sqrt{34}$ (d) $\frac{2}{9}\sqrt{13}$ **[2014]**

32. If equations $ax^2 + bx + c = 0$, ($a, b, c \in \mathbf{R}$, $a \ne 0$) and $2x^2 + 3x + 4 = 0$ have a common root, then $a : b : c$ equals:
    (a) 1 : 2 : 3 (b) 2 : 3 : 4
    (c) 4 : 3 : 2 (d) 3 : 2 : 1 **[2014, online]**

33. The sum of the roots of the equation $x^2 + |2x - 3| + 4 = 0$, is:
    (a) 2 (b) -2
    (c) $\sqrt{2}$ (d) $-\sqrt{2}$ **[2014, online]**

34. If α and β are the roots of $x^2 - 4\sqrt{2}\,kx + 2e^{4\ln k} - 1 = 0$ for some k, and $\alpha^2 + \beta^2 = 66$, then $\alpha^3 + \beta^3$ is equal to:
    (a) $248\sqrt{2}$ (b) $280\sqrt{2}$
    (c) $-32\sqrt{2}$ (d) $-280\sqrt{2}$ **[2014, online]**

35. The equation $\sqrt{3x^2 + x + 5} = x - 3$, where x is real, has:
    (a) has no solution
    (b) exactly one solution
    (c) exactly two solutions
    (d) exactly four solutions **[2014, online]**

36. Let α and β be the roots of equation $x^2 - 6x - 2 = 0$. If $a_n = \alpha^n - \beta^n$, for $n \ge 1$, then the value of $\frac{a_{10} - 2a_8}{2a_9}$ is equal to:
    (a) 6 (b) -6
    (c) 3 (d) -3 **[2015]**

37. If $2 + 3i$ is one of the roots of the equation $2x^3 - 9x^2 + kx - 13 = 0$, $k \in \mathbf{R}$, then the real root of the equation:
    (a) does not exist.
    (b) exists and is equal to $\frac{1}{2}$
    (c) exists and is equal to $-\frac{1}{2}$
    (d) exists and is equal to 1 **[2015, online]**

38. If the two roots of the equation, $(a - 1)(x^4 + x^2 + 1) + (a + 1)(x^2 + x + 1)^2 = 0$ are real and distinct, then the set of all values of a is:
    (a) $\left(-\frac{1}{2}, 0\right)$ (b) $(-\infty, -2) \cup (2, \infty)$
    (c) $\left(-\frac{1}{2}, 0\right) \cup \left(0, \frac{1}{2}\right)$ (d) $\left(0, \frac{1}{2}\right)$ **[2015, online]**

39. The sum of all real values of x satisfying the equation $(x^2 - 5x + 5)^{x^2 + 4x - 60} = 1$ is
    (a) 3 (b) -4
    (c) 6 (d) 5 **[2016]**

40. If the equations $x^2 + bx - 1 = 0$ and $x^2 + x + b = 0$ have a common root different from -1, then $|b|$ is equal to:
    (a) 2 (b) 3
    (c) $\sqrt{3}$ (d) $\sqrt{2}$ **[2016, online]**

41. If x is a solution of the equation, $\sqrt{2x+1} - \sqrt{2x-1} = 1$, $\left(x \ge \frac{1}{2}\right)$, then $\sqrt{4x^2 - 1}$ is equal to:

(a) $\dfrac{3}{4}$ (b) $\dfrac{1}{2}$

(c) $2\sqrt{2}$ (d) 2 **[2016, online]**

42. Let x, y, z be positive real numbers such that $x + y + z = 12$ and $x^3y^4z^5 = (0.1)(600)^3$. Then $x^3 + y^3 + z^3$ is equal to

(a) 342 (b) 216

(c) 258 (d) 270 **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. If the roots of the quadratic equation $x^2 + 2px + q = 0$ are tan 30° and tan 15° respectively, then q is

(a) $1 + p$ (b) $1 - p$

(c) $1 - 2p$ (d) $1 + 2p$ **[2006]**

2. The set of values of α for which the quadratic equation $(\alpha + 2)\,x^2 - 2\alpha x - \alpha = 0$ has two roots on the number line symmetrically placed about the point 1 is

(a) $\{-1, 0\}$ (b) $\{0, 2\}$

(c) ϕ (d) $\{0, 1\}$ **[2007]**

3. The number of solutions of the equation $x^2 - 4|x| - 2 = 0$ is:

(a) 1 (b) 2

(c) 3 (d) 4 **[2008]**

4. The quadratic equation whose roots are a/b and b/a, $a \neq b \neq 0$, where $a^2 = 5a - 3$, and $b^2 = 5b - 3$, is:

(a) $3x^2 - 19x + 3 = 0$

(b) $3x^2 + 19x - 3 = 0$

(c) $3x^2 + 19x + 3 = 0$

(d) $3x^2 - 19x - 3 = 0$ **[2009]**

5. If the roots of the quadratic equation $ax^2 + bx + c = 0$ are α, β, then the roots of the quadratic equation $ax^2 - bx(x - 1) + c(x - 1)^2 = 0$, are

(a) $\dfrac{\alpha+1}{\alpha}, \dfrac{\beta+1}{\beta}$ (b) $\dfrac{\alpha}{\alpha-1}, \dfrac{\beta}{\beta-1}$

(c) $\dfrac{\alpha}{\alpha+1}, \dfrac{\beta}{\beta+1}$ (d) $1 - \alpha, 1 - \beta$ **[2010]**

6. If $x^2 - 3x + 2$ is a factor of $x^4 - ax^2 + b = 0$ then the equation whose roots are a and b is

(a) $x^2 + 9x + 20 = 0$ (b) $x^2 - 9x - 20 = 0$

(c) $x^2 - 9x + 20 = 0$ (d) $x^2 + 9x - 20 = 0$ **[2011]**

7. Let $a, b, c \in \mathbf{R}$, $a > 0$ and the function $f : \mathbf{R} \to \mathbf{R}$ be defined by $f(x) = ax^2 + bx + c$.

Statement-1: $b^2 < 4ac \Rightarrow f(x) > 0$ for every value of x.

Statement-2: f is strictly decreasing in the interval $(-\infty, -b/2a)$ and strictly increasing in the interval $(-b/2a, \infty)$. **[2012]**

8. If the quadratic equation $3x^2 + 2(a^2 + 1)x + a^2 - 3a + 2 = 0$ posseses roots of opposite signs, then a lies in the interval:

(a) $(-\infty, -1)$ (b) $(-1, 1)$

(c) $(1, 2)$ (d) $(2, 3)$ **[2013]**

9. If the roots of the equation $\dfrac{1}{x+p} + \dfrac{1}{x+q} = \dfrac{1}{r}$ are equal in magnitude and opposite in sign, then product of roots is:

(a) $p^2 + q^2$ (b) $\dfrac{1}{2}(p^2 + q^2)$

(c) $-\dfrac{1}{2}(p^2 + q^2)$ (d) $-\dfrac{1}{2}(p^2 - q^2)$ **[2014]**

10. The values of k for which each root of the equation, $x^2 - 6kx + 2 - 2k + 9k^2 = 0$ is greater than 3, always satisfy the inequality:

(a) $7 - 9y > 0$ (b) $11 - 9y < 0$

(c) $29 - 11y > 0$ (d) $29 - 11y < 0$ **[2015]**

11. The number of integral values of m for which the equation, $(1 + m^2)x^2 - 2(1 + 3m)x + (1 + 8m) = 0$, has no real root, is:

(a) 2 (b) 3

(c) infinitely many (d) 1 **[2016]**

Hints and Solutions

Concept-based

1. $(x-1)^2 + 1 + |x-1| \geq 1 \ \forall\ x \in \mathbf{R}$

2. $1 = \alpha\left(\dfrac{1}{\alpha}\right) = \dfrac{k}{7}$

3. $\alpha - \beta = -1 = \Rightarrow (\alpha+\beta)^2 - 4\alpha\beta = 1$ or $p^2 - 4q = 1$

4. If α is a common root, then $\alpha^2 - a\alpha + b = 0$, $\alpha^2 + b\alpha - a = 0$

   Subtracting, we get $-(a+b)\ \alpha + b + a = 0$

   $\Rightarrow \alpha = 1$. Thus, $1 - a + b = 0 \Rightarrow a - b = 1$

5. $x^2 + x + a = 0 \Rightarrow \left(x + \dfrac{1}{2}\right)^2 = \dfrac{1}{4} - a$

   We must have $\dfrac{1}{4} - a \geq 0 \Rightarrow a \leq \dfrac{1}{4}$.

   Roots of the equation are $-\dfrac{1}{2} \pm \sqrt{\dfrac{1}{4} - a}$

   These will exceed a, if $-\dfrac{1}{2} - \sqrt{\dfrac{1}{4} - a} > a$

   $\Rightarrow -\sqrt{\dfrac{1}{4} - a} > a + \dfrac{1}{2}$

   This is possible if $a + 1/2 < 0$ and $\sqrt{\dfrac{1}{4} - a} < \left(a + \dfrac{1}{2}\right)$

   $\Rightarrow \dfrac{1}{4} - a < a^2 + a + \dfrac{1}{4}$

   $\Rightarrow a^2 + 2a > 0 \Rightarrow a < -2$ as $a < 0$.

6. $(|x| - 2)^2 = 6 \Rightarrow |x| = 2 \pm \sqrt{6}$.

   As $|x| \geq 0$, $|x| = 2 + \sqrt{6} \Rightarrow x = \pm(2 + \sqrt{6})$

7. $10 = \left(\sqrt{10}\right)^2 = |\alpha - \beta|^2 = (\alpha+\beta)^2 - 4\alpha\beta = p^2 - 3p$

   $\Rightarrow p^2 - 3p - 10 = 0 \Rightarrow (p-5)(p+2) = 0$

   $\Rightarrow p = -2, 5$

8. For the equation to be defined, $x \geq 0$, $5 + x \geq 0$. For $x \geq 0$, $x + 5 \geq 5 \Rightarrow \sqrt{x} + \sqrt{x+5} \geq \sqrt{5} > 2$

9. $D = 4(a+1)^2 - 4(a^2 - 4a + 3) \geq 0$,

   $2(a+1) < 0$ and $a^2 - 4a + 3 > 0$

   First two imply $a \geq 1/3$, $a < -1$. Not possible.

10. $\tan\alpha + \tan\beta = -a$, $\tan\alpha\tan\beta = b$.

    $1 = \tan(\alpha+\beta) = \dfrac{\tan\alpha + \tan\beta}{1 - \tan\alpha\tan\beta} = \dfrac{a}{1-b}$

    Also, $0 < \alpha < \pi/4$, $0 < \beta < \pi/4$

$\Rightarrow 0 < \tan\alpha < 1,\ 0 < \tan\beta < 1$

$\Rightarrow 0 < \tan\alpha\tan\beta < 1 \Rightarrow 0 < b < 1.$

11. Let $f(x) = (x - a)(x - b) - c$

    Use coefficient of $x^2 > 0$,

    $f(a) = -c = f(b) < 0.$

12. $D \ge 0$ and product of roots ≤ 0.

    $\Rightarrow (k + 1)^2 - (9k - 5) \ge 0$ and $9k - 5 \le 0$

    $\Rightarrow k^2 - 7k + 6 \ge 0$ and $\le 5/9$

    $\Rightarrow (k - 1)(k - 6) \ge 0$ and $k \le 5/9$

    Thus, $k \le 5/9$

13. Use : a and $a(k - \alpha)(k - \beta)$ have the opposite signs, where α, β are roots of

    $ax^2 + bx + c = 0.$

14. Write the equation as

    $(x - 2a)^2 = 4a^2 - (2a^2 - 3a + 5)$

    $= (2a + 5)(a - 1)$

    $\Rightarrow x = 2a \pm \sqrt{(2a+5)(a-1)}$

    We must have $(2a + 5)(a - 1) \ge 0$

    and $2a + \sqrt{(2a+5)(a-1)} < 2$

    $\Rightarrow a \le -5/2$ or $a \ge 1$

    and $\sqrt{(2a+5)(a-1)} < -2(a - 1)$

    Clearly, $a \ge 1$ is not possible

    For $a \le -5/2$, we must have

    $\sqrt{-(2a+5)(1-a)} < 2(1 - a)$

    $\Rightarrow -(2a + 5) < 4(1 - a) \Rightarrow a < 9/2$

15. As parabola open upwards, $a > 0$.

    Also, for $x = 0$ $ax^2 + bx + c = c < 0$.

    Since the equation has distinct roots, $b^2 - 4ac > 0$. However, we cannot be sure of sign of b.

    If can be positive, negative or zero. For instance, consider $x^2 + 2x - 3 = 0$, $x^2 - 2x - 3 = 0$ and $x^2 - 3 = 0$.

16. $9x^2 - 6x + 5 = (3x - 1)^2 + 4$ attains least value when $x = 1/3$.

17. $ax^2 + bx + c = 0$ has real roots if

    $b^2 - 4ac \ge 0$, i.e. if $b^2 \ge 4ac$.

    Minimum possible value of b is 2.

    For $b = 2$, $(a, c) = (1, 1)$

    For $b = 3$, $ac \le 9/4 \Rightarrow (a, c) = (1, 1), (1, 2)$ or $(2, 1)$

    For $b = 4$, $ac \le 4 \Rightarrow (a, c) = (1, 1), (1, 2), (2, 1), (1, 3), (3, 1), (1, 4), (4, 1), (2, 2)$

    Thus, there $4^3 - 12 = 52$ such quadratic equations.

18. LHS $> 0\ \forall\ x \in \mathbf{R}$.

19. As the roots are imaginary $b^2 - 4ac < 0$ and

    $\alpha, \beta = \frac{1}{2a}\left(-b \pm i\sqrt{4ac - b^2}\right)$

    $|\alpha| = \frac{1}{2a}\sqrt{b^2 + 4ac - b^2} = \sqrt{\frac{c}{a}} = |\beta|$

20. Suppose $\alpha, \beta > 1$, $\alpha < \beta$ be roots of $ax^2 + bx + c = 0$, then

    $ax^2 + bx + c > 0$ if $x < \alpha$ or $x > \beta$

    < 0 if $\alpha < x < \beta$

    Thus, $a + b + c > 0$.

Level 1

21. $a > 0$, $c > 0$, $4b^2 - 4ac < 0$. However nothing can be said about b. For instance, consider parabolas $y = x^2 - x + 1$, $y = x^2 + x + 1$ or $y = x^2 + 1$

22. If α is a common root, then $a\alpha^2 + 2b\alpha + c = 0$, $a\alpha^2 + 2c\alpha + \beta = 0$

    Subtracting, we get $2(b - c)\alpha + c - b = 0$

    $\Rightarrow \alpha = \frac{1}{2}$. Thus $\frac{1}{4}a + b + c = 0$

    $\Rightarrow \frac{a+b+c}{a} = \frac{3}{4}$

23. Let $f(x) = ax^2 + bx + c$. As $f(x) = 0$, does not have real roots, $f(x) > 0\ \forall\ x \in \mathbf{R}$ or $f(x) < 0\ \forall\ x \in \mathbf{R}$. But

    $f\left(-\frac{2}{3}\right) = \frac{1}{9}(4a - 6b + 9c) < 0$, therefore

    $f(x) < 0\ x\ \forall\ x \in \mathbf{R}. \Rightarrow f(1) < 0$

    $\Rightarrow a + b + c < 0.$

    $\Rightarrow \frac{b+c}{a} < -1$

24. We have $16^2 - 16c > 0 \Rightarrow c < 16$

    If $f(x) = 4x^2 - 16x + c$, then $1 < \alpha < 2 < \beta < 3$ implies $f(1) > 0, f(2) < 0, f(3) > 0$.

    $\Rightarrow c > 12,\ c < 16,\ c > 12$

    Thus, $c = 13, 14, 15$.

25. If α is a common root of the three equations, then

    $\alpha^2 + a\alpha + 12 = 0$, $\alpha^2 + b\alpha + 15 = 0$

    and $\alpha^2 + (a + b)\alpha + 36 = 0$

    $\Rightarrow b\alpha = -24,\ a\alpha = -21$

    Thus, $\alpha^2 - 21 + 12 = 0 \Rightarrow \alpha = \pm 3$

    As $\alpha > 0$, we get $\alpha = 3$.

    Therefore, $a = -7$, $b = -8$.

26. $\frac{a}{x} = \frac{2x}{x^2 - b^2} \Rightarrow a(x^2 - b^2) = 2x^2$

    $\Rightarrow (a - 2)x^2 - ab^2 = 0$

    This equation will have no solution if $a - 2$ and a have opposite signs, that is , $a(a - 2) < 0$

    $\Rightarrow 0 < a < 2.$

27. As the roots are real and distinct, $\frac{a^2}{(2a+1)^2} - \frac{4(a-2)}{2a+1} > 0$

    $\Rightarrow a^2 - 4(a - 2)(2a + 1) > 0$

    $\Rightarrow \frac{6 - 2\sqrt{23}}{7} < a < \frac{6 + 2\sqrt{23}}{7}$

Write the equation as

$$x^2 - \frac{a}{2a+1}x + \frac{a-2}{2a+1} = 0$$

Note that its roots are α and β.

As $\alpha < 1 < \beta$, we must have

$$1^2 - \frac{a}{2a+1} + \frac{a-2}{2a+1} < 0$$

$\Rightarrow 2a + 1 - a + a - 2 < 0 \Rightarrow a < 1/2$

Thus, $\frac{1}{7}\left(6 - 2\sqrt{23}\right) < a < \frac{1}{2}$

28. $8x^2 - 10x + 3 = 0 \Rightarrow (2x - 1)(4x - 3) = 0$

$\Rightarrow \alpha, \beta = 1/2. 3/4$

$$\therefore \sum_{n=0}^{\infty}\left(\alpha^n + \beta^n\right) = \frac{1}{1-\alpha} + \frac{1}{1-\beta} = 6$$

29. $b^2 - 4ac = (-a - 2c)^2 - 4ac$

$= a^2 + 4c^2 > 0$

30. Let $y = \dfrac{x^2 - bc}{2x - (b+c)}$, then

$x^2 - bc = 2xy - (b + c)y$

$\Rightarrow x^2 - 2xy + (b + c)y + - bc = 0$

As x is real,

$y^2 - (b + c)y + bc \geq 0$

$\Rightarrow (y - b)(y - c) \geq 0$

$\Rightarrow y$ cannot lie in (b, c).

31. $(\alpha - \gamma)(\alpha - \delta)(\beta - \gamma)(\beta - \delta)$

$= (\alpha^2 + r\alpha + s)(\beta^2 + r\beta + s)$

$= (-p\alpha - q + r\alpha + s)(-p\beta - q + r\beta + s)$

$= [(r - p)\alpha - (q - s)][(r - p)\beta - (q - s)]$

$$= (r-p)^2\left[\frac{q-s}{r-p} - \alpha\right]\left[\frac{q-s}{r-p} - \beta\right]$$

$$= (r-p)^2\left[\left(\frac{q-s}{r-p}\right)^2 + p\left(\frac{q-s}{r-p}\right) + q\right]$$

$= (q - s)^2 + p(q - s)(r - p) + q(r - p)^2$

32. Use $x^2 \geq 0$, $|x| \geq 0$

33. $x^2 - 3|x| + 2 = 0 \quad \Rightarrow \quad |x| = 1, 2 \quad \Rightarrow \quad x = \pm 1, \pm 2$

34. As $p, q \in \mathbf{R}$, other root of the equation is $2 - i\sqrt{5}$. Thus,

$p = 4$, $q = \left(2 + \sqrt{5}i\right)\left(2 - \sqrt{5}i\right) = 9$

35. Subtract one equation from the other to obtain $x = 1$.

36. Write the expression as

$(ap + b)^2 + (bp + c)^2 + (cp + d)^2 \leq 0.$

$\Rightarrow ap + b = 0, bp + c = 0, cp + d = 0$

$$\Rightarrow \frac{b}{a} = \frac{c}{b} = \frac{d}{c} = -p.$$

37. Use $5^x + 5^{-x} \geq 2 \ \forall \ x \in \mathbf{R}$.

38. Multiply the first equation by x and subtract from the second to obtain $x = 1$.

39. $x + 2 \geq 0 \quad \Rightarrow \quad x \geq -2$

Now, $|(x + 2)(x - 3)| = x + 2$

$|x + 2|\,|x - 3| = x + 2$

$\Rightarrow \quad x + 2 = 0$ or $|x - 3| = 1$

$\Rightarrow \quad x = -2, x = 3 \pm 1$ *i.e.*, $x = -2, 2, 4$

40. $|x|^2 - 3|x| + 2 = 0 \quad \Rightarrow \quad |x| = 1, 2 \quad \Rightarrow \quad x = \pm 1, \pm 2$

41. Use $n - 4 > 0$ and $D < 0$

42. Let $f(x) = ax^2 + bx + c$

$f(x) < 0 \ \forall \ x \in \mathbf{R} \quad \Leftrightarrow \quad a < 0, b^2 - 4ac < 0.$

Now, $g(x) = ax^2 + bx + c + (2ax + b) + 2a$

$= ax^2 + (2a + b)x + (2a + b + c)$

Here $\quad a < 0$ and $(2a + b)^2 - 4a(2a + b + c)$

$= (b^2 - 4ac) - 4a^2 < 0.$

43. Use the fact that expression becomes zero when $x = -1$.

44. Note that $p > 0$, and

$p - 4 < 0, 2p^2 - 4 > 0,$

and $\quad (p - 4)^2 - 4(2p^2 - 4) \geq 0$

$\Rightarrow \quad p < 4, p > \sqrt{2}$ and $7p^2 + 8p - 32 \leq 0.$

$$\Rightarrow \quad \sqrt{2} < p < \frac{4}{7}\left(\sqrt{15} - 1\right)$$

45. $f(x)^2 + g(x)^2 = 0 \quad \Leftrightarrow \quad f(x) = 0$ and $g(x) = 0$

46. Use D < 0

47. Show that D > 0

48. $ax^2 + bx + c > 0 \ \forall \ x > 0.$

49. $x^2 - 8x + p^2 - 6p = 0$ has real roots

$\Rightarrow 64 - 4(p^2 - 6p) \geq 0$

$\Rightarrow p^2 - 6p - 16 \leq 0 \Rightarrow (p - 8)(p + 2) \leq 0$

$\Rightarrow p \in [-2, 8]$

50. $-\dfrac{2a+3}{a+1} = -3 \quad \Rightarrow \quad a = 0.$

$\therefore$ Product of roots $= \dfrac{3a+4}{a+1} = 4$

51. Use that other root of the equation is $3 + 4i$ to obtain $p = 6$, $q = 25$

52. Let other roots be β, γ then

$(1 + i) + \beta + \gamma = 0$ and $(1 + i)\beta\gamma = -(1 - i)$

$\Rightarrow \quad \beta + \gamma = -(1 + i), \beta\gamma = i$

53. $\alpha + \beta = -p$, $\alpha\beta = -\dfrac{1}{2p^2}$.

$\Rightarrow \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta = p^2 + \dfrac{1}{p^2}$

$$\Rightarrow \alpha^2 + \beta^2 = \left(p - \frac{1}{p}\right)^2 + 2 \geq 2.$$

54. Put $\sqrt{x-1} = t$ so that $x = t^2 + 1$

$$\therefore \sqrt{x + 3 - 4\sqrt{x-1}} + \sqrt{x + 8 - 6\sqrt{x-1}} = 1$$

$\Rightarrow \sqrt{t^2 - 4t + 4} + \sqrt{t^2 - 6t + 9} = 1$

$\Rightarrow |t - 2| + |t - 3| = 1 \Rightarrow 2 \le t \le 3$

$\Rightarrow 2 \le \sqrt{x-1} \le 3$

$\Rightarrow 4 \le x - 1 \le 9 \quad \Rightarrow \quad 5 \le x \le 10.$

55. $|x - x^2 - 1| = |2x - 3 - x^2| \Rightarrow \quad |x^2 - x + 1| = |x^2 - 2x + 3|$

$\Rightarrow \left|\left(x - \frac{1}{2}\right)^2 + \frac{3}{4}\right| = |(x - 1)^2 + 2|$

$\Rightarrow x^2 - x + 1 = x^2 - 2x + 3 \quad \Rightarrow \quad x = 2$

56. $\sin \alpha + \cos \alpha = -\frac{b}{a}$, $\sin \alpha \cos \alpha = \frac{c}{a}$

Now $1 = \sin^2\alpha + \cos^2\alpha$
$= (\sin \alpha + \cos \alpha)^2 - 2\sin \alpha \cos \alpha$

$\Rightarrow \quad 1 = \frac{b^2}{a^2} - \frac{2c}{a} \quad \Rightarrow \quad a^2 = b^2 - 2ac$

$\Rightarrow \quad a^2 - b^2 + 2ac = 0.$

57. $k = \frac{x^2 - x + 1}{x^2 + x + 1}$

$\Rightarrow \quad (k - 1)x^2 + (k + 1)x + (k - 1) = 0$
As x is real $(k + 1)^2 - 4(k - 1)^2 \ge 0$
$\Rightarrow (k + 1 + 2k - 2)\ (k + 1 - 2k + 2) \ge 0$
$\Rightarrow (3k - 1)\ (3 - k) \ge 0 \Rightarrow 1/3 \le k \le 3.$

58. $\alpha^2 + b\alpha + ca = 0$ and $\alpha^2 + c\alpha + ab = 0$
$\Rightarrow (b - c)\alpha + a(c - b) = 0 \quad \Rightarrow \quad \alpha = a.$
Now, show that $a + b + c = 0$ and use the fact that other roots are b and c.

59. $mx^2 + 3x + 4 < 5\ (x^2 + 2x + 2)$
$\Rightarrow (m - 5)x^2 - 7x - 6 < 0\ \forall\, x \in \mathbf{R}$
$\Rightarrow m - 5 < 0$ and $(-7)^2 + 24(m - 5) < 0$
$\Rightarrow m < 5$ and $24m - 71 < 0 \Rightarrow m < 71/24$

60. Use the fact that expression becomes equal to 1 for $x = a, b, c$.

61. As $ax^2 + bx + c$ has no real zeros.
$ax^2 + bx + c > 0\ \forall\, x \in \mathbf{R}$ or $ax^2 + bx + c < 0\ \forall\, x \in \mathbf{R}$.
Since $a(-1)^2 + b(-1) + c < 0$, we get $ax^2 + bx + c < 0\ \forall\, x \in \mathbf{R}$
Thus, $a < 0$ and $c < 0 \Rightarrow ac > 0$.

62. $x^2 - 2x - p^2 + 1 = 0$
$\Rightarrow (x - 1)^2 = p^2$
$\Rightarrow x = 1 \pm p$
Let $\alpha = 1 - p$, $\beta = 1 + p$
Let $f(x) = x^2 - 2(p + 1)x + p(p - 1)$
As $f(x) = 0$ has distinct real roots,
$(p + 1)^2 - p(p - 1) > 0$

$\Rightarrow 3p + 1 > 0 \Rightarrow p > -\frac{1}{3}$

Also, $f(1 - p) < 0$,
and $f(1 + p) < 0$

$\Rightarrow (1 - p)^2 - 2(1 + p)\ (1 - p) + p(p - 1) < 0$
and $(1 + p)^2 - 2(1 + p)^2 + p(p - 1) < 0$

$\Rightarrow -1/4 < p < 1$ and $p > -\frac{1}{3}$

Thus, $p \in \left(-\frac{1}{4}, 1\right)$

63. $\alpha + \beta = -\frac{b}{a}$, $\alpha + \beta + 2h = -\frac{B}{A}$

64. $D = 49 + 56(q^2 + 1) > 0.$

65. Note that α, β are roots of

$x^2 + \frac{b}{a}x + \frac{c}{a} = 0$

As $\alpha < -1$, $\beta > 1$, we get

$1 - \frac{b}{a} + \frac{c}{a} < 0$

and $1 + \frac{b}{a} + \frac{c}{a} < 0$

$\Rightarrow \quad 1 + \left|\frac{b}{a}\right| + \frac{c}{a} < 0$

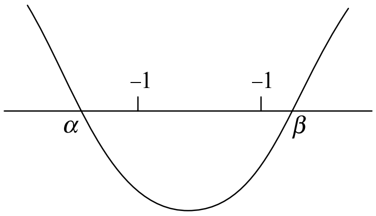

Fig. 3.22

66. Let $f(x) = ax^2 + bx + c$.
Now, $(a + c)^2 < b^2$
$\Leftrightarrow \quad (a - b + c)\ (a + b + c) < 0$
$\Rightarrow f(-1)\ f(1) < 0.$
Thus, $ax^2 + bx + c = 0$ has a real root between -1 and 1.
The other root also must be real.

67. If x is an integer and
$(x - a)\ (x - 10) = -1$
$\Rightarrow x - 10 = 1$ and $x - a = -1$ or $x - 10 = -1$ and $x - a = 1$
$\Rightarrow x = 11$ and $a = x + 1 = 12$ or $x = 9$ and $a = x - 1 = 8$

68. $4^{1.5}\left(\frac{2}{3}\right)^x + 9^{0.5}\left(\frac{3}{2}\right)^x = 10$

Put $\left(\frac{3}{2}\right)^x = t$, so that

$3t + 8/t = 10 \quad \Rightarrow \quad 3t^2 - 10t + 8 = 0$

$\Rightarrow (3t - 4)\ (t - 2) = 0 \quad \Rightarrow \quad t = \frac{4}{3}, 2$

$\Rightarrow \left(\frac{3}{2}\right)^x = \frac{4}{3}, 2$

$$\Rightarrow x = \frac{\log(4/3)}{\log(3/2)}, \frac{\log 2}{\log(3/2)}$$

69. Put $2^{\sin^2 x} = t$, so that equation becomes

$$t + \frac{5\times 2}{t} = 7 \Rightarrow t^2 - 7t + 10 = 0 \quad \Rightarrow \quad t = 2, 5$$

But $1 \le t \le 2$. Thus, $\sin^2 x = 1$

70. Let the two distinct roots lying between 0 and 1 be α, β such that $\alpha < \beta$.
As $f(x) = x^2 - 2x + k$ is a differentiable and $f(\alpha) = f(\beta) = 0$, therefore by the Roll's theorem there exists $\gamma \in (\alpha, \beta) \subset (0, 1)$ such that $f'(\gamma) = 0$
$\Rightarrow \quad 2\gamma - 2 = 0 \quad \Rightarrow \quad \gamma = 1$. Not possible.

71. $\dfrac{\alpha}{\alpha-1}+\dfrac{\alpha+1}{\alpha}=-\dfrac{b}{a}$, and $\dfrac{\alpha}{\alpha-1}.\dfrac{\alpha+1}{\alpha}=\dfrac{c}{a}$

Now, $(a + b + c)^2 = a^2\left(1+\dfrac{b}{a}+\dfrac{c}{a}\right)^2$

$$= a^2\left[1-\left\{\frac{\alpha}{\alpha-1}+\frac{\alpha+1}{\alpha}\right\}+\frac{\alpha+1}{\alpha-1}\right]^2$$

$$= a^2\left(\frac{\alpha}{\alpha-1}-\frac{\alpha+1}{\alpha}\right)^2$$

$$= a^2\left[\left(\frac{\alpha}{\alpha-1}+\frac{\alpha+1}{\alpha}\right)^2-4\frac{\alpha}{\alpha-1}.\frac{\alpha+1}{\alpha}\right]$$

$$= a^2\left[\frac{b^2}{a^2}-\frac{4c}{a}\right]=b^2-4ac$$

72. Let $x = 3m + r$, $0 \le r \le 2$.
$x^2 + x + 1 = (9m^2 + 6mr + 3m) + (r^2 + r + 1)$
Note that $x^2 + x + 1$ will be divisible by 3 if and only if $r = 1$.

73. $f(x) = \dfrac{1}{4}(\alpha - \beta)^2 - x^2 - (\alpha + \beta)x + \alpha\beta$

$$= \frac{(\alpha-\beta)^2+4\alpha\beta}{4}-\left\{x-\frac{\alpha+\beta}{2}\right\}^2+\frac{(\alpha+\beta)^2}{4}$$

$$= \frac{1}{2}(\alpha+\beta)^2-\left\{x+\frac{a}{2}\right\}^2 \le \frac{a^2}{2}$$

Thus, maximum value $f(x)$ is $\dfrac{a^2}{2}$ which is attained when $x = -\dfrac{a}{2}$

74. Let α, β be roots of $f(x) = x^2 + bx + c$, then $0 < \alpha, \beta < 1 \Rightarrow 0 < \alpha + \beta < 2$ and $\alpha\beta < 1$
$\Rightarrow \quad -b < 2$ and $c < 1$
$\Rightarrow \quad b > -2$ and $c < 1$
However, these conditions are not sufficient to guarantee that the roots are real. For instance, $x^2 + 0x + 0.5 = 0$ does not have real roots.

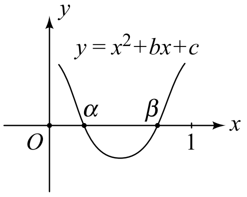

Fig. 3.23

75. Let $f(x) = ax^2 + bx + c$.
Note that $f(0) = c > 0$, $f(-1) = a - b + c < 0$ and $f(1) = a + b + c < 0$
Thus, $y = ax^2 + bx + c$ represents a parabola that open downwards. See Fig.3.21
Thus $[\alpha] = -1$ and $[\beta] = 0$
$\Rightarrow [\alpha] + [\beta] = -1$

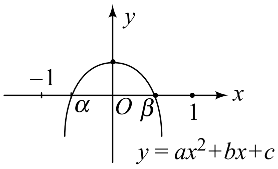

Fig. 3.24

76. $x^2 - 2mx + m^2 - 1 = 0 \Rightarrow (x - m)^2 = 1$
$\Rightarrow x - m = \pm 1 \quad \Rightarrow \quad x = m \pm 1$
Therefore, $-2 < m - 1 < m + 1 < 4$
$\Rightarrow \quad -1 < m < 3$.

77. $y = \sqrt{8+2\sqrt{8+2\sqrt{8+2\sqrt{8+\cdots}}}}$

$\Rightarrow \quad y^2 = 8 + 2y \quad \Rightarrow \quad y^2 - 2y - 8 = 0$
$\Rightarrow \quad y = 4, -2$. As $y > 0$, $y = 4$

78. $\sin\left(\dfrac{\pi x}{2\sqrt{3}}\right)=\left(x-\sqrt{3}\right)^2+1\ge 1$

But $\sin\left(\dfrac{\pi x}{2\sqrt{3}}\right) \le 1$. Thus, $\sin\left(\dfrac{\pi x}{2\sqrt{3}}\right) = 1$

Therefore, $x = \sqrt{3}$

79. $2(3 - x) = |x + 2| \ge 0 \quad \Rightarrow \quad x \le 3$
If $x \le -2$, the equation becomes
$2(3 - x) = -x - 2 \quad \Rightarrow \quad x = 8$. Not possible
If $-2 < x \le 3$, the equation becomes
$2(3 - x) = x + 2 \quad \Rightarrow \quad 3x = 4 \quad \Rightarrow \quad x = 4/3$.

80. Use product of roots < 0

81. Put $x^2 - 5x = y$;
so that $y^2 - 7y + 6 = 0 \quad \Rightarrow \quad y = 1, 6$
$\therefore\ x^2 - 5x = 1$ or $x^2 - 5x = 6$
$\Rightarrow x^2 - 5x - 1 = 0$ or $x^2 - 5x - 6 = 0$
But $x^2 - 5x - 6 = 0$ has integral roots and roots of $x^2 - 5x - 1 = 0$ are

$$x = \frac{1}{2}\left(5\pm\sqrt{29}\right)$$

82. Put $\left(\dfrac{x-1}{x+1}\right)^2 = y$ to obtain
$y^2 - 13y + 36 = 0 \quad \Rightarrow \quad y = 4, 9$
$\therefore\ \dfrac{x-1}{x+1} = \pm 2, \pm 3$
Thus, the given equation has four real roots.

83. $9^{x+2} - 6(3^{x+1}) + 1 = 0$
Put $3^{x+1} = t$ so that $t^2 - 6t + 1 = 0$

$$\Rightarrow t = \frac{6\pm\sqrt{32}}{2}=3\pm 2\sqrt{2}$$

$\Rightarrow x + 1 = \log_3 (3 + 2\sqrt{2}) > 1$

or $x + 1 = \log_3 (3 - 2\sqrt{2}) < 0$

84. Put $\left(\frac{2x-5}{3x+1}\right)^2 = t$, so that equation becomes

$81t^2 - 45t + 4 = 0$

$\Rightarrow 81t^2 - 36t - 9t + 4 = 0$

$\Rightarrow (9t - 1)(9t - 4) = 0$

$\Rightarrow t = \frac{1}{9}, \frac{4}{9} \Rightarrow \frac{2x-5}{3x+1} = \pm\frac{1}{3}, \pm\frac{2}{3}$

Thus, the given equation has four rational roots.

85. Put $x^2 + 3x + 2 = t$ to obtain $t^2 - 8(t - 2) - 4 = 0$

$\Rightarrow t^2 - 8t + 12 = 0 \Rightarrow (t - 2)(t - 6) = 0$

$\Rightarrow t = 2, 6$

But both $x^2 + 3x + 2 = 2$

and $x^2 + 3x + 2 = 6$ have integral roots.

86. Put $\sqrt{\frac{x}{x-3}} = t$ to obtain $t + \frac{1}{t} = \frac{5}{2}$

$\Rightarrow \quad t = 2, \frac{1}{2}$

$\therefore \sqrt{\frac{x}{x-3}} = 2, \frac{1}{2} \quad \Rightarrow \quad \frac{x}{x-3} = 4, \frac{1}{4}$

87. Put $x + 1/x = t$ to obtain

$4\{t^2 - 4\} + 8t = 29$ or $4t^2 + 8t - 45 = 0$

$\Rightarrow t^2 + 2t = \frac{45}{4} \Rightarrow (t + 1)^2 = \frac{45}{4} + 1 = \left(\frac{7}{2}\right)^2$

$\Rightarrow t = -1 \pm \frac{7}{2} = -\frac{9}{2}, \frac{5}{2}$

Thus, $\quad x + \frac{1}{x} = -\frac{9}{2}, \frac{5}{2}$

$\Rightarrow \quad x^2 + \frac{9}{2}x + 1 = 0, \; x^2 - \frac{5}{2}x + 1 = 0$

The first equation has irrational roots and the second equation has rational roots.

88. Divide the given equation by x^2 to obtain

$$2\left(x^2 + \frac{1}{x^2}\right) + 9\left(x + \frac{1}{x}\right) + 8 = 0$$

Put $x + \frac{1}{x} = t$ to get $2(t^2 - 2) + 9t + 8 = 0$

$\Rightarrow t = -\frac{1}{2}, -4$

$\therefore \; x + \frac{1}{x}, = -\frac{1}{2} - 4$

$\Rightarrow \quad \frac{x^2+1}{x} = -\frac{1}{2}, \; \frac{x^2+1}{x} = -4$

$\Rightarrow 2x^2 + x + 2 = 0, \quad x^2 + 4x + 1 = 0$

The first equation has non-real complex roots and the second equation has irrational roots. *viz.* $-2 \pm \sqrt{3}$.

89. Put $x - \frac{1}{x} = t$ to obtain $4t^2 - 4t + 1 = 0$

$\Rightarrow \quad t = \frac{1}{2}, \frac{1}{2}$

Now, $x - \frac{1}{x} = \frac{1}{2} \quad \Rightarrow \quad \frac{x^2 - 1}{x} = \frac{1}{2}$

$\Rightarrow \quad 2x^2 - x - 2 = 0$

$\therefore$ Sum of roots of the given equation $= \frac{1}{2} + \frac{1}{2} = 1$.

90. $(3x - 2)(x - 1)(3x + 1)(x - 2) = 21$

$\Rightarrow (3x^2 - 5x + 2)(3x^2 - 5x - 2) = 21$

$\Rightarrow (3x^2 - 5x)^2 - 4 = 21 \quad \Rightarrow \quad 3x^2 - 5x = \pm 5$

$\Rightarrow 3x^2 - 5x - 5 = 0$ or $3x^2 - 5x + 5 = 0$

The first equation has irrational roots and the second has imaginary roots.

91. Note that $x \ge 2$ and

$\Rightarrow x - 2 = \sqrt{3x-6} \quad \Rightarrow \quad x^2 - 4x + 4 = 3x - 6$

$\Rightarrow x^2 - 7x + 10 = 0 \quad \Rightarrow \quad x = 2, 5$

Both of these satisfy the given equation.

92. Note that $x \ge -\frac{1}{2}$. Put $\sqrt{2x+1} = t$, so that

$2t = t^2 - 1 - 1$ or $t^2 - 2t + 1 = 3$

$\Rightarrow t = 1 \pm \sqrt{3}$.

But $t \ge 0$, therefore $t = 1 + \sqrt{3}$

$\Rightarrow 2x + 1 = 1 + 2 + 2\sqrt{3} \quad \Rightarrow \quad x = \frac{1}{2}\left(3 + 2\sqrt{3}\right)$

93. Note that $-\sqrt{13} \le x \le \sqrt{13}$ and

$13 - x^2 = x^2 + 10x + 25$

$\Rightarrow x^2 + 5x + 6 = 0 \Rightarrow x = -2, -3$.

94. $\sqrt{x^2 - 4} - (x - 2) = \sqrt{x^2 - 5x + 6} \qquad (1)$

is defined for $x = 2$ or $x \le -2$ or $x \ge 3$. Write (1) as

$\sqrt{x-2}\left[\sqrt{x+2} - \sqrt{x-2}\right] = \sqrt{x-2}\,\sqrt{x-3}$

$\Rightarrow x = 2$ or $\sqrt{x+2} - \sqrt{x-2} = \sqrt{x-3}$

$\Rightarrow x + 2 + x - 2 - 2\sqrt{x^2 - 4} = x - 3$

$\Rightarrow x + 3 = 2\sqrt{x^2 - 4} \Rightarrow x^2 + 6x + 9 = 4(x^2 - 4)$

$\Rightarrow 3x^2 - 6x - 25 = 0$

$\Rightarrow \quad (x - 1)^2 = \frac{28}{3} \Rightarrow x = 1 \pm \sqrt{\frac{28}{3}}$

Note that $1 - \sqrt{\frac{28}{3}} < -2$ and $1 + \sqrt{\frac{28}{3}} > 3$

95. $\sqrt{x^2 - 4x + 3} + \sqrt{x^2 - 7x + 12} = 3\sqrt{x-3} \qquad (1)$

is defined for $x = 3$ or $x \ge 4$.

Write (1) as

$$\sqrt{x-3}\,[\sqrt{x-1}+\sqrt{x-4}] = 3\sqrt{x-3}$$

$$\Rightarrow x = 3 \text{ or } \sqrt{x-1}+\sqrt{x-4} = 3$$

$$\Rightarrow x = 3 \text{ or } \sqrt{x-1} = 3-\sqrt{x-4}$$

$$\Rightarrow x = 3 \text{ or } x - 1 = 9-6\sqrt{x-4}+x-4$$

$$\Rightarrow x = 3 \text{ or } 6\sqrt{x-4} = 6 \Rightarrow x = 3 \text{ or } x = 5.$$

Thus, product of roots = 15.

96. Note that $2b^2 + 77b + 18 = 0$

$\Rightarrow \quad 2 + 77/b + 18(1/b)^2 = 0$

Thus, a and $1/b$ are roots of the equation

$$18x^2 + 77x + 2 = 0$$

$\therefore \quad a + 1/b = -77/18$ and $\dfrac{a}{b} = \dfrac{2}{18} = \dfrac{1}{9}$

Now, $\dfrac{ab+a+1}{b} = a+\dfrac{1}{b}+\dfrac{a}{b} = -\dfrac{77}{18}+\dfrac{1}{9} = -\dfrac{25}{6}$

97. $\beta^2 = 7\beta - 8.$

Thus, $\dfrac{16}{\alpha}+3\beta^2-19\beta = \dfrac{16}{\alpha}+3(7\beta-8)-19\beta$

$$= \frac{16}{\alpha}+2\beta-24$$

Also, $\alpha = \dfrac{7+\sqrt{17}}{2}$, $\beta = \dfrac{7-\sqrt{17}}{2}$

$$\therefore \quad \frac{1}{\alpha} = \frac{2}{7+\sqrt{17}} = \frac{2\left(7-\sqrt{17}\right)}{49-17} = \frac{7-\sqrt{17}}{16}$$

Thus $\dfrac{16}{\alpha}+3\beta^2-19\beta$

$$= \left(7-\sqrt{17}\right)+\left(7-\sqrt{17}\right)-24 = -10$$

98. As α is a root of $x^4 + x^2 - 1 = 0$, we get

$$\alpha^4 + \alpha^2 - 1 = 0 \Rightarrow \alpha^6 + \alpha^4 - \alpha^2 = 0$$

$$\Rightarrow \quad \alpha^6 + \alpha^4 - (1 - \alpha^4) = 0 \Rightarrow \alpha^6 + 2\alpha^2 = 1$$

$$\therefore \quad (\alpha^6 + 2\alpha^2)^{2012} = 1$$

99. Use the fact that sum and product of the roots of $x^2 - x - k = 0$ are 1 and $-k$ respectively.

100. Suppose $a^2(a + k) = b^2(b + k) = c^2(c + k) = t$, then a, b, c are roots of $x^3 + kx^2 - t = 0$ thus, $bc + ca + ab = 0$ and $abc = t$

$$\Rightarrow \quad \frac{1}{a}+\frac{1}{b}+\frac{1}{c} = \frac{bc+ca+ab}{abc} = 0$$

101 For truth of Statement-2, see theory

$f(\alpha) = a^2\alpha^2 + b\alpha + c = 0$ and

$g(\beta) = a^2\beta^2 - b\beta - c = 0$

We have $a^2\alpha^2 + 2b\alpha + 2c$

$= a^2\alpha^2 - 2a^2\alpha^2 < 0$

and $a^2\beta^2 + 2b\beta + 2c$

$= a^2\beta^2 + 2a^2\beta^2 > 0$

As $a^2x^2 + 2bx + 2c$ is continuous on $[\alpha, \beta]$, by statement-2 there exists γ such that $a^2\gamma^2 + 2b\gamma + 2c = 0$

102. As $y = f(x)$ open upwards, a lies between the roots of $f(x) = 0$, if and only if $f(a) < 0$. Therefore, statement-2 is true.

If $f(x) < 0$ for $1 \le x \le 2$, then 1 and 2 lie between roots of $f(x) = 0$. Thus, we must have

$4p^2 - 4p > 0 \Rightarrow p(p - 1) > 0$

$\Rightarrow p < 0$ or $p > 1$.

Also, $f(1) = 1 + 2p + p < 0 \Rightarrow p < -1/3$ and

$f(2) = 4 + 4p + p < 0 \Rightarrow p < -4/5$.

$\therefore p \in (-\infty, -4/5)$

103. Statement-2 is false as $x^2 + 5x + 4 = 0$ meets both the conditions but does not have positive roots.

As LHS ≥ 0, $1 - 2^x \ge 0 \Rightarrow 2^x \le 1 \Rightarrow x \le 0$.

Squaring, we get

$a(2^x - 2) + 1 = 1 - 2(2^x) + 2^{2x}$

$\Rightarrow y^2 - (a + 2)y + 2a = 0$

$\Rightarrow (y - a)(y - 2) = 0 \Rightarrow y = 2, a.$

$y = 2^x = 2 \Rightarrow x = 1$. Not possible.

Thus, $y = a$. This implies

$0 < 2^x = a \le 1$

Therefore $0 < a \le 1$, and $x = \log_2 a$

104. Put $t = x + \sqrt{x^2+b^2}$

$$\Rightarrow \frac{1}{t} = \frac{1}{\sqrt{x^2+b^2}+x} = \frac{\sqrt{x^2+b^2}-x}{b^2}$$

$$\therefore t - \frac{b^2}{t} = 2x$$

Thus,

$$f(x) = (2a - t + \frac{b^2}{t})t = b^2 + 2at - t^2$$

$$= a^2 + b^2 - (t - a)^2$$

Therefore, maximum value of $f(x)$ is $a^2 + b^2$ which is attained when $t = a$ or $x = \dfrac{1}{2}\left(a-\dfrac{b^2}{a}\right)$

Statement-2 is false as maximum value of $f(x) = ax^2 + bx + c$, $a < 0$ is $(4ac - b^2)/4a$.

105. For truth of statement-2 see theory

Let $P(x) = ax^2 + bx + c$.

As $P(x) = x$ does not have real roots, $P(x) > x \ \forall \ x \in \mathbf{R}$ or $P(x) < x \ \forall \ x \in \mathbf{R}$.

Suppose $P(x) < x \;\forall\; x \in \mathbf{R}$.

$\Rightarrow P(P(x)) < P(x) < x \;\forall\; x \in \mathbf{R}$

$\Rightarrow a(ax^2 + bx + c)^2 + b(ax^2 + bx + c) + c - x = 0$

cannot have real roots.

106. Statement-2 is true as $|a + b| = |a| + |b|$

$\Leftrightarrow a, b$ are both non-negative or both non-positive.

As $ax^2 + bx + c = 0$ has imaginary roots, $ax^2 + bx + c > 0 \;\forall\; x \in \mathbf{R}$ or $ax^2 + bx + c < 0 \;\forall\; x \in \mathbf{R}$.

Since $a(-1)^2 + b(-1) + c = a - b + c < 0$,

we get $ax^2 + bx + c < 0 \;\forall\; x \in \mathbf{R}$.

Now, $|ax^2 + bx + c| + |x + y|$

$$= \left|a\left(x^2 + \frac{y}{a}\right) + (b+1)x + c\right|$$

$= |(ax^2 + bx + c) + (x + y)|$

$\Leftrightarrow (ax^2 + bx + c)(x + y) \geq 0$

$\Leftrightarrow x + y \leq 0$ as $ax^2 + bx + c < 0 \;\forall\; x \in \mathbf{R}$.

107. Statement-2 is true. See Theory

Put $x + c = t$, so that

$$f(x) = \frac{[t + (a-c)][t + (b-c)]}{t}$$

$$= t + \frac{(a-c)(b-c)}{t} + [(a - c) + (b - c)]$$

$$= \left[\sqrt{t} - \frac{\sqrt{(a-c)(b-c)}}{\sqrt{t}}\right]^2 + \left[\sqrt{a-c} + \sqrt{b-c}\right]^2$$

Thus, minimum value of $f(x)$ is $\left(\sqrt{a-c} + \sqrt{b-c}\right)^2$

and it is attained when $t = \sqrt{(a-c)(b-c)}$ or

$x = -c + \sqrt{(a-c)(b-c)} > -c$.

108. If $a \neq p$, $f(x) - g(x) = 0$ is a quadratic equation whose coefficient of $x^2 \neq 0$.

$\therefore f(x) - g(x) = 0$ has two real roots

Thus, statement-2 is true

Let $h(x) = f(x) - g(x)$

$\qquad = (a - b)x^2 + (b - q)x + (c - r)$

If $h(x) = f(x) - g(x) = 0$

for three distinct real values of x, then $a - p = 0$, $b - q = 0$, $c - r = 0$

$\Rightarrow a = p, b = q, c = r$.

$\therefore$ Statement-1 is also true.

However, statement-2 is not a correct explanation for Statement-1.

109. As A.M. ≥ G.M, we get

$$\frac{1}{2}\left(y + \frac{1}{y}\right) \geq \sqrt{y\left(\frac{1}{y}\right)} = 1$$

$$\Rightarrow y + \frac{1}{y} \geq 2.$$

Thus, statement-2 is true.

Since, $\sin^2 x = 0$,

does not satisty $\sin^4 x + p \sin^2 x + 1 = 0$, we get

$0 < \sin^2 x \leq 1$, for all x satisfying $\sin^4 x + p \sin^2 x + 1 = 0$

For such a value of $\sin x$,

$$-p = \sin^2 x + \frac{1}{\sin^2 x} \geq 2$$

$\Rightarrow p \leq -2$ or $p \in (-\infty, -2]$

Let $f(t) = t^2 + pt + 1$

As $f(0) = 1 > 0$ and $f(1) = 1 - p + 1 \leq 0$,

we get there is at least one value of $t \in (0, 1]$ such that $f(t) = 0$.

110. As $b^2 - 4ac < 0$, $f(x) > 0 \;\forall\; x \in \mathbf{R}$ or $f(x) < 0 \;\forall\; x \in \mathbf{R}$.

As $f(0) = c > 0$, $f(x) > 0 \;\forall\; x \in \mathbf{R}$.

Thus, statement-2 is true.

As $f(x) = 0$ does not have real roots, $b^2 - 4ac < 0$. By the statement-2, $f(x) > 0 \;\forall\; x \in \mathbf{R}$.

$\Rightarrow f(-1) = a - b + c > 0 \Rightarrow a > b - c$.

Also $b^2 - 4ac < 0$

$\Rightarrow a > b^2/4c$

Hence, $a > \max\left\{\frac{b^2}{4c}, b - c\right\}$.

Level 2

111. As A.M ≥ G.M, we get

$$\sqrt{x^2 + x} + \frac{\tan^2\alpha}{\sqrt{x^2 + x}} \geq 2\left[\sqrt{x^2 + x}\,\frac{\tan^2\alpha}{\sqrt{x^2 + x}}\right]^{1/2}$$

$$= 2\tan\alpha$$

112. $(a - b)^2 + 4(a + b - 1) \geq 0 \;\forall\; b \in \mathbf{R}$.

$\Rightarrow b^2 - 2b(a - 2) + a^2 + 4a - 4 \geq 0 \;\forall\; b \in \mathbf{R}$.

$\Rightarrow 4(a - 2)^2 - 4(a^2 + 4a - 4) < 0$

$\Rightarrow -8a + 8 < 0 \Rightarrow a > 1$

$\therefore a \in (1, \infty)$

113. $\alpha + \beta = -b < 0$ and $\alpha\beta = \mathrm{c} < 0$.

As $\alpha\beta < 0$, and $\alpha < \beta$,

$\alpha < 0 < \beta < -\alpha = |\alpha|$

114. As $x^2 + (a + b)x + c = 0$ has no real roots,

and the coefficient of $x^2 = 1 > 0$,

$f(x) = x^2 + (a + b)x + c > 0 \;\forall\; x \in \mathbf{R}$.

$\Rightarrow (a + b)^2 - 4\mathrm{c} < 0$.

Also $f(0) = c > 0$, $f(1) = a + b + c + 1 > 0$

$\Rightarrow c(a + b + c) + c > 0$

Next, $f(0) f(-1) > 0$

$\Rightarrow c(1 - a - b + c) > 0$

$\Rightarrow c - c(a + b - c) > 0$

115. As $x - 1 < [x] \leq x$, we get $-x \leq -[x] < -x + 1$

$= x^2 - 2x - 2 \leq x^2 - 2[x] - 2 < x^2 - 2x$

$= (x - 1)^2 - 3 \leq x^2 - 2[x] - 2 < (x - 1)^2 - 1$

Note that $(x-1)^2-3 \le 0$ for $-\sqrt{3}+1 \le x \le \sqrt{3}+1$
and $(x-1)^2-1 > 0$ for $x < 0$ or $x > 2$,
The roots of $x^2-2[x]-2=0$
lie in $\left(-\sqrt{3}+1, 0\right)$ or $(2, 1+\sqrt{3})$
If $x \in \left(-\sqrt{3}+1, 0\right)$, $[x]=-1$,
and $x^2-2[x]-2=0 \Rightarrow x^2=0$ or $x=0$.
This is not possible.
Suppose $x \in (2, 1+\sqrt{3})$, then $[x]=2$,
$x^2-2[x]-2=0 \Rightarrow x^2=6$ or $x=\sqrt{6}$.
Note that $x=\sqrt{6}$ satisfies $x^2-2[x]-2=0$

116. If $[x]$ is odd, then
$[x]^2+a[x]+b$ is odd and if $[x]$ is even, then $[x]^2+a[x]+b$ is also odd
Thus, $[x]^2+a[x]+b$ can never take value 0.

117. Let $a=\sin\alpha$, $b=\sin\beta$, $c=\sin\gamma$.
Note that a, b, c are distinct and $0 < a, b, c < 1$.
We can write the given equation as
$$f(x)=(x-b)(x-c)+(x-c)(x-a)+(x-a)(x-b)=0.$$
Assume that $a < b < c$.
Note that $f(a)=(a-b)(a-c) > 0$
$f(b)=(b-c)(b-a) < 0$
and $f(c)=(c-a)(c-b) > 0$.
Thus, $f(x)=0$ has a root in (a, b) and a root in (b, c).

118. Let $f(x)=x^2+(2\alpha+a)x+\alpha^2+a\alpha+b$.
$f(0)=\alpha^2+a\alpha+b=0$
Let other root of $f(x)=0$ be r, then
$0+r=-(2\alpha+a)=-2\alpha+\alpha+\beta=\beta-\alpha$.
Thus, two roots are 0 and $\beta-\alpha$.

119. As roots are real
$(a+b+c)^2-3\lambda(ab+bc+ca) \ge 0$
$$= 3\lambda \le \frac{(a+b+c)^2}{ab+bc+ca}$$
Since, a, b, c are sides of triangle.
$b+c-a > 0$, $c+a-b > 0$, $a+b-c > 0$
$\Rightarrow 2(ab+bc+ca) > a^2+b^2+c^2$
$\Rightarrow (a+b+c)^2 < 4(ab+bc+ca)$
Thus, $3\lambda < 4 \Rightarrow \lambda \in (-\infty, 4/3)$.

120. $\tan\theta+\cot\theta=2a$ and $\tan\theta\cot\theta=b$
Now, $2a=\tan\theta+\cot\theta \ge 2$ if $\tan\theta > 0$
and $2a=\tan\theta+\cot\theta \le -2$ if $\tan\theta < 0$.
$\Rightarrow 2|a| \ge 2 \Rightarrow |a| \ge 1$
Thus, least value of $|a|$ is 1.

121. Let $f(x)=x^3+x^2-5x-1$, then
$f(-3) < 0, f(-2) > 0, f(-1) > 0, f(0) < 0,$
$f(1) < 0, f(2) > 0.$
Thus, a root of $f(x)=0$ lies in each of the three intervals:
$(-3, -2), (-1, 0), (1, 2)$.
$\therefore$ $[\alpha]+[\beta]+[\gamma]=-3+(-1)+1=-3$

122. $\tan A \tan B = p$, $\tan A \tan B = q$.
As, $\tan(A+B)=\dfrac{\tan A+\tan B}{1-\tan A\tan B}=\dfrac{p}{1-q}$, we get
$$\sin^2(A+B)=\frac{\tan^2(A+B)}{1+\tan^2(A+B)}$$
$$=\frac{p^2/(1-q)^2}{1+p^2/(1-q)^2}=\frac{p^2}{(1-q)^2+p^2}$$

123. Put $\sqrt{x-1}=t \Rightarrow x-1=t^2$, so that equation becomes;
$$\sqrt{t^2+1+3+4t}+\sqrt{t^2+1+8+6t}=1$$
$\Rightarrow |t+2|+|t+3|=1$
Not possible as $t \ge 0$.
Thus, the equation has no solution.

124. Put $\sqrt{x^2+11}=t \Rightarrow x^2+11=t^2$, so that equation becomes
$$\sqrt{t^2+t-11}+\sqrt{t^2-t-11}=4.$$
Since $(t^2+t-11)-(t^2-t-11) \equiv 2t$,
we get
$$\sqrt{t^2+t-11}-\sqrt{t^2-t-11}=\frac{t}{2}$$
$$\therefore\ 2\sqrt{t^2+t-11}=4+\frac{t}{2}$$
$$\Rightarrow 4(t^2+t-11)=16+\frac{1}{4}t^2+4t \Rightarrow t^2=16$$
$$\Rightarrow x^2+11=16 \Rightarrow x=\pm\sqrt{5}$$

125. Note that a, b, c are roots of
$$\frac{x}{t}+\frac{y}{t-p}+\frac{z}{t-q}=1$$
$\Leftrightarrow$ $t^3-(x+y+z+p+q)t^2$
$+[(p+q)x+qy+pz]t-pqx=0.$
$\therefore$ product of roots $=pqx$
$$\Rightarrow abc=pqx \Rightarrow x=\frac{abc}{pq}$$

126. Putting $x=0, 1, 1/2$, we get
$-1 \le c \le 1$, $-1 \le a+b+c \le 1$,
$$-1 \le \frac{1}{4}a+\frac{1}{2}b+c \le 1,$$

$\Rightarrow -4 \le -a - 2b - 4c \le 4$

As $-4 \le 4a + 4b + 4c \le 4$, we get

$-8 \le 3a + 2b \le 8$.

Also, $-8 \le a + 2b \le 8$

$\Rightarrow -16 \le 2a \le 16 \Rightarrow |a| \le 8$

127. $p + q$ and $p + r$ are roots of

$at^2 + 2bp\,(t - p) + c = 0$

or $at^2 + 2bpt + c - 2bp^2 = 0$.

We have

$|q - r|^2 = |(p + q) - (p + r)|^2$

$= [(p + q) + (p + r)]^2 - 4(p + q)(p + r)$

$$= \left(\frac{-2bp}{a}\right)^2 - \frac{4\left(c - 2bp^2\right)}{a}$$

$$= \frac{4}{a^2}\left[b^2p^2 - ac + 2abp^2\right]$$

$$= \frac{4}{|a|^2}\,[(2a + b)\,bp^2 - ac]$$

$\Rightarrow |q - r|$

$$= \frac{2}{|a|}\sqrt{(2a+b)bp^2 - ac}$$

128. Put $x^2 = y$. The given equation will have four real roots if

$f(y) = ay^2 + by + c = 0$

has two non-negative roots.

This is possible if

$-\dfrac{b}{a} \ge 0$, $af(0) \ge 0$, $b^2 - 4ac \ge 0$

$\Rightarrow ab \le 0,\ ac \ge 0$.

This condition is met if $a > 0$, $b < 0$, $c > 0$ or $a < 0$, $b > 0$, $c < 0$

129. As $x = 1$ satisfies

$(b - c)\,x^2 + (c - a)\,x + (a - b) = 0$,

$x = 1$ must satisfy $x^2 + mx + 1 = 0$

$\Rightarrow 1 + m + 1 = 0 \Rightarrow m = -2$.

130. Eliminating x from $x + y + z = 4$,

and $x^2 + y^2 + z^2 = 6$, we get

$y^2 + z^2 + (4 - y - z)^2 = 6$

$\Rightarrow 2y^2 - 2(4 - z)y + (4 - z)^2 + z^2 - 6 = 0$

As y is real, we get

$(4 - z)^2 - 2[(4 - z)^2 + z^2 - 6] \ge 0$

$\Rightarrow 3z^2 - 8z + 4 \le 0$

$\Rightarrow (3z - 2)\,(z - 2) \le 0$

$\Rightarrow 2/3 \le z \le 2$.

Thus, maximum value of z is 2.

Previous Years' AIEEE/JEE Main Questions

1. α, β are root of $x^2 = 5x - 3$ or $x^2 - 5x + 3 = 0$

$\Rightarrow \alpha + \beta = 5,\ \alpha\beta = 3$.

Now, $\dfrac{\alpha}{\beta} + \dfrac{\beta}{\alpha} = \dfrac{\alpha^2 + \beta^2}{\alpha\beta} = \dfrac{(\alpha+\beta)^2 - 2\alpha\beta}{\alpha\beta}$

$$= \frac{25 - 6}{3} = \frac{19}{3}$$

and $\left(\dfrac{\alpha}{\beta}\right)\left(\dfrac{\beta}{\alpha}\right) = 1$

Thus, equation whose roots are α/β and β/α is

$$x^2 - (19/3)x + 1 = 0$$

or $\quad 3x^2 - 19x + 3 = 0$

2. $|\alpha - \beta| = |\alpha_1 - \beta_1|$

$\Rightarrow (\alpha - \beta)^2 = (\alpha_1 - \beta_1)^2$

$\Rightarrow (\alpha + \beta)^2 - 4\alpha\beta = (\alpha_1 + \beta_1)^2 - 4\alpha_1\beta_1$

$\Rightarrow a^2 - 4b = b^2 - 4a$

$\Rightarrow (a - b)(a + b + 4) = 0 \Rightarrow a + b + 4 = 0$

$[\because\ a \ne b]$

3. Let $f(x) = \dfrac{1}{3}ax^3 + \dfrac{1}{2}bx^2 + cx$.

As f is a polynomial f is continuous on [0, 1] and f is differentiable on (0, 1). Also

$$f(0) = 0 \text{ and } f(1) = \frac{1}{6}(2a + 3b + 6c) = 0$$

By the Rolle's theorem there exist some $\alpha \in (0, 1)$ such that $f'(\alpha) = 0$.

Thus, $ax^2 + bx + c = 0$ has at least one root in [0, 1].

4. For each $x \in \mathbf{R}$, $t \in \mathbf{R}$

$t^2x^2 + |x| + 9 \ge 9 > 0$

Thus, $t^2x^2 + |x| + 9 = 0$ does not have real roots.

5. Let α and 2α be the roots of the given equation, then

$(a^2 - 5a + 3)\alpha^2 + (3a - 1)\alpha + 2 = 0 \qquad (1)$

$(a^2 - 5a + 3)(4\alpha^2) + (3a - 1)(2\alpha) + 2 = 0 \qquad (2)$

Multiplying (1) by 4 and subtracting it form (2) we get

$(3a - 1)\,(2\alpha) + 6 = 0$

Clearly $\alpha \neq 1/3$. Therefore, $\alpha = -3/(3a-1)$

Putting this value in (1) we get

$$(a^2 - 5a + 3)(9) - (3a - 1)^2(3) + 2(3a - 1)^2 = 0$$

$$\Rightarrow \quad 9a^2 - 45a + 27 - (9a^2 - 6a + 1) = 0$$

$$\Rightarrow \quad -39a + 26 = 0$$

$$\Rightarrow \quad a = 2/3.$$

For $a = 2/3$, the equation becomes $x^2 + 9x + 18 = 0$, whose roots are –3, –6.

6. Let α, β be the roots of $ax^2 + bx + c = 0$

We are given

$$\alpha + \beta = \frac{1}{\alpha^2} + \frac{1}{\beta^2}$$

$$= \frac{\alpha^2 + \beta^2}{(\alpha\beta)^2} = \frac{(\alpha+\beta)^2 - 2\alpha\beta}{(\alpha\beta)^2}$$

$$\Rightarrow \quad \frac{-b}{a} = \frac{(-b/a)^2 - 2(c/a)}{(c/a)^2}$$

$$\Rightarrow \quad -\frac{b}{a}\cdot\frac{c^2}{a^2} = \frac{b^2}{a^2} - \frac{2c}{a}$$

$$\Rightarrow \quad 2a^2c = ab^2 + bc^2$$

Divide by abc to obtain

$$2\frac{a}{b} = \frac{c}{a} + \frac{b}{c}$$

$$\Rightarrow \quad \frac{c}{a}, \frac{a}{b}, \frac{b}{c} \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{a}{c}, \frac{b}{a}, \frac{c}{b} \text{ are in H.P.}$$

7. $$x^2 - 3|x| + 2 = 0$$

$$\Rightarrow \quad |x|^2 - 3|x| + 2 = 0$$

$$\Rightarrow \quad (|x| - 1)(|x| - 2) = 0$$

$$\Rightarrow \quad |x| = 1, 2$$

$$\Rightarrow \quad x = \pm 1, \pm 2$$

8. Let two numbers be α and β. We are given

$$\frac{a+\beta}{2} = 9, \ \sqrt{a\beta} = 4$$

$$\Rightarrow \quad \alpha + \beta = 18 \text{ and } \alpha\beta = 16$$

∴ Required equation is

$$x^2 - (\alpha + \beta)x + \alpha\beta = 0$$

or $$x^2 - 18x + 16 = 0$$

9. Let other root be α. Then

$$\alpha + (1 - p) = -p \text{ and } \alpha(1 - p) = 1 - p$$

$$\Rightarrow \quad \alpha = -1 \text{ and } -(1 - p) = 1 - p$$

$$\Rightarrow \quad \alpha = 1 \text{ and } 1 - p = 0$$

Thus, equation is $x^2 + x = 0$

$\Rightarrow \quad x = 0, -1$

10. Let α be the other root of $x^2 + px + 12 = 0$

∴ $(\alpha)(4) = 12$ and $\alpha + 4 = p$

$\Rightarrow \quad \alpha = 3$ and $3 + 4 = p$

Thus, $p = 7$,

As $x^2 + px + q = 0$ has equal roots, we must have $p^2 - 4q = 0$

$$\Rightarrow \quad q = \frac{1}{4}p^2 = \frac{49}{4}$$

11. See solution to Question No. 3

12. We have

$$\tan\left(\frac{P}{2}\right) + \tan\left(\frac{Q}{2}\right) = \frac{-b}{a} \text{ and } \tan\left(\frac{P}{2}\right)\tan\left(\frac{Q}{2}\right) = \frac{c}{a}$$

Also $P + Q = \pi - R = \pi/2$

$$\Rightarrow \quad \frac{P}{2} + \frac{Q}{2} = \frac{\pi}{4}$$

$$\Rightarrow \quad \tan\left(\frac{P}{2} + \frac{Q}{2}\right) = \tan\left(\frac{\pi}{4}\right)$$

$$\Rightarrow \quad \frac{\tan(P/2) + \tan(Q/2)}{1 - \tan(P/2)\tan(Q/2)} = 1$$

$$\Rightarrow \quad \frac{-bla}{1 - cla} = 1 \Rightarrow \frac{-b}{a - c} = 1$$

$$\Rightarrow \quad -b = a - c \quad \text{or} \quad c = a + b$$

13. Let α, β be roots of $x^2 - (a - 2)x - a - 1 = 0$

Then $\alpha + \beta = a - 2$, $\alpha\beta = -(a + 1)$

Now, $$\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$$

$$= (a - 2)^2 + 2(a + 1)$$

$$= a^2 - 4a + 4 + 2a + 2$$

$$= a^2 - 2a + 1 + 3$$

$$= (a - 1)^2 + 3$$

Thus, $\alpha^2 + \beta^2$ is least when $a = 1$

14. We know that if α and β are roots of $x^2 - bx + c = 0$, then $(\alpha - \beta)^2$ = discriminant $= b^2 - 4c$.

In the present case $\beta = \alpha + 1$.

$\therefore \quad 1 = b^2 - 4c$

15. We can write the given equation as

$$(x - k)^2 = 5 - k.$$

Thus, for roots to be real we must have $5 - k \geq 0$ or $k \leq 5$.

Also, for $k \leq 5$,

$$x = k \pm \sqrt{5-k}$$

For both the roots to be less than 5, we must have that larger of the two roots is less than 5. Therefore.

$$\Rightarrow \quad k + \sqrt{5-k} < \quad \Rightarrow 5\sqrt{5-k} < 5 - k \qquad (1)$$

This does not hold for $k = 5$. For $k < 5$, we can write (1) as

$1 < \sqrt{5-k}$ or $5 - k > 1$ or $k < 4$

$\therefore \quad k \in (-\infty, 4)$.

16. Let $f(x) = a_n x^n + a_{n-1}x^{n-1} + ... + a_1 x$. Then, $f(0) = 0$ and $f(\alpha) = 0$.

By the Rolle's theorem $\exists\ \beta \in (0, \alpha)$ such that $f'(\beta) = 0$.

Thus, $na_n x^{n-1} + (n - 1)a_{n-1}x^{n-2} + ... + a_1 = 0$

has a positive root β which is smaller than α.

17. Let $\alpha = \tan 30°$, $\beta = \tan 15°$, then $\alpha = \dfrac{1}{\sqrt{3}}$ and $\beta = 2 - \sqrt{3}$

$$\therefore \quad -p = \frac{1}{\sqrt{3}} + (2 - \sqrt{3})$$

$$\text{and} \quad q = \frac{1}{\sqrt{3}}(2 - \sqrt{3}) = \frac{2}{\sqrt{3}} - 1$$

$$\text{Thus,} \quad q - p = \frac{3}{\sqrt{3}} + 2 - \sqrt{3} - 1 = 1$$

$\therefore \quad 2 + q - p = 3$

18. $x^2 - 2mx + m^2 - 1 = 0$

$\Rightarrow \quad (x - m)^2 = 1 \quad \Rightarrow x = m \pm 1$

As both the roots lie between –2 and 4, we get

$-2 < m \pm 1 < 4$

$\Rightarrow \quad -1 < m < 3.$

19. Let $y = \dfrac{3x^2 + 9x + 17}{3x^2 + 9x + 7}$

$\Rightarrow \quad 3(y - 1)x^2 + 9(y - 1)x + 7y - 17 = 0$

As x is real

$81(y - 1)^2 - 12(y - 1)(7y - 17) \geq 0$

$\Rightarrow \quad 3(y - 1)[27(y - 1) - 4(7y - 17)] \geq 0$

$\Rightarrow \quad 3(y - 1)(41 - y) \geq 0$

$\Rightarrow \quad (y - 1)(y - 41) \leq 0$

$\Rightarrow \quad 1 \leq y \leq 41$

20. $\alpha + \beta = -a$, $\alpha\beta = 1$

$$|\alpha - \beta| < \sqrt{5}$$

$\Rightarrow \quad |\alpha - \beta|^2 < 5$

$\Rightarrow \quad (\alpha + \beta)^2 - 4\alpha\beta < 5$

$\Rightarrow \quad a^2 - 4 < 5$

$\Rightarrow \quad a^2 < 9$

$\Rightarrow \quad -3 < a < 3$

$\Rightarrow \quad a \in (-3, 3)$

21. Let roots of $x^2 - 6x + a = 0$ be α, $4m$ and that of $x^2 - cx + 6 = 0$ be α, $3m$ where m is an integer We have,

$\alpha + 4m = 6$, $\alpha(4m) = a$

and $\quad \alpha + 3m = c$, $\alpha(3m) = 6$

$\Rightarrow \quad \alpha m = 2 \Rightarrow \quad a = 8$

Also, $\alpha + \dfrac{8}{\alpha} = 6 \quad \Rightarrow \alpha^2 - 6\alpha + 8 = 0$

$\Rightarrow \quad (\alpha - 2)(\alpha - 4) = 0 \quad \Rightarrow \alpha = 2, 4.$

As m is an integer, $\alpha \neq 4$ ($\because$ $\alpha m = 2$)

$\therefore \quad \alpha = 2$

22. As roots of $bx^2 + cx + a = 0$ are imaginary, $c^2 - 4ab < 0$. Now,

$3b^2x^2 + 6bcx + 2c^2$

$$= 3\left[b^2x^2 + 2bcx + \frac{2}{3}c^2\right]$$

$$= 3\left[(bx + c)^2 - \frac{1}{3}c^2\right]$$

$= 3(bx + c)^2 - c^2 \geq -c^2 > -4ab$

$\therefore$ $3b^2x^2 + 6bcx + 2c^2 > -4ab\ \forall\ x \in \mathbf{R}.$

23. $x^2 - x + 1 = 0$

$\Rightarrow \quad x = -\,\omega, -\,\omega^2$ where $\omega = -\frac{1}{2} + \frac{\sqrt{3}}{2}i$

Let $\quad \alpha = -\omega$ and $\beta = -\,\omega^2$

We have $\alpha^{2009} + \beta^{2009}$

$= (-\,\omega)^{2009} + (-\,\omega^2)^{2009}$

$= (-\,1)\,[\omega^{2007}\,\omega^2 + (\omega^2)^{2007}\,\omega^4]$

$= (-\,1)\,(\omega^2 + \omega) = (-\,1)\,(-\,1) = 1$

24. As $a \neq a_1$, $p(x) = f(x) - g(x)$ is a quadratic polynomial. As $p(x) = 0$ only for $x = -1$, we get $p(x)$ must be of the form $p(x) = k(x+1)^2$ where $k = a - a_1$.

As $\quad p(-2) = 2$, we get

$$2 = k(-2+1)^2 \ \Rightarrow\ k = 2.$$

Thus, $\quad p(x) = 2(x+1)^2$

$\therefore \quad p(2) = 2(2+1)^2 = 18$

25. We can write the given equation as

$y - 1/y - 4 = 0 \quad$ where $y = e^{\sin x}$

$\Rightarrow y^2 - 4y - 1 = 0$

$\Rightarrow\ y = \frac{4 \pm \sqrt{16+4}}{2} = 2 \pm \sqrt{5}$

As $y > 0$, $y = 2 + \sqrt{5}$

$\Rightarrow \sin x = \ln(2+\sqrt{5}) > \ln(4) > 1$

This is not possible.

Thus, equation has no real roots.

26. $x^2 + 2x + 3 = 0$

$\Rightarrow \quad (x+1)^2 = 2i^2$

$\Rightarrow \quad x = -1 \pm \sqrt{2}i$

As $a, b, c \in \mathbf{R}$, if $-1 \pm \sqrt{2}i$ (or $-1 - \sqrt{2}i$) is a root of $ax^2 + bx + c = 0$, the other root must be $-1 - \sqrt{2}i$ (or $-1 \pm \sqrt{2}i$)

Thus, $x^2 + 2x + 3 = 0$ and $ax^2 + bx + c = 0$ have both roots in common, therefore

$$\frac{a}{1} = \frac{b}{2} = \frac{c}{3}$$

$\Rightarrow \quad a : b : c = 1 : 2 : 3$

27. $(\sqrt{10})^2 = |\alpha - \beta|^2 = (\alpha + \beta)^2 - 4\alpha\beta$

$\Rightarrow 10 = p^2 - 3p \quad \Rightarrow p^2 - 3p - 10 = 0$

$\Rightarrow (p-5)\,(p+2) = 0 \quad p = -\,2,\ 5$

Thus, p lies in the set $\{-2, 5\}$

28. $\frac{\alpha^2}{\beta} + \frac{\beta^2}{\alpha} = \frac{a^3 + \beta^3}{\alpha\beta} = \frac{-p}{q}$

and $\left(\frac{\alpha^2}{\beta}\right)\left(\frac{\beta^2}{\alpha}\right) = \alpha\beta = q$

Thus, required equation is

$$x^2 - \left(-\frac{p}{q}\right)x + q = 0$$

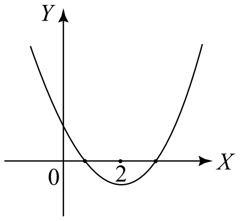
or $\qquad qx^2 + px + q^2 = 0$

29. As the roots are real and distinct

$(a+1)^2 - 4(a^2 + a - 8) > 0$

$3a^2 + 2a - 33 < 0$

$\Rightarrow \quad (3a+11)(a-3) < 0 \Rightarrow -\frac{11}{3} < a < 3 \qquad (1)$



Also, for

$2^2 - 2(a+1) + a^2 + a - 8 < 0$

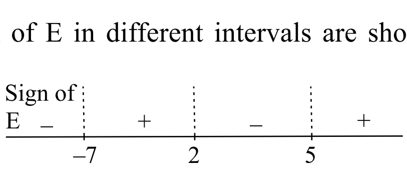
$\Rightarrow \quad a^2 - a - 6 < 0 \Rightarrow (a-3)\,(a+2) < 0$

$\Rightarrow \quad -\,2 < a < 3 \qquad (2)$

From (1) and (2), we get $-\,2 < a < 3$

30. $0 < \frac{x-5}{x^2+5x-14} = \frac{x-5}{(x+7)(x-2)} = \text{E(say)}$

Sign of E in different intervals are shown below



Thus, $\frac{x-5}{(x+7)(x-2)} > 0$

$\Rightarrow \quad -7 < x < 2$ or $x > 5$.

Therefore the least integral value α of x is $-\,6$. This value of α satisfies the relation $\alpha^2 + 5\alpha - 6 = 0$.

31. $4 = \dfrac{\alpha+\beta}{\alpha\beta} = \dfrac{-q/p}{r/p} = \dfrac{-q}{r}$

$\Rightarrow \quad q + 4r = 0$

Also, $2q = p + r$ $\quad$ [$\because$ p, q, r are in A.P.]

Thus, $\quad p = -9r,\ q = -4r$

$$|\alpha - \beta|^2 = (\alpha + \beta)^2 - 4\alpha\beta$$

$$= \left(\frac{-q}{p}\right)^2 - \frac{4r}{p}$$

$$= \frac{16}{81} - 4\left(-\frac{1}{9}\right) = \frac{52}{81}$$

$\Rightarrow \quad |\alpha - \beta| = \dfrac{2}{9}\sqrt{13}$

32. As roots of $2x^2 + 3x + 4 = 0$ are non-real complex numbers, the given quadratic equations have both roots in common. [See Solution Question No. 26.]

Thus, $\dfrac{a}{2} = \dfrac{b}{3} = \dfrac{c}{4} \quad \Rightarrow a : b : c = 2 : 3 : 4$

33. **Case 1:** When $x < 3/2$

In this case the equation becomes

$x^2 - (2x - 3) - 4 = 0$

$\Rightarrow \quad x^2 - 2x + 1 = 2$

$\Rightarrow \quad (x - 1)^2 = 2 \quad \Rightarrow \quad x - 1 = \pm\sqrt{2}$

$\Rightarrow \quad x = 1 \pm \sqrt{2}$

As $x < 3/2$, we take $x = 1 - \sqrt{2}$

Case 2: When $x \geq 3/2$

In this case the equation becomes

$x^2 + (2x - 3) - 4 = 0$

$\Rightarrow \quad (x + 1)^2 = 8 \Rightarrow x + 1 \pm 2\sqrt{2}$

As $x \geq 3/2$, $x = -1 + 2\sqrt{2}$

sum of roots $= \left(1 - \sqrt{2}\right) + \left(-1 + 2\sqrt{2}\right) = \sqrt{2}$

34. $\alpha + \beta = 4\sqrt{2}\,k$, $\alpha\beta = 2e^{4\ln k} - 1 = 2k^4 - 1$

Now,

$66 = \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta = 32k^2 - 2(2k^4 - 1)$

$\Rightarrow 33 = 16k^2 - 2k^4 + 1$

$\Rightarrow 2k^4 - 16k^2 + 32 = 0$

$\Rightarrow k^4 - 8k^2 + 16 = 0$

$\Rightarrow (k^2 - 4)^2 = 0 \Rightarrow k = 2 \qquad [\because\ k > 0]$

We have

$$\alpha^3 + \beta^3 = (\alpha + \beta)^3 - 3\alpha\beta\,(\alpha + \beta)$$

$$= (\alpha + \beta)\ [(\alpha + \beta)^2 - 3\alpha\beta]$$

$$= \left(4\sqrt{2}\right)(2)\left[66 - \left\{2(2^4) - 1\right\}\right]$$

$$= 280\sqrt{2}$$

35. Note that we must have $3x^2 + x + 5 \geq 0$ and $x - 3 \geq 0$ or $x \geq 3$. Squaring both sides of (1), we get

$$3x^2 + x + 5 = x^2 - 6x + 9$$

$\Rightarrow \qquad 2x^2 + 7x - 4 = 0$

$\Rightarrow \qquad (2x - 1)(x + 4) = 0$

$\Rightarrow \qquad x = 1/2,\ -4$

None of these satisfy the inequality $x \geq 3$. Thus, (1) has no solution.

36. $\alpha + \beta = 6$, $\alpha\beta = -2$.

$a_{10} - 2a_8 = \alpha^{10} + \beta^{10} + \alpha\beta\,(\alpha^8 + \beta^8)$

$= (\alpha + \beta)\ (\alpha^9 + \beta^9) = 6a_9$

$\Rightarrow \quad \dfrac{a_{10} - 2a_8}{2a_9} = 3$

37. As the coefficients of

$2x^3 - 9x^2 - kx - 13 = 0$

are all real, non-real complex roots occur in conjugate pair, so let the roots of (1) be $2 + 3i$, $2 - 3i$ and α, where $\alpha \in$ **R.** Now,

$(2 + 3i) + (2 - 3i) + \alpha = 9/2 \Rightarrow \alpha = 1/2$

$\therefore$ real root of the equation is 1/2.

[Verification: $(2 + 3i)\ (2 - 3i)\alpha = 13/2 \Rightarrow \alpha = 1/2$]

38. Write

$$x^4 + x^2 + 1 = x^4 + 2x^2 + 1 - x^2$$

$$= (x^2 + 1)^2 - x^2$$

$$= (x^2 + x + 1)\ (x^2 - x + 1)$$

The given equation, now can be written as

$(x^2 + x + 1)\ [(a - 1)(x^2 - x + 1) + (a + 1)\ (x^2 + x + 1)] = 0$

$\Rightarrow (x^2 + x + 1)\ [2ax^2 + 2x + 2a] = 0$

As x is real, we get

$ax^2 + x + a = 0.$

This equation will have real and distinct roots if

$a \neq 0$ and $1 - 4a^2 > 0 \Rightarrow a \neq 0,\ a^2 < 1/4$

$\Rightarrow a \in (-1/2, 0) \cup (0, 1/2)$

39. If $x^2 - 5x + 5 \neq 1$, then $x^2 + 4x - 60 = 0$

$\Rightarrow (x + 10)(x - 6) = 0 \Rightarrow x = -10, 6$

When $x = -10$ and 6, $x^2 - 5x + 5 \neq 1$

If $x^2 - 5x + 5 = 1$, $(x^2 - 5x + 5)^{x^2+4x-60} = 1$

In this case, $x^2 - 5x + 4 = 0$

$\Rightarrow (x - 1)(x - 4) = 0 \Rightarrow x = 1, 4$

If $x^2 - 5x + 5 = -1$, then $x^2 + 4x - 60$ must be even integer.

But $x^2 - 5x + 6 = 0 \Rightarrow x = 2, 3$

For $x = 2$, $x^2 + 4x - 60 = -48$ is even.

For $x = 3$, $x^2 + 4x - 60 = -39$ is odd.

Thus, sum of desired values is $-10 + 6 + 1 + 4 + 2 = 3$.

40. Let α be common roots of

$x^2 + bx - 1 = 0$ and $x^2 + x + b = 0$.

Then $\alpha^2 + b\alpha - 1 = 0$ and $\alpha^2 + \alpha + b = 0$

$\Rightarrow (\alpha^2 + b\alpha - 1) - (\alpha^2 + \alpha + b) = 0$

$\Rightarrow (b - 1)\alpha - (b + 1) = 0$

$\Rightarrow \alpha = \frac{b+1}{b-1}$ if $b \neq 1$

As $\alpha \neq -1$, $b \neq 0$

Also, $\left(\frac{b+1}{b-1}\right)^2 + b\left(\frac{b+1}{b-1}\right) - 1 = 0$

$\Rightarrow (b + 1)^2 + b(b + 1)(b - 1) - (b - 1)^2 = 0$

$\Rightarrow 4b + b(b + 1)(b - 1) = 0$

As $b \neq 0$, $4 + b^2 - 1 = 0 \Rightarrow b^2 = 3$

$\Rightarrow |b| = \sqrt{3}$

41. We are given

$\sqrt{2x+1} - \sqrt{2x-1} = 1 \qquad (1)$

Also, $(2x + 1) - (2x - 1) = 2 \qquad (2)$

Dividing (2) by (1),

$\sqrt{2x+1} + \sqrt{2x-1} = 2 \qquad (3)$

From (1) and (3), we get

$\sqrt{2x+1} = \frac{3}{2},\ \sqrt{2x-1} = \frac{1}{2}$

$\therefore \sqrt{4x^2 - 1} = \frac{3}{4}$

42. $x + y + z = 12$, $x^3y^4z^5 = (0.1)(600)^3$

We have

$x^3y^4z^5 = (0.1)(600)(600)^2$

$= (60)(600)^2$

$= 3^3 2^8 5^5$

$\therefore$ we may take

$x = 3, y = 4, z = 5$

Thus, $x^3 + y^3 + z^3 = 3^3 + 4^3 + 5^3$

$= 27 + 64 + 125 = 216$

Previous Years' B-Architecture Entrance Examination Questions

1. $\tan 30^\circ + \tan 15^\circ = -2p$

$\tan 30^\circ \tan 15^\circ = q$

$$1 = \tan 45^\circ = \frac{\tan 30^\circ + \tan 15^\circ}{1 - \tan 30^\circ \tan 15^\circ}$$

$\Rightarrow \quad 1 = \frac{-2p}{1-q} \quad \Rightarrow \quad 1 - q = -2p$

$\Rightarrow \quad q = 1 + 2p.$

2. Let roots of the equation be $1 - k$ and $1 + k$, where $k > 0$.

Then $2 = (1 - k) + (1 + k) = \frac{2\alpha}{\alpha+2}$

$\Rightarrow \quad 1 = \frac{\alpha}{\alpha+2}$

This is not possible for any value of α.

3. $|x|^2 - 4|x| - 2 = 0$

$\Rightarrow (|x| - 2)^2 = 6 \quad \Rightarrow \quad |x| - 2 = \pm\sqrt{6}$

$\Rightarrow |x| = 2 \pm \sqrt{6}$

As $|x| > 0$, $|x| = 2 + \sqrt{6}$

$\Rightarrow x = \pm(2 + \sqrt{6})$

$\therefore$ there are two values of x.

4. See Solution to Question 1 in Previous Years' AIEEE/JEE Questions.

5. $ax^2 - bx(x - 1) + c(x - 1)^2 = 0$

$$\Rightarrow \quad a\left(-\frac{x}{x-1}\right)^2 + b\left(-\frac{x}{x-1}\right) + c = 0$$

$$\Rightarrow \quad -\frac{x}{x-1} = \alpha, \beta$$

$$\Rightarrow \quad x = \frac{\alpha}{\alpha+1}, \frac{\beta}{\beta+1}$$

6. $x^4 - ax^2 + b = (x^2 - 3x + 2)\,p(x)$

$$= (x-1)(x-2)\,p(x)$$

where $p(x)$ is a polynomial of degree 2.

$\therefore\ 1 - a + b = 0$ and $16 - 4a + b = 0$

$\Rightarrow\ a = 5,\ b = 4$

Thus, equation whose roots are a and b is

$x^2 - 9x + 20 = 0$

7. $f'(x) = 2ax + b = a\left(x + \dfrac{b}{2a}\right)$

As $a > 0$,

$$f'(x) < 0 \text{ for } x < -b/2a$$

and $f'(x) > 0$ for $x > -b/2a$

Thus, f is strictly decreasing in the interval $(-\infty, -b/2a)$ and strictly increasing in the interval $(-b/2a, \infty)$.

Also, Min $f(x) = f\left(\dfrac{-b}{2a}\right) = \dfrac{4ac - b^2}{4a} > 0$

if $b^2 < 4ac$

As Min $f(x) > 0$, $f(x) > 0\ \forall\ x \in \mathbf{R}$

$\therefore$ Both the statements are true and statement- 2 is a correct explanation for statement-1.

8. As the roots are of opposite signs, the product of roots must be negative, that is,

$$\frac{a^2 - 3a + 2}{3} < 0 \Rightarrow (a-1)(a-2) < 0$$

$\Rightarrow\ a \in (1, 2)$

9. The given equation can be written as

$r(2x + p + q) = (x + p)(x + q)$

or $x^2 + (p + q - 2r) + pq - r(p + q) = 0$

Let roots of this equation be α, $-\alpha$.

Then

$$0 = \alpha + (-\alpha) = -(p + q - 2r) \Rightarrow 2r = p + q$$

and $\alpha(-\alpha) = pq - r(p + q)$

$$= pq - \frac{1}{2}(p+q)^2 = -\frac{1}{2}(p^2 + q^2)$$

10. Write the equation as

$$(x - 3k)^2 = 2(k - 1)$$

$$\Rightarrow \quad x = 3k \pm \sqrt{2}\sqrt{k-1}$$

Both the roots will be greater than 3 if smaller root is greater than 3, that is, if

$3k - \sqrt{2}\sqrt{k-1} > 3$

$\Rightarrow\ 3(k-1) > \sqrt{2}\sqrt{k-1}$

$\Rightarrow\ k > 1$ and $9(k - 1) > 2 \Rightarrow\ k > 11/9$

$\Rightarrow\ 11 - 9k < 0.$

11. $(1 + 3m)^2 - (1 + m^2)(1 + 8m) < 0$

$\Rightarrow 1 + 6m + 9m^2 - (1 + m^2 + 8m + 8m^3) < 0$

$\Rightarrow -2m + 8m^2 - 8m^3 < 0$

$\Rightarrow 2m(4m^2 - 4m + 1) > 0$

$\Rightarrow m(2m - 1)^2 > 0$

which is true for each $m \in \mathbf{N}$.

CHAPTER FOUR

Determinants

EVALUATION OF DETERMINANTS

A determinant of order two is written as

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} \qquad (a_{ij} \in \mathbf{C}\ \forall\ i, j)$$

and is equal to $a_{11}\, a_{22} - a_{12}\, a_{21}$.

A determinant of order three is written as

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \qquad (a_{ij} \in \mathbf{C}\ \forall\ i, j)$$

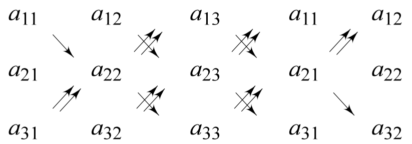
and is equal to

$$a_{11}\begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12}\begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13}\begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= a_{11}\,(a_{22}\, a_{33} - a_{23}\, a_{32}) - a_{12}\,(a_{21}\, a_{33} - a_{23}\, a_{31}) + a_{13}(a_{21}\, a_{32} - a_{22}\, a_{31})$$

$$= a_{11}\, a_{22}\, a_{33} + a_{12}\, a_{23}\, a_{31} + a_{13}\, a_{32}\, a_{21} - a_{13}\, a_{31}\, a_{22} - a_{32}\, a_{23}\, a_{11} - a_{12}\, a_{21}\, a_{33}$$

A determinant of order 3 can also be evaluated by using the following diagram, due to **Sarrus:**



a_{11} a_{12} a_{13} a_{11} a_{12}
a_{21} a_{22} a_{23} a_{21} a_{22}
a_{31} a_{32} a_{33} a_{31} a_{32}

The product of the three terms on each of the three single arrows are prefixed by a positive sign and the product of the three terms on each of the three double arrows are prefixed by a negative sign.

Remark

This method does not work for higher order determinants.

MINORS AND COFACTORS

Minor

Let $A = (a_{ij})_{n\times n}$ be a square matrix of order n. Then the minor M_{ij} of the element a_{ij} of the matrix A is the determinant of the square sub-matrix of order $(n - 1)$ obtained by deleting ith row and jth column of matrix A.

Illustration 1

Minor of element a_{23} in the determinant

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

is

$$M_{23} = \begin{vmatrix} a_{11} & a_{12} \\ a_{31} & a_{32} \end{vmatrix}$$

Cofactor

Let $A = (a_{ij})_{n\times n}$ be a square matrix of order n. Then the cofactor of the element a_{ij} of the matrix A is denoted by C_{ij} and is equal to $(-1)^{i+j}\, M_{ij}$ where M_{ij} is the minor of the element a_{ij} of the matrix A.

Note that

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \begin{aligned} &= a_{11}\, M_{11} - a_{12}\, M_{12} + a_{13}\, M_{13} \\ &= a_{11}\, C_{11} + a_{12}C_{12} + a_{13}C_{13} \end{aligned}$$

If $$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

then $$\begin{aligned} \Delta &= a_{i1}\, C_{i1} + a_{i2}\, C_{i2} + a_{i3}\, C_{i3} \qquad i = 1, 2, 3 \\ &= a_{1j}\, C_{1j} + a_{2j}\, C_{2j} + a_{3j}\, C_{3j} \qquad j = 1, 2, 3 \end{aligned}$$

Note

$$a_{i1}\, C_{j1} + a_{i2}\, C_{j2} + a_{i3}\, C_{j3} = 0 \qquad i \neq j$$

and $$a_{1i}\, C_{1j} + a_{2i}\, C_{2j} + a_{3i}\, C_{3j} = 0 \qquad i \neq j$$

Remark

The above results remain true for determinants of every order.

PROPERTIES OF DETERMINANTS

1. Reflection Property

The determinant remains unaltered if its rows are changed into columns and the columns into rows.
In other words, if A is a square matrix, then $|A| = |A'|$ where A' is transpose of A.

2. All-zero Property

If all the elements of a row (column) are zero, then the determinant is zero.

3. Proportionality [Repetition] Property

If the elements of a row (column) are proportional [identical] to the element of the some other row (column), then the determinant is zero.

4. Switching Property

The interchange of any two rows (columns) of the determinant changes its sign.

5. Scalar Multiple Property

If all the elements of a row (column) of a determinant are multiplied by a non-zero constant, then the determinant gets multiplied by the same constant.

6. Property of Invariance

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 + \alpha b_1 + \beta c_1 & b_1 & c_1 \\ a_2 + \alpha b_2 + \beta c_2 & b_2 & c_2 \\ a_3 + \alpha b_3 + \beta c_3 & b_3 & c_3 \end{vmatrix}$$

That is, a determinant remains unaltered under an operation of the form $C_i \to C_i + \alpha C_j + \beta C_k$, where $j, k \neq i$, or an operation of the form $R_i \to R_i + \alpha R_j + \beta R_k$, where $j, k \neq i$.

7. Sum Property

$$\begin{vmatrix} a_1 + b_1 & c_1 & d_1 \\ a_2 + b_2 & c_2 & d_2 \\ a_3 + b_3 & c_3 & d_3 \end{vmatrix} = \begin{vmatrix} a_1 & c_1 & d_1 \\ a_2 & c_2 & d_2 \\ a_3 & c_3 & d_3 \end{vmatrix} + \begin{vmatrix} b_1 & c_1 & d_1 \\ b_2 & c_2 & d_2 \\ b_3 & c_3 & d_3 \end{vmatrix}$$

Remark

It is one of the most under used property. But evaluation of some of the determinants beame very easy when we use it.

Illustration 2

To evaluate

$$\Delta = \begin{vmatrix} 1+a & b & c \\ a & 1+b & c \\ a & b & 1+c \end{vmatrix}$$

write $\Delta = \Delta_1 + a\Delta_2$ where

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 0 & 1+b & c \\ 0 & b & 1+c \end{vmatrix}$$

$$= (1 + b)\,(1 + c) - bc = 1 + b + c$$

and

$$\Delta_2 = \begin{vmatrix} 1 & b & c \\ 1 & 1+b & c \\ 1 & b & 1+c \end{vmatrix}$$

Using $C_2 \to C_2 - bC_1$ and $C_3 \to C_3 - cC_1$,
we get

$$\Delta_2 = \begin{vmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{vmatrix} = 1$$

$\therefore$ $\Delta = 1 + a + b + c$

8. Factor Property

If a determinant Δ becomes zero when we put $x = \alpha$, then $(x - \alpha)$ is a factor of Δ.

9. Triangle Property

If all the elements of a determinant above or below the main diagonal consists of zeros, then the determinant is equal to the product of diagonal elements. That is,

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ 0 & b_2 & b_3 \\ 0 & 0 & c_3 \end{vmatrix} = \begin{vmatrix} a_1 & 0 & 0 \\ a_2 & b_2 & 0 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 b_2 c_3$$

10. Product of Two Determinants

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \begin{vmatrix} \alpha_1 & \beta_1 & \gamma_1 \\ \alpha_2 & \beta_2 & \gamma_2 \\ \alpha_3 & \beta_3 & \gamma_3 \end{vmatrix}$$

$$= \begin{vmatrix} a_1\alpha_1 + b_1\beta_1 + c_1\gamma_1 & a_1\alpha_2 + b_1\beta_2 + c_1\gamma_2 & a_1\alpha_3 + b_1\beta_3 + c_1\gamma_3 \\ a_2\alpha_1 + b_2\beta_1 + c_2\gamma_1 & a_2\alpha_2 + b_2\beta_2 + c_2\gamma_2 & a_2\alpha_3 + b_2\beta_3 + c_2\gamma_3 \\ a_3\alpha_1 + b_3\beta_1 + c_3\gamma_1 & a_3\alpha_2 + b_3\beta_2 + c_3\gamma_2 & a_3\alpha_3 + b_3\beta_3 + c_3\gamma_3 \end{vmatrix}$$

Here we have multiplied rows by rows. We can also multiply rows by columns, or columns by rows, or columns by columns.

11. Conjugate of a Determinant

If $a_i, b_i, c_i \in \mathbf{C}$ (i = 1, 2, 3), and

$$Z = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \text{ then } \overline{Z} = \begin{vmatrix} \overline{a}_1 & \overline{b}_1 & \overline{c}_1 \\ \overline{a}_2 & \overline{b}_2 & \overline{c}_2 \\ \overline{a}_3 & \overline{b}_3 & \overline{c}_3 \end{vmatrix}$$

12. Differentiation of a Determinant

If each $a_i(x)$ is differentiable function

and $$\Delta(x) = \begin{vmatrix} a_1(x) & a_2(x) \\ a_3(x) & a_4(x) \end{vmatrix}$$

then $$\Delta'(x) = \begin{vmatrix} a_1'(x) & a_2(x) \\ a_3'(x) & a_4(x) \end{vmatrix} + \begin{vmatrix} a_1(x) & a_2'(x) \\ a_3(x) & a_4'(x) \end{vmatrix}$$

If we write $\Delta(x) = [C_1, C_2]$, where C_i denotes ith column, then

$\Delta'(x) = [C_1', C_2] + [C_1, C_2']$ where C_1' denotes the column which contains the derivative of all the functions in the ith column C_i. Similarly, if

$$\Delta(x) = \begin{bmatrix} R_1 \\ R_2 \end{bmatrix} \quad \text{then} \quad \Delta'(x) = \begin{bmatrix} R_1' \\ R_2 \end{bmatrix} + \begin{bmatrix} R_1 \\ R_2' \end{bmatrix}$$

Next, if $$\Delta(x) = \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21}(x) & a_{22}(x) & a_{23}(x) \\ a_{31}(x) & a_{32}(x) & a_{33}(x) \end{vmatrix}$$

then $\Delta'(x)$

$$= \begin{vmatrix} a_{11}'(x) & a_{12}(x) & a_{13}(x) \\ a_{21}'(x) & a_{22}(x) & a_{23}(x) \\ a_{31}'(x) & a_{32}(x) & a_{33}(x) \end{vmatrix} + \begin{vmatrix} a_{11}(x) & a_{12}'(x) & a_{13}(x) \\ a_{21}(x) & a_{22}'(x) & a_{23}(x) \\ a_{31}(x) & a_{32}'(x) & a_{33}(x) \end{vmatrix}$$

$$+ \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}'(x) \\ a_{21}(x) & a_{22}(x) & a_{23}'(x) \\ a_{31}(x) & a_{32}(x) & a_{33}'(x) \end{vmatrix}$$

$$= [C_1', C_2, C_3] + [C_1, C_2', C_3] + [C_1, C_2, C_3']$$

Similarly, if

$$\Delta(x) = \begin{bmatrix} R_1 \\ R_2 \\ R_3 \end{bmatrix} \text{ then } \Delta'(x) = \begin{bmatrix} R_1' \\ R_2 \\ R_3 \end{bmatrix} + \begin{bmatrix} R_1 \\ R_2' \\ R_3 \end{bmatrix} + \begin{bmatrix} R_1 \\ R_2 \\ R_3' \end{bmatrix}$$

Corollary (Differentiation and Integration of Determinant)

If $$\Delta(x) = \begin{vmatrix} a_{11}(x) & a_{12}(x) & a_{13}(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

where a_{21}, a_{22}, a_{23}, a_{31}, a_{32} and a_{33} are constants, then

$$\Delta'(x) = \begin{vmatrix} a_{11}'(x) & a_{12}'(x) & a_{13}'(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \text{ and}$$

$$\int \Delta(x)dx = \begin{vmatrix} \int a_{11}(x)dx & \int a_{12}(x)dx & \int a_{13}(x)dx \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

In general, for any positive integer m

$$\Delta^m(x) = \begin{vmatrix} a_{11}^m(x) & a_{12}^m(x) & a_{13}^m(x) \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

13. Determinant of Cofactor Matrix

If $$\Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \text{ then } \Delta_1 = \begin{vmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{vmatrix} = \Delta^2$$

where C_{ij} denotes the co-factor of the element a_{ij} in Δ.

SOME TIPS FOR QUICK EVALUATION OF DETERMINANTS

1. If Δ is a skew symmetric determinant of odd order, then $\Delta = 0$

Illustration 3

Let $$\Delta = \begin{vmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{vmatrix}$$

Using the reflection property, write

$$\Delta = \begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix}$$

Taking –1 common from R_1, R_2 and R_3 we get

$$\Delta = (-1)^3 \begin{vmatrix} 0 & a & b \\ -a & 0 & c \\ -b & -c & 0 \end{vmatrix} = -\Delta$$

$$\Rightarrow \quad 2\Delta = 0 \quad \Rightarrow \quad \Delta = 0$$

2. If a_1, a_2, a_3 are in A.P.; b_1, b_2, b_3 are in A.P. and c_1, c_2, c_3 are also in A.P. Then

$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = 0$$

Use $C_1 \to C_1 + C_3 - 2C_2$

3. If a_1, a_2, a_3 are in G.P.; b_1, b_2, b_3 are also in G.P., with the same common ratio, then

$$\Delta = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = 0$$

[c_1, c_2, c_3 can be any three complex numbers.]

Some Frequently used Determinants

1. $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ bc & ca & ab \end{vmatrix}$

$$= (a-b)(b-c)(c-a)$$

2. $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^3 & b^3 & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(a+b+c)$

3. $\begin{vmatrix} 1 & 1 & 1 \\ a^2 & b^2 & c^2 \\ a^3 & b^3 & c^3 \end{vmatrix} = (a-b)(b-c)(c-a)(bc+ca+ab)$

4. $\begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 3abc - a^3 - b^3 - c^3$

$$= (a+b+c)(bc+ca+ab-a^2-b^2-c^2)$$

$$= -\frac{1}{2}(a+b+c)\left[(b-c)^2+(c-a)^2+(a-b)^2\right]$$

LINEAR EQUATIONS

The system of linear homogeneous equations

$$a_1 x + b_1 y + c_1 z = 0$$
$$a_2 x + b_2 y + c_2 z = 0$$
$$a_3 x + b_3 y + c_3 z = 0$$

has a non-trivial solution (i.e., at least one of the x, y, z is different from zero) if and only if $\Delta = 0$, where

$$\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$$

If $\Delta \neq 0$, then the only solution of the above system of equations is $x = 0$, $y = 0$ and $z = 0$.

Corollary If at least one of x, y, z is non-zero and x, y and z are connected by the three given equations, then the elimination of x, y and z leads to the relation

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

CRAMER'S RULE

If $\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \neq 0$

then the solution of the system of linear equations

$$a_1 x + b_1 y + c_1 z = d_1$$
$$a_2 x + b_2 y + c_2 z = d_2$$
$$a_3 x + b_3 y + c_3 z = d_3$$

is given by $x = \dfrac{\Delta_1}{\Delta}$, $y = \dfrac{\Delta_2}{\Delta}$, $z = \dfrac{\Delta_3}{\Delta}$

where

$$\Delta_1 = \begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}, \quad \Delta_2 = \begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix} \text{ and}$$

$$\Delta_3 = \begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}$$

SOLVED EXAMPLES

Concept-based

Straight Objective Type Questions

Example 1: Let

$$\Delta(x, y) = \begin{vmatrix} 1 & x & y \\ 1 & x+y & y \\ 1 & x & x+y \end{vmatrix}$$

Then $\Delta(-3, 2)$ equals

(a) 13 (b) – 6

(c) 12 (d) – 5

Ans. (b)

Solution: Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$ we get

$$\Delta(x, y) = \begin{vmatrix} 1 & x & y \\ 0 & y & 0 \\ 0 & 0 & x \end{vmatrix} = xy$$

$$\therefore \quad \Delta(-3, 2) = -6$$

Example 2: Suppose a, b, c are distinct real numbers and

$$\Delta = \begin{vmatrix} a & a^2 & b+c \\ b & b^2 & c+a \\ c & c^2 & a+b \end{vmatrix} = 0$$

Then $a + b + c$ equals

(a) -1 (b) 2
(c) 0 (d) -5

Ans. (b)

Solution: Using $C_3 \to C_3 + C_1$ and taking $(a + b + c)$ common from C_3 we get

$$\Delta = (a + b + c)\,\Delta_1 \qquad (1)$$

where

$$\Delta_1 = \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix}$$

Using $R_1 \to R_1 - R_2$ and $R_2 \to R_2 - R_3$, we get

$$\Delta_1 = \begin{vmatrix} a-b & a^2-b^2 & 0 \\ b-c & b^2-c^2 & 0 \\ c & c^2 & 1 \end{vmatrix}$$

$$= (a-b)(b-c)\begin{vmatrix} 1 & a+b & 0 \\ 1 & b+c & 0 \\ c & c^2 & 1 \end{vmatrix}$$

$$= (a-b)(b-c)\begin{vmatrix} 1 & a+b \\ 1 & b+c \end{vmatrix}$$

[Expand along C_3]

$$= (a-b)(b-c)(c-a) \qquad (2)$$

From (1) and (2)

$$\Delta = (a+b+c)(a-b)(b-c)(c-a)$$

As $\Delta = 0$ and a, b, c are distinct,

we get $a + b + c = 0$

Example 3: Suppose $A = (a_{ij})_{3\times 3}$, where $a_{ij} \in \mathbf{R}$. If det (adj A) = 25, then |det (A)| equals:

(a) 5 (b) 12.5
(c) $5\sqrt{5}$ (d) $5^{2/3}$

Ans. (a)

Solution: Using det (adj A) = $(\det(A))^2$, we get

$$(\det(A))^2 = 25 \quad \Rightarrow \quad |\det(A)| = 5$$

Example 4: Let

$$\Delta = \begin{vmatrix} 0 & b-a & c-a \\ a-b & 0 & c-b \\ a-c & b-c & 0 \end{vmatrix}, \text{ then}$$

Δ equals:

(a) 0 (b) abc
(c) $a^2 + b^2 + c^2$ (d) $bc + ca + ab$

Ans. (a)

Solution: Interchanging the rows and columns, we get

$$\Delta = \begin{vmatrix} 0 & a-b & a-c \\ b-a & 0 & b-c \\ c-a & c-b & 0 \end{vmatrix}$$

Taking -1 common from each of R_1, R_2, R_3 we get

$$\Delta = (-1)^3\begin{vmatrix} 0 & b-a & c-a \\ a-b & 0 & c-b \\ a-c & b-c & 0 \end{vmatrix}$$

$$\Rightarrow \quad \Delta = -\Delta \Rightarrow 2\Delta = 0 \text{ or } \Delta = 0$$

Alternative Solution

Δ is a skew symmetric determinant of odd order, therefore $\Delta = 0$

Example 5: Let $A = (a_{ij})_{3\times 3}$, where $a_{ij} \in \mathbf{C}$ the set of complex numbers. If det (A) = $2 - 3i$, then det (A^{-1}) equals:

(a) $\frac{1}{13}(2 - 3i)$ (b) $\frac{1}{13}(2 + 3i)$
(c) $2 - 3i$ (d) $2 + 3i$

Ans. (b)

Solution: $\det(A^{-1}) = \dfrac{1}{\det(A)} = \dfrac{1}{2-3i}$

$$= \frac{2+3i}{2^2+3^2} = \frac{1}{13}(2+3i)$$

Example 6: In a triangle ABC, if

$$\Delta = \begin{vmatrix} 1 & a & b \\ 1 & c & a \\ 1 & b & c \end{vmatrix} = 0$$

then $\sin^2 A + \sin^2 B + \sin^2 C$ is:

(a) $\frac{3\sqrt{3}}{2}$ (b) $\frac{5}{4}$
(c) $\frac{9}{4}$ (d) 2

Ans. (a)

Solution: Evaluating along C_1, we get

$$\Delta = (c^2 - ab) + (b^2 - ac) + (a^2 - bc) = 0$$

$$\Rightarrow \quad (a-b)^2 + (b-c)^2 + (c-a)^2 = 0$$

$$\Rightarrow \quad a = b = c \Rightarrow A = B = C = \pi/3$$

$$\therefore \quad \sin^2 A + \sin^2 B + \sin^2 C = \frac{3\sqrt{3}}{2}.$$

Example 7: If

$$\begin{vmatrix} x^2+x & x+1 & x-2 \\ 2x^2+3x-1 & 3x & 3x-3 \\ x^2+2x+3 & 2x-1 & 2x-1 \end{vmatrix} = Ax + B,$$

then A is equal to:

(a) 12 (b) 18

(c) 24 (d) 30

Ans. (c)

Solution: Applying $R_2 \to R_2 - R_1 - R_3$, we get

$$Ax + B = \begin{vmatrix} x^2+x & x+1 & x-2 \\ -4 & 0 & 0 \\ x^2+2x+3 & 2x-1 & 2x-1 \end{vmatrix}$$

Expanding along R_2, we get

$$Ax + B = (-1)(-4)\begin{vmatrix} x+1 & x-2 \\ 2x-1 & 2x-1 \end{vmatrix}$$

$$= 4\begin{vmatrix} 3 & x-2 \\ 0 & 2x-1 \end{vmatrix}$$

$$= 4(3)\,(2x-1) = 24x - 12$$

Thus, $A = 24$

Example 8: Suppose a, b, c are three integers such $a < b < c$ and p is a prime number.

Let $$\Delta = \begin{vmatrix} a & a^2 & p+a^3 \\ b & b^2 & p+b^3 \\ c & c^2 & p+c^3 \end{vmatrix}$$

If $\Delta = 0$, then which one of the following is **not** true

(a) $a = -1, b = 1$ (b) $b = 1, c = p$

(c) $a = 0, c = p$ (d) $abc + p = 0$

Ans. (c)

Solution: Write $\Delta = p\Delta_1 + \Delta_2$
where

$$\Delta_1 = \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix} \quad \text{and} \quad \Delta_2 = \begin{vmatrix} a & a^2 & a^3 \\ b & b^2 & b^3 \\ c & c^2 & c^3 \end{vmatrix}$$

write

$$\Delta_2 = abc\begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = abc(-1)^2\begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix}$$

$$= abc\,\Delta_1$$

Thus, $\Delta = (p + abc)\,\Delta_1$.

Using $R_2 \to R_2 - R_3$, $R_1 \to R_1 - R_2$, we get

$$\Delta_1 = \begin{vmatrix} a-b & a^2-b^2 & 0 \\ b-c & b^2-c^2 & 0 \\ c & c^2 & 1 \end{vmatrix}$$

$$= (a-b)(b-c)\begin{vmatrix} 1 & a+b \\ 1 & b+c \end{vmatrix}$$

$$= (a-b)\,(b-c)\,(c-a)$$

As $a < b < c$, $\Delta_1 \neq 0$. Therefore,

$$\Delta = 0 \quad \Rightarrow \quad p + abc = 0$$

$$\Rightarrow \qquad p = -abc$$

As p is prime and a, b, c are integers such that $a < b < c$, we must have $-a = 1, b = 1, c = p$.

$$\Rightarrow \qquad a = -1, b = 1, c = p.$$

Example 9: Suppose

$$P(x) = \begin{vmatrix} x & -51 & -71 \\ 51 & x & -73 \\ 71 & 73 & x \end{vmatrix}$$

Product of zeros of $P(x)$ is

(a) 0 (b) 195

(c) –195 (d) –264333

Ans. (a)

Solution:

TIP

Suppose $P(x) = x^3 + ax^2 + bx + c$, then product of zeros of $P(x)$ is $-c = -P(0)$.

Now, $$-c = -P(0) = -\begin{vmatrix} 0 & -51 & -71 \\ 51 & 0 & -73 \\ 71 & 73 & 0 \end{vmatrix}$$

$$= 0$$

[∵ Skew symmetric determinant of odd order]

Example 10: Let

$$P(x) = \begin{vmatrix} x & -3+4i & 3-4i \\ x & -7i & 5+6i \\ -x & 7-2i & -7-2i \end{vmatrix}$$

The number of values of x for which $P(x) = 0$ is

(a) 0 (b) 1

(c) 2 (d) 3

Ans. (b)

Solution: Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 + R_1$, we get

$$P(x) = \begin{vmatrix} x & -3+4i & 3-4i \\ 0 & 3-11i & 2+10i \\ 0 & 4+2i & -4-6i \end{vmatrix}$$

As $P(x)$ is a linear polynomial, $P(x) = 0$ for exactly one value of x.

Example 11: Let

$$\Delta(\theta) = \begin{vmatrix} 1 & \sin\theta & 1 \\ -\sin\theta & 1 & \sin\theta \\ -1 & -\sin\theta & 1 \end{vmatrix}, \; 0 \le \theta \le 2\pi$$

Solution of $\Delta(\theta) = 3$ is

(a) $\left\{\frac{\pi}{2}, \frac{3\pi}{2}\right\}$ (b) $\left\{\frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}\right\}$

(c) $\left\{\frac{\pi}{4}, \frac{3\pi}{4}\right\}$ (d) $\left\{\frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4}, \pi\right\}$

Ans. (b)

Solution: Using $C_1 \to C_1 + C_3$, we get

$$\Delta(\theta) = \begin{vmatrix} 2 & \sin\theta & 1 \\ 0 & 1 & \sin\theta \\ 0 & -\sin\theta & 1 \end{vmatrix}$$

$$= 2\,(1 + \sin^2\theta)$$

$$\therefore \quad \Delta(\theta) = 3 \;\Rightarrow\; 2\sin^2\theta = 1$$

$$\Rightarrow \quad \sin\theta = \pm\frac{1}{\sqrt{2}} \;\Rightarrow\; \theta = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$$

Example 12: Suppose $a \in \mathbf{R}$ and $x \neq 0$. Let

$$\Delta(x) = \begin{vmatrix} 1-x & a & a^2 \\ a & a^2 - x & a^3 \\ a^2 & a^3 & a^4 - x \end{vmatrix}$$

Number of values of x for which $\Delta(x) = 0$ is

(a) 0 (b) 1

(c) 2 (d) 3

Ans. (b)

Solution: Using the sum property, write

$$\Delta(x) = \Delta_1 - x\Delta_2$$

where

$$\Delta_1 = \begin{vmatrix} 1 & a & a^2 \\ a & a^2 - x & a^3 \\ a^2 & a^3 & a^4 - x \end{vmatrix}$$

and

$$\Delta_2 = \begin{vmatrix} 1 & a & a^2 \\ 0 & a^2 - x & a^3 \\ 0 & a^3 & a^4 - x \end{vmatrix}$$

$$= (a^2 - x)(a^4 - x) - a^6$$

$$= -(a^2 + a^4)x + x^2$$

In Δ_1, use $C_2 \to C_2 - aC_1$, $C_3 \to C_3 - a^2C_1$ to obtain

$$\Delta_1 = \begin{vmatrix} 1 & 0 & 0 \\ a & -x & 0 \\ a^2 & 0 & -x \end{vmatrix} = x^2$$

Thus, $\Delta(x) = x^2 + (a^2 + a^4)\,x^2 - x^3$

$$= (1 + a^2 + a^4)\,x^2 - x^3$$

As $x \neq 0$, $\Delta(x) = 0 \;\Rightarrow\; x = \dfrac{1}{1 + a + a^2}$.

Thus, $\Delta(x) = 0$ for exactly one value of x.

Example 13: If

$$\begin{vmatrix} a^2 & b^2 & c^2 \\ (a+\lambda)^2 & (b+\lambda)^2 & (c+\lambda)^2 \\ (a-\lambda)^2 & (b-\lambda)^2 & (c-\lambda)^2 \end{vmatrix} = k\lambda \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$$

$\lambda \neq 0$, then k is equal to:

(a) $4\lambda abc$ (b) $-4\lambda abc$

(c) $4\lambda^2$ (d) $-4\lambda^2$

Ans. (c)

Solution: Using $R_3 \to R_3 - R_2$ and $R_2 \to R_2 - R_1$, we get

$$\Delta = \begin{vmatrix} a^2 & b^2 & c^2 \\ 2a\lambda + \lambda^2 & 2b\lambda + \lambda^2 & 2c\lambda + \lambda^2 \\ -4a\lambda & -4b\lambda & -4c\lambda \end{vmatrix}$$

Take -4λ common from R_3, and applying $R_2 \to R_2 - 2\lambda R_3$, we get

$$\Delta = -4\lambda^3 \begin{vmatrix} a^2 & b^2 & c^2 \\ 1 & 1 & 1 \\ a & b & c \end{vmatrix}$$

$$= \lambda(4\lambda^2) \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$$

$$\therefore \quad k = 4\lambda^2$$

Example 14: Let

$$f(\theta) = \begin{vmatrix} 1 & \cos\theta & -1 \\ -\sin\theta & 1 & -\cos\theta \\ -1 & \sin\theta & 1 \end{vmatrix}$$

Suppose A and B are respectively maximum and minimum value of $f(\theta)$. Then (A, B) is equal to:

(a) (2, 1) (b) (2, 0)

(c) $(\sqrt{2}, 1)$ (d) $\left(2, \frac{1}{\sqrt{2}}\right)$

Ans. (b)

Solution: Using $C_1 \to C_1 + C_3$, we get

$$f(\theta) = \begin{vmatrix} 0 & \cos\theta & -1 \\ -(\sin\theta + \cos\theta) & 1 & -\cos\theta \\ 0 & \sin\theta & 1 \end{vmatrix}$$

Evaluating along C_1, we get

$$f(\theta) = (\sin\theta + \cos\theta)\begin{vmatrix} \cos\theta & -1 \\ \sin\theta & 1 \end{vmatrix}$$

$$= (\sin\theta + \cos\theta)^2$$

$$= \left[\sqrt{2}\left(\frac{1}{\sqrt{2}}\sin\theta + \frac{1}{\sqrt{2}}\cos\theta\right)\right]^2$$

$$= 2\sin^2\left(\frac{\pi}{4} + \theta\right)$$

As $\quad 0 \le \sin^2\left(\frac{\pi}{4} + \theta\right) \le 1$, we get

$$0 \le f(\theta) \le 2$$

$$A = 2 \quad \text{for} \quad \theta = \frac{\pi}{4}$$

and $\quad B = 0 \quad \text{for} \quad \theta = -\frac{\pi}{4}$

Thus, $\quad (A, B) = (2, 0)$

Example 15: If a, b, c are non-zero real numbers and if the system of equations

$(a - 1)x = y + z,$

$(a - 1)y = z + x,$

$(a - 1)z = x + y,$

has a non-trivial solution, then $ab + bc + ca$ equals:

(a) $a + b + c$ (b) abc

(c) 1 (d) –1

Ans. (b)

Solution: As the given system of equations has a non-trivial solution,

$$\Delta = \begin{vmatrix} a-1 & -1 & -1 \\ -1 & b-1 & -1 \\ -1 & -1 & c-1 \end{vmatrix} = 0$$

Write

$$\Delta = \begin{vmatrix} a & -1 & -1 \\ 0 & b-1 & -1 \\ 0 & -1 & c-1 \end{vmatrix} - \begin{vmatrix} 1 & -1 & -1 \\ 1 & b-1 & -1 \\ 1 & -1 & c-1 \end{vmatrix}$$

$$= a[(b-1)(c-1) - 1] - \begin{vmatrix} 1 & 0 & 0 \\ 1 & b & 0 \\ 1 & 0 & c \end{vmatrix}$$

[use $C_2 \to C_2 + C_1$
$C_3 \to C_2 + C_1$]

$$= a(bc - b - c) - bc$$

As $\Delta = 0$, we get

$$ab + bc + ca = abc$$

LEVEL 1

Straight Objective Type Questions

Example 16: Let

$$P(x) = \begin{vmatrix} 7 & 6 & x-10 \\ 2 & x-10 & 5 \\ x-10 & 3 & 4 \end{vmatrix}$$

sum of zeros of $P(x)$ is

(a) 30 (b) 28

(c) 27 (d) 25

Ans. (a)

Solution: Using $R_1 \leftrightarrow R_3$, write

$$P(x) = -\begin{vmatrix} x-10 & 3 & 4 \\ 2 & x-10 & 5 \\ 7 & 6 & x-10 \end{vmatrix}$$

TIP

Observe $P(x)$ is of the form
$P(x) = -(x - 10)^3 + a(x - 10) + b$
where a, b are some real numbers.

∴ sum of zeros of $P(x)$

$$= -\frac{\text{coefficient of } x^2}{\text{coefficient of } x^3} = 30.$$

Example 17: Let

$$P(x) = \begin{vmatrix} x^2-13 & 4 & 2 \\ 3 & x^2-13 & 7 \\ 6 & 5 & x^2-13 \end{vmatrix}$$

If $x = -2$ is a zero of $P(x)$, then sum of the remaining five zeros is

(a) –2 (b) 0

(c) 2 (d) 3

Ans. (c)

Solution:

TIP

Observe
$P(x) = (x^2 - 13)^3 + a(x^2 - 13) + b.$
where a, b are some real numbers.

As coefficient of x^5 in $P(x)$ is 0, sum of six zeros of $P(x)$ is 0.

⇒ sum of the remaining five zeros + (–2) = 0

$\Rightarrow$ sum of the remaining five zeros = 2.

Example 18: Suppose α, β are two real numbers and $f(n) = \alpha^n + \beta^n$. Let

$$\Delta = \begin{vmatrix} 3 & 1+f(1) & 1+f(2) \\ 1+f(1) & 1+f(2) & 1+f(3) \\ 1+f(2) & 1+f(3) & 1+f(4) \end{vmatrix}$$

If $\Delta = k(\alpha - 1)^2 (\beta - 1)^2 (\alpha - \beta)^2$, then k is equal to

(a) 1 (b) $4\alpha\beta$
(c) 9 (d) $\alpha^2\beta^2$

Ans. (a)

Solution:

$$\Delta = \begin{vmatrix} 1+1+1 & 1+\alpha+\beta & 1+\alpha^2+\beta^2 \\ 1+\alpha+\beta & 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 \\ 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 & 1+\alpha^4+\beta^4 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} = \Delta_1^2$$

where $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix}$

Applying $C_3 \to C_3 - C_2$ and $C_2 \to C_2 - C_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & 0 & 0 \\ 1 & \alpha - 1 & \beta - \alpha \\ 1 & \alpha^2 - 1 & \beta^2 - \alpha^2 \end{vmatrix}$$

$$= (\alpha - 1)(\beta - \alpha)\begin{vmatrix} 1 & 1 \\ \alpha + 1 & \beta + \alpha \end{vmatrix}$$

$$= (\alpha - 1)(\beta - 1)(\beta - \alpha)$$

Thus, $\Delta = (\alpha - 1)^2 (\beta - 1)^2 (\alpha - \beta)^2$

$\therefore$ $k = 1$

Example 19: Suppose a, b and c are distinct real numbers. Let

$$\Delta = \begin{vmatrix} a & a+c & a-b \\ b-c & b & a+b \\ c+b & c-a & c \end{vmatrix} = 0$$

Then the straight line $a(x - 5) + b(y - 2) + c = 0$ passes through the fixed point

(a) (5, 2) (b) (6, 2)
(c) (6, 3) (d) (5, 3)

Ans. (c)

Solution: Applying $C_1 \to aC_1 + bC_2 + cC_3$, we get

Let $\Delta = \dfrac{1}{a}\begin{vmatrix} a(a+b+c) & a+c & a-b \\ b(a+b+c) & b & a+b \\ c(a+b+c) & c-a & c \end{vmatrix}$

$$= \frac{1}{a}a(a+b+c)\Delta_1 \text{, where}$$

$$\Delta_1 = \begin{vmatrix} a & a+c & a-b \\ b & b & a+b \\ c & c-a & c \end{vmatrix}$$

Using $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$, we get

$$\Delta_1 = \begin{vmatrix} a & c & -b \\ b & 0 & a \\ c & -a & 0 \end{vmatrix} = a(a^2 + b^2 + c^2)$$

$\therefore$ $\Delta = (a + b + c)(a^2 + b^2 + c^2) = 0$

As a, b, c are distinct real numbers, $a^2 + b^2 + c^2 \neq 0$, therefore $a + b + c = 0$.

$\Rightarrow$ the line $a(x - 5) + b(y - 2) + c = 0$ passes through (6, 3).

Example 20: Suppose a, b, c and x are real numbers. Let

$$\Delta = \begin{vmatrix} 1+a & 1+ax & 1+ax^2 \\ 1+b & 1+bx & 1+bx^2 \\ 1+c & 1+cx & 1+cx^2 \end{vmatrix}$$

Then Δ is independent of

(a) a, b, c (b) x
(c) a, b, c, x (d) none of these

Ans. (c)

Solution: Write $\Delta = \Delta_1 + \Delta_2$, where

$$\Delta_1 = \begin{vmatrix} 1 & 1+ax & 1+ax^2 \\ 1 & 1+bx & 1+bx^2 \\ 1 & 1+cx & 1+cx^2 \end{vmatrix}$$

and $\Delta_2 = \begin{vmatrix} a & ax & ax^2 \\ b & bx & bx^2 \\ c & cx & cx^2 \end{vmatrix} = 0$

[$\because$ C_1 and C_2 are propotional]

In Δ_1, use $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$ to obtain

$$\Delta_1 = \begin{vmatrix} 1 & ax & ax^2 \\ 1 & bx & bx^2 \\ 1 & cx & cx^2 \end{vmatrix} = 0$$

[$\because$ C_2 and C_3 are proportional]

Thus, $\Delta = 0$ and hence independent of a, b, c, x.

Example 21: Suppose $a, b, c > 1$ and

$$f(x) = \begin{vmatrix} a^{-x} & a^x & x \\ b^{-3x} & b^{3x} & 3x^3 \\ c^{-5x} & c^{5x} & 5x^5 \end{vmatrix}, x \in \mathbf{R}$$

then f is

(a) a constant function
(b) a polynomial of degree 5
(c) an odd function
(d) an even function

Ans. (d)

◎ **Solution:**

$$f(-x) = \begin{vmatrix} a^{x} & a^{-x} & -x \\ b^{3x} & b^{-3x} & -3x^{3} \\ c^{5x} & c^{-5x} & -5x^{5} \end{vmatrix}$$

$$= (-1)(-1)\begin{vmatrix} a^{-x} & a^{x} & x \\ b^{-3x} & b^{3x} & 3x^{3} \\ c^{-5x} & c^{5x} & 5x^{5} \end{vmatrix}$$

$$= f(x)$$

Thus, f is an even function.

◉ **Example 22:** Suppose n, m are natural numbers and

$$f(x) = \begin{vmatrix} 1 & (1+x)^{m} & (1+mx)^{mn} \\ (1+mx)^{n} & 1 & (1+nx)^{mn} \\ (1+nx)^{m} & (1+x)^{n} & 1 \end{vmatrix}$$

constant term of the polynomial $f(x)$ is:

(a) 1 (b) $m + n$
(c) $m - n$ (d) 0

Ans. (d)

◎ **Solution:** Constant term of polynomial $f(x)$ is $f(0)$, and

$$f(0) = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = 0$$

◉ **Example 23:** Suppose a, b, c are sides of a scalene triangle. Let

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

Then

(a) $\Delta \le 0$ (b) $\Delta < 0$
(c) $\Delta > 0$ (d) $\Delta \ge 0$

Ans. (b)

◎ **Solution:** Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (a + b + c)\,\Delta_1$$

where

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 0 & c-b & a-c \\ 0 & a-b & b-c \end{vmatrix}$$

$$= -(b-c)^2 - (a-b)(a-c)$$

$$= -(a^2 + b^2 + c^2 - bc - ca - ab)$$

$$\Rightarrow \qquad \Delta_1 = -\frac{1}{2}\,[(b-c)^2 + (c-a)^2 + (a-b)^2] < 0$$

As $a + b + c > 0$, we get

$$\Delta = (a + b + c)\,\Delta_1 < 0$$

◉ **Example 24:** Suppose A, B, C are angles of a triangle, and let

$$\Delta = \begin{vmatrix} e^{2iA} & e^{-iC} & e^{-iB} \\ e^{-iC} & e^{2iB} & e^{-iA} \\ e^{-iB} & e^{-iA} & e^{2iC} \end{vmatrix}$$

Then value of Δ is

(a) – 1 (b) – 4
(c) 0 (d) 4

Ans. (b)

◎ **Solution:** Taking e^{iA}, common from R_1, e^{iB} from R_2 and e^{iC} from R_3, we get

$$\Delta = e^{i(A+B+C)}\,\Delta_1$$

where

$$\Delta_1 = \begin{vmatrix} e^{iA} & e^{-i(A+C)} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{iB} & e^{-i(A+B)} \\ e^{-i(B+C)} & e^{-i(A+C)} & e^{iC} \end{vmatrix}$$

But $A + B + C = \pi$, so that $e^{i(A+B+C)} = e^{i\pi}$

$$= \cos \pi + i \sin \pi = -1. \text{ Also,}$$

$$A + C = \pi - B \quad \Rightarrow \quad e^{-i(A+C)} = e^{-\pi i}\, e^{iB} = -e^{iB}.$$

Thus,

$$\Delta_1 = \begin{vmatrix} e^{iA} & -e^{iB} & -e^{iC} \\ -e^{iA} & e^{iB} & -e^{iC} \\ -e^{iA} & -e^{iB} & e^{iC} \end{vmatrix}$$

$$= e^{i(A+B+C)}\begin{vmatrix} 1 & -1 & -1 \\ -1 & 1 & -1 \\ -1 & -1 & 1 \end{vmatrix}$$

Using $C_1 \to C_1 + C_2$, we get

$$\Delta_1 = (-1)\begin{vmatrix} 0 & -1 & -1 \\ 0 & 1 & -1 \\ -2 & -1 & 1 \end{vmatrix} = (-1)\,(-2)\,(2) = 4$$

Therefore, $\Delta = (-1)\,\Delta_1 = -4$

◉ **Example 25:** Suppose x_1, x_2, x_3 are real numbers such that $x_1 x_2 x_3 \neq 0$. Let

$$\Delta = \begin{vmatrix} x_1 + a_1 b_1 & a_1 b_2 & a_1 b_3 \\ a_2 b_1 & x_2 + a_2 b_2 & a_2 b_3 \\ a_3 b_1 & a_3 b_2 & x_3 + a_3 b_3 \end{vmatrix}$$

Then $\dfrac{\Delta}{x_1x_2x_3} - 1$ equals:

(a) $\dfrac{a_1b_1}{x_1} + \dfrac{a_2b_2}{x_2} + \dfrac{a_3b_3}{x_3}$

(b) -1

(c) $\dfrac{a_1a_2a_3 + b_1b_2b_3}{x_1x_2x_3}$

(d) 0

Ans. (a)

Solution: Using the sum property, write

$$\Delta = x_1\,\Delta_1 + b_1\,\Delta_2$$

where

$$\Delta_1 = \begin{vmatrix} 1 & a_1b_2 & a_1b_3 \\ 0 & x_2 + a_2b_2 & a_2b_3 \\ 0 & a_3b_2 & x_3 + a_3b_3 \end{vmatrix}$$

$$= (x_2 + a_2\,b_2)\,(x_3 + a_3\,b_3) - a_3\,b_2\,a_2\,b_3$$

$$= x_2\,x_3 + x_2\,a_3\,b_3 + x_3\,a_2\,b_2$$

and $$\Delta_2 = \begin{vmatrix} a_1 & a_1b_2 & a_1b_3 \\ a_2 & x_2 + a_2b_2 & a_2b_3 \\ a_3 & a_3b_2 & x_3 + a_3b_3 \end{vmatrix}$$

Using $C_2 \to C_2 - b_2\,C_1$, $C_3 \to C_3 - b_3\,C_1$, we get

$$\Delta_2 = \begin{vmatrix} a_1 & 0 & 0 \\ a_2 & x_2 & 0 \\ a_3 & 0 & x_3 \end{vmatrix} = a_1x_2x_3$$

Thus,

$$\Delta = x_1[x_2\,x_3 + x_2\,a_3\,b_3 + x_3\,a_2\,b_2] + a_1\,b_1\,x_2\,x_3$$

$$\Rightarrow \quad \frac{\Delta}{x_1x_2x_3} - 1 = \frac{a_1b_1}{x_1} + \frac{a_2b_2}{x_2} + \frac{a_3b_3}{x_3}$$

Example 26: Let $p\lambda^4 + q\lambda^3 + r\lambda^2 + s\lambda + t$

$$= \begin{vmatrix} \lambda^2 + 3\lambda & \lambda - 1 & \lambda - 3 \\ \lambda - 1 & -2\lambda & \lambda - 4 \\ \lambda - 3 & \lambda + 4 & 3\lambda \end{vmatrix}$$

where p, q, r, s and t are constants. Then value of t is

(a) 0 (b) -1

(c) 2 (d) 3

Ans. (a)

Solution: Putting $\lambda = 0$, we obtain

$$t = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 0 & -4 \\ -3 & 4 & 0 \end{vmatrix} = 0$$

as it is a skew symmetric determinant of odd order.

Example 27: Let $\Delta = \begin{vmatrix} 1 & -4 & 20 \\ 1 & -2 & 5 \\ 1 & 2x & 5x^2 \end{vmatrix}$. Solution set of $\Delta = 0$ is

(a) $\{-2, 3\}$ (b) $\{-3, 4\}$

(c) $\{4, -6\}$ (d) $\{-2, -1\}$

Ans. (d)

Solution: Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$ we get

$$\Delta = \begin{vmatrix} 1 & -4 & 20 \\ 0 & 2 & -15 \\ 0 & 2\,(x+2) & 5\,(x^2-4) \end{vmatrix} = 2(x+2) \begin{vmatrix} 1 & -15 \\ 1 & 5\,(x-2) \end{vmatrix}$$

$$= 10(x + 2)\,(x + 1)$$

Now, $\Delta = 0 \Rightarrow x = -2, -1$.

Example 28: Let $\Delta = \begin{vmatrix} 1 & a & a^2 - bc \\ 1 & b & b^2 - ca \\ 1 & c & c^2 - ab \end{vmatrix}$, then Δ is equal to

(a) 0 (b) $a + b + c$

(c) $\dfrac{1}{2}(a^2 + b^2 + c^2)$ (d) none of these

Ans. (a)

Solution: Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = (b - a)\,(c - a) \begin{vmatrix} 1 & a & a^2 - bc \\ 0 & 1 & a + b + c \\ 0 & 1 & a + b + c \end{vmatrix} = 0$$

[$\because$ R_2 and R_3 are identical]

Example 29: Suppose a, b, $c > 0$ and a, b, c are the pth, qth, rth terms of a G.P. Let

$$\Delta = \begin{vmatrix} 1 & p & \log a \\ 1 & q & \log b \\ 1 & r & \log c \end{vmatrix}$$

then numerical value of Δ is

(a) -1 (b) 2

(c) 0 (d) none of these

Ans. (c)

Solution: Let $a = AR^{p-1}$, $b = AR^{q-1}$ and $c = AR^{r-1}$

$\Rightarrow$ $\log a = \alpha + (p - 1)\beta$, $\log b = \alpha + (q - 1)\beta$ and $\log c = \alpha + (r - 1)\beta$

where $\alpha = \log a$, $\beta = \log R$.

Now,

$$\Delta = \begin{vmatrix} 1 & p & \alpha + (p-1)\,\beta \\ 1 & q & \alpha + (q-1)\,\beta \\ 1 & r & \alpha + (r-1)\,\beta \end{vmatrix}$$

Using $C_3 \to C_3 - (\alpha - \beta)C_1 - \beta C_3$, we get $\Delta = 0$.

Example 30: Let $\omega = \frac{1}{2}\left(-1+\sqrt{3}i\right)$ and

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & -1-\omega^2 & \omega^2 \\ 1 & \omega^2 & \omega^4 \end{vmatrix} \text{ then } \Delta \text{ equals}$$

(a) 3ω (b) $3\omega(\omega - 1)$
(c) $3\omega^2$ (d) $3\omega(1 - \omega)$

Ans. (b)

Solution: Using $\omega^3 = 1$ and $1 + \omega + \omega^2 = 0$, and applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} 3 & 1 & 1 \\ 0 & \omega & \omega^2 \\ 0 & \omega^2 & \omega \end{vmatrix} = 3(\omega^2 - \omega) = 3\omega(\omega - 1)$$

Example 31: Let a, b, and c be respectively the pth, qth and rth terms of a harmonic progression and

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ p & q & r \\ bc & ca & ab \end{vmatrix}$$

Then numerical value of Δ is

(a) 0 (b) – 1
(c) 1 (d) none of these

Ans. (a)

Solution: $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are the pth, qth, rth terms of an A.P.

Let $\frac{1}{a} = A + (p-1)D$, $\frac{1}{b} = A + (q-1)D$,

and $\frac{1}{c} = A + (r-1)D$.

Now

$$\Delta = abc \begin{vmatrix} 1 & 1 & 1 \\ p & q & r \\ A+(p-1)D & A+(q-1)D & A+(r-1)D \end{vmatrix}$$

Using $R_3 \to R_3 - (A - D)R_1 - DR_2$, we get
$\Delta = 0$.

Example 32: Let $\omega \neq 1$ be complex cube root of unity and n be a natural number and

$$\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix}$$

Then Δ equals

(a) 0 (b) 1
(c) ω (d) ω^2

Ans. (a)

Solution: If n is a multiple of 3, we get each element of Δ becomes 1.

$\therefore$ $\Delta = 0$.

If $n = 3k + 1$, then

$$\Delta = \begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix} = 0 \quad [\text{use } C_1 \to C_1 + C_2 + C_3]$$

If $n = 3k + 2$, then

$$\Delta = \begin{vmatrix} 1 & \omega^2 & \omega \\ \omega^2 & \omega & 1 \\ \omega & 1 & \omega^2 \end{vmatrix} = 0 \quad [\text{use } C_1 \to C_1 + C_2 + C_3]$$

Example 33: Let

$$\Delta = \begin{vmatrix} b+c & q+r & y+z \\ c+a & r+p & z+x \\ a+b & p+q & x+y \end{vmatrix} \text{ and } \Delta_1 = \begin{vmatrix} x & a & p \\ y & b & q \\ z & c & r \end{vmatrix},$$

then

(a) $\Delta = 2\Delta_1$ (b) $\Delta = -2\Delta_1$
(c) $\Delta = 4\Delta_1$ (d) $\Delta = -4\Delta_1$

Ans. (a)

Solution: Using $R_1 \to R_1 + R_2 + R_3$, we get

$$\Delta = \begin{vmatrix} 2(a+b+c) & 2(p+q+r) & 2(x+y+z) \\ c+a & r+p & z+x \\ a+b & p+q & x+y \end{vmatrix}$$

Taking 2 common from R_1 and applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we obtain

$$\Delta = 2\begin{vmatrix} a+b+c & p+q+r & x+y+z \\ -b & -q & -y \\ -c & -r & -z \end{vmatrix}$$

Applying $R_1 \to R_1 + R_2 + R_3$, we get

$$\Delta = 2(-1)(-1)\begin{vmatrix} a & p & x \\ b & q & y \\ c & r & z \end{vmatrix} = -2\begin{vmatrix} a & x & p \\ b & y & q \\ c & z & r \end{vmatrix}$$

$$= 2\begin{vmatrix} x & a & p \\ y & b & q \\ z & c & r \end{vmatrix} = 2\Delta_1$$

Example 34: If $x = -2$, and $\Delta = \begin{vmatrix} x+y & x & x \\ 5x+4y & 4x & 2x \\ 10x+8y & 8x & 3x \end{vmatrix}$ then numerical value of Δ is

(a) 8 (b) – 8
(c) 4 (d) – 4

Ans. (b)

Solution: Taking x common from C_2 and C_3 we obtain

$$\Delta = x^2 \begin{vmatrix} x+y & 1 & 1 \\ 5x+4y & 4 & 2 \\ 10x+8y & 8 & 3 \end{vmatrix} = x^3 \begin{vmatrix} 1 & 1 & 1 \\ 5 & 4 & 2 \\ 10 & 8 & 3 \end{vmatrix}$$

[using $C_1 \to C_1 - yC_2$]

Next using $C_1 \to C_1 - C_2$, $C_2 \to C_2 - C_3$, we obtain

$$D = x^3 \begin{vmatrix} 0 & 0 & 1 \\ 1 & 2 & 2 \\ 2 & 5 & 3 \end{vmatrix} = x^3 \begin{vmatrix} 1 & 2 \\ 2 & 5 \end{vmatrix} = x^3$$

As $x = -2, \Delta = -8.$

Example 35: If $a = \omega \neq 1$, is a cube root of unity, $b = -785$, $c = 2008\, i$, and

$$\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 2a & 3a+2b & 4a+3b+2c \\ 3a & 6a+3b & 10a+6b+3c \end{vmatrix}$$

then Δ equals

(a) $-i$ (b) i
(c) 1 (d) $1 - wi$

Ans. (c)

Solution: Write

$$\Delta = a \begin{vmatrix} 1 & a+b & a+b+c \\ 2 & 3a+2b & 4a+3b+2c \\ 3 & 6a+3b & 10a+6b+3c \end{vmatrix}$$

and apply $C_2 \to C_2 - bC_1$, $C_3 \to C_3 - cC_1$ to obtain

$$\Delta = a \begin{vmatrix} 1 & a & a+b \\ 2 & 3a & 4a+3b \\ 3 & 6a & 10a+6c \end{vmatrix}$$

Take a common from C_2 and apply $C_3 \to C_3 - bC_2$ to obtain

$$\Delta = a^2 \begin{vmatrix} 1 & 1 & a \\ 2 & 3 & 4a \\ 3 & 6 & 10a \end{vmatrix} = a^3 \begin{vmatrix} 1 & 1 & 1 \\ 2 & 3 & 4 \\ 3 & 6 & 10 \end{vmatrix}$$

Apply $C_3 \to C_3 - C_2$, $C_2 \to C_2 - C_1$ to obtain

$$\Delta = a^3 \begin{vmatrix} 1 & 0 & 0 \\ 2 & 1 & 1 \\ 3 & 3 & 4 \end{vmatrix} = a^3 = \omega^3 = 1.$$

Example 36: Let x, y, z be positive and $x, y, z \neq 1$. Let

$$\Delta = \begin{vmatrix} 1 & \log_x y & \log_x z \\ \log_y x & 1 & \log_y z \\ \log_z x & \log_z y & 1 \end{vmatrix},$$

then numerical value of Δ is

(a) -1 (b) 0
(c) 1 (d) none of these

Ans. (b)

Solution: Using change of base formula

$$\log_a b = \frac{\log b}{\log a}, \; a, b > 0, a, b \neq 1,$$

we can write

$$\Delta = \frac{1}{\log x \log y \log z} \begin{vmatrix} \log x & \log y & \log z \\ \log x & \log y & \log z \\ \log x & \log y & \log z \end{vmatrix} = 0.$$

Example 37: Let $\omega \neq 1$ be a cube root of unity and

$$\Delta = \begin{vmatrix} 1-\omega-\omega^2 & 2 & 2 \\ 2\omega & \omega-\omega^2-1 & 2\omega \\ 2\omega^2 & 2\omega^2 & \omega^2-1-\omega \end{vmatrix}$$

then Δ equals

(a) $-\omega$ (b) $3\omega(1-\omega)$
(c) 0 (d) $1-\omega^2$

Ans. (c)

Solution: Using $R_1 \to R_1 + R_2 + R_3$ and $1 + \omega + \omega^2 = 0$, we obtain

$$\Delta = 0.$$

Example 38: Suppose $x = -\frac{1}{3}\left(1+\sqrt{7}i\right)$ and

$$y = \cos\frac{\pi}{4} + i\sin\frac{\pi}{4}.$$

Let $$\Delta = \begin{vmatrix} 1 & x & x \\ 1 & x+y & y \\ 1 & x & x+y \end{vmatrix},$$

then Δ equals

(a) $-\sqrt{7}$ (b) 7
(c) i (d) $-1.$

Ans. (c)

Solution: Using $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} 1 & x & x \\ 0 & y & y-x \\ 0 & 0 & y \end{vmatrix} = y^2 = \cos\frac{\pi}{2} + i\sin\frac{\pi}{2} = 0 + i(1) = i$$

[Using De Moivre's Theorem]

Example 39: Let $x = \cos\frac{\pi}{3} + i\sin\frac{\pi}{3}$ and

$$\Delta = \begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ 1 & x^2 & 1 \end{vmatrix}$$

then numerical value of Δ is

(a) 0 (b) -1
(c) 8 (d) -4

Ans. (c)

◎ **Solution:** Use $C_3 \to C_3 - xC_2$ and $C_2 \to C_2 - xC_1$.

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ x^2 & 1-x^3 & 0 \\ 1 & x^2-x & 1-x^3 \end{vmatrix}$$

$$= (1-x^3)^2 = [1 - \cos\pi - i\sin\pi]^2 = 8$$

[De Moivre's Theorem]

◉ **Example 40:** Let $f(x) = [2^{-x^2}[2^{x^2}]]$, $x \in \mathbf{R}$. ([ ] denotes the greatest integer function.) Let $x_1 = 0$, $x_2 = \log_2 3$ and $x_3 = \sqrt{2}$. Suppose $0 < x_4 < 1$.

$$\Delta = \begin{vmatrix} f(x_1) & f(x_2) & f(x_3) \\ f(x_4) & f(x_4) & f(x_2) \\ f(x_2) & f(x_3) & f(x_1) \end{vmatrix}, \text{ then } \Delta \text{ is equal to:}$$

(a) -1 (b) 0
(c) 1 (d) $2\log_2{}^3$

Ans. (b)

◎ **Solution:** $0 \le [2^{x^2}] \le 2^{x^2} \Rightarrow 0 \le \dfrac{[2^{x^2}]}{2^{x^2}} \le 1$. Therefore, range $f(x)$ is $\{0, 1\}$

Also $[2^{x^2}] = 2^{x^2} \Leftrightarrow 2^{x^2}$ is a positive integer.

Thus, $f(x_1) = 1, f(x_2) = 1, f(x_3) = 1$ and $f(x_4) = 0$.
Therefore,

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 0 & 0 & 1 \\ 1 & 1 & 1 \end{vmatrix} = 0$$

◉ **Example 41:** If $\omega \ne 1$ is a cube root of unity and

$$\Delta = \begin{vmatrix} x+\omega^2 & \omega & 1 \\ \omega & \omega^2 & 1+x \\ 1 & x+\omega & \omega^2 \end{vmatrix} = 0, \text{ then value of } x \text{ is}$$

(a) 0 (b) 1
(c) -1 (d) none of these

Ans. (a)

◎ **Solution:** Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} x+\omega^2+\omega+1 & \omega & 1 \\ \omega+\omega^2+1+x & \omega^2 & 1+x \\ 1+x+\omega+\omega^2 & x+\omega & \omega^2 \end{vmatrix}$$

$$= \begin{vmatrix} x & \omega & 1 \\ x & \omega^2 & 1+x \\ x & x+\omega & \omega^2 \end{vmatrix} \text{ using } 1+\omega+\omega^2 = 0$$

Δ is clearly equal to 0 for $x = 0$.

◉ **Example 42:** Let $f: \mathbf{N} \to \mathbf{N}$ be defined by

$$f(x) = (x+1)^2 + x - \left[\sqrt{(x+1)^2 + (x+1)}\right]^2$$

([ ] denotes the greatest integer function). Suppose *a, b, c* are three distinct natural numbers. Let

$$\Delta = \begin{vmatrix} f(a) & a^2 & a \\ f(b) & b^2 & b \\ f(c) & c^2 & c \end{vmatrix}$$

The Δ is equal to:

(a) $-(a+b+c)$ (b) $a+b+c$
(c) -1 (d) 0

Ans. (d)

◎ **Solution:** If $n \in \mathbf{N}$, then

$$n^2 < n^2 + n < (n+1)^2$$

$$\Rightarrow \quad n < \sqrt{n^2+n} < n+1$$

$$\Rightarrow \quad \left[\sqrt{n^2+n}\right] = n$$

$$\Rightarrow \quad \left[\sqrt{(x+1)^2+(x+1)}\right] = x+1 \ \forall\, x \in \mathbf{N}.$$

$\therefore \quad f(x) = (x+1)^2 + x - (x+1)^2 = x \ \forall\, x \in \mathbf{N}$.

Thus,

$$\Delta = \begin{vmatrix} a & a^2 & a \\ b & b^2 & b \\ c & c^2 & c \end{vmatrix} = 0$$

[$\because$ C_1 and C_3 are identical]

◉ **Example 43:** If $x = -9$ is a root of $\begin{vmatrix} x & 3 & 7 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix} = 0$, then the other two roots are

(a) 3, 7 (b) 2, 7
(c) 3, 6 (d) 2, 6

Ans. (b)

◎ **Solution:** Applying $R_1 \to R_1 + R_2 + R_3$, we get

$$\Delta = \begin{vmatrix} x+9 & x+9 & x+9 \\ 2 & x & 2 \\ 7 & 6 & x \end{vmatrix}$$

Taking $x + 9$ common from R_1 and applying $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$ we get

$$\Delta = (x+9)\begin{vmatrix} 1 & 0 & 0 \\ 2 & x-2 & 0 \\ 7 & -1 & x-7 \end{vmatrix}$$

$$= (x+9)(x-2)(x-7)$$

Thus, $\Delta = 0 \Rightarrow x = -9, 2, 7$

$\therefore$ the other two roots are 2 and 7.

Example 44: If $\Delta_1 = \begin{vmatrix} x & b & b \\ a & x & b \\ a & a & x \end{vmatrix}$ and $\Delta_2 = \begin{vmatrix} x & b \\ a & x \end{vmatrix}$, then

(a) $\Delta_1 = 3(\Delta_2)^2$ (b) $\dfrac{d}{dx}(\Delta_1) = 3\Delta_2$

(c) $\dfrac{d}{dx}(\Delta_1) = 3\Delta_2^2$ (d) $\Delta_1 = 3\Delta_2^{3/2}$

Ans. (b)

Solution: We have

$$\frac{d\Delta_1}{dx} = \begin{vmatrix} 1 & b & b \\ 0 & x & b \\ 0 & a & x \end{vmatrix} + \begin{vmatrix} x & 0 & b \\ a & 1 & b \\ a & 0 & x \end{vmatrix} + \begin{vmatrix} x & b & 0 \\ a & x & 0 \\ a & b & 1 \end{vmatrix}$$

$$= \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix} + \begin{vmatrix} x & b \\ a & x \end{vmatrix}$$

$$= 3\Delta_2.$$

Example 45: If $x \varepsilon \mathbf{R}$ and $n \varepsilon \mathbf{I}$, then the determinant

$$\Delta = \begin{vmatrix} \sin(n\pi) & \sin x - \cos x & \log\tan x \\ \cos x - \sin x & \cos[(2n+1)\pi/2] & \log\cot x \\ \log\cot x & \log\tan x & \tan(n\pi) \end{vmatrix}$$

equals

(a) 0 (b) $\log\tan x - \log\cot x$

(c) $\tan(\pi/4 - x)$ (d) none of these

Ans. (a)

Solution: We can write Δ as

$$\Delta = \begin{vmatrix} 0 & \sin x - \cos x & \log\tan x \\ -(\sin x - \cos x) & 0 & -\log\tan x \\ -\log\tan x & \log\tan x & 0 \end{vmatrix}$$

$$= (-1)^3 \begin{vmatrix} 0 & -(\sin x - \cos x) & -\log\tan x \\ \sin x - \cos x & 0 & \log\tan x \\ \log\tan x & -\log\tan x & 0 \end{vmatrix}$$

[taking – 1 common from R_1, R_2 and R_3]

$= -\Delta$ [using the reflection property]

$\Rightarrow 2\Delta = 0 \Rightarrow \Delta = 0.$

Example 46: Let $\Delta_1 = \begin{vmatrix} ax & by & cz \\ x^2 & y^2 & z^2 \\ 1 & 1 & 1 \end{vmatrix}$ and

$\Delta_2 = \begin{vmatrix} a & b & c \\ x & y & z \\ yz & zx & xy \end{vmatrix}$, then $\Delta_1 - \Delta_2$ equals

(a) $(x-1)(y-1)(z-1)$

(b) $(x-y)(y-z)(z-x)$

(c) $abc\,(x-y)(y-z)(z-x)$

(d) 0

Ans. (d)

Solution: Multiplying R_3 of Δ_1 by xyz, we get

$$\Delta_1 = \frac{1}{xyz}\begin{vmatrix} ax & by & cz \\ x^2 & y^2 & z^2 \\ xyz & xyz & xyz \end{vmatrix} = \frac{xyz}{xyz}\begin{vmatrix} a & b & c \\ x & y & z \\ yz & zx & xy \end{vmatrix} = \Delta_2$$

[taking x, y, z common from C_1, C_2, C_3 respectively]

$\Rightarrow \quad \Delta_1 - \Delta_2 = 0.$

Example 47: If

$$\Delta(x) = \begin{vmatrix} 1 & x & x+1 \\ 2x & x(x-1) & x(x+1) \\ 3x(x-1) & x(x-1)(x-2) & x(x^2-1) \end{vmatrix}$$

then $\Delta(100)$ equals

(a) 0 (b) – 100

(c) 100! (d) – 100!

Ans. (a)

Solution: Taking x common from C_2, $x + 1$ from C_3 and $x - 1$ from R_3, we get

$$\Delta(x) = x(x+1)(x-1)\begin{vmatrix} 1 & 1 & 1 \\ 2x & x-1 & x \\ 3x & x-2 & x \end{vmatrix}$$

Applying $C_1 \to C_1 - C_3$, $C_2 \to C_2 - C_3$, we get

$$\Delta(x) = x(x+1)(x-1)\begin{vmatrix} 0 & 0 & 1 \\ x & -1 & x \\ 2x & -2 & x \end{vmatrix} = 0$$

[$\because$ C_1 and C_2 are proportional]

Thus, $\quad \Delta(100) = 0$

Example 48: If $\Delta(x) = \begin{vmatrix} 1 & 1 & 1 \\ (e^x + e^{-x})^2 & (\pi^x + \pi^{-x})^2 & 2 \\ (e^x - e^{-x})^2 & (\pi^x - \pi^{-x})^2 & -2 \end{vmatrix}$

then $\Delta(x)$ equals

(a) x^2 (b) $x^2 - 1$

(c) $e^{x^2} - \pi^{x^2}$ (d) 0

Ans. (d)

Solution: Using $R_2 \to R_2 - R_3$ and $(a^x + a^{-x})^2 - (a^x - a^{-x})^2 = 4a^x a^{-x} = 4$, we get

$$\Delta(x) = \begin{vmatrix} 1 & 1 & 1 \\ 4 & 4 & 4 \\ (e^x - e^{-x})^2 & (\pi^x - \pi^{-x})^2 & -2 \end{vmatrix} = 0$$

[since R_1 and R_2 are proportional]

Example 49: If $\Delta(x) = \begin{vmatrix} 1 & \cos x & 1-\cos x \\ 1+\sin x & \cos x & 1+\sin x-\cos x \\ \sin x & \sin x & 1 \end{vmatrix}$, then $\int_0^{\pi/2} \Delta(x)\, dx$ equals

(a) 1/4 (b) 1/2

(c) 0 (d) – 1/2

Ans. (d)

Solution: Using $C_1 \to C_1 - C_2 - C_3$, we get

$$\Delta(x) = \begin{vmatrix} 0 & \cos x & 1-\cos x \\ 0 & \cos x & 1+\sin x-\cos x \\ -1 & \sin x & 1 \end{vmatrix}$$

$$= (-1)\begin{vmatrix} \cos x & 1-\cos x \\ \cos x & 1+\sin x-\cos x \end{vmatrix}$$

$$= (-1)\cos x\,[1 + \sin x - \cos x - 1 + \cos x]$$

$$= -\cos x \sin x = -\frac{1}{2}(\sin 2x)$$

$$\therefore \quad \int_0^{\pi/2} \Delta(x)\, dx = -\frac{1}{2}\frac{(-1)}{2}\cos 2x \Big]_0^{\pi/2}$$

$$= \frac{1}{4}(\cos \pi - \cos 0) = -\frac{1}{2}$$

Example 50: The determinant

$$\Delta = \begin{vmatrix} a & b & a\alpha+b \\ b & c & b\alpha+c \\ a\alpha+b & b\alpha+c & 0 \end{vmatrix} \text{ equals zero, if}$$

(a) a, b, c are in A.P.

(b) a, b, c are in H.P.

(c) $x - \alpha$ is a factor of $ax^2 + 2bx + c$

(d) $x - \alpha$ is a factor of $ax^2 + bx + c$

Ans. (c)

Solution: Applying $C_3 \to C_3 - \alpha C_1 - C_2$, we get

$$\Delta = \begin{vmatrix} a & b & 0 \\ b & c & 0 \\ a\alpha+b & b\alpha+c & -\left(a\alpha^2+2b\alpha+c\right) \end{vmatrix}$$

$$= -(a\alpha^2 + 2b\alpha + c)\begin{vmatrix} a & b \\ b & c \end{vmatrix} \quad [\text{expanding along } C_3]$$

$$= -(a\alpha^2 + 2b\alpha + c)(ac - b^2)$$

$= 0$ if $x - \alpha$ is a factor of $ax^2 + 2bx + c$.

Example 51: If $\theta \,\varepsilon\, \mathbf{R}$, then the determinant

$$\Delta = \begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ \sin(\theta+2\pi/3) & \cos(\theta+2\pi/3) & \sin(2\theta+4\pi/3) \\ \sin(\theta-2\pi/3) & \cos(\theta-2\pi/3) & \sin(2\theta-4\pi/3) \end{vmatrix}$$

equals

(a) $-\sin\theta - \cos\theta$ (b) $\sin 2\theta$

(c) $1 + \sin 2\theta - \cos 2\theta$ (d) 0

Ans. (d)

Solution: Applying $R_2 \to R_2 + R_3$, and using $\sin(A + B) + \sin(A - B) = 2\sin A \cos B$ and $\cos(A + B) + \cos(A - B) = 2\cos A \cos B$, we get

$$\Delta = \begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ 2\sin\theta\cos(2\pi/3) & 2\cos\theta\cos(2\pi/3) & 2\sin 2\theta\cos(4\pi/3) \\ \sin(\theta-2\pi/3) & \cos(\theta-2\pi/3) & \sin(2\theta-4\pi/3) \end{vmatrix}$$

$$\Delta = \begin{vmatrix} \sin\theta & \cos\theta & \sin 2\theta \\ -\sin\theta & -\cos\theta & -\sin 2\theta \\ \sin(\theta-2\pi/3) & \cos(\theta-2\pi/3) & \sin(2\theta-4\pi/3) \end{vmatrix}$$

since $\cos(2\pi/3) = \cos(\pi - \pi/3) = -\cos(\pi/3) = -1/2$

and $\cos(4\pi/3) = \cos(\pi + \pi/3) = -\cos(\pi/3) = -1/2$

$\Rightarrow \quad \Delta = 0 \quad [\because R_1 \text{ and } R_2 \text{ are proportional.}]$

Example 52: If α, β, γ are the roots of $x^3 + px^2 + q = 0$, where $q \neq 0$, and

$$\Delta = \begin{vmatrix} 1/\alpha & 1/\beta & 1/\gamma \\ 1/\beta & 1/\gamma & 1/\alpha \\ 1/\gamma & 1/\alpha & 1/\beta \end{vmatrix}$$

then Δ equals

(a) $-p/q$ (b) $1/q$

(c) p^2/q (d) 0

Ans. (d)

Solution: We have $\beta\gamma + \gamma\alpha + \alpha\beta = 0$. We can write Δ as

$$\Delta = \frac{1}{\alpha^3\beta^3\gamma^3}\begin{vmatrix} \beta\gamma & \gamma\alpha & \alpha\beta \\ \gamma\alpha & \alpha\beta & \beta\gamma \\ \alpha\beta & \beta\gamma & \gamma\alpha \end{vmatrix}$$

$$= \frac{1}{\alpha^3\beta^3\gamma^3}\begin{vmatrix} \beta\gamma+\gamma\alpha+\alpha\beta & \gamma\alpha & \alpha\beta \\ \gamma\alpha+\alpha\beta+\beta\gamma & \alpha\beta & \beta\gamma \\ \alpha\beta+\beta\gamma+\gamma\alpha & \beta\gamma & \gamma\alpha \end{vmatrix}$$

$$[\text{using } C_1 \to C_1 + C_2 + C_3]$$

$$= \frac{1}{\alpha^3\beta^3\gamma^3}\begin{vmatrix} 0 & \gamma\alpha & \alpha\beta \\ 0 & \alpha\beta & \beta\gamma \\ 0 & \beta\gamma & \gamma\alpha \end{vmatrix} = 0 \text{ [all zero property]}$$

Example 53: If A, B, C are the angles of a triangle, and

$$\Delta = \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$$

then Δ equals

(a) 0 (b) − 1

(c) 2 cos A cos B cos C (d) none of these

Ans. (a)

◎ **Solution:** Applying $C_1 \to aC_1 + bC_2 + cC_3$, we get

$$\Delta = \frac{1}{a}\begin{vmatrix} -a + b\cos C + c\cos B & \cos C & \cos B \\ a\cos C - b + c\cos A & -1 & \cos A \\ a\cos B + b\cos A - c & \cos A & -1 \end{vmatrix}$$

$$= \frac{1}{a}\begin{vmatrix} 0 & \cos C & \cos B \\ 0 & -1 & \cos A \\ 0 & \cos A & -1 \end{vmatrix} = 0$$

[using projection formulae and all zero property.]

◉ **Example 54:** If a, b, c are three complex numbers such that $a^2 + b^2 + c^2 = 0$ and

$$\Delta = \begin{vmatrix} b^2 + c^2 & ab & ac \\ ab & c^2 + a^2 & bc \\ ac & bc & a^2 + b^2 \end{vmatrix} = ka^2\, b^2\, c^2,$$

then the value of k is

(a) 1 (b) 2

(c) − 2 (d) 4

Ans. (*d*)

◎ **Solution:** Using $a^2 + b^2 + c^2 = 0$, we can write Δ as

$$\Delta = \begin{vmatrix} -a^2 & ab & ac \\ ab & -b^2 & bc \\ ac & bc & -c^2 \end{vmatrix} = abc\begin{vmatrix} -a & a & a \\ b & -b & b \\ c & c & -c \end{vmatrix}$$

[taking a, b, c common from C_1, C_2, C_3 respectively]

$$= a^2\, b^2\, c^2\begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix}$$

[taking a, b, c common from R_1, R_2, R_3 respectively]

$$= a^2\, b^2\, c^2\begin{vmatrix} 0 & 2 & 1 \\ 2 & 0 & 1 \\ 0 & 0 & -1 \end{vmatrix} = -\,2a^2\, b^2\, c^2\begin{vmatrix} 2 & 1 \\ 0 & -1 \end{vmatrix} = 4a^2\, b^2\, c^2$$

[applying $C_1 \to C_1 + C_3$ and $C_3 \to C_2 + C_3$]

Thus, $k = 4$.

◉ **Example 55:** If θ, $\phi\ \varepsilon\ \boldsymbol{R}$, then the determinant

$$\Delta = \begin{vmatrix} \cos\theta & -\sin\theta & 1 \\ \sin\theta & \cos\theta & 1 \\ \cos(\theta + \phi) & -\sin(\theta + \phi) & 0 \end{vmatrix}$$

lies in the interval

(a) $\left[-\sqrt{2}, \sqrt{2}\right]$ (b) $[-1, 1]$

(c) $\left[-\sqrt{2}, 1\right]$ (d) $\left[-1, \sqrt{2}\right]$

Ans. (a)

◎ **Solution:** Applying $R_3 \to R_3 - \cos\varphi\, R_1 + \sin\varphi\, R_2$, we get

$$\Delta = \begin{vmatrix} \cos\theta & -\sin\theta & 1 \\ \sin\theta & \cos\theta & 1 \\ 0 & 0 & \sin\varphi - \cos\phi \end{vmatrix}$$

$$= (\sin\varphi - \cos\varphi)\,(\cos^2\theta + \sin^2\theta)$$

$$= \sqrt{2}\left\{\frac{1}{\sqrt{2}}\sin\varphi - \frac{1}{\sqrt{2}}\cos\varphi\right\} = \sqrt{2}\ \sin(\phi - \pi/4)$$

As $-1 \le \sin(\phi - \pi/4) \le 1$, $-\sqrt{2} \le \sqrt{2}\ \sin(\varphi - \pi/4) \le \sqrt{2}$ or $-\sqrt{2} \le \Delta \le \sqrt{2}$.

◉ **Example 56:** If $\Delta_1 = \begin{vmatrix} b+c & a-b & a \\ c+a & b-c & b \\ a+b & c-a & c \end{vmatrix}$ and

$\Delta_2 = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$, then $\Delta_1 - \Delta_2$ equal

(a) 0 (b) $3abc$

(c) $6abc$ (d) $2(a^3 + b^3 + c^3)$

Ans. (a)

◎ **Solution:** Using $C_1 \to C_1 + C_3$ and $C_2 \to C_2 - C_3$ in Δ_1, we get

$$\Delta_1 = \begin{vmatrix} a+b+c & -b & a \\ a+b+c & -c & b \\ a+b+c & -a & c \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 - C_3$, we get

$$\Delta_1 = \begin{vmatrix} c & -b & a \\ a & -c & b \\ b & -a & c \end{vmatrix} = -\begin{vmatrix} a & -b & c \\ b & -c & a \\ c & -a & b \end{vmatrix} = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

$\Rightarrow \Delta_1 = \Delta_2 \Rightarrow \Delta_1 - \Delta_2 = 0.$

◉ **Example 57:** If x, y, z are different from zero and

$$\Delta = \begin{vmatrix} a & b-y & c-z \\ a-x & b & c-z \\ a-x & b-y & c \end{vmatrix} = 0,$$

then the value of the expression $\frac{a}{x} + \frac{b}{y} + \frac{c}{z}$ is

(a) 0 (b) −1

(c) 1 (d) 2

Ans. (d)

◎ **Solution:** Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} a & b-y & c-z \\ -x & y & 0 \\ -x & 0 & z \end{vmatrix} = 0$$

Expanding along C_3, we get

$$(c-z)\begin{vmatrix} -x & y \\ -x & 0 \end{vmatrix} + z\begin{vmatrix} a & b-y \\ -x & y \end{vmatrix} = 0$$

$$\Rightarrow \quad (c-z)(xy) + z(ay + bx - xy) = 0$$

$$\Rightarrow \quad cxy - xyz + ayz + bxz - xyz = 0$$

$$\Rightarrow \quad ayz + bzx + cxy = 2xyz$$

$$\Rightarrow \quad \frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 2$$

Example 58: If $p + q + r = a + b + c = 0$, then the determinant

$$\Delta = \begin{vmatrix} pa & qb & rc \\ qc & ra & pb \\ rb & pc & qa \end{vmatrix} \text{ equals}$$

(a) 0 (b) 1
(c) $pa + qb + rc$ (d) none of these

Ans. (a)

Solution: We have

$$\Delta = pqr(a^3 + b^3 + c^3) - abc(p^3 + q^3 + r^3)$$

But $a + b + c = 0 \Rightarrow (a + b)^3 = -c^3$

$$\Rightarrow \quad a^3 + b^3 + 3ab(a + b) + c^3 = 0$$

$$\Rightarrow \quad a^3 + b^3 + c^3 = -3ab(-c) = 3abc$$

Similarly, $p^3 + q^3 + r^3 = 3pqr$

Thus, $\Delta = pqr(3abc) - abc(3pqr) = 0$

Example 59: The system of equations

$$\lambda x + y + z = 0$$
$$-x + \lambda y + z = 0$$
$$-x - y + \lambda z = 0$$

will have a non-trivial solution if real values of λ are

(a) 0, 1 (b) 0, – 1
(c) 0, 2 (d) 0

Ans. (d)

Solution: The system of equation will have a non-trivial solution if and only if

$\Delta = 0$ where

$$\Delta = \begin{vmatrix} \lambda & 1 & 1 \\ -1 & \lambda & 1 \\ -1 & -1 & \lambda \end{vmatrix} = \lambda^3 + 3\lambda = \lambda(\lambda^2 + 1)$$

Thus, $\Delta = 0$, $\lambda \in \mathbf{R} \Rightarrow \lambda = 0$

Example 60: The values of k for which the system of equations

$$x + ky - 3z = 0 \qquad (1)$$
$$3x + ky - 2z = 0 \qquad (2)$$
$$2x + 3y - 4z = 0 \qquad (3)$$

has a non-trivial solution is (are)

(a) $\frac{21}{10}$ (b) $\frac{31}{10}$
(c) – 5 (d) 4

Ans. (a)

Solution:

From (1) and (2), $2x + z = 0 \Rightarrow 2x = -z$.

From (3), we get $3y = 5z$

$$\therefore \quad x = -\frac{1}{2}z, \; y = \frac{5}{3}z$$

Substituting this in (1) we get

$$-\frac{1}{2}z + \frac{5k}{3}z - 3z = 0. \Rightarrow \left(\frac{5k}{3} - \frac{7}{2}\right)z = 0$$

Now, $\quad z \neq 0 \;\Rightarrow\; k = \frac{21}{10}$.

Example 61: If $a \in \mathbf{R}$ and the system of equations $x + ay = 0$, $az + y = 0$, $ax + z = 0$ has infinite number of solution then the value of a is

(a) – 1 (b) 1
(c) 0 (d) no real value

Ans. (a)

Solution: We have $x = -ay$, therefore

$$-a^2y + z = 0 \Rightarrow z = a^2y.$$

Thus, $\quad az + y = 0 \Rightarrow (a^3 + 1)z = 0.$

For the system of equations to have infinite number of solutions $a^3 + 1 = 0$

$\Rightarrow \quad a = -1 \qquad [\therefore a$ is real$]$

Example 62: Given $2x - y + 2z = 2$,

$$x - 2y + z = -4,$$
$$x + y + \lambda z = 4$$

then the value of λ such that the given system of equations has no solution, is

(a) 3 (b) 1
(c) 0 (d) – 3

Ans. (b)

Solution: From the first two equations, we get

$$x + y = 6 - z$$

Putting this value in the last equation we get

$$6 + (-1 + \lambda)z = 4 = (\lambda - 1)z = -2.$$

For the system of equations to have no solutions, $\lambda = 1$

Example 63: If the system of linear equations

$$x + 2ay + az = 0$$
$$x + 3by + bz = 0$$
$$x + 4cy + cz = 0$$

has a non-zero solution, then a, b, c

(a) are in G.P.
(b) are in H.P.

(c) satisfy $a + 2b + 3c = 0$
(d) are in A.P.

Ans. (b)

◎ **Solution:** The system will have a non-zero solution if

$$\Delta = \begin{vmatrix} 1 & 2a & a \\ 1 & 3b & b \\ 1 & 4c & c \end{vmatrix} = 0$$

Using $C_2 \to C_2 - 2C_3$, we get

$$\Delta = \begin{vmatrix} 1 & 0 & a \\ 1 & b & b \\ 1 & 2c & c \end{vmatrix} = 0$$

$$\Rightarrow \ 1(bc - 2bc) + a(2c - b) = 0 \Rightarrow 2ac = bc + ab$$

$$\Rightarrow \ \frac{2ac}{a+c} = b \Rightarrow a, b, c \text{ are in H.P.}$$

◉ **Example 64:** The system of homogenous equations

$$(a - 1)x + (a + 2)y + az = 0$$
$$(a + 1)x + ay + (a + 2)z = 0$$
$$ax + (a + 1)y + (a - 1)z = 0$$

has a non-trivial solution if a equals

(a) $\frac{1}{2}$ (b) $-\frac{1}{2}$
(c) 2 (d) – 1.

Ans. (b)

◎ **Solution:** The system of equations will have a non-trivial solution if $\Delta = 0$ where

$$\Delta = \begin{vmatrix} a-1 & a+2 & a \\ a+1 & a & a+2 \\ a & a+1 & a-1 \end{vmatrix}$$

Using $C_1 \to C_1 - C_3$ and $C_2 \to C_2 - C_3$, we obtain

$$\Delta = \begin{vmatrix} -1 & 2 & a \\ -1 & -2 & a+2 \\ 1 & 2 & a-1 \end{vmatrix}$$

Using $R_3 \to R_3 + R_2$, we get

$$\Delta = \begin{vmatrix} -1 & 2 & a \\ -1 & -2 & a+2 \\ 0 & 0 & 2a+1 \end{vmatrix} = (2a + 1)\,(2 + 2) = 4(2a + 1)$$

Now, $\Delta = 0 \Rightarrow a = -1/2$.

◉ **Example 65:** The system of equations

$$\alpha x + y + z = \alpha - 1$$
$$x + \alpha y + z = \alpha - 1$$
$$x + y + \alpha z = \alpha - 1$$

has no solution, if α equals

(a) – 2 (b) 1
(c) – 2 (d) either – 2 or 1

Ans. (a)

◎ **Solution:** Let

$$\Delta = \begin{vmatrix} \alpha & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (\alpha + 2)\begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix} = (\alpha + 2)\begin{vmatrix} 1 & 1 & 1 \\ 0 & \alpha - 1 & 0 \\ 0 & 1 & \alpha - 1 \end{vmatrix}$$

[using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$]

$\therefore$ $\Delta = (\alpha + 2)\,(\alpha - 1)^2$

For no solution, $\Delta = 0 \Rightarrow \alpha = -2, 1$.

For $\alpha = 1$, the system of equations has infinite number of solutions.

For $\alpha = -2$, on adding the three equations we obtain

$$0 = -9$$

Thus, system of equations has no solution for $\alpha = -2$.

◉ **Example 66:** Suppose $a, b, c, \alpha \in \mathbf{R}$ and $abc\,\alpha \neq 0$. If the system of equations:

$$(a + \alpha)x + \alpha y + \alpha z = 0 \tag{1}$$
$$\alpha x + (b + \alpha)y + \alpha z = 0 \tag{2}$$
$$\alpha x + \alpha y + (\alpha + c)z = 0 \tag{3}$$

has a non-trivial solution, then $\alpha\left(\frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right)$ is equal to

(a) – 1 (b) 0
(c) abc (d) $bc + ca + ab$

Ans. (a)

◎ **Solution:** From (1) and (2)

$$ax - by = 0$$

and from (2) and (3)

$$ax - cz = 0$$

$\therefore$ $ax = by = cz$

$$\Rightarrow \ \frac{x}{1/a} = \frac{y}{1/b} = \frac{z}{1/c}$$

Putting in (1) we get

$$\frac{a+\alpha}{a} + \frac{\alpha}{b} + \frac{\alpha}{c} = 0$$

$$\Rightarrow \ \alpha\left(\frac{1}{a} + \frac{1}{b} + \frac{1}{c}\right) = -1$$

◉ **Example 67:** Suppose $a, b, \in \mathbf{R}$ and $a, b \neq 1$. If the system of equations:

$$ax + y + z = 0 \tag{1}$$
$$x + by + z = 0 \tag{2}$$
$$x + y + 2z = 0 \tag{3}$$

has a non-trivial solution, then

(a) $a + b = 2$ (b) $a + b = ab$

(c) $a + \frac{1}{b} = 2$ (d) $a + b = 0$

Ans. (a)

Solution: From (1) and (3)

$$(a - 1)x - z = 0$$

and from (2) and (3)

$$(b - 1)y = z$$

$$\therefore \quad \frac{x}{\frac{1}{(1-a)}} = \frac{y}{\frac{1}{(1-b)}} = \frac{z}{1}$$

Putting in (1) we get

$$\frac{a}{1-a} + \frac{1}{1-b} + 1 = 0$$

$$\Rightarrow \quad \frac{a}{1-a} = -\frac{1}{1-b}$$

$$\Rightarrow \quad 1 - b = -1 + a$$

$$\Rightarrow \quad a + b = 2$$

Example 68: If $a^2 + b^2 + c^2 = -2$ and

$$f(x) = \begin{vmatrix} 1+a^2x & (1+b^2)x & (1+c^2)x \\ (1+a^2)x & 1+b^2x & (1+c^2)x \\ (1+a^2)x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

then $f(x)$ is a polynomial of degree

(a) 3 (b) 2

(c) 1 (d) 0

Ans. (b)

Solution: Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 1 & 1+b^2x & (1+c^2)x \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

[using $a^2 + b^2 + c^2 = -2$]

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 0 & 1-x & 0 \\ 0 & 0 & 1-x \end{vmatrix} = (1 - x)^2$$

which is a polynomial of degree 2.

Example 69:

$$\text{Let} \quad f(x) = \begin{vmatrix} \sec x & \cos x & \sec^2 x + \cot x \operatorname{cosec}^2 x \\ \cos^2 x & \cos^2 x & \operatorname{cosec}^2 x \\ 1 & \cos^2 x & \operatorname{cosec}^2 x \end{vmatrix}$$

then value of $\int_{\pi/4}^{\pi/2} f(x)dx$ is

(a) 0 (b) $\pi/48$

(c) $-\frac{\pi}{2} - \frac{\pi}{15\sqrt{2}}$ (d) none of these

Ans. (d)

Solution: Applying $R_2 \to R_2 - R_3$, we get

$$f(x) = \begin{vmatrix} \sec x & \cos x & \sec^2 x + \cot x \operatorname{cosec}^2 x \\ -\sin^2 x & 0 & 0 \\ 1 & \cos^2 x & \operatorname{cosec}^2 x \end{vmatrix}$$

$$= -(-\sin^2 x) \begin{vmatrix} \cos x & \sec^2 x + \cot x \operatorname{cosec}^2 x \\ \cos^2 x & \operatorname{cosec}^2 x \end{vmatrix}$$

$$= \sin^2 x [\cos x \operatorname{cosec}^2 x - \cos^2 x (\sec^2 x + \cot x \operatorname{cosec}^2 x)]$$

$$= \cos x - \sin^2 x - \frac{\cos^3 x}{\sin x}$$

$$= \cos x - \frac{1}{2} (1 - \cos 2x) - \left(\frac{1}{\sin x} - \sin x\right) \cos x$$

$$\text{Thus, } \int_{\pi/4}^{\pi/2} f(x)\, dx = \int_{\pi/4}^{\pi/2} \cos x\, dx - \frac{1}{2} \int_{\pi/4}^{\pi/2} dx + \frac{1}{2} \int_{\pi/4}^{\pi/2} \cos 2x\, dx - \int_{\pi/4}^{\pi/2} \left(\frac{1}{\sin x} - \sin x\right) \cos x dx$$

$$= 1 - \frac{1}{\sqrt{2}} - \frac{1}{2}\left(\frac{\pi}{2} - \frac{\pi}{4}\right) + \frac{1}{4}(0 - 1) - \left[\left(\log|t| - \frac{t^2}{2}\right)\right]_{1/\sqrt{2}}^{1}$$

where $t = \sin x$

$$= 1 - \frac{1}{\sqrt{2}} - \frac{\pi}{8} - \frac{1}{2}\log 2$$

Example 70: If $a + b + c = 0$, then a root of the equation

$$\Delta = \begin{vmatrix} a-x & c & b \\ c & b-x & a \\ b & a & c-x \end{vmatrix} = 0 \text{ is}$$

(a) 1 (b) -1

(c) $a^2 + b^2 + c^2$ (d) 0

Ans. (d)

Solution: Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} a+b+c-x & c & b \\ a+b+c-x & b-x & a \\ a+b+c-x & a & c-x \end{vmatrix}$$

$$= \begin{vmatrix} -x & c & b \\ -x & b-x & a \\ -x & a & c-x \end{vmatrix} \quad [\because a + b + c = 0]$$

Δ clearly equals 0 when $x = 0$.

It is unnecessary to evaluate the determinant further.

Example 71: A root of the equation

$$\Delta = \begin{vmatrix} 0 & x-a & x-b \\ x+a & 0 & x-c \\ x+b & x+c & 0 \end{vmatrix} = 0 \text{ is}$$

(a) $\frac{1}{2}(a+b+c)$ (b) 0

(c) –1 (d) 1

Ans. (b)

Solution: When we substitute $x = 0$, Δ becomes

$$\begin{vmatrix} 0 & -a & -b \\ a & 0 & -c \\ b & c & 0 \end{vmatrix}$$

which is equal to 0 as Δ is skew symmetric determinant of odd order.

Alternative Solution

Evaluating Δ along R_1, we get

$$-(x-a)\begin{vmatrix} x+a & x-c \\ x+b & 0 \end{vmatrix} + (x-b)\begin{vmatrix} x+a & 0 \\ x+b & x+c \end{vmatrix} = 0$$

$\Rightarrow$ $(x-a)(x+b)(x-c) + (x-b)(x+a)(x+c) = 0$

$\Rightarrow$ $x^3 + (-a+b-c)x^2 + (-ab+ac-bc)x + abc + x^3 + (a-b+c)x^2 + (-ab+ac-bc) - abc = 0$

$\Rightarrow$ $2x^3 - 2(ab-ac+bc)x = 0$

$\Rightarrow$ $2x[x^2 - (ab-ac+bc)] = 0$

$\Rightarrow$ $x = 0$ or $x = \pm\sqrt{ab-ac+bc}$

$\therefore$ one of the roots of the equation is 0.

Example 72: If α, β, γ are three real numbers such that $\alpha+\beta+\gamma = 0$, then

$$\Delta = \begin{vmatrix} 1 & \cos\gamma & \cos\beta \\ \cos\gamma & 1 & \cos\alpha \\ \cos\beta & \cos\alpha & 1 \end{vmatrix} \text{ equals}$$

(a) – 1 (b) 0

(c) 1 (d) $\cos\alpha\cos\beta\cos\gamma$

Ans. (b)

Solution: Let A, B and C be three real numbers such that $\alpha = B - C$, $\beta = C - A$ and $\gamma = A - B$, clearly $\alpha+\beta+\gamma = 0$. We have

$$\Delta = \begin{vmatrix} 1 & \cos(A-B) & \cos(C-A) \\ \cos(A-B) & 1 & \cos(B-C) \\ \cos(C-A) & \cos(B-C) & 1 \end{vmatrix}$$

$$= \begin{vmatrix} \cos^2 A+\sin^2 A & \cos A\cos B+\sin A\sin B & \cos C\cos A+\sin A\sin C \\ \cos A\cos B+\sin A\sin B & \cos^2 B+\sin^2 B & \cos B\cos C+\sin B\sin C \\ \cos C\cos A+\sin C\sin A & \cos B\cos C+\sin B\sin C & \cos^2 C+\sin^2 C \end{vmatrix}$$

$$= \begin{vmatrix} \cos A & \sin A & 0 \\ \cos B & \sin B & 0 \\ \cos C & \sin C & 0 \end{vmatrix}\begin{vmatrix} \cos A & \sin A & 0 \\ \cos B & \sin B & 0 \\ \cos C & \sin C & 0 \end{vmatrix} = (0)\,(0) = 0.$$

Example 73: If a, b, c are the sides of a ΔABC opposite angles A, B, C respectively, and

$$\Delta = \begin{vmatrix} a^2 & b\sin A & c\sin A \\ b\sin A & 1 & \cos(B-C) \\ c\sin A & \cos(B-C) & 1 \end{vmatrix}, \text{ then } \Delta \text{ equals}$$

(a) $\sin A - \sin C \sin B$ (b) abc

(c) 1 (d) 0

Ans. (d)

Solution: By the law of sines

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = k \text{ (say)}$$

$\Rightarrow a = k\sin A$, $b = k\sin B$, $c = k\sin C$. Now

$$\Delta = \begin{vmatrix} a^2 & ab/k & ac/k \\ ab/k & 1 & \cos(B-C) \\ ac/k & \cos(B-C) & 1 \end{vmatrix}$$

$$= a^2\begin{vmatrix} 1 & \sin B & \sin C \\ \sin B & 1 & \cos(B-C) \\ \sin C & \cos(B-C) & 1 \end{vmatrix}$$

$$= a^2\begin{vmatrix} 1 & \sin(A+C) & \sin(A+B) \\ \sin(A+C) & 1 & \cos(B-C) \\ \sin(A+B) & \cos(B-C) & 1 \end{vmatrix}$$

$$= a^2\begin{vmatrix} \sin A & \cos A & 0 \\ \cos C & \sin C & 0 \\ \cos B & \sin B & 0 \end{vmatrix}\begin{vmatrix} \sin A & \cos A & 0 \\ \cos C & \sin C & 0 \\ \cos B & \sin B & 0 \end{vmatrix}$$

$$= a^2(0) = 0$$

Example 74: If a, b, c are distinct, and $\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^3 & b^3 & c^3 \end{vmatrix}$ $= (b-c)(c-a)(a-b)(a+b+c)$

then $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ (x-a)^2 & (x-b)^2 & (x-c)^2 \\ (x-b)(x-c) & (x-c)(x-a) & (x-a)(x-b) \end{vmatrix}$

vanishes if

(a) $x = \frac{1}{3}(a+b+c)$

(b) $x = \frac{2}{3}(a+b+c)$

(c) $x = a+b+c$

(d) none of these

Ans. (a)

◎ **Solution:** Multiplying C_1 by $(x-a)$, C_2 by $(x-b)$ and C_3 by $(x-c)$, we get

$$\Delta = \frac{1}{ABC}\begin{vmatrix} A & B & C \\ A^3 & B^3 & C^3 \\ ABC & ABC & ABC \end{vmatrix}$$

where $A = x-a$, $B = x-b$, $C = x-c$.

$$\Delta = \begin{vmatrix} A & B & C \\ A^3 & B^3 & C^3 \\ 1 & 1 & 1 \end{vmatrix} = (-1)(-1)\begin{vmatrix} 1 & 1 & 1 \\ A & B & C \\ A^3 & B^3 & C^3 \end{vmatrix}$$

$$= (B-C)(C-A)(A-B)(A+B+C)$$

$$= (c-b)(a-b)(b-a)[3x-(a+b+c)]$$

Note that Δ become 0 when $x = \frac{1}{3}(a+b+c)$

◉ **Example 75:** The equation

$$\Delta = \begin{vmatrix} x-a & x-b & x-c \\ x-b & x-c & x-a \\ x-c & x-a & x-b \end{vmatrix} = 0$$

is satisfied when

(a) $x = \frac{1}{3}(a+b+c)$ (b) $x = \frac{1}{2}(a+b+c)$

(c) $x = a+b+c$ (d) $x = 0$

Ans. (a)

◎ **Solution:** Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = \begin{vmatrix} 3x-(a+b+c) & x-b & x-c \\ 3x-(a+b+c) & x-c & x-a \\ 3x-(a+b+c) & x-a & x-b \end{vmatrix}$$

Note that Δ becomes 0 when $x = \frac{1}{3}(a+b+c)$.

◉ **Example 76:** If α, β, γ are different from 1 and are the roots of $ax^3 + bx^2 + cx + d = 0$ and $(\beta-\gamma)(\gamma-\alpha)(\alpha-\beta) = 25/2$, then the determinant

$$\Delta = \begin{vmatrix} \dfrac{\alpha}{1-\alpha} & \dfrac{\beta}{1-\beta} & \dfrac{\gamma}{1-\gamma} \\ \alpha & \beta & \gamma \\ \alpha^2 & \beta^2 & \gamma^2 \end{vmatrix} \text{ equals}$$

(a) $\frac{25\,d}{2a}$ (b) $\frac{25\,d}{a}$

(c) $\frac{-25d}{a+b+c+d}$ (d) none of these

Ans. (d)

◎ **Solution:** Taking α, β, γ common from C_1, C_2, C_3 respectively, we get

$$\Delta = \alpha\beta\gamma\begin{vmatrix} \dfrac{1}{1-\alpha} & \dfrac{1}{1-\beta} & \dfrac{1}{1-\gamma} \\ 1 & 1 & 1 \\ \alpha & \beta & \gamma \end{vmatrix}$$

$$= \alpha\beta\gamma\begin{vmatrix} \dfrac{1}{1-\alpha} & \dfrac{1}{1-\beta}-\dfrac{1}{1-\alpha} & \dfrac{1}{1-\gamma}-\dfrac{1}{1-\alpha} \\ 1 & 0 & 0 \\ \alpha & \beta-\alpha & \gamma-\alpha \end{vmatrix}$$

[using $C_2 \to C_2 - C_1$, and $C_3 \to C_3 - C_1$]

$$= \frac{\alpha\beta\gamma(-1)(\beta-\alpha)(\gamma-\alpha)}{(1-\alpha)(1-\beta)(1-\gamma)}\begin{vmatrix} 1-\gamma & 1-\beta \\ 1 & 1 \end{vmatrix}$$

$$= \frac{\alpha\beta\gamma(\alpha-\beta)(\beta-\gamma)(\gamma-\alpha)}{(1-\alpha)(1-\beta)(1-\gamma)}$$

As α, β, γ are the roots of $ax^3 + bx^2 + cx + d = 0$,

$ax^3 + bx^2 + cx + d = a(x-\alpha)(x-\beta)(x-\gamma)$

and $\alpha\beta\gamma = -d/a$

Thus, $\Delta = \dfrac{(-d/a)(25/2)}{(a+b+c+d)/a} = -\dfrac{25d}{2(a+b+c+d)}$

◉ **Example 77:** Let $P = [a_{ij}]$ be a 3×3 matrix and $Q = [b_{ij}]$, where $b_{ij} = 2^{i+j}a_{ij}$ for $1 \le i, j \le 3$. If the determinant of P is 2, then the determinant of the matrix Q is

(a) 2^{10} (b) 2^{11}

(c) 2^{12} (d) 2^{13}

Ans. (d)

◎ **Solution:**

$$\det(Q) = \begin{vmatrix} 2^2 a_{11} & 2^3 a_{12} & 2^4 a_{13} \\ 2^3 a_{21} & 2^4 a_{22} & 2^5 a_{23} \\ 2^4 a_{31} & 2^5 a_{32} & 2^6 a_{33} \end{vmatrix}$$

$$= (2^2)(2^3)(2^4)\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ 2a_{21} & 2a_{22} & 2a_{23} \\ 2^2a_{31} & 2^2a_{32} & 2^2a_{33} \end{vmatrix}$$

$$= 2^9\,(2)\,(2^2)\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = 2^{12}\det(P) = 2^{13}$$

◉ **Example 78:** If x is a positive integer, and $\Delta(x) = \begin{vmatrix} x! & (x+1)! & (x+2)! \\ (x+1)! & (x+2)! & (x+3)! \\ (x+2)! & (x+3)! & (x+4)! \end{vmatrix}$, then $\Delta(x)$ is equal to

(a) $2x!\,(x+1)!$
(b) $2x!\,(x+1)!\,(x+2)!$
(b) $2x!\,(x+3)!$
(d) $2(x+1)!\,(x+2)!\,(x+3)!$

Ans. (b)

◎ **Solution:** Taking $x!$ common from R_1, $(x+1)!$ from R_2 and $(x+2)!$ from R_3 to obtain

$$\Delta(x) = x!\,(x+1)!\,(x+2)!\,\Delta_1(x) \text{ where}$$

$$\Delta_1(x) = \begin{vmatrix} 1 & x+1 & (x+1)(x+2) \\ 1 & x+2 & (x+2)(x+3) \\ 1 & x+3 & (x+3)(x+4) \end{vmatrix}$$

Applying $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta_1(x) = \begin{vmatrix} 1 & x+1 & (x+1)(x+2) \\ 0 & 1 & 2(x+2) \\ 0 & 1 & 2(x+3) \end{vmatrix} = 2$$

◉ **Example 79:** Let a, b, c be such that $b(a+c) \neq 0$.

$$\text{If } \Delta = \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix}$$

$$+ \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^n c \end{vmatrix} = 0$$

Then the value of n is

(a) any odd integer
(b) any integer
(c) zero
(d) any even integer

Ans. (a)

◎ **Solution:** Let $\Delta_2 = \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^n c \end{vmatrix}$

$$= \begin{vmatrix} a+1 & a-1 & (-1)^{n+2}a \\ b+1 & b-1 & (-1)^{n+1}b \\ c-1 & c+1 & (-1)^n c \end{vmatrix}$$

[using the reflection property]

$$= (-1)^2\begin{vmatrix} (-1)^{n+2}a & a+1 & a-1 \\ (-1)^{n+1}b & b+1 & b-1 \\ (-1)^n c & c-1 & c+1 \end{vmatrix}$$

Thus,

$$\Delta = \begin{vmatrix} a+(-1)^{n+2}a & a+1 & a-1 \\ -b+(-1)^{n+1}b & b+1 & b-1 \\ c+(-1)^n c & c-1 & c+1 \end{vmatrix}$$

The first column consists of all 0's if n is any odd integer.
$\therefore\ \Delta = 0$ if n is any odd integer.

◉ **Example 80:** Let ω be the complex number $\cos\dfrac{2\pi}{3} + i\sin\dfrac{2\pi}{3}$. Then the number of distinct complex number z satisfying $\begin{vmatrix} z+1 & \omega & \omega^2 \\ \omega & z+\omega^2 & 1 \\ \omega^2 & 1 & z+\omega \end{vmatrix} = 0$ is

(a) 1 (b) 0
(c) 2 (d) 3

Ans. (a)

◎ **Solution:** Denote the given determinant by Δ.
Using $C_1 \to C_1 + C_2 + C_3$ and $1 + \omega + \omega^2 = 0$, we get

$$\Delta = z\begin{vmatrix} 1 & \omega & \omega^2 \\ 1 & z+\omega^2 & 1 \\ 1 & 1 & z+\omega \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$$\Delta = z\begin{vmatrix} 1 & \omega & \omega^2 \\ 0 & z+\omega^2-\omega & 1-\omega^2 \\ 0 & 1-\omega & z+\omega-\omega^2 \end{vmatrix}$$

$$= z[(z+\omega^2-\omega)(z+\omega-\omega^2) - (1-\omega)(1-\omega^2)]$$
$$= z[z^2 - (\omega^2-\omega)^2 - (1-\omega-\omega^2+1)]$$
$$= z[z^2 - (\omega^4+\omega^2-2\omega^3) - 3] = z(z^2) = z^3$$

Thus, $z^3 = 0 \Rightarrow z = 0$

Thus, there is just one value of z, satisfying the given equation.

Assertion-Reason Type Questions

Example 81: Let $\Delta_n = \begin{vmatrix} a_n & a_{n+3} & a_{n+6} \\ a_{n+1} & a_{n+4} & a_{n+7} \\ a_{n+2} & a_{n+5} & a_{n+8} \end{vmatrix}$

Statement-1: If $a_k > 0 \ \forall \ k \geq 1$ and $a_1, a_2, a_3, \ldots$ are in G.P. then

$$\Delta_n = 0 \ \forall \ n \geq 1.$$

Statement-2: If $a_1, a_2, a_3 \ldots$ are in A.P. then

$$\Delta_n = 0 \ \forall \ n \geq 1.$$

Ans. (b)

Solution: Let $a_k = ar^{k-1} \ \forall \ k \geq 1$, then

$$\Delta_n = a_n a_{n+3}\, a_{n+6} \begin{vmatrix} 1 & 1 & 1 \\ r & r & r \\ r^2 & r^2 & r^2 \end{vmatrix} = 0$$

Next, if $a_k = b + (k-1)d$, then using $C_2 \to C_3 - C_1$ and $C_2 \to C_2 - C_1$, we get

$$\Delta_n = \begin{vmatrix} a_n & 3d & 3d \\ a_{n+1} & 3d & 3d \\ a_{n+2} & 3d & 3d \end{vmatrix} = 0$$

[$\because$ C_2 and C_3 are identical]

Example 82: Let $f(x) = \begin{vmatrix} 0 & \cos x & -\sin x \\ \sin x & 0 & \cos x \\ \cos x & \sin x & 0 \end{vmatrix}^2$.

Statement-1: If $\sin 2x = 1$, then $f(x) = 2/3$

Statement-2: $f(x) = 0$ if $\sin x = \cos x$

Ans. (d)

Solution: Multiplication of two determinants leads us

$$f(x) = \begin{vmatrix} 1 & -y & y \\ -y & 1 & y \\ y & y & 1 \end{vmatrix}$$

where $y = \sin x \cos x$

Using $C_1 \to C_1 - C_2$, $C_2 \to C_2 + C_3$, we get

$$f(x) = (1+y)^2 \begin{vmatrix} 1 & 0 & y \\ -1 & 1 & y \\ 0 & 1 & 1 \end{vmatrix} = (1+y)^2 \begin{vmatrix} 1 & 0 & y \\ 0 & 1 & 2y \\ 0 & 1 & 1 \end{vmatrix}$$

$$= (1+y)^2 (1 - 2y)$$

When $\sin 2x = 1$, $y = 1/2$ and $f(x) = 0$

When $\sin x = \cos x$, $1 - 2y = 1 - 2\sin^2 x = \cos 2x = 0$

$\therefore \quad f(x) = 0.$

Example 83: Suppose $x > 0$, $y > 0$, $z > 0$ and

$$\Delta(a, b, c) = \begin{vmatrix} x\log 2 & 3 & 15 + \log(a^x) \\ y\log 3 & 5 & 25 + \log(b^y) \\ z\log 5 & 7 & 35 + \log(c^z) \end{vmatrix}$$

Statement-1: $\Delta(8, 27, 125) = 0$

Statement-2: $\Delta\left(\frac{1}{2}, \frac{1}{3}, \frac{1}{5}\right) = 0$

Ans. (b)

Solution: Using $\log(b^c) = c \log b$ and applying $C_3 \to C_3 - 5C_2$ we get

$$\Delta(a, b, c) = \begin{vmatrix} x\log 2 & 3 & x\log a \\ y\log 3 & 5 & y\log b \\ z\log 5 & 7 & z\log c \end{vmatrix}$$

$\Delta(8, 27, 125) = \Delta(2^3, 3^3, 5^3) = 0$ as in this case C_1 and C_3 are proportional. Similarly, $\Delta(1/2, 1/3, 1/5) = \Delta(2^{-1}, 3^{-1}, 5^{-1}) = 0$.

Example 84: Let $a \neq 0$, $p \neq 0$ and

$$\Delta = \begin{vmatrix} a & b & c \\ 0 & p & q \\ p & q & 0 \end{vmatrix}$$

Statement-1: If the equations

$$ax^2 + bx + c = 0 \text{ and } px + q = 0$$

have a common root, then $\Delta = 0$.

Statement-2: If $\Delta = 0$, then the equations

$$ax^2 + bx + c = 0 \text{ and } px + q = 0$$

have a common root.

Ans. (b)

Solution: If λ is a common root of

$$ax^2 + bx + c = 0 \text{ and } px + q = 0, \text{ then}$$

$$a\lambda^2 + b\lambda + c = 0,\ p\lambda + q = 0 \text{ and } p\lambda^2 + q\lambda = 0$$

Eliminating λ, we obtained $\Delta = 0$.

For statement-2, expanding Δ along C_1 we obtain

$-aq^2 + p(bq - cp) = 0$

or $$a\left(-\frac{q}{p}\right)^2 + b\left(-\frac{q}{p}\right) + c = 0$$

Thus, $ax^2 + bx + c = 0$ and $px + q = 0$ have a common root.

Example 85: Statement-1:

$$\Delta = \begin{vmatrix} \sin\pi & \cos(x + \pi/4) & \tan(x - \pi/4) \\ \sin(x - \pi/4) & -\cos(\pi/2) & \log(x/y) \\ \cot(\pi/4 + x) & \log(y/x) & \tan\pi \end{vmatrix} = 0$$

Statement-2: A skew symmetric determinant of odd order equals 0.
Ans. (a)

◎ **Solution:** For statement-2, see theory.
Now, using

$$\cos\left(x+\frac{\pi}{4}\right) = \cos\left[\frac{\pi}{2}-\left(\frac{\pi}{4}-x\right)\right]$$

$$= \sin\left(\frac{\pi}{4}-x\right) = -\sin\left(x-\frac{\pi}{4}\right);$$

$$\cot\left(\frac{\pi}{4}+x\right) = \cot\left[\frac{\pi}{2}-\left(\frac{\pi}{4}-x\right)\right]$$

$$= \tan\left(\frac{\pi}{4}-x\right) = -\tan\left(x-\frac{\pi}{4}\right),$$

and $\log(x/y) = -\log(y/x)$

we find Δ is a skew symmetric determinant of odd order.

◉ **Example 86:** Let $f: Q \to [-1, 1]$ by
$f(x) = \sin x$

Let x_1, x_2, x_3 be three distinct rational numbers. Let $a = f(x_1)$, $b = f(x_2)$, $c = f(x_3)$.

Statement-1:

$$\Delta = \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} \neq 0$$

Statement-2: f is a one-to-one function.
Ans. (a)

◎ **Solution:** Let $x_1, x_2 \in \mathbf{Q}$ be such that

$$f(x_1) = f(x_2)$$

$\Rightarrow \quad \sin x_1 = \sin x_2$

$\Rightarrow \quad x_1 = n\pi + (-1)^n x_2,\ n \in \mathbf{I}$

$\Rightarrow \quad x_1 + (-1)^{n+1} x_2 = n\pi,\ n \in \mathbf{I}.$

But LHS is rational and RHS is irrational except when $n = 0$.

$\therefore \quad x_1 = x_2$

Thus, f is one-to-one.

Also, $\quad \Delta = (a-b)(b-c)(c-a) \neq 0$

as x_1, x_2, x_3 are distinct and hence a, b, c are distinct.

◉ **Example 87:** Let

$$f(x) = \begin{vmatrix} x^2+3x & x-1 & x+3 \\ x+1 & -2x & x-4 \\ x-3 & x+4 & 3x \end{vmatrix}$$

$$= ax^4 + bx^3 + cx^2 + dx + e$$

Statement-1: $a = -1$
Statement-2: $e = f(0)$

Ans. (a)

◎ **Solution:** $e = f(0) = \begin{vmatrix} 0 & -1 & 3 \\ 1 & 0 & -4 \\ -3 & 4 & 0 \end{vmatrix}$
$= 0$

[skew symmetric determinant of odd order]

$\therefore$ Statement-2 is true.

To obtain a, replace x by $\frac{1}{x}$, so that

$$\begin{vmatrix} \left(\frac{1}{x}\right)^2+\frac{3}{x} & \frac{1}{x}-1 & \frac{1}{x}+3 \\ \frac{1}{x}+1 & -\frac{2}{x} & \frac{1}{x}-4 \\ \frac{1}{x}-3 & \frac{1}{x}+4 & \frac{3}{x} \end{vmatrix}$$

$$a\left(\frac{1}{x}\right)^4 + b\left(\frac{1}{x}\right)^3 + c\left(\frac{1}{x}\right)^2 + d\left(\frac{1}{x}\right) + e$$

Take x^2 common from C_1, x from C_2 and C_3

$$= \frac{1}{x^4}\begin{vmatrix} 1+3x & 1-x & 1+3x \\ x+x^2 & -2 & 1-4x \\ x-3x^2 & 1+4x & 3x \end{vmatrix}$$

$$= \frac{1}{x^4}\left[a + bx + cx^2 + dx^3 + ex^4\right]$$

Cancel $1/x^4$ and put $x = 0$ to obtain

$$\begin{vmatrix} 1 & 1 & 1 \\ 0 & -2 & 1 \\ 0 & 1 & 0 \end{vmatrix} = a$$

$\Rightarrow \quad a = -1$

◉ **Example 88:** **Statement-1:** The system of line equations

$x + (\sin\alpha)\,y + (\cos\alpha)\,z = 0$
$x + (\cos\alpha)\,y + (\sin\alpha)\,z = 0$
$x - (\sin\alpha)\,y - (\cos\alpha)\,z = 0$

has a non-trivial solution for only one value of α lying in the interval $(0, \pi/2)$.

Statement-2: The equation in α

$$\Delta = \begin{vmatrix} \cos\alpha & \sin\alpha & \cos\alpha \\ \sin\alpha & \cos\alpha & \sin\alpha \\ \cos\alpha & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

has only one solution lying in the interval $(0, \pi/2)$.
Ans. (b)

◎ **Solution:** Using $C_1 \to C_1 - C_3$ in Δ, we get

$$\Delta = \begin{vmatrix} 0 & \sin\alpha & \cos\alpha \\ 0 & \cos\alpha & \sin\alpha \\ 2\cos\alpha & -\sin\alpha & -\cos\alpha \end{vmatrix}$$

$$= 2\cos\alpha\,(\sin^2\alpha - \cos^2\alpha)$$

$$= -2\cos\alpha\cos 2\alpha$$

$$\Delta = 0 \text{ for } \alpha = \pi/4 \in (0, \pi/2).$$

This is the only value of α lying in $(0, \pi/2)$ for which $\Delta = 0$.

The system of linear equations will have a non-trivial solution if and only if

$$\Delta_1 = \begin{vmatrix} 1 & \sin\alpha & \cos\alpha \\ 1 & \cos\alpha & \sin\alpha \\ 1 & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

Using $R_2 \to R_2 + R_1$, we get

$$\Delta_1 = \begin{vmatrix} 2 & 0 & 0 \\ 1 & \cos\alpha & \sin\alpha \\ 1 & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

$$\Rightarrow \quad 2(-\cos^2\alpha + \sin^2\alpha) = 0$$

$$\Rightarrow \quad -2\cos 2\alpha = 0$$

This is true for only one value of $\alpha \in (0, \pi/2)$ viz, $\alpha = \pi/4$.

Thus, statement-1 is also true. However, statement-2 is not a correct reason for statement-1.

LEVEL 2

Straight Objective Type Questions

Example 89: Consider the system of equations in x, y, z:

$$(\sin 3\theta)\, x - y + z = 0$$
$$(\cos 2\theta)\, x + 4y + 3z = 0$$
$$2x + 7y + 7z = 0$$

The values of θ for which the system has a non-trivial solution are given by

(a) $\pi\left(n + \frac{1}{3}(-1)^n\right)$ (b) $\pi\left(n + \frac{1}{4}(-1)^n\right)$

(b) $\pi\left(n + \frac{1}{6}(-1)^n\right)$ (d) $\frac{n\pi}{2}$

where n is an integer

Ans. (c)

Solution: For the system of equations to have a non-trivial solution we must have

$$\Delta = \begin{vmatrix} \sin 3\theta & -1 & 1 \\ \cos 2\theta & 4 & 3 \\ 2 & 7 & 7 \end{vmatrix} = 0$$

Using $R_2 \to R_2 + 4R_1$ and $R_3 \to R_3 + 7R_1$ we get

$$\Delta = \begin{vmatrix} \sin 3\theta & -1 & 1 \\ \cos 2\theta + 4\sin 3\theta & 0 & 7 \\ 2 + 7\sin 3\theta & 0 & 14 \end{vmatrix} = 0$$

$$\Rightarrow \quad 2(\cos 2\theta + 4\sin 3\theta) - (2 + 7\sin 3\theta) = 0$$

$$\Rightarrow \quad \sin 3\theta + 2\cos 2\theta - 2 = 0$$

$$\Rightarrow \quad 3\sin\theta - 4\sin^3\theta - 4\sin^2\theta = 0$$

$$\Rightarrow \quad \sin\theta(2\sin\theta + 3)(2\sin\theta - 1) = 0$$

$$\Rightarrow \quad \sin\theta = 0 \text{ or } \sin\theta = 1/2 \qquad [\because |\sin\theta| \le 1]$$

$$\Rightarrow \quad \theta = m\pi \text{ or } \theta = n\left(\pi + \frac{(-1)^n}{6}\right) \text{ where } m \text{ and } n \text{ are integers}$$

Example 90:

Let $$\Delta(x) = \begin{vmatrix} 3 + 2\sin^4 x & 2\cos^4 x & \sin^2 2x \\ 2\sin^4 x & 3 + 2\cos^4 x & \sin^2 2x \\ 2\sin^4 x & 2\cos^4 x & 3 + \sin^2 2x \end{vmatrix}$$

then $\int_{-\pi/2}^{\pi/2} x\Delta(x)dx$ equals

(a) π^2 (b) $\pi(\pi - 1)$
(c) 1 (d) 0

Ans. (d)

Solution: Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta(x) = f(x)\begin{vmatrix} 1 & 2\cos^4 x & \sin^2 2x \\ 1 & 3 + 2\cos^4 x & \sin^2 2x \\ 1 & 2\cos^4 x & 3 + \sin^2 2x \end{vmatrix}$$

where $$f(x) = 3 + 2\sin^4 x + 2\cos^4 x + \sin^2 2x$$
$$= 3 + 2(\sin^4 x + \cos^4 x + 2\sin^2 x\cos^2 x)$$
$$= 3 + 2(\cos^2 x + \sin^2 x)^2 = 5$$

Applying $C_2 \to C_2 - (2\cos^4 x)\, C_1$ and $C_3 \to C_3 - (\sin^2 2x)\, C_1$, we get

$$\Delta(x) = 5\begin{vmatrix} 1 & 0 & 0 \\ 1 & 3 & 0 \\ 1 & 0 & 3 \end{vmatrix} = 45$$

Thus, $\int_{-\pi/2}^{\pi/2} x\Delta(x)dx = 45\int_{-\pi/2}^{\pi/2} xdx = 0$

Example 91: If $f(x)$, $g(x)$and $h(x)$ are three polynomials of degree 3 then

$$\phi(x) = \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \\ f'''(x) & g'''(x) & h'''(x) \end{vmatrix}$$

is a polynomial of degree

(a) 3 (b) 4
(c) 5 (d) none of these

Ans. (d)

◎ **Solution:** We have

$$\phi'(x) = \begin{vmatrix} f''(x) & g''(x) & h''(x) \\ f''(x) & g''(x) & h''(x) \\ f'''(x) & g'''(x) & h'''(x) \end{vmatrix} + \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f'''(x) & g'''(x) & h'''(x) \\ f'''(x) & g'''(x) & h'''(x) \end{vmatrix} + \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \\ f^{iv}(x) & g^{iv}(x) & h^{iv}(x) \end{vmatrix}$$

$$= 0 + 0 + \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f''(x) & g''(x) & h''(x) \\ 0 & 0 & 0 \end{vmatrix} = 0$$

since f, g, h are polynomials of degree 3, $f^{iv}(x) = g^{iv}(x) = h^{iv}(x) = 0$

$\Rightarrow \phi(x)$ must be a constant.

◉ **Example 92:** The determinant

$$\Delta = \begin{vmatrix} a & a+b & a+2b \\ a+2b & a & a+b \\ a+b & a+2b & a \end{vmatrix}$$

equals

(a) $9b^2(a+b)$ (b) $9a^2(a+b)$
(c) $9(a+b)^3$ (d) $9ab(a+b)$

Ans. (a)

◎ **Solution:** Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = 3(a+b)\begin{vmatrix} 1 & a+b & a+2b \\ 1 & a & a+b \\ 1 & a+2b & a \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$,

$$\Delta = 3(a+b)\begin{vmatrix} 1 & a+b & a+2b \\ 0 & -b & -b \\ 0 & b & -2b \end{vmatrix}$$

$$= 3(a+b)\begin{vmatrix} -b & -b \\ b & -2b \end{vmatrix} = 9b^2(a+b)$$

◉ **Example 93:** Let

$$\Delta(x) = \begin{vmatrix} \sin x & \cos x & \sin 2x + \cos 2x \\ 0 & 1 & 1 \\ 1 & 0 & -1 \end{vmatrix}$$

then $\Delta'(x)$ vanishes at least once in

(a) $(0, \pi/2)$ (b) $(\pi/2, \pi)$
(c) $(0, \pi/4)$ (d) $(-\pi/2, 0)$

Ans. (a)

◎ **Solution:** The function $\Delta(x)$ is continuous on $[0, \pi/2]$ and differentiable on $(0, \pi/2)$. Also $\Delta(0) = 0$ and $\Delta(\pi/2) = 0$. Thus, by the Rolle's theorem there exists at least one $c \,\varepsilon\, (0, \pi/2)$ such that $\Delta'(c) = 0$.

◉ **Example 94:** Let $\Delta(x) = \begin{vmatrix} \cos^2 x & \cos x \sin x & -\sin x \\ \cos x \sin x & \sin^2 x & \cos x \\ \sin x & -\cos x & 0 \end{vmatrix}$

then $\int_0^{\pi/2} [\Delta(x) + \Delta'(x)]\, dx$ equals

(a) $\pi/3$ (b) $\pi/2$
(c) 2π (d) $3\pi/2$

Ans. (b)

◎ **Solution:** Applying $C_1 \to C_1 - \sin x\, C_3$ and $C_2 \to C_2 + \cos x\, C_3$, we get

$$\Delta(x) = \begin{vmatrix} 1 & 0 & -\sin x \\ 0 & 1 & \cos x \\ \sin x & -\cos x & 0 \end{vmatrix}$$

Applying $R_3 \to R_3 - \sin x\, R_1 + \cos x\, R_2$, we get

$$\Delta(x) = \begin{vmatrix} 1 & 0 & -\sin x \\ 0 & 1 & \cos x \\ 0 & 0 & \cos^2 x + \sin^2 x \end{vmatrix} = 1$$

$$\Rightarrow \qquad \Delta'(x) = 0$$

Thus, $\int_0^{\pi/2} [\Delta(x) + \Delta'(x)]\, dx = \int_0^{\pi/2} dx = \dfrac{\pi}{2}$.

◉ **Example 95:** The determinant

$$\Delta = \begin{vmatrix} \sqrt{13}+\sqrt{3} & 2\sqrt{5} & \sqrt{5} \\ \sqrt{15}+\sqrt{26} & 5 & \sqrt{10} \\ 3+\sqrt{65} & \sqrt{15} & 5 \end{vmatrix} \text{ equals}$$

(a) $15\sqrt{2} - 25\sqrt{3}$ (b) $25\sqrt{3} - 15\sqrt{2}$
(c) $3\sqrt{5}$ (d) $-15\sqrt{2} + 7\sqrt{3}$

Ans. (a)

◎ **Solution:** Taking $\sqrt{5}$ common from C_2 and C_3, we get

$$\Delta = \left(\sqrt{5}\right)^2 \begin{vmatrix} \sqrt{13}+\sqrt{3} & 2 & 1 \\ \sqrt{15}+\sqrt{26} & \sqrt{5} & \sqrt{2} \\ 3+\sqrt{65} & \sqrt{3} & \sqrt{5} \end{vmatrix}$$

Applying $C_1 \to C_1 - \sqrt{13}\; C_3 - \sqrt{3}\; C_2$, we get

$$\Delta = (5)\begin{vmatrix} -\sqrt{3} & 2 & 1 \\ 0 & \sqrt{5} & \sqrt{2} \\ 0 & \sqrt{3} & \sqrt{5} \end{vmatrix} = 5\left(-\sqrt{3}\right)\left(5 - \sqrt{6}\right)$$

$$= 5\left(\sqrt{18}\right) - 25\sqrt{3} = 15\sqrt{2} - 25\sqrt{3}$$

◉ **Example 96:** The values of λ for which the system of equations

$$x + y - 3 = 0$$
$$(1 + \lambda)x + (2 + \lambda)y - 8 = 0$$
$$x - (1 + \lambda)y + (2 + \lambda) = 0$$

has a non-trivial solution, are

(a) $-5/3, 1$ (b) $2/3, -3$
(c) $-1/3, -3$ (d) 0

Ans. (a)

◎ **Solution:** The given system of equations has a non trivial solution if

$$\Delta = \begin{vmatrix} 1 & 1 & -3 \\ 1+\lambda & 2+\lambda & -8 \\ 1 & -(1+\lambda) & 2+\lambda \end{vmatrix} = 0$$

Applying $C_2 \to C_2 - C_1$ and $C_3 \to C_3 + 3C_1$, we get

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ 1+\lambda & 1 & -5+3\lambda \\ 1 & -2-\lambda & 5+\lambda \end{vmatrix} = 0$$

$$\Rightarrow \quad (5 + \lambda) + (2 + \lambda)(3\lambda - 5) = 0$$
$$\Rightarrow \quad 5 + \lambda + 6\lambda - 10 + 3\lambda^2 - 5\lambda = 0$$
$$\Rightarrow \quad 3\lambda^2 + 2\lambda - 5 = 0 \Rightarrow (3\lambda + 5)(\lambda - 1) = 0$$
$$\Rightarrow \quad \lambda = -5/3 \text{ or } \lambda = 1.$$

◉ **Example 97:** The values of m for which the system of equations $3x + my = m$ and $2x - 5y = 20$ has a solution satisfying the conditions $x > 0$, $y > 0$ are given by the set

(a) $\{m : m < -13/2\}$
(b) $\{m : m > 17/2\}$
(c) $\{m : m < -13/2 \text{ or } m > 17/2\}$
(d) none of these

Ans. (d)

◎ **Solution:** Here $\Delta = \begin{vmatrix} 3 & m \\ 2 & -5 \end{vmatrix} = -15 - 2m$

$$\Delta_x = \begin{vmatrix} m & m \\ 20 & -5 \end{vmatrix} = -25m$$

$$\text{and } \Delta_y = \begin{vmatrix} 3 & m \\ 2 & 20 \end{vmatrix} = 60 - 2m$$

If $\Delta = 0$, then $m = -15/2$. But for this value of m, $\Delta_x \neq 0$ and $\Delta_y \neq 0$. Thus, in this case, the system of equations is not consistent.

If $\Delta \neq 0$, then $x = \dfrac{25m}{2m+15}$ and $y = \dfrac{2m-60}{2m+15}$, by the Cramer's rule.

Now, $x > 0, y > 0 \Leftrightarrow 25m > 0, 2m - 60 > 0, 2m + 15 > 0$
or $25m < 0, 2m - 60 < 0, 2m + 15 < 0$
$\Rightarrow m > 30$ or $m < -15/2$.

◉ **Example 98:** If $a + b + c \neq 0$, the system of equations

$$(b + c)(y + z) - ax = b - c$$
$$(c + a)(z + x) - by = c - a$$
$$(a + b)(x + y) - cz = a - b$$

has

(a) a unique solution
(b) no solution
(c) infinite number of solutions
(d) finitely many solutions

Ans. (a)

◎ **Solution:** We can write the above system of equations

$$(a + b + c)(y + z) - a(x + y + z) = b - c$$
$$(a + b + c)(z + x) - b(x + y + z) = c - a$$
$$(a + b + c)(x + y) - c(x + y + z) = a - b$$

Adding the above equations, we obtain

$$2(a + b + c)(x + y + z) - (a + b + c)(x + y + z) = 0$$
$$\Rightarrow \quad (a + b + c)(x + y + z) = 0$$
$$\Rightarrow \quad x + y + z = 0 \qquad [\because a + b + c \neq 0]$$
$$\Rightarrow \quad y + z = -x$$
$$\therefore \quad (b + c)(-x) - ax = b - c \Rightarrow x = \frac{c-b}{a+b+c}$$

Similarly, $y = \dfrac{a-c}{a+b+c}$, $z = \dfrac{b-a}{a+b+c}$.

◉ **Example 99:** Let a, b, c be positive real numbers. The following system of equations in x, y and z.

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1,\ \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,\ \frac{-x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

has

(a) no solution
(b) unique solution
(c) infinitely many solutions
(d) finitely many solutions

Ans. (d)

◎ **Solution:** Adding all the equations, we obtain

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 3$$

Subtracting first equation from it we get $\dfrac{2z^2}{c^2} = 2 \Rightarrow z^2 = c^2$ $\Rightarrow z = \pm c$. Similarly, $x = \pm a$, $y = \pm b$. Thus, the given system of equations has eight solutions.

◉ **Example 100:** If the system of equations

$$x - ky - z = 0,\ kx - y - z = 0,\ x + y - z = 0$$

has a non-zero solution, then the possible values of k are

(a) $-1, 2$ (b) $1, 2$
(c) $0, 1$ (d) $-1, 1$

Ans. (d)

◎ **Solution:** As the given system has a non-zero solution,

$$0 = \begin{vmatrix} 1 & -k & -1 \\ k & -1 & -1 \\ 1 & 1 & -1 \end{vmatrix} = \begin{vmatrix} 1+k & -k-1 & -1 \\ 1+k & -2 & -1 \\ 0 & 0 & -1 \end{vmatrix}$$

[using $C_1 \to C_1 - C_2$, $C_2 \to C_2 + C_3$]

$$\Rightarrow \quad 0 = (-1)\,[(1+k)(-2) - (1+k)(-k-1)]$$

$$\Rightarrow \quad 0 = (1+k)(-2+k+1) \Rightarrow k = -1, 1$$

◉ **Example 101:** If the system of equations

$\lambda x_1 + x_2 + x_3 = 1$, $x_1 + \lambda x_2 + x_3 = 1$, $x_1 + x_2 + \lambda x_3 = 1$

is inconsistent, then λ equals

(a) 5 (b) $-2/3$

(c) -3 (d) -2

Ans. (d)

◎ **Solution:** Let $\Delta = \begin{vmatrix} \lambda & 1 & 1 \\ 1 & \lambda & 1 \\ 1 & 1 & \lambda \end{vmatrix} = \begin{vmatrix} \lambda+2 & 1 & 1 \\ \lambda+2 & \lambda & 1 \\ \lambda+2 & 1 & \lambda \end{vmatrix}$

[$C_1 \to C_1 + C_2 + C_3$]

$$= (\lambda+2)\begin{vmatrix} 1 & 1 & 1 \\ 1 & \lambda & 1 \\ 1 & 1 & \lambda \end{vmatrix} = (\lambda+2)\begin{vmatrix} 1 & 0 & 0 \\ 1 & \lambda-1 & 0 \\ 1 & 0 & \lambda-1 \end{vmatrix}$$

[using $C_2 \to C_2 - C_1$ and $C_3 \to C_3 - C_1$]

$$= (\lambda+2)(\lambda-1)^2$$

If $\Delta = 0$, then $\lambda = -2$ or $\lambda = 1$.

But when $\lambda = 1$, the system of equation becomes $x_1 + x_2 + x_3 = 1$ which has infinite number of solutions. When $\lambda = -2$, by adding three equations, we obtain $0 = 3$ and thus, the system of equations is inconsistent.

◉ **Example 102:** If $p \neq a$, $q \neq b$, $r \neq c$ and the system of equations

$$px + ay + az = 0$$
$$bx + qy + bz = 0$$
$$cx + cy + rz = 0$$

has a non-trivial solution, then the value of

$$\frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} \text{ is}$$

(a) -1 (b) 0

(c) 1 (d) 2

Ans. (d)

◎ **Solution:** As the given system of equations has a non-trivial solution

$$\Delta = \begin{vmatrix} p & a & a \\ b & q & b \\ c & c & r \end{vmatrix} = 0$$

Applying $C_3 \to C_3 - C_2$ and $C_2 \to C_2 - C_1$, we get

$$\Delta = \begin{vmatrix} p & a-p & a-p \\ b & q-b & 0 \\ c & 0 & r-c \end{vmatrix} = 0$$

Expanding along C_3, we get

$$(a-p)\begin{vmatrix} b & q-b \\ c & 0 \end{vmatrix} + (r-c)\begin{vmatrix} p & a-p \\ b & q-b \end{vmatrix} = 0$$

$\Rightarrow (a-p)(-c)(q-b) + (r-c)\,\{p(q-b) - b(a-p)\} = 0$

$\Rightarrow (p-a)(q-b)\,c + p\,(r-c)(q-b) + b\,(r-c)(p-a) = 0$

Dividing by $(p-a)(q-b)(r-c)$ we get

$$\frac{c}{r-c} + \frac{p}{p-a} + \frac{b}{q-b} = 0$$

$$\Rightarrow \frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} = \frac{q-b}{q-b} + \frac{r-c}{r-c} = 2$$

◉ **Example 103:** Let λ and α be real. Relation between λ and α for which the system of equations

$$\lambda x + (\sin\alpha)y + (\cos\alpha)z = 0$$
$$x + (\cos\alpha)y + (\sin\alpha)z = 0$$
$$-x + (\sin\alpha)y - (\cos\alpha)z = 0$$

has a non-trivial solution is

(a) $\lambda = \sin 2\alpha + \cos 2\alpha$

(b) $\lambda = |\sin 2\alpha|$

(c) $\lambda = |\sin 2\alpha - \cos 2\alpha|$

(d) $\lambda = \cos 2\alpha$

Ans. (a)

◎ **Solution:** The system of equations will have a non-trivial solution if and only if

$$0 = \begin{vmatrix} \lambda & \sin\alpha & \cos\alpha \\ 1 & \cos\alpha & \sin\alpha \\ -1 & \sin\alpha & -\cos\alpha \end{vmatrix}$$

$$= \begin{vmatrix} 0 & (\lambda+1)\sin\alpha & (1-\lambda)\cos\alpha \\ 0 & \cos\alpha+\sin\alpha & \sin\alpha-\cos\alpha \\ -1 & \sin\alpha & -\cos\alpha \end{vmatrix}$$

[using $R_1 \to R_1 + \lambda R_3$, $R_2 \to R_2 + R_3$]

$$= (\lambda+1)\sin\alpha\,(\sin\alpha - \cos\alpha) + (\lambda-1)\cos\alpha(\cos\alpha + \sin\alpha)$$

$$= \lambda(\sin^2\alpha + \cos^2\alpha) + [\sin^2\alpha - \cos^2\alpha - 2\sin\alpha\cos\alpha]$$

Thus, $\lambda = \sin 2\alpha + \cos 2\alpha$

◉ **Example 104:** If $f_r(x)$, $g_r(x)$, $h_r(x)$, $r = 1, 2, 3$ are polynomials in x such that $f_r(a) = g_r(a) = h_r(a)$, $r = 1, 2, 3$

and $$F(x) = \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix}$$

then $F'(a)$ is

(a) -1 (b) a

(c) 0 (d) none of these

Ans. (c)

◎ **Solution:** Differentiating w.r.t. x we get $F'(x)$

$$= \begin{vmatrix} f_1'(x) & f_2'(x) & f_3'(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix} + \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1'(x) & g_2'(x) & g_3'(x) \\ h_1(x) & h_2(x) & h_3(x) \end{vmatrix}$$

$$+ \begin{vmatrix} f_1(x) & f_2(x) & f_3(x) \\ g_1(x) & g_2(x) & g_3(x) \\ h_1'(x) & h_2'(x) & h_3'(x) \end{vmatrix}$$

Since $f_r(a) = g_r(a) = h_r(a)$ for $r = 1, 2, 3$, we get each of the three determinants on the right side becomes zero when x is replaced by a. (In each case two rows become identical.) Thus, $F'(a) = 0$.

◉ **Example 105:** The number of real values of a for which the system of equations

$$x + ay - z = 0,\ 2x - y + az = 0,\ ax + y + 2z = 0$$

has a non-trivial solution, is

(a) 3 (b) 1

(c) 0 (d) infinite

Ans. (a)

◎ **Solution:** Since the given system of equations has a non-trivial solution,

$$\Delta = \begin{vmatrix} 1 & a & -1 \\ 2 & -1 & a \\ a & 1 & 2 \end{vmatrix} = 0$$

Using $C_1 \to C_1 + C_3$, $C_2 \to C_2 + aC_3$, we get

$$\Delta = \begin{vmatrix} 0 & 0 & -1 \\ 2+a & -1+a^2 & a \\ 2+a & 1+2a & 2 \end{vmatrix} = 0$$

$$\Rightarrow \quad (-1)\begin{vmatrix} 2+a & -1+a^2 \\ 2+a & 1+2a \end{vmatrix} = 0$$

$$\Rightarrow \quad (2 + a)(1 + 2a + 1 - a^2) = 0$$

$$\Rightarrow \quad a = -2,\ 1 \pm\sqrt{3}.$$

Thus, there are three real values of a for which the system of equations has a non-trivial solution.

◉ **Example 106:** The solution set of

$$x + 2y + z = 1$$

$$2x - 3y + w = 2$$

subject $\quad x \geq 0, y \geq 0, z \geq 0, w \geq 0$ is

(a) $x = \frac{1}{7}(y - w), \quad y \geq w \geq 0, z \geq 0$

(b) $x = \frac{1}{8}(y + w), \quad z = \frac{1}{3}(y - w), y \geq w \geq 0$

(c) $x = \frac{1}{7}(y - w), \quad z = \frac{1}{3}(y + w), y \geq 0$

(d) $x = 1, y = 0, \quad z = 0, w = 0.$

Ans. (d)

◎ **Solution:** We have

$$1 - (x + 2y) = z \geq 0$$

and $\quad 2x - 3y - 2 = -w \leq 0.$

$\Rightarrow \quad x + 2y \leq 1$ and $2x - 3y \leq 2$, $x \geq 0$, $y \geq 0$

The only point where the two shaded region intersect is (1, 0). Thus, $x = 1$, $y = 0$ for these values $z = 0$, $w = 0$.

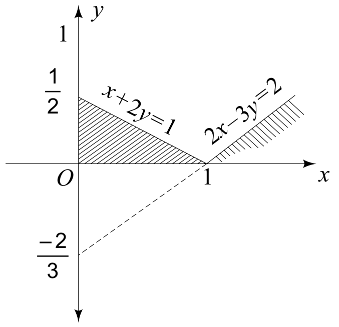


Fig. 4.1

◉ **Example 107:** The number of values of k for which the system of equations

$$(k + 1)x + 8y = 4k$$

$$kx + (k + 3)y = 3k - 1$$

has infinitely many solutions is

(a) 0 (b) 1

(c) 2 (d) infinite

Ans. (b)

◎ **Solution:** Let $\Delta = \begin{vmatrix} k+1 & 8 \\ k & k+3 \end{vmatrix}$

$$= k^2 - 4k + 3 = (k - 1)(k - 3)$$

If $\Delta \neq 0$, the system of equations has a unique solution.

For the system of equations to have an infinite number of solutions

$$\Delta = 0 \Rightarrow k = 3, 1$$

For $k = 3$, the system equations becomes

$$4x + 8y = 12 \text{ and } 3x + 6y = 8$$

$$\Rightarrow \quad x + 2y = 3,\ x + 2y = \frac{8}{3}$$

Thus, in this case the system of equations has no solution.

For $k = 1$, the system of equations becomes

$$2x + 8y = 4 \text{ and } x + 4y = 2$$

$$\Rightarrow \quad x + 4y = 2,\ x + 4y = 2$$

This system has infinite number of solutions.

Example 108: Suppose $a, b, c \in \mathbf{R}$ and let

$$f(x) = \begin{vmatrix} 0 & a-x & b-x \\ -a-x & 0 & c-x \\ -b-x & -c-x & 0 \end{vmatrix}$$

Then coefficient of x^2 in $f(x)$ is

(a) $-(a+b+c)$ (b) $a+b+c$

(c) 0 (d) $ab+bc+ca$

Ans. (c)

Solution: Expanding along C_1

$$f(x) = (a+x)\begin{vmatrix} a-x & b-x \\ -c-x & 0 \end{vmatrix} - (b+x)\begin{vmatrix} a-x & b-x \\ 0 & c-x \end{vmatrix}$$

$$= (a+x)(b-x)(c+x) - (b+x)(a-x)(c-x)$$

$$= -[(x+a)(x-b)(x+c) + (x-a)(x+b)(x-c)]$$

$$= -[2x^3 + x^2(a-b+c-a+b-c) + \ldots]$$

$$= -2x^3 + 0x^2 + \ldots$$

$\therefore$ coefficient of x^2 in $f(x)$ is 0.

Example 109: If the system of equations

$$x - ky - z = 0,\ kx - y - z = 0,\ x + y - z = 0$$

has a non-zero solution, then possible values of k are

(a) $-1, 2$ (b) $1, 2$

(c) $0, 1$ (d) $-1, 1$

Ans. (d)

Solution: Subtracting the last equation from the first two equations, we get

$$-(k+1)y = 0$$

$$(k-1)x - 2y = 0.$$

If $k = -1$, we can choose y in infinite number of ways, corresponding to which we can choose x and z in infinite number of ways.

If $k = 1$, then $y = 0$ and x and hence z can be chosen in infinite number of ways.

Example 110: Let $a_2, a_3 \in \mathbf{R}$ be such that $|a_2 - a_3| = 6$. Let

$$f(x) = \begin{vmatrix} 1 & a_3 & a_2 \\ 1 & a_3 & 2a_2 - x \\ 1 & 2a_3 - x & a_2 \end{vmatrix}, x \in \mathbf{R}$$

The maximum value of $f(x)$ is

(a) 6 (b) 9

(c) 12 (d) 36

Ans. (b)

Solution: Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$f(x) = \begin{vmatrix} 1 & a_3 & a_2 \\ 0 & 0 & a_2 - x \\ 0 & a_3 - x & 0 \end{vmatrix}$$

$$= -(a_2 - x)(a_3 - x) = -[x^2 - (a_2 + a_3)x + a_2a_3]$$

$$= \frac{1}{4}(a_2 - a_3)^2 - \left(x - \frac{a_2 + a_3}{2}\right)^2 \le 9$$

$f(x)$ attains maximum value 9 when

$$x = \frac{1}{2}(a_2 + a_3).$$

EXERCISES

Concept-based Straight Objective Type Questions

1. Suppose $A = (a_{ij})_{n \times n}$, where $a_{ij} \in \mathbf{R}$.

   If $\det(\text{adj}(A)A^{-1}) = 3$, then $\det(\text{adj}(A))$ equals:

   (a) $\sqrt{3}$ (b) 3

   (c) $3\sqrt{3}$ (d) 9

2. If a, b, c are in A.P. and p is a real number, and

   $$\Delta = \begin{vmatrix} p+c & p+2 & p+a \\ p+b & p+5 & p+b \\ p+a & p+8 & p+c \end{vmatrix}$$

   then Δ equals:

   (a) $-p^3$ (b) p^3

   (c) $p^3 - 2abc$ (d) 0

3. Suppose $x \neq 1$ and

   $$\Delta = \begin{vmatrix} 1 & x & x^2 \\ x^2 & 1 & x \\ x & x^2 & 1 \end{vmatrix}$$

   then $\Delta = 0$

   (a) for exactly two distinct complex numbers

   (b) for exactly four distinct complex numbers

   (c) for exactly two distinct real numbers

   (d) none of these

4. Let $D = \begin{vmatrix} 10! & 11! & 12! \\ 11! & 12! & 13! \\ 12! & 13! & 14! \end{vmatrix}$, then $\dfrac{D}{(10!)^3} - 260$ equals:

(a) 1 (b) 2
(c) 3 (d) 4

5. Let

$$P(x) = \begin{vmatrix} x+1 & 2 & 3 \\ 1 & x+2 & 3 \\ 1 & 2 & x+3 \end{vmatrix},$$

the product of zeros of $P(x)$ is

(a) 0 (b) 6
(c) – 6 (d) 12

6. Let $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ be vertices of an equilateral triangle whose side is 4 units. Let

$$\Delta = \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix},$$

then Δ^2 is equal to

(a) 64 (b) 128
(c) 192 (d) 256

7. Suppose a, b, c are in A.P. If p, q, r are also in A.P., then value of

$$\Delta = \begin{vmatrix} x^2+a & x+p & c \\ x^2+b & x+q & b \\ x^2+c & x+r & a \end{vmatrix},$$

is dependent on

(a) x (b) a, b, c
(c) p, q, r (d) none of these

8. Suppose a, b are two non-zero numbers. Let

$$\Delta = \begin{vmatrix} 2 & a+b & a^2+b^2 \\ a+b & a^2+b^2 & a^3+b^3 \\ a^2+b^2 & a^3+b^3 & a^4+b^4 \end{vmatrix},$$

then Δ is equal to:

(a) 0 (b) ab
(c) $a^6 + b^6$ (d) $a^3b^5 + a^5b^3$

9. Suppose a, b, $c > 1$. Let

$$\Delta = \begin{vmatrix} \log a & \log b & \log c \\ \log(2007a) & \log(2007b) & \log(2007c) \\ \log(2017a) & \log(2017b) & \log(2017c) \end{vmatrix}$$

then Δ is equal to:

(a) 0 (b) log (4024 abc)
(c) $\log\left(\dfrac{2017}{2007}\right)$ (d) none of these

10. Suppose a, b, $c \in \mathbf{R}$. Let

$$\Delta = \begin{vmatrix} (a+2016)^2 & (b+2016)^2 & (a+2016)^2 \\ (a-2016)^2 & (b-2016)^2 & (c-2016)^2 \\ a^2 & b^2 & c^2 \end{vmatrix}$$

If $\Delta = k\,(2016)^3\,(a - b)\,(b - c)(c - a)$, then k is equal to:

(a) – 1 (b) – 4
(c) 4 (d) 1

11. Let $P(x) = \begin{vmatrix} x & -6 & -1 \\ 2 & -3x & x+3 \\ -3 & 2x & x+2 \end{vmatrix}$,

sum of the zeros of $P(x)$ is

(a) – 6 (b) – 7
(c) 13/5 (d) –12/5

12. Let n be an integer and x, y, $z > 1$. Suppose

$$\Delta = \begin{vmatrix} x^{n+1} & x^{n+2} & x^{n+3} \\ y^{n+1} & y^{n+2} & y^{n+3} \\ z^{n+1} & z^{n+2} & z^{n+3} \end{vmatrix}$$

If $\Delta = (x - y)\,(y - z)(z - x)\,x^2\,y^2\,z^2$, then n is equal to:

(a) –1 (b) 0
(c) 1 (d) 2

13. Suppose a, b, c are distinct real numbers. Let

$$P(x) = \begin{vmatrix} 0 & x^3-a & x^4-b \\ x^3+a & 0 & x^5+c \\ x^4+b & x^5-c & 0 \end{vmatrix}$$

A value of x satisfying $P(x) = 0$ is

(a) $-(a + b + c)$ (b) $a + b + c$
(c) $a + b - c$ (d) 0

14. Suppose a, b, $c \in \mathbf{R}$ and $abc \neq 0$. Let

$$\Delta = \begin{vmatrix} 1+a & 1 & 1 \\ 1+b & 1+2b & 1 \\ 1+c & 1+c & 1+3c \end{vmatrix}$$

If $\Delta = 0$, then $\dfrac{1}{a}+\dfrac{1}{b}+\dfrac{1}{c}$ is equal to:

(a) 0 (b) –1
(c) –2 (d) –3

15. Suppose n and m are natural numbers such that

$$\Delta = \begin{vmatrix} x^m & x^{m+2} & x^{2m} \\ 1 & x^n & 2^n \\ x^{m+5} & x^{n+6} & x^{2m+5} \end{vmatrix}$$

Then a possible relationship between n and m is

(a) $n = m + 2$ (b) $n = m + 1$
(c) $n = m$ (d) $n = m - 1$

LEVEL 1

Straight Objective Type Questions

16. Suppose $a, b, c \in \mathbf{R}$ and $a + b + c \neq 0$. Let

$$\Delta = \begin{vmatrix} b+c & c+a & a+b \\ c+a & a+b & b+c \\ a+b & b+c & c+a \end{vmatrix}$$

If $\Delta = 0$, then

(a) $a = b = c$ (b) $a^3 + b^3 - c^3 = 0$

(c) $a = b + c$ (d) $a = b = c = 0$

17. Distance of line

$$y = \begin{vmatrix} x+1 & x & x \\ x & x+2 & x \\ x & x & x+3 \end{vmatrix}$$

from the origin is

(a) $\dfrac{6}{11}$ (b) $\dfrac{7}{13}$

(c) $\dfrac{6}{\sqrt{122}}$ (d) $\dfrac{7}{\sqrt{122}}$

18. Suppose $a, b, c \in \mathbf{R}$. Let

$$\Delta = \begin{vmatrix} 3a & -a+b & -a+c \\ -b+a & 3b & -b+c \\ -c+a & -c+b & 3c \end{vmatrix}$$

Then Δ equals

(a) $3(a + b + c)(bc + ca + ab)$

(b) $a + b + c$

(c) $3(a + b + c)(a^2 + b^2 + c^2)$

(d) 0

19. Suppose a, b, c are in A.P. Let

$$\Delta = \begin{vmatrix} p^2+2^{n+1}+2a & q^2+2^{n+2}+3b & r^2+a \\ 2^n+a & 2^{n+1}+b & 2b \\ p^2+2^n+a & q^2+2^{n+1}+2b & r^2-c \end{vmatrix}$$

Then Δ equals:

(a) -1 (b) 0

(c) $p^2q^2r^2 - 3abc$ (d) $p^2q^2r^2 - 4(a + b + c)$

20. Suppose a, b, c, d, e and f are in G.P. with common ratio > 1. Let p, q, r be three real numbers. Let

$$\Delta = \begin{vmatrix} a^2 & d^2 & p \\ b^2 & e^2 & q \\ c^2 & f^2 & r \end{vmatrix}$$

Then Δ depends on

(a) a, b, c (b) d, e, f

(c) p, q, r (d) none of these

21. Suppose point (x, y, z) in space satisfies the equation

$$\begin{vmatrix} x^2+1 & xy & xz \\ yx & y^2+1 & yz \\ zx & zy & z^2+1 \end{vmatrix} = 5$$

Then (x, y, z) lies on a

(a) plane (b) straight line

(c) sphere (d) none of these

22. Suppose A, B, and C are angles of a triangle. Let

$$\Delta = \begin{vmatrix} -1 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix}$$

then Δ equals:

(a) 0 (b) -1

(c) -2 (d) -3

23. Let

$$\Delta = \begin{vmatrix} a & x & x \\ x & b & x \\ x & x & c \end{vmatrix}$$

and $f(x) = (x - a)(x - b)(x - c)$

Determinant Δ is equal to:

(a) $f(x) - x^3$ (b) $f'(x)$

(c) $xf'(x) - f(x)$ (d) $f'(x) - xf''(x)$

24. Straight line

$$\begin{vmatrix} 2-x-y & 4 & 4 \\ 2x & x-y-2 & 2x \\ 2y & 2y & y-2-x \end{vmatrix} = 0$$

passes through the fixed point

(a) $(-2, -2)$ (b) $(-2, 0)$

(c) $(0, -2)$ (d) $(-1, -1)$

25. Suppose $a \in \mathbf{R}$. Let

$$f(x) = \begin{vmatrix} x+a & x & x \\ x & x+a & x \\ x & x & x+a \end{vmatrix}$$

Then $f(2x) - f(x)$ is equal to

(a) $3xa^2$ (b) $3x^2a$

(c) xa^2 (d) a^2x

26. If α, β, γ are the roots of $x^3 + ax^2 + b = 0$, then the determinant

$$\Delta = \begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} \text{ equals}$$

(a) $-a^3$ (b) $a^3 - 3b$
(c) $a^2 - 3b$ (d) a^3

27. If α, β, γ are the roots of $x^3 + bx + c = 0$, then the determinant

$$\Delta = \begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix} \text{ equals}$$

(a) $-b^3$ (b) $b^3 - 3c$
(c) $b^2 - 3c$ (d) 0

28. If a, b, c are distinct and different from zero and

$$\Delta = \begin{vmatrix} bc & ca & ab \\ ca & ab & bc \\ ab & bc & ca \end{vmatrix} = 0, \text{ then}$$

(a) $a^{-1} + b^{-1} + c^{-1} = 0$
(b) $a^{-1} + b^{-1} - c^{-1} = 0$
(c) $a^{-1} - b^{-1} + c^{-1} = 0$
(d) $a^{-1} - b^{-1} - c^{-1} = 0$

29. The determinant $\Delta = \begin{vmatrix} \lambda a & \lambda^2 + a^2 & 1 \\ \lambda b & \lambda^2 + b^2 & 1 \\ \lambda c & \lambda^2 + c^2 & 1 \end{vmatrix}$ equals

(a) $\lambda(a - b)(b - c)(c - a)$
(b) $\lambda(a^2 + b^2 + c^2)$
(c) $\lambda(a + b + c)$
(d) $\lambda^2(a - b)(b - c)(c - a)$

30. If α, β, γ are real numbers, then the determinant

$$\Delta = \begin{vmatrix} \sin^2\alpha & \cos 2\alpha & \cos^2\alpha \\ \sin^2\beta & \cos 2\beta & \cos^2\beta \\ \sin^2\gamma & \cos 2\gamma & \cos^2\gamma \end{vmatrix} \text{ equals}$$

(a) 0
(b) -1
(c) $\sin^2\alpha + \sin^2\beta + \sin^2\gamma$
(d) none of these

31. If $bc + ca + ab = 18$, and

$$\begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix} = \lambda \begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$$

the value of λ is
(a) -1 (b) 0
(c) 9 (d) 18

32. If $x \neq 0$, the determinant

$$\Delta = \begin{vmatrix} a_0 & a_1 & a_2 \\ -x & x & 0 \\ 0 & -x & x \end{vmatrix}$$

vanishes if
(a) $a_0 + a_1 + a_2 = 0$ (b) $a_0 + a_1 = 2a_2$
(c) $a_0 + a_2 = 2a_1$ (d) none of these

33. If $x \in \mathbf{R}$, the determinant

$$\Delta = \begin{vmatrix} 1 & \cos x & 0 \\ -1 & 1 - \cos x & \sin x + \cos x \\ 0 & -1 & 1 - \sqrt{2}\sin(x + \pi/4) \end{vmatrix} \text{ equals}$$

(a) 0 (b) -1
(c) 1 (d) none of these

34. The factors of $\Delta = \begin{vmatrix} x & a & b \\ a & x & b \\ a & b & x \end{vmatrix}$ are

(a) $x - a$, $x - b$ and $x + a + b$
(b) $x - a$, $x - b$ and $x - a - b$
(c) $x + a$, $x + b$ and $x - a - b$
(d) none of these

35. If $\theta \,\varepsilon\, \mathbf{R}$, maximum value of

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 + \sin\theta & 1 \\ 1 & 1 & 1 + \cos\theta \end{vmatrix} \text{ is}$$

(a) 1/2 (b) $\sqrt{3}/2$
(c) $\sqrt{2}$ (d) $3\sqrt{2}/4$

36. If $\Delta = \begin{vmatrix} x + a & b & c \\ a & x + b & c \\ a & b & x + c \end{vmatrix} = 0$, then x equals

(a) $a + b + c$ (b) $-(a + b + c)$
(c) $0, a + b + c$ (d) $0, -(a + b + c)$

37. The determinant

$$\begin{vmatrix} \sec^2\theta & \tan^2\theta & 1 \\ \tan^2\theta & \sec^2\theta & -1 \\ 12 & 10 & 2 \end{vmatrix} \text{ equals}$$

(a) $2\sin^2\theta$
(b) $12\sec^2\theta - 10\tan^2\theta$
(c) $12\sec^2\theta - 10\tan^2\theta + 5$
(d) 0

38. If $\Delta = \begin{vmatrix} -a & 2b & 0 \\ 0 & -a & 2b \\ 2b & 0 & -a \end{vmatrix} = 0$, then

(a) $1/b$ is a cube root of unity
(b) a is one of the cube roots of unity

(c) b is one of the cube roots of 8
(d) a/b is a cube root of 8

39. The determinant

$$\Delta = \begin{vmatrix} 1 & 1+i & i \\ 1+i & i & 1 \\ i & 1 & 1+i \end{vmatrix} \text{ equals}$$

(a) $7 + 4i$
(b) $-7 + 4i$
(c) $-7 - 4i$
(d) $2(i - 1)$

40. If a, b, c are non-zero real numbers, then

$$\Delta = \begin{vmatrix} 1 & ab & \dfrac{1}{a}+\dfrac{1}{b} \\ 1 & bc & \dfrac{1}{b}+\dfrac{1}{c} \\ 1 & ca & \dfrac{1}{c}+\dfrac{1}{a} \end{vmatrix} \text{ equals}$$

(a) 0
(b) $bc + ca + ab$
(c) $a^{-1} + b^{-1} + c^{-1}$
(d) $abc - 1$

41. If $a, b, c > 1$, then $\Delta = \begin{vmatrix} \log_a(abc) & \log_a b & \log_a c \\ \log_b(abc) & 1 & \log_b c \\ \log_c(abc) & \log_c b & 1 \end{vmatrix}$ equals

(a) 0
(b) $\log_a b + \log_b c + \log_c a$
(c) $\log_{abc}(a + b + c)$
(d) none of these

42. If $\Delta = \begin{vmatrix} a+bx & c+dx & p+qx \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix} = \lambda \begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$

then λ equals

(a) 0
(b) 1
(c) x
(d) $1 - x^2$

43. Let $\Delta = \begin{vmatrix} 1 & \sin\theta & 1 \\ -\sin\theta & 1 & \sin\theta \\ -1 & -\sin\theta & 1 \end{vmatrix}$, $0 \le \theta \le 2\pi$.The

(a) $\Delta = 0$
(b) $\Delta \in (2, \infty)$
(c) $\Delta \in (2, 4)$
(d) $\Delta \in [2, 4]$

44. The determinant $\Delta = \begin{vmatrix} b^2-ab & b-c & bc-ac \\ ab-a^2 & a-b & b^2-ab \\ bc-ac & c-a & ab-a^2 \end{vmatrix}$ equals

(a) $(b - c)(c - a)(a - b)$
(b) $abc(b - c)(c - a)(a - b)$
(c) $(a + b + c)(b - c)(c - a)(a - b)$
(d) 0

45. If $\Delta = \begin{vmatrix} 6i & -3i & w \\ 4 & 3i & -w \\ 20 & 3 & iw \end{vmatrix} = x + iy$, then

(a) $x = 3, y = 1$
(b) $x = 1, y = 3$
(c) $x = 0, y = 3$
(d) $x = 0, y = 0$

46. If $-\dfrac{\pi}{4} \le x \le \dfrac{\pi}{4}$, the number of distinct real roots of $\Delta = 0$

$$\Delta = \begin{vmatrix} \sin x & \cos x & \cos x \\ \cos x & \sin x & \cos x \\ \cos x & \cos x & \sin x \end{vmatrix} \text{ is}$$

(a) 0
(b) 2
(c) 1
(d) 3

47. If $\omega \ne 1$ is a complex cube root of unity, and

$$x + iy = \begin{vmatrix} 1 & i & -\omega \\ -i & 1 & \omega^2 \\ \omega & -\omega^2 & 1 \end{vmatrix} \text{ then}$$

(a) $x = -1, y = 0$
(b) $x = 1, y = -1$
(c) $x = 1, y = 1$
(d) none of these

48. If $e^{ix} = \cos x + i\sin x$ and

$$x + iy = \begin{vmatrix} 1 & e^{\pi i/4} & e^{\pi i/3} \\ e^{-\pi i/4} & 1 & e^{2\pi i/3} \\ e^{-\pi i/3} & e^{-2\pi i/3} & e^{-2\pi i/3} \end{vmatrix}, \text{ then}$$

(a) $x = -1, y = \sqrt{2}$
(b) $x = 1, y = -\sqrt{2}$
(c) $x = -\sqrt{2}, y = \sqrt{2}$
(d) none of these

49. If a, b, c ε **R**, the number of real roots of the equation

$$\begin{vmatrix} x & c & -b \\ -c & x & a \\ b & -a & x \end{vmatrix} = 0, \text{ is}$$

(a) 0
(b) 1
(c) 2
(d) 3

50. If $\Delta = \begin{vmatrix} 1 & x & x^2 \\ x & x^2 & 1 \\ x^2 & 1 & x \end{vmatrix} = -7$ and

$$\Delta_1 = \begin{vmatrix} x^3-1 & 0 & x-x^4 \\ 0 & x-x^4 & x^3-1 \\ x-x^4 & x^3-1 & 0 \end{vmatrix}, \text{ then}$$

(a) $\Delta = 7$
(b) $\Delta = 343$
(c) $\Delta = -49$
(d) $\Delta = 49$

51. If $\Delta = \begin{vmatrix} \sin\alpha & \cos\alpha & \sin\alpha+\cos\beta \\ \sin\beta & \cos\alpha & \sin\beta+\cos\beta \\ \sin\gamma & \cos\alpha & \sin\gamma+\cos\beta \end{vmatrix}$ then Δ equals
   (a) $\sin\alpha\sin\beta\sin\gamma$
   (b) $\cos\alpha\sec\beta\tan\gamma$
   (c) $\sin\alpha\sin\beta\sin\gamma+\cos\alpha\cos\beta\cos\gamma$
   (d) 0

52. Suppose $a, b, c \in \mathbf{R}$ and $a, b, c > 0$,
   Let $\Delta = \begin{vmatrix} \log a & \log b & \log c \\ \log(7a) & \log(49b) & \log(343c) \\ \log(3a) & \log(9b) & \log(27c) \end{vmatrix}$
   then Δ is equals to
   (a) 0 (b) –1
   (c) 1 (d) 30

53. The values of θ lying between $\theta = 0$ and $\theta = \pi/2$ and satisfying the equation
$$\Delta = \begin{vmatrix} 1+\cos^2\theta & \sin^2\theta & 4\sin 4\theta \\ \cos^2\theta & 1+\sin^2\theta & 4\sin 4\theta \\ \cos^2\theta & \sin^2\theta & 1+4\sin 4\theta \end{vmatrix} = 0$$
   are given by
   (a) $\pi/24, 5\pi/24$ (b) $7\pi/24, 11\pi/24$
   (c) $5\pi/24, 7\pi/24$ (d) $11\pi/24, \pi/24$

54. The number of distinct roots of the equation
$$P(x) = \begin{vmatrix} x^2-1 & x^2+2x+1 & 2x^2+3x+1 \\ 2x^2+x-1 & 2x^2+5x-3 & 4x^2+4x-3 \\ 6x^2-x-2 & 6x^2-7x+2 & 12x^2-5x-2 \end{vmatrix} = 0$$
   is
   (a) 6 (b) 5
   (c) 3 (d) 4

55. If $a_r = \cos\dfrac{2r\pi}{9} + i\sin\dfrac{2r\pi}{9}$, then value of the determinant
$$\Delta = \begin{vmatrix} 1 & a_8 & a_7 \\ a_3 & a_2 & a_1 \\ a_6 & a_5 & a_4 \end{vmatrix} \text{ is}$$
   (a) – 1 (b) 1
   (c) 0 (d) – 2

56. If $a \neq p$, $b \neq q$, $c \neq r$ and the system of equations
   $px + by + cz = 0$
   $ax + qy + cz = 0$
   $ax + by + rz = 0$
   has a non-zero solution, then value of
   $\dfrac{p+a}{p-a} + \dfrac{q+b}{q-b} + \dfrac{r+c}{r-c}$ is
   (a) 2 (b) – 2
   (c) 1 (d) 1

57. For a fixed positive integer n, if
$$D = \begin{vmatrix} n! & (n+1)! & (n+2)! \\ (n+1)! & (n+2)! & (n+3)! \\ (n+2)! & (n+3)! & (n+4)! \end{vmatrix}$$
   then $\dfrac{D}{n!(n+1)!(n+2)!}$ is equal to
   (a) – 4 (b) – 2
   (c) 2 (d) 4

58. If a, b, c are in A.P., and $\Delta = \begin{vmatrix} x+2 & x+7 & a \\ x+5 & x+11 & b \\ x+8 & x+15 & c \end{vmatrix}$
   then Δ equals
   (a) 0 (b) 1
   (c) $-(a+b+c)$ (d) $a+b+c$.

59. If $\Delta = \begin{vmatrix} 1+y & 1-y & 1-y \\ 1-y & 1+y & 1-y \\ 1-y & 1-y & 1+y \end{vmatrix} = 0$, then value of y are
   (a) 0, 3 (b) 2, – 1
   (c) – 1, 3 (d) 0, 2

60. The determinant
$$\Delta = \begin{vmatrix} al+a'l' & am+a'm' & an+a'n' \\ bl+b'l' & bm+b'm' & bn+b'n' \\ cl+c'l' & cm+c'm' & cn+c'n' \end{vmatrix}$$
   is equal to
   (a) $(abc + a'b'c')(lmn + l'm'n')$
   (b) $abc\,lmn + a'b'c'\,l'm'n'$
   (c) $(a^2+b^2+c^2)(l^2+m^2+n^2) + (a'^2+b'^2+c'^2)(l'^2+m'^2+n'^2)$
   (d) 0

61. If $a = i$, $b = \omega$, $c = \omega^2$ where ω is complex cube root of unity, then
$$\Delta = \begin{vmatrix} a & a+b & a+b+c \\ 3a & 4a+3b & 5a+4b+3c \\ 6a & 9a+6b & 11a+9b+6c \end{vmatrix} \text{ is equal to}$$
   (a) $-\omega$ (b) $-\omega^2$
   (c) i (d) $-i$

62. If $\Delta = \begin{vmatrix} 1 & 1 & 1 \\ {}^{m}C_1 & {}^{m+3}C_1 & {}^{m+6}C_1 \\ {}^{m}C_2 & {}^{m+3}C_2 & {}^{m+6}C_2 \end{vmatrix} = 2^{\alpha}\,3^{\beta}\,5^{\gamma}$, then
   $\alpha + \beta + \gamma$ is equal
   (a) 3 (b) 5
   (c) 7 (d) none of these

63. Suppose $a, b, c, x, y \in \mathbf{R}$. Let
$$\Delta = \begin{vmatrix} 1 & 2+ax & 3+ay \\ 1 & 2+bx & 3+by \\ 1 & 2+cx & 3+cy \end{vmatrix}$$

Then Δ is independent of

(a) a, b, c (b) x, y

(c) a, b, c, y (d) a, b, c, x, y

64. If A, B and C are the angles of a triangle, then the determinant

$$\Delta = \begin{vmatrix} 0 & \cos C & \cos B \\ \cos C & -1 & \cos A \\ \cos B & \cos A & -1 \end{vmatrix} \text{ is equal to}$$

(a) $\sin^2 A$ (b) $\sin^2 B$

(c) $\sin^2 C$ (d) 0

65. Let $f(x) = \begin{vmatrix} \cos x & x & 1 \\ 2\sin x & x^2 & 2x \\ \tan x & x & 1 \end{vmatrix}$, then $\lim\limits_{x\to 0} \dfrac{f(x)}{x^2}$ is given by

(a) 0 (b) -1

(c) 2 (d) 3

66. If ω is a complex cube root of unity, then value of

$$\Delta = \begin{vmatrix} a_1 + b_1\omega & a_1\omega^2 + b_1 & c_1 + b_1\omega \\ a_2 + b_2\omega & a_2\omega^2 + b_2 & c_2 + b_2\omega \\ a_3 + b_3\omega & a_3\omega^2 + b_3 & c_3 + b_3\omega \end{vmatrix}$$

is

(a) 0 (b) -1

(c) 2 (d) none of these

67. If $pqr \neq 0$ and the system of equations

$$(p + a)x + by + cz = 0$$
$$ax + (q + b)y + cz = 0$$
$$ax + by + (r + c)z = 0$$

has a non-trivial solution, then value of $\dfrac{a}{p} + \dfrac{b}{q} + \dfrac{c}{r}$ is

(a) -1 (b) 0

(c) 1 (d) 2

68. The system of equations

$$ax + by + (a\alpha + b)z = 0$$
$$bx + cy + (b\alpha + c)z = 0$$
$$(a\alpha + b)x + (b\alpha + c)y = 0$$

has a non-zero solutions if a, b, c are in

(a) A.P. (b) G.P.

(c) H.P. (d) A.G.P.

69. If the system of equations

$$ax + ay - z = 0$$
$$bx - y + bz = 0$$
$$-x + cy + cz = 0$$

(where $a, b, c \neq -1$) has a non-trivial solution, then value of $\dfrac{1}{1+a} + \dfrac{1}{1+b} + \dfrac{1}{1+c}$ is

(a) 2 (b) -1

(c) -2 (d) 0

70. The values of λ for which the system of equations

$$(\lambda + 5)x + (\lambda - 4)y + z = 0$$
$$(\lambda - 2)x + (\lambda + 3)y + z = 0$$
$$\lambda x + \lambda y + z = 0$$

has a non-trivial solution is (are)

(a) $-1, 2$ (b) $0, -1$

(c) 0 (d) none of these

71. Given the system of equations

$$(b + c)(y + z) - ax = b - c$$
$$(c + a)(z + x) - by = c - a$$
$$(a + b)(x + y) - cz = a - b$$

(where $a + b + c \neq 0$); then $x : y : z$ is given by

(a) $b - c : c - a : a - b$ (b) $b + c : c + a : a + b$

(c) $a : b : c$ (d) $\dfrac{a}{b} : \dfrac{b}{c} : \dfrac{c}{a}$

72. If $a, b, c \;\varepsilon\; \mathbf{R}$ and $a + b + c \neq 0$ and the system of equations

$$ax + by + cz = 0$$
$$bx + cy + az = 0$$
$$cx + ay + bz = 0$$

has a non-zero solution, then $a : b : c$ is given by

(a) $1 : \alpha : \beta$
where α, β are roots of $ax^2 + bx + c = 0$

(b) $1 : r : r^2$ where r is some positive real number

(c) $1 : k : 2k$ where k is some positive real number

(d) none of these

73. If p is a constant and

$$f(x) = \begin{vmatrix} x^3 & x^3 & 3x^2 \\ 1 & -6 & 4 \\ p & p^2 & p^3 \end{vmatrix}, \text{ then } f'''(x) \text{ is}$$

(a) proportional to x^3 (b) proportional to x^2

(c) proportional to x (d) a constant

74. If $\Delta = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$ and

$$D = \begin{vmatrix} a_1 + pb_1 & b_1 + qc_1 & c_1 + ra_1 \\ a_2 + pb_2 & b_2 + qc_2 & c_2 + ra_2 \\ a_3 + pb_3 & b_3 + qc_3 & c_3 + ra_3 \end{vmatrix} \text{ then}$$

(a) $D = \Delta$ (b) $D = \Delta(1 - pqr)$

(c) $D = \Delta(1 + pqr)$ (d) $D = \Delta(1 + p + q + r)$

75. Number of real values of λ for which the system of equations

$$(\lambda + 3)x + (\lambda + 2)y + z = 0$$
$$3x + (\lambda + 3)y + z = 0$$
$$2x + 3y + z = 0$$

has a non-trivial solutions is

(a) 0 (b) 1

(c) 2 (d) infinite

Assertion-Reason Type Questions

76. **Statement-1:** If

$$\Delta(x) = \begin{vmatrix} \sin x - \cos x & \sin\left(x - \frac{\pi}{3}\right) & \cos\left(x - \frac{\pi}{3}\right) \\ \sin\left(\frac{\pi}{3} - x\right) & \tan\left(x - \frac{\pi}{4}\right) & \sec\left(x - \frac{\pi}{4}\right) \\ \cos\left(\frac{2\pi}{3} + x\right) & \sec\left(\frac{2\pi}{3} + x\right) & \cot\left(x + \frac{\pi}{4}\right) \end{vmatrix}$$

then $\Delta\left(\frac{\pi}{4}\right) = 0$

Statement-2: If A is a skew symmetric matrix of odd order, then $|A| = 0$.

77. **Statement-1:** Let $p < 0$ and $\alpha_1, \alpha_2, \ldots \alpha_9$ be the nine roots of $x^9 = p$, then

$$\Delta = \begin{vmatrix} \alpha_1 & \alpha_2 & \alpha_3 \\ \alpha_4 & \alpha_5 & \alpha_6 \\ \alpha_7 & \alpha_8 & \alpha_9 \end{vmatrix} = 0$$

Statement-2: If two rows of a determinant are identical, then determinant equals zero.

78. **Statement-1:**

$$w = \begin{vmatrix} \sqrt{6} & 2i & 3 + \sqrt{6}i \\ \sqrt{12} & \sqrt{3} + \sqrt{8}i & 3\sqrt{2} + \sqrt{6}i \\ \sqrt{18} & \sqrt{2} + \sqrt{12}i & \sqrt{27} + 2i \end{vmatrix}$$

is a purely imaginary number.

Statement-2: $|z| = |\bar{z}|$ for each complex number z.

79. **Statement-1:** If $a_i, b_i \in \mathbf{N}$, for $i = 1, 2, 3$ and

$$\Delta(x) = \begin{vmatrix} (1+x)^{a_1 b_1} & (1+x)^{a_1 b_2} & (1+x)^{a_1 b_3} \\ (1+x)^{a_2 b_1} & (1+x)^{a_2 b_2} & (1+x)^{a_2 b_3} \\ (1+x)^{a_3 b_1} & (1+x)^{a_3 b_2} & (1+x)^{a_3 b_3} \end{vmatrix},$$

then coefficient of x in expansion of $\Delta(x)$ is 0.

Statement-2: If $P(x) = (1 + x)^n$, $n \in \mathbf{N}$ then coefficient of x in the expansion of $P(x)$ is $P'(0)$.

80. **Statement-1:** If $a + b + c = 0$ and $a^2 + b^2 + c^2 \neq bc + ca + ab$, then the system of homogenous equations

$$ax + by + cz = 0$$
$$bx + cy + az = 0$$
$$cx + ay + bz = 0$$

has infinite number of solutions.

Statement-2: If $|A| = 0$, the system of equations $AX = B$ has infinite number of solutions.

81. Suppose $a, b, c \in \mathbf{R}$. Consider the system of linear equations:

$$ax + by + cz = 0$$
$$bx + cy + az = 0$$
$$cx + ay + bz = 0$$

Statement-1: If $a + b + c \neq 0$ and $a^2 + b^2 + c^2 = bc + ca + ab$, then the system of equations has infinite number of solutions.

Statement-2: If $a + b + c = 0$ and $a^2 + b^2 + c^2 \neq bc + ca + ab$, then the system of equations has unique solutions.

82. Suppose $a_1, a_2, a_3, b_1, b_2, b_3 \in \mathbf{R}$.

Let

$$\Delta_1 = \begin{vmatrix} a_1 & b_1 & 1 \\ a_2 & b_2 & 1 \\ a_3 & b_3 & 1 \end{vmatrix}$$

$$\Delta_2 = \begin{vmatrix} 2a_1b_1 & a_1b_2 + a_2b_1 & a_1b_3 + a_3b_1 \\ a_1b_2 + a_2b_1 & 2a_2b_2 & a_2b_3 + a_3b_2 \\ a_1b_3 + a_3b_1 & a_2b_3 + a_3b_2 & 2a_3b_3 \end{vmatrix}$$

Statement-1: $\Delta_2 \neq 0$ for some values of $a_1, a_2, a_3, b_1, b_2, b_3 \in \mathbf{R}$.

Statement-2: If (a_1, b_1), (a_2, b_2), (a_3, b_3) are non-collinear than $\Delta_1 \neq 0$.

83. Suppose a_1, b_1, c_1, d_1 a_2, b_2, c_2, d_2 are eight integers.

Statement-1: $\left(a_1^2 + b_1^2 + c_1^2 + d_1^2\right)\left(a_2^2 + b_2^2 + c_2^2 + d_2^2\right)$ can be written in the form $a^2 + b^2 + c^2 + d^2$ where a, b, c, d are some integers.

Statement-2: If $a, b, c, d \in \mathbf{Z}$, then

$$a^2 + b^2 + c^2 + d^2 = \begin{vmatrix} a + ib & c + id \\ -c + id & a - ib \end{vmatrix}$$

LEVEL 2

Straight Objective Type Questions

84. If $l_1^2 + m_1^2 + n_1^2 = 1$ etc., and $l_1l_2 + m_1m_2 + n_1n_2 = 0$ etc., and

$$\Delta = \begin{vmatrix} l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \\ l_3 & m_3 & n_3 \end{vmatrix}$$

then

(a) $|\Delta| = 3$ (b) $|\Delta| = 2$

(c) $|\Delta| = 1$ (d) $\Delta = 0$

85. If a, b, c are non-zero real number and

$$\Delta = \begin{vmatrix} b^2c^2 & bc & b+c \\ c^2a^2 & ca & c+a \\ a^2b^2 & ab & a+b \end{vmatrix}$$

then Δ equals

(a) abc (b) $a^2\,b^2\,c^2$

(c) $bc + ca + ab$ (d) 0

86. Let $\Delta(x) = \begin{vmatrix} x^2-5x+3 & 2x-5 & 3 \\ 3x^2+x+9 & 6x+1 & 9 \\ 7x^2-6x+9 & 14x-6 & 21 \end{vmatrix}$

$= ax^3 + bx^2 + cx + d$,

then a equals

(a) – 1 (b) 0

(c) 2 (d) none of these

87. The number of distinct values of t for which the system

$(a + t)x + by + cz = 0$

$ax + (b + t)y + cz = 0$

$ax + by + (c + t)z = 0$

has a non-trivial solution is

(a) 1 (b) 2

(c) 3 (d) none of these

88. If $a^2 + b^2 + c^2 = 1$, then

$$\begin{vmatrix} a^2+(b^2+c^2)\cos\theta & ab\,(1-\cos\theta) & ac\,(1-\cos\theta) \\ ba\,(1-\cos\theta) & b^2+(c^2+a^2)\cos\theta & bc\,(1-\cos\theta) \\ ca(1-\cos\theta) & cb(1-\cos\theta) & c^2+(a^2+b^2)\cos\theta \end{vmatrix}$$ equals

(a) $\cos^2\theta$ (b) 0

(c) 1 (d) $\sin^2\theta$

89. Suppose $\alpha, \beta, \gamma, \theta \in \mathbf{R}$ and

$$A(\alpha, \beta, \gamma, \theta) = \begin{vmatrix} \cos(\alpha+\theta) & \sin(\alpha+\theta) & 1 \\ \cos(\beta+\theta) & \sin(\beta+\theta) & 1 \\ \cos(\gamma+\theta) & \sin(\gamma+\theta) & 1 \end{vmatrix}$$

Numerical value of $A\left(-\frac{\pi}{2}, 0, \frac{\pi}{2}, \frac{2\pi}{13}\right)$ is

(a) 0 (b) – 1

(c) 2 (d) none of these

90. If a, b, c are positive integers such that $a > b > c$ and

$$\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} = -2$$

then $3a + 7b - 10c$ equals

(a) 10 (b) 11

(c) 12 (d) 13

91. If $A, B, C, P, Q, R \in \mathbf{R}$, and

$$\Delta = \begin{vmatrix} \cos(A+P) & \cos(A+Q) & \cos(A+R) \\ \cos(B+P) & \cos(B+Q) & \cos(B+R) \\ \cos(C+P) & \cos(C+Q) & \cos(C+R) \end{vmatrix}$$

(a) Δ depends on P, Q, R

(b) Δ depends on A, B, C

(c) Δ depends on A, B, C, P, Q, R

(d) none of these

92. Let $f(x) = \begin{vmatrix} 2\cos x & 1 & 0 \\ 1 & 2\cos x & 1 \\ 0 & 1 & 2\cos x \end{vmatrix}$ then

(a) $f\left(\frac{\pi}{3}\right) = 1$ (b) $f'\left(\frac{\pi}{3}\right) = -\sqrt{3}$

(c) $f\left(\frac{\pi}{2}\right) = -1$ (d) none of these

93. Consider the set A consisting of all determinants of order 3 with entries 0 and 1 only. Let B be the subset of A consisting of all the determinants with value 1. Let C be the subset of A consisting of all the determinants with value –1. Then

(a) $C = \phi$

(b) B has as many elements as C

(c) $A = B \cap C$

(d) $A = B \cup C$

94. let $\omega = e^{2\pi i/3}$ and consider the system of linear equations

$$x + y + z = a$$
$$x + \omega y + \omega^2 z = b$$
$$x + \omega^2 y + \omega z = c$$

If x, y, z is a solution of the above system of equations, then value of $\dfrac{|a|^2 + |b|^2 + |c|^2}{|x|^2 + |y|^2 + |z|^2}$ is

(a) 9 (b) 6
(c) 3 (d) 1

95. If a, b, c are distinct and $\begin{vmatrix} a & a^2 & a^3 - 1 \\ b & b^2 & b^3 - 1 \\ c & c^2 & c^3 - 1 \end{vmatrix} = 0$ then abc equals

(a) 0 (b) 1
(c) –1 (d) –2

96. If the adjoint of a 3 × 3 matrix P is $\begin{pmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{pmatrix}$ then the possible value(s) of determinant P is (are)

(a) ± 2 (b) ± 3
(d) ± 1 (d) 0

97. If $\begin{vmatrix} 1 & -3 & 4 \\ -5 & x+2 & 2 \\ 4 & 1 & x-6 \end{vmatrix} = 0$, then x equals

(a) 17, 21 (b) 0,19
(c) 0, 35 (d) 21, 35

Previous Years' AIEEE/JEE Main Questions

1. If the equation $ax^2 + 2bx + c = 0$ has equal roots then the determinant

$$\Delta = \begin{vmatrix} a & b & ax+b \\ b & c & bx+c \\ ax+b & bx+c & 0 \end{vmatrix}$$

is

(a) positive (b) negative
(c) 0 (d) dependent on a.

[2002]

2. If $l, m, n > 0$ and l, m, n are the pth, qth, rth terms of a G.P., then determinant

$$\Delta = \begin{vmatrix} \log l & p & 1 \\ \log m & q & 1 \\ \log n & r & 1 \end{vmatrix} \text{ equals}$$ **[2002]**

(a) 0 (b) – 1
(c) $p + q + r$ (d) none of these

3. If 1, ω, ω^2 are the cube roots of unity then

$$\Delta = \begin{vmatrix} 1 & \omega^n & \omega^{2n} \\ \omega^n & \omega^{2n} & 1 \\ \omega^{2n} & 1 & \omega^n \end{vmatrix} \text{ equals}$$

(a) 1 (b) 2
(c) ω^2 (d) 0 **[2003]**

4. If the system of linear equations $x + 2ay + az = 0$, $x + 3by + bz = 0$, $x + 4cy + cz = 0$ has a non-zero solution, then a, b, c

(a) are in G.P
(b) are in H.P.
(c) satisfy $a + 2b + 3c = 0$
(d) are in A.P. **[2003]**

5. If $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in G.P., then the value of the determinant

$$\begin{vmatrix} \log a_n & \log a_{n+1} & \log a_{n+2} \\ \log a_{n+1} & \log a_{n+2} & \log a_{n+3} \\ \log a_{n+2} & \log a_{n+3} & \log a_{n+4} \end{vmatrix}$$

is

(a) 2 (b) 1
(c) 0 (d) – 2 **[2004, 2005]**

6. If $a^2 + b^2 + c^2 = -2$ and

$$f(x) = \begin{vmatrix} 1+a^2x & (1+b^2)x & (1+c^2)x \\ (1+a^2)x & 1+b^2x & (1+c^2)x \\ (1+a^2)x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

then $f(x)$ is a polynomial of degree

(a) 3 (b) 2
(1) 1 (d) 0 **[2005]**

7. The system of equations

$$\alpha x + y + z = \alpha - 1$$
$$x + \alpha y + z = \alpha - 1$$
$$x + y + \alpha z = \alpha - 1$$

has no solution, if α is

(a) not – 2
(b) 1
(c) – 2
(d) either – 2 or 1 **[2005]**

8. If $D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$ for $x \neq 0$, $y \neq 0$, then D is
   (a) divisible by neither x nor y
   (b) divisible by both x and y
   (c) divisible by x but not y
   (d) divisible by y but not x **[2007]**

9. Let a, b, c be such that $b(a + c) \neq 0$. If

$$\Delta = \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^{n}c \end{vmatrix} = 0$$

   then the value of n is
   (a) any odd integer
   (b) any integer
   (c) zero
   (d) any even integer

[2009]

10. If a, b, c are sides of a scalene triangle, then the value of $\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$ is:
   (a) non-negative
   (b) negative
   (c) positive
   (d) non-positive

[2013 online]

11. **Statement-1:** The system of linear equations

$$x + (\sin \alpha)y + (\cos \alpha)z = 0$$
$$x + (\cos \alpha)y + (\sin \alpha)z = 0$$
$$x - (\sin \alpha)y - (\cos \alpha)z = 0$$

   has a non-trivial solution for only one value of α lying in the interval $(0, \pi/2)$.

   Statement-2: The equation in α

$$\Delta = \begin{vmatrix} \cos\alpha & \sin\alpha & \cos\alpha \\ \sin\alpha & \cos\alpha & \sin\alpha \\ \cos\alpha & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

   has only one solution lyining in the interval $(0, \pi/2)$. **[2013 online]**

12. If α, $\beta \neq 0$, and $f(n) = \alpha^n + \beta^n$ and

$$\begin{vmatrix} 3 & 1+f(1) & 1+f(2) \\ 1+f(1) & 1+f(2) & 1+f(3) \\ 1+f(2) & 1+f(3) & 1+f(4) \end{vmatrix}$$

   $= K(1 - \alpha)^2 (1 - \beta)^2 (\alpha - \beta)^2$, then K is equal to:
   (a) $\dfrac{1}{\alpha\beta}$ (b) 1
   (c) –1 (d) $\alpha\beta$

[2014]

13. If a, b, c are non-zero real numbers and if the system of equations
   $(a - 1)x = y + z$,
   $(b - 1)y = z + x$,
   $(c - 1)z = x + y$,
   has a non-trivial solution, then $ab + bc + ca$ equals:
   (a) $a + b + c$ (b) abc
   (c) 1 (d) –1 **[2014 online]**

14. Let for $i = 1, 2, 3$, $p_i(x)$ be a polynomial of degree 2 in x, $p_i'(x)$ and $p_i''(x)$ be the first and second order derivatives of $p_i(x)$ respectively. Let,

$$A(x) = \begin{bmatrix} p_1(x) & p_1'(x) & p_1''(x) \\ p_2(x) & p_2'(x) & p_2''(x) \\ p_3(x) & p_3'(x) & p_3''(x) \end{bmatrix}$$

   and $B(x) = [A(x)]^T A(x)$. Then determinant of $B(x)$.
   (a) is a polynomial of degree 6 in x
   (b) is a polynomial of degree 3 in x
   (c) is a polynomial of degree 2 in x
   (d) does not depend on x

[2014 online]

15. If

$$\begin{vmatrix} a^2 & b^2 & c^2 \\ (a+\lambda)^2 & (b+\lambda)^2 & (c+\lambda)^2 \\ (a-\lambda)^2 & (b-\lambda)^2 & (c-\lambda)^2 \end{vmatrix} = \mathrm{k}\lambda \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}, \lambda \neq 0,$$

   then k is equal to:
   (a) $4\lambda abc$ (b) $-4\lambda abc$
   (c) $4\lambda^2$ (d) $-4\lambda^2$

[2014 online]

16. If $\Delta_r = \begin{vmatrix} r & 2r-1 & 3r-2 \\ \dfrac{n}{2} & n-1 & a \\ \dfrac{1}{2}n(n-1) & (n-1)^2 & \dfrac{1}{2}(n-1)(3n+4) \end{vmatrix}$

   then the value of $\displaystyle\sum_{r=1}^{n-1} \Delta_r$:
   (a) depends only on a
   (b) depends only on n
   (c) depends both on a and n
   (d) is independent of both a and n.

[2014 online]

17. The set of all values of λ for which the system of linear equations:

$$\begin{aligned} 2x_1 - 2x_2 + x_3 &= \lambda x_1 \\ 2x_1 - 3x_2 + 2x_3 &= \lambda x_2 \\ -x_1 + 2x_2 &= \lambda x_3 \end{aligned}$$

has a non-trivial solution,

(a) is an empty set
(b) is a singleton
(c) contains two elements
(d) contains more than two elements **[2015]**

18. If $\Delta = \begin{vmatrix} x^2+x & x+1 & x-2 \\ 2x^2+3x-1 & 3x & 3x-3 \\ x^2+2x+3 & 2x-1 & 2x-1 \end{vmatrix} = ax - 12,$

then a is equal to:

(a) 12 (b) 24
(c) – 12 (d) – 24 **[2015 online]**

19*. The least value of the product xyz for which the determinant $\Delta = \begin{vmatrix} x & 1 & 1 \\ 1 & y & 1 \\ 1 & 1 & z \end{vmatrix}$ is non-negative, is:

(a) $-2\sqrt{2}$ (b) $-16\sqrt{2}$
(c) – 8 (d) – 1 **[2015 online]**

20. The system of linear equations

$$\begin{aligned} x + \lambda y - z &= 0 \\ \lambda x - y - z &= 0 \\ x + y - \lambda z &= 0 \end{aligned}$$

has a non-trivial solution for

(a) infinitely many values of λ
(b) exactly one value of λ
(c) exactly two values of λ
(d) exactly three values of λ **[2016]**

21. The number of distinct real roots of the equation.

$$\Delta = \begin{vmatrix} \cos x & \sin x & \sin x \\ \sin x & \cos x & \sin x \\ \sin x & \sin x & \cos x \end{vmatrix} = 0$$

in the interval $\left[-\frac{\pi}{4}, \frac{\pi}{4}\right]$ is:

(a) 1 (b) 4
(c) 2 (d) 3 **[2016 online]**

Previous Years' B-Architecture Entrance Examination Questions

1. If the system of equations

$$\begin{aligned} x + y + z &= 0 \\ ax + by + z &= 0 \\ bx + y + z &= 0 \end{aligned}$$

has a non-trivial solution, then

(a) $b^2 = 2b + 1$ (b) $b^2 = 2b - 1$
(c) $b - a = 0$ (d) $b^2 = 2b$ **[2006]**

2. The system of linear equations

$$\begin{aligned} (\lambda + 3)x + (\lambda + 2)y + z &= 0 \\ 3x + (\lambda + 3)y + z &= 0 \\ 2x + 3y + z &= 0 \end{aligned}$$

has a non-trivial solution

(a) if $\lambda = 1$ (b) if $\lambda = -1$
(c) for no real value of λ
(d) if $\lambda = 0$ **[2007]**

3. If

$$\Delta_k = \begin{vmatrix} 2(3^{k-1}) & 3(4^{k-1}) & 4(5^{k-1}) \\ \alpha & \beta & \gamma \\ 3^n - 1 & 4^n - 1 & 5^n - 1 \end{vmatrix}$$

then the value of $\sum_{k=1}^{n} \Delta_k$ depends

(a) only on α and β not on γ
(b) on all α, β and γ
(c) on none of α, β and γ
(d) only on α, not on β and γ **[2007]**

4. Let $A = (a_{ij})$ be a 3 × 3 matrix whose determinant is 5. The determinant of the matrix $B = (2^{i-j} a_{ij})$ is

(a) 5 (b) 10
(c) 20 (d) 40 **[2008]**

5. Let $\Delta_r = \begin{vmatrix} 2^{r-1} & 2(3^{r-1}) & 4(5^{r-1}) \\ \alpha & \beta & \gamma \\ 2^n - 1 & 3^n - 1 & 5^n - 1 \end{vmatrix}$, for

$r = 1, 2, \ldots, n$. Then $\sum_{r=1}^{n} \Delta_r$ is

(a) independent of α, β, γ and n
(b) independent of n only
(c) depends on α, β, γ and n
(d) independent of α, β, γ only **[2010]**

---

* Question is incorrect as xyz can take any real value.

6. If x_1, x_2, x_3,…, x_{13} are in A.P. then the value of $\begin{vmatrix} e^{x_1} & e^{x_4} & e^{x_7} \\ e^{x_4} & e^{x_7} & e^{x_{10}} \\ e^{x_7} & e^{x_{10}} & e^{x_{13}} \end{vmatrix}$ is:

   (a) 27 (b) 0

   (c) 1 (d) 9 **[2011]**

7. The value of the determinant $\begin{vmatrix} \sqrt{13}+\sqrt{3} & 2\sqrt{5} & \sqrt{5} \\ \sqrt{15}+\sqrt{26} & 5 & \sqrt{10} \\ 3+\sqrt{65} & \sqrt{15} & 5 \end{vmatrix}$ is equal to:

   (a) $5\sqrt{3}(\sqrt{6}-5)$ (b) $5\sqrt{3}(\sqrt{6}-\sqrt{5})$

   (c) $5(\sqrt{6}-5)$ (d) $\sqrt{3}(\sqrt{6}-\sqrt{5})$ **[2012]**

8. If the system of linear equations, $x + 2ay + az = 0$, $x + 3by + bz = 0$ and $x + 4cy + cz = 0$ has a non-zero solution, then a, b, c satisfy:

   (a) $2b = a + c$ (b) $b^2 = ac$

   (c) $2ac = ab + bc$ (d) $2ab = ac + bc$ **[2013]**

9. In a ΔABC, if $\begin{vmatrix} 1 & a & b \\ 1 & c & a \\ 1 & b & c \end{vmatrix} = 0,$ then $\sin^2 A + \sin^2 B + \sin^2 C$ is

   (a) $\frac{3}{2}\sqrt{3}$ (b) $\frac{9}{4}$

   (c) $\frac{5}{4}$ (d) 2 **[2014]**

10. The system of linear equations

$$x - y + z = 1$$
$$x + y - z = 3$$
$$x - 4y + 4z = \alpha$$

   has:

   (a) a unique solution when $\alpha = 2$

   (b) a unique solution when $\alpha \neq -2$

   (c) an infinite number of solutions, when $\alpha = 2$

   (d) an infinite number of solutions, when $\alpha = -2$

   [2015]

11. For all values of $\theta \in \left(0, \frac{\pi}{2}\right)$, the determinant of the matrix $\Delta = \begin{bmatrix} -2 & \tan\theta + \sec^2\theta & 3 \\ -\sin\theta & \cos\theta & \sin\theta \\ -3 & -4 & 3 \end{bmatrix}$ always lies in the interval:

   (a) [3, 5] (b) (4, 6)

   (c) $\left(\frac{5}{2}, \frac{19}{4}\right)$ (d) $\left[\frac{7}{2}, \frac{21}{4}\right]$ **[2016]**

Hints and Solutions

Concept-based

1. det (adj (A)) A^{-1}) = det (adj(A)) det(A^{-1})

$$= (\det(A))^2 \, \frac{1}{\det(A)} = \det(A)$$

2. Use $R_1 \to R_1 + R_3 - 2R_2$

3. Using $R_2 \to R_2 - x^2R_1$ and $R_3 \to R_3 - xR_1$, we get

$$\Delta = \begin{vmatrix} 1 & x & \\ 0 & 1-x^3 & x(1-x^3) \\ 0 & 0 & 1-x^3 \end{vmatrix}$$

$$= (1 - x^3)^2 = (1 - x)^2\,(1 + x + x^2)^2$$

As $x \neq 1, \Delta = 0 \Rightarrow 1 + x + x^2 = 0 \Rightarrow x = \omega, \omega^2$

4. Taking 10!, 11! and 12! common from C_1, C_2, C_3 respectively, we get

$$D = (10!\ 11!\ 12!)\, D_1$$

where

$$D_1 = \begin{vmatrix} 1 & 1 & 1 \\ 11 & 12 & 13 \\ (11)(12) & (12)(13) & (13)(14) \end{vmatrix}$$

Using $C_3 \to C_3 - C_2$ and $C_2 \to C_2 - C_1$, we get

$$D_1 = \begin{vmatrix} 1 & 0 & 0 \\ 11 & 1 & 1 \\ (11)(12) & 2(12) & 2(13) \end{vmatrix} = 2$$

Thus, $\dfrac{D}{(10!)^3} = 2(11)\ (12) = 264$

5. Product of zeros $= -P(0) = 0$

6. $\dfrac{1}{2}|\Delta|$ = area of triangle $= \dfrac{\sqrt{3}}{4}(4)^2 = 4\sqrt{3}$

$\Rightarrow\ |\Delta| = 8\sqrt{3}\ \Rightarrow\ \Delta^2 = 192$

7. Use $R_1 \to R_1 + R_3 - 2R_2$.

8. Write

$$\Delta = \begin{vmatrix} 1+1 & a+b & a^2+b^2 \\ a+b & a^2+b^2 & a^3+b^3 \\ a^2+b^2 & a^3+b^3 & a^4+b^4 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 1 & 0 \\ a & b & 0 \\ a^2 & b^2 & 0 \end{vmatrix}\begin{vmatrix} 1 & 1 & 0 \\ a & b & 0 \\ a^2 & b^2 & 0 \end{vmatrix} = 0$$

9. Use $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$ and $\log x - \log y = \log (x/y)$ to obtain

$$\Delta = \begin{vmatrix} \log a & \log b & \log c \\ \log(2007) & \log(2007) & \log(2007) \\ \log(2017) & \log(2017) & \log(2017) \end{vmatrix} = 0$$

[$\because$ R_2 and R_3 are proportional]

10. Using $R_2 \to R_2 - R_1$, we get

$$\Delta = -4(2016)\begin{vmatrix} (a+2016)^2 & (b+2016)^2 & (c+2016)^2 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$$

Applying $R_1 \to R_1 - 2\ (2016)\ R_2 - R_3$, we get

$$\Delta = -4(2016)^3\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix}$$

$$= -4\ (2016)^3\,(a - b)\,(b - c)\,(c - a)$$

11. Using $R_2 \to R_2 + R_1$, $R_3 \to R_3 - R_1$, we get

$$P(x) = \begin{vmatrix} x & -6 & -1 \\ x+2 & -3(x+2) & x+2 \\ -3-x & 2(x+3) & x+3 \end{vmatrix}$$

$$= (x + 2)\,(x + 3)\begin{vmatrix} x & -6 & -1 \\ 1 & -3 & 1 \\ -1 & 2 & 1 \end{vmatrix}$$

Using $R_1 \to R_1 + R_3$, $R_2 \to R_2 - R_3$, we get

$$P(x) = (x + 2)\,(x + 3)\begin{vmatrix} x-1 & -4 & 0 \\ x & -5 & 0 \\ -1 & 2 & 1 \end{vmatrix}$$

$$= (x + 2)\,(x + 3)\,(-\,5x + 13)$$

sum of zeros of $P(x)$ is $-2 - 3 + 13/5 = -12/5$.

12. Write Δ as

$$\Delta = x^{n+1}\,y^{n+1}\,z^{n+1}\begin{vmatrix} 1 & x & x^2 \\ 1 & y & y^2 \\ 1 & z & z^2 \end{vmatrix}$$

$$= (xyz)^{n+1}\,(x - y)\,(y - z)(z - x)$$

$$\therefore \qquad n+1 = 2 \qquad \Rightarrow \quad n = 1.$$

13. When $x = 0$, $P(0)$ is a skew-symmetric determinant of odd order.

14. Write $\Delta = \Delta_1 + a\Delta_2$ where

$$\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ 1+b & 1+2b & 1 \\ 1+c & 1+c & 1+3c \end{vmatrix}$$

and $$\Delta_2 = \begin{vmatrix} 1 & 0 & 0 \\ 1+b & 1+2b & 1 \\ 1+c & 1+c & 1+3c \end{vmatrix}$$

$$= (1 + 2b)\,(1 + 3c) - (1 + c)$$

$$= 2\,(b + c + 3c)$$

In Δ_1, apply $C_2 \to C_2 - C_1$ and $C_3 \to C_3 - C_1$ to obtain

$$\Delta_1 = \begin{vmatrix} 1 & 0 & 0 \\ 1+b & b & -b \\ 1+c & 0 & 2c \end{vmatrix} = 2bc$$

Thus, $\Delta = 2(bc + ac + ab + 3abc)$

$$\therefore \quad \Delta = 0 \quad \Rightarrow \quad \frac{1}{a}+\frac{1}{b}+\frac{1}{c} = -3$$

15. Taking x^m common from R_1 and x^{m+5} from R_3, we get

$$\Delta = x^{2m+5}\begin{vmatrix} 1 & x^2 & x^m \\ 1 & x^n & 2^n \\ 1 & x^{n-m} & x^m \end{vmatrix}$$

If $n - m = 2$, then R_1 and R_3 are identical and hence $\Delta = 0$.

Level 1

16. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = 2(a+b+c)\begin{vmatrix} 1 & c+a & a+b \\ 1 & a+b & b+c \\ 1 & b+c & c+a \end{vmatrix}$$

Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = 2(a+b+c)\begin{vmatrix} 1 & c+a & a+b \\ 0 & b-c & c-a \\ 0 & b-a & c-b \end{vmatrix}$$

$$= -2(a+b+c)\,[(b-c)^2 + (b-a)\,(c-a)]$$
$$= -(a+b+c)\,[(b-c)^2 + (c-a)^2 + (a-b)^2]$$

Now, use $\Delta = 0$, $a + b + c \neq 0$.

17. Write $y = \Delta_1 + \Delta_2$ where

$$\Delta_1 = \begin{vmatrix} 1 & x & x \\ 0 & x+2 & x \\ 0 & x & x+3 \end{vmatrix} = 5x+6$$

$$\text{and} \quad \Delta_2 = x\begin{vmatrix} 1 & x & x \\ 1 & x+2 & x \\ 1 & x & x+3 \end{vmatrix} = x\begin{vmatrix} 1 & 0 & 0 \\ 1 & 2 & 0 \\ 1 & 0 & 3 \end{vmatrix} = 6x$$

Thus, $y = 11x + 6$

Its distance from the origin $= \dfrac{6}{\sqrt{122}}$

18. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (a+b+c)\begin{vmatrix} 1 & -a+b & -a+c \\ 1 & 3b & -b+c \\ 1 & -c+b & 3c \end{vmatrix}$$

Now, use $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = (a+b+c)\begin{vmatrix} 1 & -a+b & -a+c \\ 0 & 2b+a & -b+a \\ 0 & -c+a & a+2c \end{vmatrix}$$

$$\Delta = (a+b+c)\,[(a+2b)\,(a+2c) - (a-c)\,(a-b)]$$
$$= 3(a+b+c)\,(bc+ca+ab)$$

19. Using $R_1 \to R_1 - R_3 - R_2$ we get R_1 consists of all zeros.

20. If R is the common ratio of the G.P., then $b = aR$, $c = aR^2$, $d = aR^3$, $e = aR^4$, $f = aR^5$, and

$$\Delta = (a^2)(a^2R^6)\begin{vmatrix} 1 & 1 & p \\ R^2 & R^2 & q \\ R^4 & R^4 & r \end{vmatrix} = 0$$

[$\because$ C_1 and C_2 are identical]

21. Multiply C_1 by x, C_2 by y and C_3 by z to obtain

$$5 = \frac{1}{xyz}\begin{vmatrix} (x^2+1)x & xy^2 & xz^2 \\ yx^2 & (y^2+1)y & yz^2 \\ zx^2 & zy^2 & z(z^2+1) \end{vmatrix}$$

Taking x common from R_1, y from R_2 and z from R_3, we get

$$5 = \frac{xyz}{xyz}\begin{vmatrix} x^2+1 & y^2 & z^2 \\ x^2 & y^2+1 & z^2 \\ x^2 & y^2 & z^2 \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$5 = (x^2 + y^2 + z^2 + 1)\,\Delta_1$$

$$\text{where } \Delta_1 = \begin{vmatrix} 1 & y^2 & z^2 \\ 1 & y^2+1 & z^2 \\ 1 & y^2 & z^2+1 \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & y^2 & z^2 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1$$

Thus, $x^2 + y^2 + z^2 = 4$, which represents a sphere.

22. Apply $R_1 \to aR_1 + bR_2 + cR_3$ and use $a = b\cos C + c\cos B$ etc.

23. Write $\Delta = \Delta_1 + x\Delta_2$ where

$$\Delta_1 = \begin{vmatrix} a-x & x & x \\ 0 & b & x \\ 0 & x & c \end{vmatrix} = (a-x)(bc-x^2)$$

$$\text{and} \quad \Delta_2 = \begin{vmatrix} 1 & x & x \\ 1 & b & x \\ 1 & x & c \end{vmatrix}$$

$$= \begin{vmatrix} 1 & x & x \\ 0 & b-x & 0 \\ 0 & 0 & c-x \end{vmatrix} \qquad [\text{use } R_2 \to R_2 - R_1,\ R_3 \to R_3 - R_1]$$

$$= (b-x)\,(c-x)$$

Thus, $\Delta = (a - x)(bc - x^2) + x(b - x)(c - x)$

$$= 2x^3 - (a + b + c)x^2 + abc$$

Also, $xf'(x) - f(x)$

$$= x[(x - b)(x - c) + (x - a)(x - c) + (x - a)(x - b)] - f(x)$$

$$= 2x^3 - (a + b + c)x^2 + abc$$

24. Applying $R_1 \to R_1 + R_2 + R_3$, we get

$$0 = (x+y+2)\begin{vmatrix} 1 & 1 & 1 \\ 2x & x-y-2 & 2x \\ 2y & 2y & y-2-x \end{vmatrix}$$

Using $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$, we get

$$0 = (x+y+2)\begin{vmatrix} 1 & 0 & 0 \\ 2x & -(x+y+2) & 0 \\ 2y & 0 & -(x+y+2) \end{vmatrix}$$

$$\Rightarrow \quad 0 = (x + y + 2)^3$$

$$\Rightarrow \quad x + y + 2 = 0$$

It passes through (–1, –1).

25. Write $f(x) = \Delta_1 + x\Delta_2$ where

$$\Delta_1 = \begin{vmatrix} a & x & x \\ 0 & x+a & x \\ 0 & x & x+a \end{vmatrix} = a[(x + a)^2 - x^2]$$

$$= 2\,xa^2 + a^3$$

and $$\Delta_2 = \begin{vmatrix} 1 & x & x \\ 1 & x+a & x \\ 1 & x & x+a \end{vmatrix}$$

$$= \begin{vmatrix} 1 & x & x \\ 0 & a & 0 \\ 0 & 0 & a \end{vmatrix} = a^2$$

Thus, $$f(x) = 2xa^2 + a^3 + xa^2$$

$$= 3xa^2 + a^3$$

$\therefore\ f(2x) - f(x) = 3xa^2$

26. $\alpha + \beta + \gamma = -a,\ \beta\gamma + \gamma\alpha + \alpha\beta = 0,\ \alpha\beta\gamma = -b.$

Applying $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (\alpha+\beta+\gamma)\begin{vmatrix} 1 & \beta & \gamma \\ 1 & \gamma & \alpha \\ 1 & \alpha & \beta \end{vmatrix} \qquad (1)$$

Using $R_3 \to R_3 - R_2$ and $R_2 \to R_2 - R_1$, we get

$$\Delta = -a\begin{vmatrix} 1 & \beta & \gamma \\ 0 & \gamma-\beta & \alpha-\gamma \\ 0 & \alpha-\gamma & \beta-\alpha \end{vmatrix}$$

$$= -a[(\gamma - \beta)(\beta - \alpha) - (\alpha - \gamma)^2]$$

$$= -a[\beta\gamma + \gamma\alpha + \alpha\beta - (\alpha^2 + \beta^2 + \gamma^2)] \quad (2)$$

$$= -a[0 - a^2] = a^3$$

27. In this case $\alpha + \beta + \gamma = 0$.

Thus, from (1) in solution to question 26, we get $\Delta = 0$.

28. We can write

$$\Delta = (abc)^2\begin{vmatrix} \alpha & \beta & \gamma \\ \beta & \gamma & \alpha \\ \gamma & \alpha & \beta \end{vmatrix}$$

where $\alpha = \dfrac{1}{a},\ \beta = \dfrac{1}{b},\ \gamma = \dfrac{1}{c}$

From (2) in solution question 26, we have

$$\Delta = (abc)^2(\alpha + \beta + \gamma)[(\beta - \gamma)^2 + (\gamma - \alpha)^2 + (\alpha - \beta)^2]$$

$$\Rightarrow \alpha + \beta + \gamma = 0 \quad \Rightarrow \quad a^{-1} + b^{-1} + c^{-1} = 0$$

29. Using $C_2 \to C_2 - \lambda^2 C_3$, we can write

$$\Delta = \lambda\begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix}$$

Using $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = \lambda\begin{vmatrix} a & a^2 & 1 \\ b-a & b^2-a^2 & 0 \\ c-b & c^2-b^2 & 0 \end{vmatrix}$$

$$= \lambda(b - a)(c - b)\begin{vmatrix} 1 & b+a \\ 1 & c+b \end{vmatrix}$$

$$= \lambda(b - a)(c - b)(c - a)$$

$$= \lambda(a - b)(b - c)(c - a)$$

30. Use $C_2 \to C_2 - C_3 + C_1$ to show that C_2 consists of all zeros.

31. We know

$$\begin{vmatrix} 1 & 1 & 1 \\ a & b & c \\ a^2 & b^2 & c^2 \end{vmatrix} = (a - b)(b - c)(c - a)$$

$$\text{Let } \Delta_1 = \begin{vmatrix} 1 & a^2 & a^3 \\ 1 & b^2 & b^3 \\ 1 & c^2 & c^3 \end{vmatrix}$$

Using $R_3 \to R_3 - R_2$ and $R_2 \to R_2 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & a^2 & a^3 \\ 0 & b^2-a^2 & b^3-a^3 \\ 0 & c^2-b^2 & c^3-b^3 \end{vmatrix}$$

$$= (b - a)(c - b)\begin{vmatrix} b+a & b^2+a^2+ba \\ c+b & c^2+b^2+cb \end{vmatrix}$$

Applying $C_2 \to C_2 - bC_1$, we get

$$\Delta_1 = (b-a)\,(c-b)\begin{vmatrix} b+a & a^2 \\ c+b & c^2 \end{vmatrix}$$

$$= (b-a)\,(c-b)\begin{vmatrix} b+a & a^2 \\ c-a & c^2-a^2 \end{vmatrix}$$

[using $R_2 \to R_2 - R_1$]

$$= (b-a)\,(c-b)\,(c-a)\begin{vmatrix} b+a & a^2 \\ 1 & c+a \end{vmatrix}$$

$$= (a-b)\,(b-c)\,(c-a)\,(bc+ca+ab)$$

Thus, $\lambda = 18$

32. Show that $\Delta = (a_0 + a_1 + a_2)x^2$
33. Using $R_2 \to R_2 + R_1$, we get

$$\Delta = \begin{vmatrix} 1 & \cos x & 0 \\ 0 & 1 & \sin + \cos x \\ 0 & -1 & 1 - (\sin x + \cos x) \end{vmatrix}$$

Using $R_3 \to R_3 + R_2$, we get

$$\Delta = \begin{vmatrix} 1 & \cos x & 0 \\ 0 & 1 & \sin + \cos x \\ 0 & 0 & 1 \end{vmatrix} = 1$$

34. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (x+a+b)\begin{vmatrix} 1 & a & b \\ 1 & x & b \\ 1 & b & x \end{vmatrix}$$

Using $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = (x+a+b)\begin{vmatrix} 1 & a & b \\ 0 & x-a & 0 \\ 0 & b-a & x-b \end{vmatrix}$$

$$= (x+a+b)\,(x-a)\,(x-b)$$

35. Use $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$ to obtain

$$\Delta = \sin\theta\cos\theta = \frac{1}{2}\sin(2\theta)$$

36. Use $C_1 \to C_1 + C_2 + C_3$ to obtain

$$\Delta = (x+a+b+c)\begin{vmatrix} 1 & b & c \\ 1 & x+b & c \\ 1 & b & x+c \end{vmatrix}$$

Now use $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$ to obtain

$$\Delta = x^2(x+a+b+c)$$

Thus, $\Delta = 0 \Rightarrow x = 0$ or $x = -(a+b+c)$

37. Use $C_1 \to C_1 - C_2$.
38. Show $\Delta = -a^3 + 8b^3$

Thus, $\Delta = 0 \Rightarrow \left(\frac{a}{b}\right)^3 = 8$

$\Rightarrow a/b$ is a cube root of 8.

39. Using $C_1 \to C_1 + C_2 + C_3$, we can write $\Delta = 2(1+i)\Delta_1$ where

$$\Delta_1 = \begin{vmatrix} 1 & 1+i & i \\ 1 & i & 1 \\ 1 & 1 & 1+i \end{vmatrix} = \begin{vmatrix} 1 & 1+i & i \\ 0 & -1 & 1-i \\ 0 & -i & 1 \end{vmatrix} = i$$

[using $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$]

Thus, $\Delta = 2(i-1)$

40. Write $\Delta = abc\begin{vmatrix} 1 & \frac{1}{c} & \frac{1}{a}+\frac{1}{b} \\ 1 & \frac{1}{a} & \frac{1}{b}+\frac{1}{c} \\ 1 & \frac{1}{b} & \frac{1}{c}+\frac{1}{a} \end{vmatrix}$

and use $C_2 \to C_2 + C_1$, to show that $\Delta = 0$

41. Applying $C_1 \to C_1 - C_2 - C_3$ and reduce Δ to determinant in Example 36.
42. Applying $R_1 \to R_1 - xR_2$ we get

$$\Delta = \begin{vmatrix} a(1-x^2) & c(1-x^2) & p(1-x^2) \\ ax+b & cx+d & px+q \\ u & v & w \end{vmatrix}$$

Take $1 - x^2$ common from R_1 and apply $R_2 \to R_2 - xR_1$ to obtain

$$\Delta = (1-x^2)\begin{vmatrix} a & c & p \\ b & d & q \\ u & v & w \end{vmatrix}$$

43. Applying $R_1 \to R_1 + R_3$ to obtain

$$\Delta = \begin{vmatrix} 0 & 0 & 2 \\ -\sin\theta & 1 & \sin\theta \\ -1 & -\sin\theta & 1 \end{vmatrix} = 2(\sin^2\theta + 1)$$

As $0 \le \sin^2\theta \le 1$, we get $\Delta \in [2, 4]$.

44. Write $\Delta = \Delta_1 - \Delta_2$ where

$$\Delta_1 = \begin{vmatrix} b^2-ab & b & bc-ac \\ ab-a^2 & a & b^2-ab \\ bc-ac & c & ab-a^2 \end{vmatrix} \text{ and}$$

$$\Delta_2 = \begin{vmatrix} b^2-ab & c & bc-ac \\ ab-a^2 & b & b^2-ab \\ bc-ac & a & ab-a^2 \end{vmatrix}$$

In Δ_1 use $C_1 \to C_1 - (b-a)C_2$ to show that $\Delta_1 = 0$.

In Δ_2 use $C_3 \to C_3 - (b - a)C_2$ to show that $\Delta_2 = 0$.

Thus, $\Delta = 0$.

45. We can write

$$\Delta = -3iw \begin{vmatrix} 6i & 1 & 1 \\ 4 & -1 & -1 \\ 20 & i & i \end{vmatrix} = 0$$

$\therefore \quad x = 0, y = 0$

46. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (\sin x + 2\cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 1 & \sin x & \cos x \\ 1 & \cos x & \sin x \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = (\sin x + 2\cos x) \begin{vmatrix} 1 & \cos x & \cos x \\ 0 & \sin - \cos x & 0 \\ 0 & 0 & \sin x - \cos x \end{vmatrix}$$

$$= (\sin x + 2\cos x)\,(\sin x - \cos x)^2$$

$$\Delta = 0 \Rightarrow \tan x = -2, \tan x = 1.$$

As $-\dfrac{\pi}{4} \le x \le \dfrac{\pi}{4}$, $-1 \le \tan x \le 1$.

Thus, $\tan x = 1 \Rightarrow x = \pi/4$.

47. Applying $C_1 \to C_1 + iC_2$, we get

$$x + iy = \begin{vmatrix} 0 & i & -\omega \\ 0 & 1 & \omega^2 \\ \omega - i\omega^2 & -\omega^2 & 1 \end{vmatrix}$$

$$= (\omega - i\omega^2)\,(i\omega^2 + \omega)$$

$$= \omega^2 - i^2\omega^4 = \omega^2 + \omega = -1$$

$$\Rightarrow x = -1, y = 0.$$

48. Taking conjugate, we get

$$x - iy = \begin{vmatrix} 1 & e^{-\pi i/4} & e^{-\pi i/3} \\ e^{\pi i/4} & 1 & e^{-2\pi i/3} \\ e^{\pi i/3} & e^{2\pi i/3} & e^{2\pi i/3} \end{vmatrix}$$

$$= \begin{vmatrix} 1 & e^{\pi i/4} & e^{\pi i/3} \\ e^{-\pi i/4} & 1 & e^{2\pi i/3} \\ e^{-\pi i/3} & e^{-2\pi i/3} & e^{2\pi i/3} \end{vmatrix}$$

Now,

$$2iy = (x + iy) - (x - iy)$$

$$= \begin{vmatrix} 1 & e^{\pi i/4} & 0 \\ e^{-\pi i/4} & 1 & 0 \\ e^{-\pi i/3} & e^{-2\pi i/3} & e^{-2\pi i/3} - e^{2\pi i/3} \end{vmatrix}$$

$$= (e^{-2\pi i/3} - e^{2\pi i/3})\,[1 - 1] = 0$$

$$\Rightarrow y = 0.$$

49. Show that the determinant equals $x^3 + (a^2 + b^2 + c^2)x = 0$.

$\Rightarrow x = 0$ as $x \in \mathbf{R}$

$\therefore$ Number of real roots of the equation is one.

50. Note that

$$\Delta_1 = \begin{vmatrix} C_{11} & C_{12} & C_{13} \\ C_{21} & C_{22} & C_{23} \\ C_{31} & C_{32} & C_{33} \end{vmatrix}$$

where C_{ij} cofactor of (i, j)th element of

$$\begin{bmatrix} 1 & x & x^2 \\ x & x^2 & 1 \\ x^2 & 1 & x \end{bmatrix}$$

$\therefore \quad \Delta_1 = \Delta^2 = 49$

51. Applying $C_3 \to C_3 - C_1$, we get

$$\Delta = \begin{vmatrix} \sin\alpha & \cos\alpha & \cos\beta \\ \sin\beta & \cos\alpha & \cos\beta \\ \sin\gamma & \cos\alpha & \cos\beta \end{vmatrix} = 0$$

52. Using $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, and $\log x - \log y = \log\left(\dfrac{x}{y}\right)$, we get

$$\Delta = \begin{vmatrix} \log a & \log b & \log c \\ \log 7 & \log(7^2) & \log(7^3) \\ \log(3) & \log(3^2) & \log(3^3) \end{vmatrix}$$

$$= (\log 7)\,(\log 3)\,\Delta_1$$

$$\text{where } \Delta_1 = \begin{vmatrix} \log a & \log b & \log c \\ 1 & 2 & 3 \\ 1 & 2 & 3 \end{vmatrix} = 0$$

$\therefore \quad \Delta = 0$

53. $C_3 \to C_3 + C_1 + C_2$, gives

$$\Delta = (2 + 4\sin 4\theta) \begin{vmatrix} 1 + \cos^2\theta & \sin^2\theta & 1 \\ \cos^2\theta & 1 + \sin^2\theta & 1 \\ \cos^2\theta & \sin^2\theta & 1 \end{vmatrix}$$

Applying $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = 2(1 + 2\sin 4\theta) \begin{vmatrix} 1 + \cos^2\theta & \sin^2\theta & 1 \\ -1 & 1 & 0 \\ 0 & -1 & 0 \end{vmatrix}$$

$$= 2(1 + 2\sin 4\theta)$$

$$\Delta = 0 \Rightarrow \sin 4\theta = -1/2$$

Now, $0 \le \theta \le \dfrac{\pi}{2} \Rightarrow 0 \le 4\theta \le 2\pi$

$$\therefore \quad 4\theta = \frac{7\pi}{6}, \frac{11\pi}{6} \quad \Rightarrow \quad \theta = \frac{7\pi}{24}, \frac{11\pi}{24}$$

54.

$$P(x) = \begin{vmatrix} (x-1)(x+1) & (x+1)^2 & (2x+1)(x+1) \\ (2x-1)(x+1) & (2x-1)(x+3) & (2x+3)(2x-1) \\ (2x+1)(3x-2) & (2x-1)(3x-2) & (4x+1)(3x-2) \end{vmatrix}$$

$$= (x+1)(2x-1)(3x-2)\begin{vmatrix} x-1 & x+1 & 2x+1 \\ x+1 & x+3 & 2x+3 \\ 2x+1 & 2x-1 & 4x+1 \end{vmatrix}$$

Using $C_2 \to C_2 - C_1$, $C_3 \to C_3 - 2C_1$, we get

$$P(x) = (x+1)(2x-1)(3x-2)\begin{vmatrix} x-1 & 2 & 3 \\ x+1 & 2 & 1 \\ 2x+1 & -2 & -1 \end{vmatrix}$$

Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 + R_1$, we get

$$P(x) = (x+1)(2x-1)(3x-2)\begin{vmatrix} x-1 & 2 & 3 \\ 2 & 0 & -2 \\ 3x & 0 & 2 \end{vmatrix}$$

$$P(x) = -4(x+1)(2x-1)(3x-2)(3x+2)$$

$\therefore$ $P(x) = 0$ has four distinct roots.

55. Put $a_r = w^r$ where $w = \cos\dfrac{2\pi}{9} + i\sin\dfrac{2\pi}{9}$.

Note that $w^9 = 1 \Rightarrow \dfrac{1}{w} = w^8$. Now,

$$\Delta = \begin{vmatrix} 1 & w^8 & w^7 \\ w^3 & w^2 & w \\ w^6 & w^5 & w^4 \end{vmatrix} = 0$$

as C_2 and C_3 are proportional.

56. As the system has a non-zero solution

$$\Delta = \begin{vmatrix} p & b & c \\ a & q & c \\ a & b & r \end{vmatrix} = 0$$

Applying $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = \begin{vmatrix} p & b & c \\ a-p & q-b & 0 \\ a-p & 0 & r-c \end{vmatrix} = 0$$

Expanding along R_3, we get

$-(a-p)(q-b)c + (r-c)[p(q-b) - b(a-p)] = 0.$

Dividing $(p-a)(q-b)(r-c)$, we get

$$\frac{c}{r-c} + \frac{p}{p-a} + \frac{b}{q-b} = 0.$$

$$\Rightarrow \quad \frac{c-r}{r-c} + \frac{r}{r-c} + \frac{p}{p-a} + \frac{b-q}{q-b} + \frac{q}{q-b} = 0$$

$$\Rightarrow \quad \frac{p}{p-a} + \frac{q}{q-b} + \frac{r}{r-c} = 2.$$

Now use

$$\frac{p+a}{p-a} = \frac{2p-(p-a)}{p-a} = \frac{2p}{p-a} - 1 \text{ etc.}$$

57. We can write D as

$$D = n!\,(n+1)!\,(n+2)!\begin{vmatrix} 1 & n+1 & (n+1)(n+2) \\ 1 & n+2 & (n+3)(n+2) \\ 1 & n+3 & (n+4)(n+3) \end{vmatrix}$$

Applying $R_3 \to R_3 - R_3$, $R_2 \to R_2 - R_1$, we get

$$D = n!\,(n+1)!\,(n+2)!\begin{vmatrix} 1 & n+1 & (n+1)(n+2) \\ 0 & 1 & 2(n+2) \\ 0 & 1 & 2(n+3) \end{vmatrix}$$

$$\Rightarrow \quad \frac{D}{n!(n+1)!(n+2)!} = 2$$

58. Use $R_1 \to R_1 + R_3 - 2R_2$

59. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (3-y)\begin{vmatrix} 1 & 1-y & 1-y \\ 1 & 1+y & 1-y \\ 1 & 1-y & 1+y \end{vmatrix}$$

Applying $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = (3-y)\begin{vmatrix} 1 & 1-y & 1-y \\ 0 & 2y & 0 \\ 0 & -2y & 2y \end{vmatrix} = (3-y)(4y^2)$$

$\therefore \quad \Delta = 0 \Rightarrow y = 0$ or $y = 3$.

60. Write $\Delta = l\Delta_1 + l'\Delta_2$, where

$$\Delta_1 = \begin{vmatrix} a & am + a'm' & an + a'n' \\ b & bm + b'm' & bn + b'n' \\ c & cm + c'm' & cn + c'n' \end{vmatrix} \text{ and}$$

$$\Delta_2 = \begin{vmatrix} a' & am + a'm' & an + a'n' \\ b' & bm + b'm' & bn + b'n' \\ c' & cm + c'm' & cn + c'n' \end{vmatrix}$$

In Δ_1 apply $C_2 \to C_2 - mC_1$, $C_3 \to C_3 - nC_1$ to obtain

$$\Delta_1 = \begin{vmatrix} a & a'm' & a'n' \\ b & b'm' & b'n' \\ c & c'm' & c'n' \end{vmatrix} = 0$$

Similarly $\Delta_2 = 0$. Thus, $\Delta = 0$

61. Imitate Example 35.

62. We have

$$\Delta = \begin{vmatrix} 1 & 1 & 1 \\ m & m+3 & m+6 \\ \frac{1}{2}m(m-1) & \frac{1}{2}(m+3)(m+2) & \frac{1}{2}(m+6)(m+5) \end{vmatrix}$$

Applying $C_3 \to C_3 - C_2$, $C_2 \to C_2 - C_1$, we get

$$\Delta = \begin{vmatrix} 1 & 0 & 0 \\ m & 3 & 3 \\ \frac{1}{2}m(m-1) & 3(m+1) & 3(m+4) \end{vmatrix}$$

$= 3^2(m + 4 - m - 1) = 3^3$

$\therefore \quad \alpha + \beta + \gamma = 3$

63. Use $C_2 \to C_2 - 2C_1$, $C_3 \to C_3 - 3C_1$ to obtain C_2 and C_3 are proportional.

64. Write $\Delta = \dfrac{1}{a}\begin{vmatrix} 0 & \cos C & \cos B \\ a\cos C & -1 & \cos A \\ a\cos B & \cos A & -1 \end{vmatrix}$

Applying $C_1 \to C_1 + bC_2 + cC_3$, we get

$$\Delta = \frac{1}{a}\begin{vmatrix} a & \cos C & \cos B \\ 0 & -1 & \cos A \\ 0 & \cos A & -1 \end{vmatrix} = \sin^2 A$$

65. For $x \neq 0$,

$$\frac{f(x)}{x^2} = \begin{vmatrix} \cos x & 1 & 1 \\ 2\dfrac{\sin x}{x} & 1 & 2 \\ \tan x & 1 & 1 \end{vmatrix}$$

$$\lim_{x \to 0} \frac{f(x)}{x^2} = \begin{vmatrix} 1 & 1 & 1 \\ 2 & 1 & 2 \\ 0 & 1 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 0 \\ 2 & 1 & 2 \\ 0 & 1 & 1 \end{vmatrix} = -1$$

[using $R_1 \to R_1 - R_3$]

66. Applying $C_2 \to C_2 - \omega^2 C_1$ we find the second column of Δ becomes 0.

67. The system will have a non-trivial solution if

$$\Delta = \begin{vmatrix} p+a & b & c \\ a & q+b & c \\ a & b & r+c \end{vmatrix} = 0$$

Write

$$\Delta = pqr\begin{vmatrix} 1+\dfrac{a}{p} & \dfrac{b}{q} & \dfrac{c}{r} \\ \dfrac{a}{p} & 1+\dfrac{b}{q} & \dfrac{c}{r} \\ \dfrac{a}{p} & \dfrac{b}{q} & 1+\dfrac{c}{r} \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = pqr\left(1+\frac{a}{p}+\frac{b}{q}+\frac{c}{r}\right)\begin{vmatrix} 1 & \dfrac{b}{q} & \dfrac{c}{r} \\ 1 & 1+\dfrac{b}{q} & \dfrac{c}{r} \\ 1 & \dfrac{b}{q} & 1+\dfrac{c}{r} \end{vmatrix}$$

Apply $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = pqr\left(1+\frac{a}{p}+\frac{b}{q}+\frac{c}{r}\right) \qquad (1)$$

$$\therefore \qquad \Delta = 0, pqr \neq 0 \Rightarrow \frac{a}{p}+\frac{b}{q}+\frac{c}{r} = -1.$$

68. The system will have a non-zero solution if

$$\Delta = \begin{vmatrix} a & b & a\alpha+b \\ b & c & b\alpha+c \\ a\alpha+b & b\alpha+c & 0 \end{vmatrix} = 0$$

Applying $R_3 \to R_3 - \alpha R_1 - R_2$ to obtain

$$\Delta = \begin{vmatrix} a & b & a\alpha+b \\ b & c & b\alpha+c \\ 0 & 0 & -(a\alpha^2+2b\alpha+c) \end{vmatrix}$$

$= -(a\alpha^2 + 2b\alpha + c)(ac - b^2)$

Note that $\Delta = 0$ if a, b, c are in G.P.

69. The system will have a non-trivial solution if

$$\Delta = \begin{vmatrix} a & a & -1 \\ b & -1 & b \\ -1 & c & c \end{vmatrix} = 0.$$

Using $C_3 \to C_3 - C_2$, $C_2 \to C_2 - C_1$, we get

$$\Delta = \begin{vmatrix} a & 0 & -(1+a) \\ b & -(1+b) & (b+1) \\ -1 & c+1 & 0 \end{vmatrix}$$

$= -a(b + 1)(c + 1) - (1 + a)[b(c + 1) - (1 + b)]$

$$\therefore \quad \Delta = 0 \Rightarrow -\frac{a}{1+a} - \frac{b}{1+b} + \frac{1}{1+c} = 0$$

$$\Rightarrow \quad \frac{1}{1+a} + \frac{1}{1+b} + \frac{1}{1+c} = 2.$$

70. The system will have a non-trivial solution if $\Delta = 0$ where

$$\Delta = \begin{vmatrix} \lambda+5 & \lambda-4 & 1 \\ \lambda-2 & \lambda+3 & 1 \\ \lambda & \lambda & 1 \end{vmatrix}$$

Applying $C_2 \to C_2 - \lambda C_3$, $C_1 \to C_1 - \lambda C_3$, we get

$$\Delta = \begin{vmatrix} 5 & -4 & 1 \\ -2 & 3 & 1 \\ 0 & 0 & 1 \end{vmatrix} = 7 \neq 0$$

Thus, the system cannot have a non-trivial solution.

71. Adding above the system of equations, we get $(a + b + c)\ (x + y + z) = 0 \Rightarrow x + y + z = 0$

$\therefore\quad (b + c)\ (-x) - ax = b - c$

$\Rightarrow\quad x = -\ \dfrac{b-c}{a+b+c}$ etc.

72. The above system of equations will have a non-trivial solution if

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix} = 0$$

But $\Delta = -\dfrac{1}{2}\ (a + b + c)$
$[(b - c)^2 + (c - a)^2 + (a - b)^2]$

$\therefore\quad \Delta = 0,\ a + b + c \neq 0$

$\Rightarrow\quad a = b = c.$

Thus, $a : b : c = 1 : 1 : 1$

73. $f'''(x) = \begin{vmatrix} 6 & 6 & 0 \\ 1 & -6 & 4 \\ p & p^2 & p^3 \end{vmatrix}$

$\therefore\quad f'''(x)$ is a constant.

74. Write

$D = \Delta_1 + p\Delta_2$ where

$$\Delta_1 = \begin{vmatrix} a_1 & b_1 + q\,c_1 & c_1 + ra_1 \\ a_2 & b_2 + qc_2 & c_2 + ra_2 \\ a_3 & b_3 + qc_3 & c_3 + ra_3 \end{vmatrix} \text{ and}$$

$$\Delta_2 = \begin{vmatrix} b_1 & b_1 + q\,c_1 & c_1 + ra_1 \\ b_2 & b_2 + qc_2 & c_2 + ra_2 \\ b_3 & b_3 + qc_3 & c_3 + ra_3 \end{vmatrix}$$

Now show that $\Delta_1 = \Delta$ and $\Delta_2 = pqr\ \Delta$.

75. The system will have a non-trivial solution if

$$\Delta = \begin{vmatrix} \lambda+3 & \lambda+2 & 1 \\ 3 & \lambda+3 & 1 \\ 2 & 3 & 1 \end{vmatrix} = 0.$$

Using $R_1 \to R_1 - R_2$ and $R_2 \to R_2 - R_3$, we get

$$\Delta = \begin{vmatrix} \lambda & -1 & 0 \\ 1 & \lambda & 0 \\ 2 & 3 & 1 \end{vmatrix} = \lambda^2 + 1$$

Note that there is no real value of λ for which $\Delta = 0$.

76. Let A be a skew symmetric matrix of order n, then $|A'| = (-1)^n\ |A| \Rightarrow |A| = (-1)^n\ |A|$

If n is odd, then $|A| = -\ |A| \Rightarrow 2|A| = 0 \Rightarrow |A| = 0.$ We have

$$\Delta\left(\frac{\pi}{4}\right) = \begin{vmatrix} 0 & \sin(\pi/12) & \cos(\pi/12) \\ -\sin(\pi/12) & 0 & \sec(\pi/12) \\ -\cos(\pi/12) & -\sec(\pi/12) & 0 \end{vmatrix} = 0$$

[using statement-2]

77. Statement-2 is true, see theory.

The roots of $x^9 = p$ are $p^{1/9}\ \omega^r$

where $\omega = \cos\ \dfrac{2\pi}{9} + i\ \sin\ \dfrac{2\pi}{9}$.

value of determinant Δ depends on $\alpha_1, \alpha_2, \ldots \alpha_9$. If we put $\alpha_k = p^{1/9}\ \omega^k$, then

$$\Delta = (p^{1/9})^3 \begin{vmatrix} 1 & \omega^8 & \omega^7 \\ 1 & \omega & \omega^2 \\ 1 & \omega & \omega^2 \end{vmatrix} = 0$$

However, if $\alpha_1 = p^{1/9}$, $\alpha_2 = p^{1/9}\ \omega^8$,
$a_3 = p^{1/9}\ \omega^7$, $\alpha_4 = p^{1/9}\ \omega$, $\alpha_5 = p^{1/9}\ \omega^5$
$\alpha_6 = p^{1/9}\ \omega^4$, $\alpha_7 = p^{1/9}\ \omega^2$, $\alpha_8 = p^{1/9}\ \omega^3$,
$\alpha_9 = p^{1/9}\ \omega^6$, then

$$\Delta = (p^{1/9})^3 \begin{vmatrix} 1 & \omega^8 & \omega^7 \\ \omega & \omega^5 & \omega^4 \\ \omega^2 & \omega^3 & \omega^6 \end{vmatrix}$$

$$= p^{1/3}\ (2\omega^2 - \omega^7 - \omega^6) \neq 0.$$

78. Statement-2 is true.

Using $R_2 \to R_2 - \sqrt{2}\ R_1$ and $R_3 \to R_3 - \sqrt{3}\ R_1$, we get

$$w = \begin{vmatrix} \sqrt{6} & 2i & 3+\sqrt{6}i \\ 0 & \sqrt{3} & (\sqrt{6}-2\sqrt{3})i \\ 0 & \sqrt{2} & (2-3\sqrt{2})i \end{vmatrix}$$

$$= \sqrt{6}\left[2\sqrt{3} - 3\sqrt{6} - 2\sqrt{3} + 2\sqrt{6}\right]i = -6i$$

79. We first show statement-2 is true.

$$P(x) = 1 + \binom{n}{1}x + \binom{n}{2}x^2 + \ldots + \binom{n}{n}x^n$$

$$\Rightarrow\quad P'(x) = \binom{n}{1} + 2\binom{n}{2}x + \ldots + n\binom{n}{n}x^{n-1}$$

$\Rightarrow\quad P'(0) = \dbinom{n}{1}$ = coefficient of x in the expansion of $P(x)$

$\therefore\quad$ Statement-2 is true.

Note that $\Delta(x)$ consists of 6 terms of the form $(1 + x)^n$.

Thus, coefficients of x in $\Delta(x) = \Delta'(0)$

$$\text{But } \Delta'(0) = \begin{vmatrix} a_1b_1 & a_1b_2 & a_1b_3 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} + \begin{vmatrix} 1 & 1 & 1 \\ a_2b_1 & a_2b_2 & a_2b_3 \\ 1 & 1 & 1 \end{vmatrix}$$

$$+\begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ a_3b_1 & a_3b_2 & a_3b_3 \end{vmatrix} = 0$$

80. Statement-2 is not always true. For instance, the system of equations

$$x + 2y + 3z = 1$$
$$2x + 3y + 4z = 2$$
$$3x + 4y + 5z = 4$$

has no solution but $|A| = 0$

For statement-1, let

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$, we obtain

$$\Delta = (a + b + c)\begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix} = 0$$

Also, note that $x = y = z$ satisfies each of the three equations.

Thus, the system of equations has infinite number of solutions.

81. Let

$$\Delta = \begin{vmatrix} a & b & c \\ b & c & a \\ c & a & b \end{vmatrix}$$
$$= -\frac{1}{2}(a+b+c)\left[(b-c)^2+(c-a)^2+(a-b)^2\right]$$

If $a + b + c \neq 0$ and $a^2 + b^2 + c^2 = bc + ca + ab$, then $(b - c)^2 + (c - a)^2 + (a - b)^2 = 0$

$\Rightarrow \quad a = b = c \neq 0 \qquad [\because\ a + b + c \neq 0]$

Thus, the system of equation reduces to $x + y + z = 0$ which is satisfied by infinite number of solutions.

$\therefore$ Statement-1 is true.

If $a + b + c = 0$ and $a^2 + b^2 + c^2 \neq bc + ca + ab$, then at least one following is true:

$a^2 \neq bc, \quad b^2 \neq ca, \quad c^2 \neq ab.$

Suppose $b^2 - ac \neq 0$

Write first two equations as:

$$ax + by = (a + b)z$$
$$bx + cy = (b + c)z$$

Eliminating y, we get

$$(ac - b^2)x = (ac - b^2)z$$
$$\Rightarrow \quad x = z$$

Thus, from (1) equation, we get

$$by = bz \quad \Rightarrow \quad y = z$$
$$\therefore \quad x = y = z$$

Therefore, statement-2 is false.

82. If (a_1, b_1), (a_2, b_2) (a_3, b_3) are non-collinear, then $\Delta_1 \neq 0$. Therefore statement-2 is true.

We can write Δ_2 as

$$\Delta_2 = \begin{vmatrix} a_1 & b_1 & 0 \\ a_2 & b_2 & 0 \\ a_3 & b_3 & 0 \end{vmatrix}\begin{vmatrix} b_1 & a_1 & 0 \\ b_2 & a_2 & 0 \\ a_3 & b_3 & 0 \end{vmatrix} = 0$$

for all values of $a_1, a_2, a_3, b_1, b_2, b_3 \in \mathbf{R}$.

83. As $\begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix}$

$$= (a + ib)\,(a - ib) + (c - id)\,(c + id)$$
$$= a^2 + b^2 + c^2 + d^2$$

we get statement-2 is true.

Now,

$$\left(a_1^2 + b_1^2 + c_1^2 + d_1^2\right)\left(a_2^2 + b_2^2 + c_2^2 + d_2^2\right)$$
$$= \begin{vmatrix} a_1+ib_1 & c_1+id_1 \\ -c_1+id_1 & a_1-ib_1 \end{vmatrix}\begin{vmatrix} a_2+ib_2 & c_2+id_2 \\ -c_2+id_2 & a_2-ib_2 \end{vmatrix}$$
$$= \begin{vmatrix} a+ib & c+id \\ -c+id & a-ib \end{vmatrix} = a^2 + b^2 + c^2 + d^2$$

where $a = a_1a_2 - b_1b_2 + c_1c_2 - d_1d_2$,
$b = a_2b_1 + a_1b_2 + c_1d_2 + c_2d_1$,
$c = -\,a_2c_1 + b_2d_1 - b_2c_1 + a_2d_1$,
$d = -\,b_2c_1 + a_2d_1 - b_1c_2 - b_1d_2$

Level 2

84. We have

$$\Delta^2 = \begin{vmatrix} l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \\ l_3 & m_3 & n_3 \end{vmatrix}\begin{vmatrix} l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \\ l_3 & m_3 & n_3 \end{vmatrix}$$
$$= \begin{vmatrix} a_1 & b_{21} & b_{31} \\ b_{12} & a_2 & b_{32} \\ b_{13} & b_{23} & a_3 \end{vmatrix}$$

where $a_k = l_k^2 + m_k^2 + n_k^2 = 1$ for $k = 1, 2, 3$

and $b_{ij} = l_i\,l_j + m_im_j + n_in_j = 0\ \forall\ i \neq j$

Thus, $\Delta^2 = \begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 1 \Rightarrow |\Delta| = 1.$

85. Using $R_1 \to aR_1$, $R_2 \to bR_2$, $R_3 \to cR_3$, we get

$$\Delta = \frac{1}{abc}\begin{vmatrix} ab^2c^2 & abc & ab+ac \\ a^2bc^2 & abc & bc+ab \\ a^2b^2c & abc & ac+bc \end{vmatrix}$$
$$= \frac{a^2b^2c^2}{abc}\begin{vmatrix} bc & 1 & ab+ac \\ ca & 1 & bc+ab \\ ab & 1 & ac+bc \end{vmatrix}$$

using $C_3 \to C_3 + C_1$, we get C_2 and C_3 are propotional. Thus, $\Delta = 0$

86. Using $C_1 \to C_1 - (x^2/3)C_3$, $C_2 \to C_2 - (2x/3)\, C_3$, we get

$$\Delta(x) = \begin{vmatrix} -5x+3 & -5 & 3 \\ x+9 & 1 & 9 \\ -6x+9 & -6 & 21 \end{vmatrix}$$

Using $C_1 \to C_1 - xC_2$, we get

$$\Delta(x) = \begin{vmatrix} 3 & -5 & 3 \\ 9 & 1 & 9 \\ 9 & -6 & 21 \end{vmatrix} = a \text{ constant.}$$

Thus, $a = 0$.

Alternate Solution

Replacing x by $1/x$, we get

$$\begin{vmatrix} \dfrac{1}{x^2} & -5\left(\dfrac{1}{x}\right)+3 & 2\left(\dfrac{1}{x}\right)-5 & 3 \\ 3\left(\dfrac{1}{x^2}\right) & +\dfrac{1}{x}+9 & 6\left(\dfrac{1}{x}\right)+1 & 9 \\ 7\left(\dfrac{1}{x^2}\right) & -6\left(\dfrac{1}{x}\right)+9 & 14\left(\dfrac{1}{x}\right)-6 & 21 \end{vmatrix}$$

$$= a\left(\frac{1}{x^3}\right)+b\left(\frac{1}{x^2}\right)+c\left(\frac{1}{x}\right)+d$$

$$\Rightarrow \begin{vmatrix} 1-5x+3x^2 & 2-5x & 3 \\ 3+x+9x^2 & 6+x & 9 \\ 7-6x+9x^2 & 14-6x & 21 \end{vmatrix} = a + bx + cx^2 + dx^3$$

Putting $x = 0$, we get

$$a = \begin{vmatrix} 1 & 2 & 3 \\ 3 & 6 & 9 \\ 7 & 14 & 21 \end{vmatrix} = 0$$

[$\because$ C_1 and C_2 are proportional]

87. The given system of equations will have a non-trivial solution if

$$\Delta = \begin{vmatrix} a+t & b & c \\ a & b+t & c \\ a & b & c+t \end{vmatrix} = 0$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (a + b + c + t) \begin{vmatrix} 1 & b & c \\ 1 & b+t & c \\ 1 & b & c+t \end{vmatrix} = 0$$

Using $C_2 \to C_2 - bC_1$, $C_3 \to C_3 - cC_1$, we get

$\Delta = (a + b + c + t)t^2 = 0 \Rightarrow t = 0, -(a + b + c)$

Thus, there are just two distinct values of t.

88. First multiply C_1 by a, C_2 by b, C_3 by c, followed by multiplying R_1 by $1/a$, R_2 by $1/b$ and R_3 by $1/c$, we get

$$\Delta = \begin{vmatrix} a^2+(b^2+c^2)\cos\theta & b^2(1-\cos\theta) & c^2(1-\cos\theta) \\ a^2(1-\cos\theta) & b^2+(c^2+a^2)\cos\theta & c^2(1-\cos\theta) \\ a^2(1-\cos\theta) & b^2(1-\cos\theta) & c^2+(a^2+b^2)\cos\theta \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$ and $a^2 + b^2 + c^2 = 1$, we get

$$\Delta = \begin{vmatrix} 1 & b^2(1-\cos\theta) & c^2(1-\cos\theta) \\ 1 & b^2+(1-b^2)\cos\theta & c^2(1-\cos\theta) \\ 1 & b^2(1-\cos\theta) & c^2+(1-c^2)\cos\theta \end{vmatrix}$$

Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = \begin{vmatrix} 1 & b^2(1-\cos\theta) & c^2(1-\cos\theta) \\ 0 & \cos\theta & 0 \\ 0 & 0 & \cos\theta \end{vmatrix} = \cos^2\theta$$

89. We have

$$\frac{dA}{d\theta} = \begin{vmatrix} -\sin(\alpha+\theta) & \sin(\alpha+\theta) & 1 \\ -\sin(\beta+\theta) & \sin(\beta+\theta) & 1 \\ -\sin(\gamma+\theta) & \sin(\gamma+\theta) & 1 \end{vmatrix}$$

$$+\begin{vmatrix} \cos(\alpha+\theta) & \cos(\alpha+\theta) & 1 \\ \cos(\beta+\theta) & \cos(\beta+\theta) & 1 \\ \cos(\gamma+\theta) & \cos(\gamma+\theta) & 1 \end{vmatrix}$$

$= 0 + 0 = 0$

$\Rightarrow A$ is independent θ. Thus, $A(\alpha, \beta, \gamma, \theta) = A(\alpha, \beta, \gamma, 0)$

$$\Rightarrow A\left(-\frac{\pi}{2}, 0, \frac{\pi}{2}, \frac{2\pi}{13}\right) = A\left(-\frac{\pi}{2}, 0, \frac{\pi}{2}, 0\right)$$

$$= \begin{vmatrix} 0 & -1 & 1 \\ 1 & 0 & 1 \\ 0 & 1 & 1 \end{vmatrix} = 2$$

90. We have $\Delta = (a - b)(b - c)(c - a) = -2$.

As $a > b > c$, $a - b$, $b - c$ are positive integers and $c - a$ is a negative integers.

Only possibilities are

$a - b = 2$, $b - c = 1$, $c - a = -1$ (1)

or $a - b = 1$, $b - c = 2$, $c - a = -1$ (2)

or $a - b = 1$, $b - c = 1$, $c - a = -2$ (3)

(1) and (2) lead us to $0 = 2$.

$\therefore\ a - b = 1,\ b - c = 1,\ c - a = -2.$

Now, $3a + 7b - 10c = 3(a - c) + 7(b - c) = 13$

91. Write

$$\Delta = \begin{vmatrix} \cos A & \sin A & 0 \\ \cos B & \sin B & 0 \\ \cos C & \sin C & 0 \end{vmatrix} \begin{vmatrix} \cos P & -\sin P & 0 \\ \cos Q & -\sin Q & 0 \\ \cos R & -\sin R & 0 \end{vmatrix}$$

$= 0$

Alternate Solution

Write $\Delta = \cos P\ \Delta_1 - \sin P\ \Delta_2$

$$\text{where } \Delta_1 = \begin{vmatrix} \cos A & \cos(A+Q) & \cos(A+R) \\ \cos B & \cos(B+Q) & \cos(B+R) \\ \cos C & \cos(C+Q) & \cos(C+R) \end{vmatrix}$$

$$\text{and } \Delta_2 = \begin{vmatrix} \sin A & \cos(A+Q) & \cos(A+R) \\ \sin B & \cos(B+Q) & \cos(B+R) \\ \sin C & \cos(C+Q) & \cos(C+R) \end{vmatrix}$$

In Δ_1, use $C_2 \to C_2 - \cos Q\ C_1$

$C_3 \to C_3 - \cos R\ C_1$

$$\Delta_1 = \begin{vmatrix} \cos A & \sin A \sin Q & \sin A \sin R \\ \cos B & \sin B \sin Q & \sin B \sin R \\ \cos C & \sin C \sin Q & \sin C \sin R \end{vmatrix}$$

$= 0$ [$\because$ C_2 and C_3 are propotional]

Similarly, $\Delta_2 = 0$

Thus, $\Delta = 0$

92. Expanding along C_1, we get

$$f(x) = 2\cos x \begin{vmatrix} 2\cos x & 1 \\ 1 & 2\cos x \end{vmatrix} - \begin{vmatrix} 1 & 0 \\ 1 & 2\cos x \end{vmatrix}$$

$= 8\cos^3 x - 4\cos x = 4\cos x \cos 2x$

$$\Rightarrow f\left(\frac{\pi}{3}\right) = -1,\ f\left(\frac{\pi}{2}\right) = 0.$$

$f'(x) = -4[\sin x \cos 2x + 2\cos x \sin 2x]$

$= -4[\sin 3x + \cos x \sin 2x]$

$$\Rightarrow f'\left(\frac{\pi}{3}\right) = -4\left[\sin \pi + \cos\left(\frac{\pi}{3}\right)\sin\left(\frac{2\pi}{3}\right)\right]$$

$= -\sqrt{3}$

93. For each $\Delta \in B$, there exist $\Delta_1 \in C$ where Δ_1 is obtained by interchanging 1st and 2nd row of Δ, similarly, for each $\Delta \in C$ there exists $\Delta_1 \in B$.

$\therefore$ B and C has same number of elements.

94. $$|a|^2 = |x|^2 + |y|^2 + |z|^2 + \bar{x}y + x\bar{y} + x\bar{z} + \bar{x}z + y\bar{z} + \bar{y}z$$

$\therefore\ |a|^2 + |b|^2 + |c|^2 = 3(|x|^2 + |y|^2 + |z|^2) +$

$(\bar{x}y + x\bar{y} + x\bar{z} + \bar{x}z + y\bar{z} + \bar{y}z)(1 + \omega + \omega^2)$

$$\Rightarrow \frac{|a|^2 + |b|^2 + |c|^2}{|x|^2 + |y|^2 + |z|^2} = 3$$

95. Write the determinant as $= abc\ \Delta_1 - \Delta_2$

$$\text{where } \Delta_1 = \begin{vmatrix} 1 & a & a^2 \\ 1 & b & b^2 \\ 1 & c & c^2 \end{vmatrix} = (a - b)(b - c)(c - a)$$

$$\text{and } \Delta_2 = \begin{vmatrix} a & a^2 & 1 \\ b & b^2 & 1 \\ c & c^2 & 1 \end{vmatrix} = \Delta_1$$

$\therefore\ (a - b)(b - c)(c - a)(abc - 1) = 0$

Since, a, b, c are distinct, we get

$abc - 1 = 0$ or $abc = 1$

96. $$|P|^2 = |\text{adj } P| = \begin{vmatrix} 1 & 4 & 4 \\ 2 & 1 & 7 \\ 1 & 1 & 3 \end{vmatrix} = 4$$

$\Rightarrow |P| = \pm 2$

97. Using $R_2 \to R_2 + 5R_1$, $R_3 \to R_3 - 4R_1$, we get

$$\begin{vmatrix} 1 & -3 & 4 \\ 0 & x-13 & 22 \\ 0 & 13 & x-22 \end{vmatrix} = 0$$

$\Rightarrow (x - 13)(x - 22) - (13)(22) = 0$

$\Rightarrow x(x - 35) = 0 \Rightarrow x = 0, 35$

Previous Years' AIEEE/JEE Main Questions

1. As $ax^2 + 2bx + c = 0$ has equal roots,

$b^2 - ac = 0$

Using $R_3 \to R_3 - xR_1 - R_2$, we get

$$\Delta = \begin{vmatrix} a & b & ax+b \\ b & c & bx+c \\ 0 & 0 & \alpha \end{vmatrix}$$

where $\alpha = 0 - x(ax + b) - (bx + c)$

$= -(ax^2 + 2bx + c)$

$\therefore \quad \Delta = \alpha(ac - b^2) = 0$

2. As l, m, n are pth, qth, rth terms of a G.P., log l, log m, log n are pth, qth, rth terms of an A.P. Let first term of the A.P. be a and its common difference be d.

   Now,

   $$\Delta = \begin{vmatrix} a+(p-1)d & p & 1 \\ a+(q-1)d & q & 1 \\ a+(r-1)d & r & 1 \end{vmatrix}$$

   Using $C_1 \to C_1 - dC_2 - (a - d)C_3$, we get

   $$\Delta = \begin{vmatrix} 0 & p & 1 \\ 0 & q & 1 \\ 0 & r & 1 \end{vmatrix} = 0$$

3. If n is a multiple of 3, we get each element of Δ becomes 1.

   $\therefore \quad \Delta = 0$

   If $n = 3k + 1$, then

   $$\Delta = \begin{vmatrix} 1 & \omega & \omega^2 \\ \omega & \omega^2 & 1 \\ \omega^2 & 1 & \omega \end{vmatrix} = 0 \quad [\text{use } C_1 \to C_1 + C_2 + C_3]$$

   If $n = 3k + 2$, then

   $$\Delta = \begin{vmatrix} 1 & \omega^2 & \omega \\ \omega^2 & \omega & 1 \\ \omega & 1 & \omega^2 \end{vmatrix} = 0 \quad [\text{use } C_1 \to C_1 + C_2 + C_3]$$

4. As the system has a non-zero solution

   $$\begin{vmatrix} 1 & 2a & a \\ 1 & 3b & b \\ 1 & 4c & c \end{vmatrix} = 0$$

   $$\begin{vmatrix} 1/a & 2 & 1 \\ 1/b & 3 & 1 \\ 1/c & 4 & 1 \end{vmatrix} = 0$$

   Using $R_1 \to R_1 - 2R_2 + R_3$, we get

   $$\Rightarrow \begin{vmatrix} 1/a - 2/b + 1/c & 0 & 0 \\ 1/b & 3 & 1 \\ 1/c & 4 & 1 \end{vmatrix} = 0$$

   $$\frac{1}{a} - \frac{2}{b} + \frac{1}{c} = 0$$

   $\Rightarrow \quad a, c, b$ are in H.P.

5. Let R be the common ratio of the G.P. Applying $C_3 \to C_3 - C_2$ and $C_2 \to C_2 - C_1$, we get that the given determinant

   $$= \begin{vmatrix} \log a_n & \log R & \log R \\ \log a_{n+1} & \log R & \log R \\ \log a_{n+2} & \log R & \log R \end{vmatrix} = 0$$

6. Applying $C_1 \to C_1 + C_2 + C_3$, we get

   $$f(x) = \begin{vmatrix} 1+2x+(a^2+b^2+c^2)x & (1+b^2)x & (1+c^2)x \\ 1+2x+(a^2+b^2+c^2)x & 1+b^2x & (1+c^2)x \\ 1+2x+(a^2+b^2+c^2)x & (1+b^2)x & 1+c^2x \end{vmatrix}$$

   $$= \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 1 & 1+b^2x & (1+c^2)x \\ 1 & (1+b^2)x & 1+c^2x \end{vmatrix}$$

   Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

   $$f(x) = \begin{vmatrix} 1 & (1+b^2)x & (1+c^2)x \\ 0 & 1-x & 0 \\ 0 & 0 & 1-x \end{vmatrix}$$

   $= (1 - x)^2$

   which is a polynomial of degree 2.

7. If A denotes the coefficient matrix, then

   $$|A| = \begin{vmatrix} \alpha & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix} = (\alpha+2)\begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & 1 \\ 1 & 1 & \alpha \end{vmatrix}$$

   [using $C_1 \to C_1 + C_2 + C_3$]

   $$= (\alpha+2)\begin{vmatrix} 1 & 1 & 1 \\ 0 & \alpha-1 & 0 \\ 0 & 0 & \alpha-1 \end{vmatrix}$$

   $= (\alpha + 2)(\alpha - 1)^2$

   If $|A| \neq 0$, the system has a unique solution.

   If $|A| = 0$, then $\alpha = -2$ or $\alpha = 1$. For $\alpha = 1$, the system of equations becomes $x + y + z = 0$ which has infinite number of solutions.

   For $\alpha = -2$, the system of equation becomes

   $$-2x + y + z = -3$$
   $$x - 2y + z = -3$$

$$x + y - 2z = -3$$

which on adding becomes $0 = -9$

Thus, the system has no solution if $\alpha = -2$.

8. $$D = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1+x & 1 \\ 1 & 1 & 1+y \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$ and $R_3 \to R_3 - R_1$, we get

$$D = \begin{vmatrix} 1 & 1 & 1 \\ 0 & x & 0 \\ 0 & 0 & y \end{vmatrix} = xy$$

which is divisible by both x and y.

9. Let $$\Delta_2 = \begin{vmatrix} a+1 & b+1 & c-1 \\ a-1 & b-1 & c+1 \\ (-1)^{n+2}a & (-1)^{n+1}b & (-1)^n c \end{vmatrix}$$

Using the reflection property, we get

$$\Delta_2 = \begin{vmatrix} a+1 & a-1 & (-1)^{n+2}a \\ b+1 & b-1 & (-1)^{n+1}b \\ c-1 & c+1 & (-1)^n c \end{vmatrix}$$

$$= (-1)^2 \begin{vmatrix} (-1)^{n+2}a & a+1 & a-1 \\ (-1)^{n+1}b & b+1 & b-1 \\ (-1)^n c & c-1 & c+1 \end{vmatrix}$$

Thus,

$$\Delta = \begin{vmatrix} a & a+1 & a-1 \\ -b & b+1 & b-1 \\ c & c-1 & c+1 \end{vmatrix} + \begin{vmatrix} (-1)^{n+2}a & a+1 & a-1 \\ (-1)^{n+1}b & b+1 & b-1 \\ (-1)^n c & c-1 & c+1 \end{vmatrix}$$

$$= \begin{vmatrix} a+(-1)^{n+2}a & a+1 & a-1 \\ -b+(-1)^{n+1}b & b+1 & b-1 \\ c+(-1)^n c & c-1 & c+1 \end{vmatrix}$$

The first column consists of all 0's if n is any odd integer.

$\therefore\ \ \Delta = 0$ if n is any odd integer.

10. Using $C_1 \to C_1 + C_2 + C_3$, we get
$\Delta = (a + b + c)\,\Delta_1$
where

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 1 & c & a \\ 1 & a & b \end{vmatrix}$$

Applying $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & b & c \\ 0 & c-b & a-c \\ 0 & a-b & b-c \end{vmatrix}$$

$= -(b - c)^2 - (a - b)(a - c)$

$= -(a^2 + b^2 + c^2 - bc - ca - ab)$

$$\Rightarrow \quad \Delta_1 = -\frac{1}{2}[(b-c)^2 + (c-a)^2 + (a-b)^2] < 0$$

As $a + b + c > 0$, we get

$\Delta = (a + b + c)\,\Delta_1 < 0$

11. Using $C_1 \to C_1 - C_3$ in Δ, we get

$$\Delta = \begin{vmatrix} 0 & \sin\alpha & \cos\alpha \\ 0 & \cos\alpha & \sin\alpha \\ 2\cos\alpha & -\sin\alpha & -\cos\alpha \end{vmatrix}$$

$= 2\cos\alpha\,(\sin^2\alpha - \cos^2\alpha)$

$= -2\cos\alpha\cos 2\alpha$

$\Delta = 0$ for $\alpha = \pi/4 \in (0, \pi/2)$.

This is the only value of α lying in $(0, \pi/2)$ for which $\Delta = 0$.

The system of linear equation will have a non-trivial solution if and only if

$$\Delta_1 = \begin{vmatrix} 1 & \sin\alpha & \cos\alpha \\ 1 & \cos\alpha & \sin\alpha \\ 1 & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

Using $R_2 \to R_2 + R_1$, we get

$$\Delta_1 = \begin{vmatrix} 2 & 0 & 0 \\ 1 & \cos\alpha & \sin\alpha \\ 1 & -\sin\alpha & -\cos\alpha \end{vmatrix} = 0$$

$\Rightarrow\ \ 2(-\cos^2\alpha + \sin^2\alpha) = 0$
$\Rightarrow\ \ -2\cos 2\alpha = 0$

This is true for only one value of $\alpha \in (0, \pi/2)$ viz, $\alpha = \pi/4$.

Thus, statement-1 is also true. However statement-2 is not a correct reason for statement-1.

12. $$\Delta = \begin{vmatrix} 1+1+1 & 1+\alpha+\beta & 1+\alpha^2+\beta^2 \\ 1+\alpha+\beta & 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 \\ 1+\alpha^2+\beta^2 & 1+\alpha^3+\beta^3 & 1+\alpha^4+\beta^4 \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix} = \Delta_1^2$$

where $\Delta_1 = \begin{vmatrix} 1 & 1 & 1 \\ 1 & \alpha & \beta \\ 1 & \alpha^2 & \beta^2 \end{vmatrix}$

Applying $C_3 \to C_3 - C_2$ and $C_2 \to C_2 - C_1$, we get

$$\Delta_1 = \begin{vmatrix} 1 & 0 & 0 \\ 1 & \alpha - 1 & \beta - \alpha \\ 1 & \alpha^2 - 1 & \beta^2 - \alpha^2 \end{vmatrix}$$

$$= (\alpha - 1)(\beta - \alpha) \begin{vmatrix} 1 & 1 \\ \alpha + 1 & \beta + \alpha \end{vmatrix}$$

$$= (\alpha - 1)\ (\beta - 1)\ (\beta - \alpha)$$

Thus, $\Delta = (\alpha - 1)^2\ (\beta - 1)^2 (\alpha - \beta)^2$

$\therefore\ K = 1$

13. As the given system of equations has a non-trivial solutions.

$$\Delta = \begin{vmatrix} a - 1 & -1 & -1 \\ -1 & b - 1 & -1 \\ -1 & -1 & c - 1 \end{vmatrix} = 0$$

Write

$$\Delta = \begin{vmatrix} a & -1 & -1 \\ 0 & b - 1 & -1 \\ 0 & -1 & c - 1 \end{vmatrix} - \begin{vmatrix} 1 & -1 & -1 \\ 1 & b - 1 & -1 \\ 1 & -1 & c - 1 \end{vmatrix}$$

$$= a[(b - 1)(c - 1) - 1] - \begin{vmatrix} 1 & 0 & 0 \\ 1 & b & 0 \\ 1 & 0 & c \end{vmatrix}$$

[use $C_2 \to C_2 + C_1$, C_3 — $C_3 + C_1$]

$= a\ (bc - b - c) - bc$

As $\Delta = 0$, we get

$ab + bc + ca = abc$

14. We have $|B(x)| = |(A(x))^T A(x)|$

$= |A(x)^T|\ |A(x)|$

$= |A(x)|\ |A(x)| = |A(x)|^2$

Let $p_i(x) = a_i x^2 + b_i x + c_i\ \ (i = 1, 2, 3)$

Applying $C_1 \to C_1 - \frac{1}{2}x^2 C_3, C_2 \to C_2 - xC_3$.

we get

$$|A(x)| = 2 \begin{vmatrix} b_1 x + c_1 & b_1 & a_1 \\ b_2 x + c_2 & b_2 & a_2 \\ b_3 + c_3 & b_3 & a_3 \end{vmatrix}$$

Applying $C_1 \to C_1 - xC_2$, we get

$$|A(x)| = 2 \begin{vmatrix} c_1 & b_1 & a_1 \\ c_2 & b_2 & a_2 \\ c_3 & b_3 & a_3 \end{vmatrix}$$

$\therefore\ |B(x)|$ is independent of x.

15. Using $R_3 \to R_3 - R_2$ and $R_2 \to R_2 - R_1$, we get

$$\Delta = \begin{vmatrix} a^2 & b^2 & c^2 \\ 2a\lambda + \lambda^2 & 2b\lambda + \lambda^2 & 2c\lambda + \lambda^2 \\ -4a\lambda & -4b\lambda & -4c\lambda \end{vmatrix}$$

Take -4λ common from R_3, and applying $R_2 \to R_2 - 2\lambda R_3$, we get

$$\Delta = -4\lambda^3 \begin{vmatrix} a^2 & b^2 & c^2 \\ 1 & 1 & 1 \\ a & b & c \end{vmatrix}$$

$$= \lambda(4\lambda^2) \begin{vmatrix} a^2 & b^2 & c^2 \\ a & b & c \\ 1 & 1 & 1 \end{vmatrix}$$

$\therefore\ k = 4\lambda^2$

16. As $\sum_{r=1}^{n-1} r = \frac{1}{2}n(n-1), \sum_{r=1}^{n-1} (2r - 1) = (n - 1)^2$

and $\sum_{r=1}^{n-1} (3r - 2) = \frac{3}{2}n(n-1) - 2(n-1)$

$$= \frac{1}{2}(n-1)(3n-4)$$

Thus,

$$\sum_{r=1}^{n-1} \Delta_r = \begin{vmatrix} n(n-1)/2 & (n-1)^2 & (n-1)(3n-4)/2 \\ n/2 & n-1 & a \\ n(n-1)/2 & (n-1)^2 & (n-1)(3n+4)/2 \end{vmatrix}$$

Using $R_3 \to R_3 - R_1$, we get

$$\sum_{r=1}^{n-1} \Delta_r = \begin{vmatrix} n(n-1)/2 & (n-1)^2 & (n-1)(3n-4)/2 \\ n/2 & n-1 & a \\ 0 & 0 & 4(n-1) \end{vmatrix}$$

Expanding along R_3, we get

$$\sum_{r=1}^{n-1}\Delta_r = 4(n-1)\begin{vmatrix} n(n-1)/2 & (n-1)^2 \\ n/2 & n-1 \end{vmatrix}$$

$$= 4(n-1)\left(\frac{n}{2}\right)(n-1)\begin{vmatrix} n-1 & n-1 \\ 1 & 1 \end{vmatrix} = 0$$

17. The system will have a non-trivial solution if

$$\Delta = \begin{vmatrix} 2-\lambda & -2 & 1 \\ 2 & -3-\lambda & 2 \\ -1 & 2 & -\lambda \end{vmatrix} = 0$$

Using $R_1 \to R_1 + R_3$, $R_2 \to R_2 + 2R_3$,

$$\Delta = \begin{vmatrix} 1-\lambda & 0 & 1-\lambda \\ 0 & 1-\lambda & 2-2\lambda \\ -1 & 2 & -\lambda \end{vmatrix} = 0$$

$$\Rightarrow \quad (1-\lambda)^2\begin{vmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ -1 & 2 & -\lambda \end{vmatrix} = 0$$

Using $C_3 \to C_3 - C_1$, we get

$$(1-\lambda)^2\begin{vmatrix} 1 & 0 & 0 \\ 0 & 1 & 2 \\ -1 & 2 & -\lambda+1 \end{vmatrix} = 0$$

$\Rightarrow (1 - \lambda)^2 [- \lambda + 1 - 4] = 0 \Rightarrow \lambda = 1, - 3$

Thus, the set contains two elements

18. Using $R_2 \to R_2 - R_1 - R_3$, we get

$$\Delta = \begin{vmatrix} x^2+x & x+1 & x-2 \\ -4 & 0 & 0 \\ x^2+2x+3 & 2x-1 & 2x-1 \end{vmatrix}$$

Expanding along R_2, we get

$$\Delta = -(-4)\begin{vmatrix} x+1 & x-2 \\ 2x-1 & 2x-1 \end{vmatrix}$$

Using $C_2 \to C_2 - C_1$, we get

$$\Delta = 4\begin{vmatrix} x+1 & -3 \\ 2x-1 & 0 \end{vmatrix}$$

$= 4(3)\ (2x - 1)$

$= 24x - 12$

$\therefore\ a = 24$

TIP : Put $x = 1$ to obtain

$$\begin{vmatrix} 2 & 2 & -1 \\ 4 & 3 & 0 \\ 6 & 1 & 1 \end{vmatrix} = a - 12$$

$\Rightarrow 12 = a - 12$

$\Rightarrow a = 24$

19. Let x be any real number and $y = 1$, $z = 1$, then

$$\Delta = \begin{vmatrix} x & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{vmatrix} = 0 \geq 0$$

and $xyz = x$ can take any real value, thus, minimum value of xyz does not exist.

20. The given system of equations has a non-trivial solution if

$$\begin{vmatrix} 1 & \lambda & -1 \\ \lambda & -1 & -1 \\ 1 & 1 & -\lambda \end{vmatrix} = 0$$

$\Rightarrow \lambda - \lambda - \lambda - 1 + 1 + \lambda^3 = 0$

$\Rightarrow \lambda\ (\lambda - 1)\ (\lambda + 1) = 0$

$\Rightarrow \lambda = 0, -1, 1$

When $\lambda = 0$, $x = -y = z = k \neq 0$

When $\lambda = -1$, $x = 0$, $y = -z = k \neq 0$

When $\lambda = 1$, $y = 0$, $x = -z = k \neq 0$

Thus, there are three values of λ, for which the system of equations has a non-trivial solutions.

21. Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (2\sin x + \cos x)\begin{vmatrix} 1 & \sin x & \sin x \\ 1 & \cos x & \sin x \\ 1 & \sin x & \cos x \end{vmatrix}$$

Using $C_2 \to C_2 - (\sin x)\ C_1$

and $C_3 \to C_3 - (\sin x)\ C_1$,

we get

$$\Delta = (2\sin x + \cos x)\begin{vmatrix} 1 & 0 & 0 \\ 1 & \cos x - \sin x & 0 \\ 1 & 0 & \cos x - \sin x \end{vmatrix}$$

$= (2\sin x + \cos x)\ (\cos x - \sin x)^2$

$\therefore\ \Delta = 0 \Rightarrow \tan x = -\dfrac{1}{2}, 1$

As $-\pi/4 \leq x \leq \pi/4$, $-1 \leq \tan x \leq 1$

and $\tan x$ is one-to-one in the interval $[-\pi/4, \pi/4]$.

Thus, there are two values of x.

Previous Years' B-Architecture Entrance Examination Questions

1. From first and third equation

$$(b-1)x = 0$$

If $b \neq 1$, $x = 0$.

In this case $y + z = 0$, $by + z = 0$

$\Rightarrow \quad (b-1)y = 0 \quad \Rightarrow y = 0$

Thus, $z = 0$

That is, if $b \neq 1$, then the system has only trivial solution.

$\therefore \quad b = 1$

From first and second equation,

$(a-1)\,x = 0$.

If $a \neq 1$, $x = 0$ and $y + z = 0$

In this case the system has infinite number of solution.

If $a = 1$, all the three equations become identical to $x + y + z = 0$ and the system has infinite number of solutions.

$b = 1 \Rightarrow (b-1)^2 = 0 \quad \Rightarrow b^2 = 2b - 1$

2. As the system has a non-trivial solution,

$$\Delta = \begin{vmatrix} \lambda+3 & \lambda+2 & 1 \\ 3 & \lambda+3 & 1 \\ 2 & 3 & 1 \end{vmatrix} = 0$$

Using $R_1 \to R_1 - R_3$, $R_2 \to R_2 - R_3$, we get

$$\Delta = \begin{vmatrix} \lambda+1 & \lambda-1 & 0 \\ 1 & \lambda & 0 \\ 2 & 3 & 1 \end{vmatrix} = 0$$

$\Rightarrow \Delta = \lambda(\lambda + 1) - (\lambda - 1) = 0$

$\Rightarrow (\lambda - 1)^2 = 0 \quad \Rightarrow \lambda = 1$

For $\lambda = 1$, the system becomes

$$4x + 3y + z = 0 \qquad \text{(i)}$$

$$3x + 4y + z = 0 \qquad \text{(ii)}$$

$$2x + 3y + z = 0 \qquad \text{(iii)}$$

From (i) and (iii) $x = 0$

From (i) and (ii) $3y + z = 0$

and $\quad 4y + z = 0$

$\Rightarrow \quad y = 0, z = 0$

Thus, the system has non-trivial solution for no value of λ.

3. $$\sum_{k=1}^{2} \Delta_k = \begin{vmatrix} a & b & c \\ \alpha & \beta & \gamma \\ 3^n - 1 & 4^n - 1 & 5^n - 1 \end{vmatrix}$$

where $a = \sum_{k=1}^{n} 2(3^{k-1})$

$$= \frac{2(3^n - 1)}{3 - 1} = 3^n - 1,$$

$$b = \sum_{k=1}^{n} 3(4^{k-1}) = \frac{3(4^n - 1)}{4 - 1} = 4^n - 1$$

and $c = \sum_{k=1}^{n} 4(5^{k-1}) = \dfrac{4(5^n - 1)}{5 - 1} = 5^n - 1$

Thus, $\sum_{k=1}^{n} \Delta_k = \begin{vmatrix} a & b & c \\ \alpha & \beta & \gamma \\ a & b & c \end{vmatrix} = 0$

4. $$\det(B) = \begin{vmatrix} a_{11} & 2^{-1} a_{12} & 2^{-2} a_{13} \\ 2a_{21} & a_{22} & 2^{-1} a_{23} \\ 2^2 a_{31} & 2a_{32} & a_{33} \end{vmatrix}$$

$$= (2^{-2})(2^{-1}) \begin{vmatrix} 2^2 a_{11} & 2a_{12} & a_{13} \\ 2^2 a_{21} & 2a_{22} & a_{23} \\ 2^2 a_{31} & 2a_{32} & a_{33} \end{vmatrix}$$

$$= (2^{-3})(2^2)(2) \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$= \det(A) = 5$

5. $$\sum_{r=1}^{n} \Delta_r = \begin{vmatrix} a & b & c \\ \alpha & \beta & \gamma \\ 2^n - 1 & 3^n - 1 & 5^n - 1 \end{vmatrix}$$

where $\quad a = \sum_{r=1}^{n} 2^{r-1} = 2^n - 1$

$$b = \sum_{r=1}^{n} 2(3^{r-1}) = \frac{2(3^n - 1)}{3 - 1}$$

$= 3^n - 1$

and $\quad c = \sum_{r=1}^{n} 4(5^{r-1}) = \dfrac{4(5^n - 1)}{5 - 1}$

$= 5^n - 1$

Thus, $$\sum_{r=1}^{n}\Delta_r = \begin{vmatrix} a & b & c \\ \alpha & \beta & \gamma \\ a & b & c \end{vmatrix} = 0$$

6. Taking e^{x_1} common from R_1, e^{x_4} common from R_2 and e^{x_7} from R_3, we get

$\Delta = e^{x_1 + x_4 + x_7}\Delta_1$

where

$$\Delta_1 = \begin{vmatrix} 1 & e^{3d} & e^{6d} \\ 1 & e^{3d} & e^{6d} \\ 1 & e^{3d} & e^{6d} \end{vmatrix} = 0$$

where d is common difference of A.P.

$\therefore\ \Delta = 0$

7. Taking $\sqrt{5}$ common from C_2 and C_3, we get

$\Delta = 5\Delta_1$

where $$\Delta_1 = \begin{vmatrix} \sqrt{13}+\sqrt{3} & 2 & 1 \\ \sqrt{15}+\sqrt{26} & \sqrt{5} & \sqrt{2} \\ 3+\sqrt{65} & \sqrt{3} & \sqrt{5} \end{vmatrix}$$

Applying, $C_1 \to C_1 - \sqrt{3}C_2 - \sqrt{13}C_3$, we get

$$\Delta_1 = \begin{vmatrix} -\sqrt{3} & 2 & 1 \\ 0 & \sqrt{5} & \sqrt{2} \\ 0 & \sqrt{3} & \sqrt{5} \end{vmatrix}$$

$$= -\sqrt{3}(5-\sqrt{6})$$

Thus, $\Delta = 5\sqrt{3}(\sqrt{6}-5)$

8. As the given system has a non-zero solution

$$\begin{vmatrix} 1 & 2a & a \\ 1 & 3b & b \\ 1 & 4c & c \end{vmatrix} = 0$$

$$\Rightarrow abc\begin{vmatrix} 1/a & 2 & 1 \\ 1/b & 3 & 1 \\ 1/c & 4 & 1 \end{vmatrix} = 0$$

Using $R_1 \to R_1 - 2R_2 + R_3$, we get

$$abc\begin{vmatrix} \frac{1}{a}-\frac{2}{b}+\frac{1}{c} & 0 & 0 \\ 1/b & 3 & 1 \\ 1/c & 4 & 1 \end{vmatrix} = 0$$

$$\Rightarrow \quad abc\left(\frac{1}{a}-\frac{2}{b}+\frac{1}{c}\right)(-1) = 0$$

$\Rightarrow\quad 2ac = ab + bc$

9. Using $R_1 \to R_1 - R_2$, $R_3 \to R_3 - R_2$, we get

$$\begin{vmatrix} 0 & a-c & b-a \\ 1 & c & a \\ 0 & b-c & c-a \end{vmatrix} = 0$$

$\Rightarrow\quad (a-c)^2 + (b-a)(b-c) = 0$

$\Rightarrow\quad a^2 - 2ac + c^2 + b^2 - ab - bc + ac = 0$

$\Rightarrow\quad a^2 + b^2 + c^2 - bc - ca - ab = 0$

$\Rightarrow\quad (a-b)^2 + (b-c)^2 + (c-a)^2 = 0$

$\Rightarrow\quad a = b = c \quad \Rightarrow A = B = C$

$\Rightarrow\quad \sin A = \sin B = \sin C = \sqrt{3}/2$

Thus, $\sin^2 A + \sin^2 B + \sin^2 C = 9/4$

10. From the first two equations $x = 2$.

$\therefore\quad y - z = 1$ and $-4y + 4z = \alpha - 2$

$\Rightarrow\quad 4y - 4z + (-4y + 4z) = 4 + (\alpha - 2)$

$\Rightarrow\quad 0 = \alpha + 2$

Thus, the system has no solution for $\alpha \neq -2$.

If $\alpha = -2$, the system is consistent and has infinite number of solutions, since $y - z = 1$ has infinite number of solutions.

11. Using $C_1 \to C_1 + C_3$, we get

$$\Delta = \begin{vmatrix} 1 & \tan\theta + \sec^2\theta & 3 \\ 0 & \cos\theta & \sin\theta \\ 0 & -4 & 3 \end{vmatrix}$$

$= 3\cos\theta + 4\sin\theta$

$$\frac{d\Delta}{d\theta} = -3\cos\theta + 4\sin\theta$$

$$\frac{d\Delta}{d\theta} = 0 \Rightarrow \frac{\sin\theta}{4} = \frac{\cos\theta}{3} = \frac{1}{5}$$

$\Rightarrow \sin\theta = 4/5$, $\cos\theta = 3/5$

Max $\Delta = \max\{\Delta(0), \Delta(\sin^{-1}(4/5)), \Delta(1)\}$

$$= \max\left\{3, \frac{24}{5}, 4\right\} = \frac{24}{5}$$

min $\Delta = 3$.

$\therefore\ \Delta \in [3, 5]$

CHAPTER FIVE

Matrices

THE ALGEBRA OF MATRICES

A *matrix* is a rectangular array of numbers. The numbers may be real or complex. It may be represented as

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & & & \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix}$$

or as $A = (a_{ij})_{m \times n}$.

A matrix with m rows and n columns is called as $m \times n$ matrix and the *size* (or *dimension*) of this matrix is said be $m \times n$.

Two matrices are said to be *equal* provided they are of the same size and corresponding elements are equal. For example

$$\begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} = \begin{bmatrix} -1 & 2 & 5 \\ 7 & 3 & 11 \end{bmatrix}$$

if and only if

$a = -1, \quad b = 2, \quad c = 5, \quad d = 7, \quad e = 3$ and $f = 11$.

Definitions A matrix $A = (a_{ij})_{m \times n}$ is said to be a

(i)	*square matrix*	if $m = n$
(ii)	*row matrix*	if $m = 1$
(iii)	*column matrix*	if $n = 1$
(iv)	*null or zero matrix*	if $a_{ij} = 0 \ \forall\ i$ and j
(v)	*diagonal matrix*	if $m = n$ and $a_{ij} = 0 \ \forall\ i \neq j$
(vi)	*Scalar matrix*	if $m = n$ and $a_{ij} = 0 \ \forall\ i \neq j$ and $a_{ii} = \lambda \ \forall i$
(vii)	*Unit or identity matrix*	if $m = n$ and $a_{ij} = 0 \ \forall\ i \neq j$ and $a_{ii} = 1 \ \forall\ i$
(viii)	*Upper triangular matrix*	if $m = n$ and $a_{ij} = 0 \ \forall\ i > j$
(ix)	*Lower triangular matrix*	if $m = n$ and $a_{ij} = 0 \ \forall\ i < j$

A matrix is said to be triangular if it is either lower or upper triangular matrix.

Addition of Matrices Two matrices A and B can be added if and only if they are of the same size. If two matrices are of the same size, addition is carried out term by term. For instance

$$\begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} + \begin{bmatrix} p & q & r \\ s & t & u \end{bmatrix} = \begin{bmatrix} a+p & b+q & c+r \\ d+s & e+t & f+u \end{bmatrix}$$

Addition is *not defined* for matrices of different sizes.

The additive inverse of a matrix A, denoted by $-A$, is the matrix whose elements are the negatives of the corresponding elements of A. For example,

$$-\begin{bmatrix} a & b \\ c & d \\ e & f \end{bmatrix} = \begin{bmatrix} -a & -b \\ -c & -d \\ -e & -f \end{bmatrix}$$

If A and B are two matrices of the same size, then the *differences* between A and B is defined by

$$A - B = A + (-B)$$

Thus, the subtraction is carried out term-by-term. For instance

$$\begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} - \begin{bmatrix} p & q & r \\ s & t & u \end{bmatrix} = \begin{bmatrix} a-p & b-q & c-r \\ d-s & e-t & f-u \end{bmatrix}$$

Properties of Addition If A, B and C are three matrices of the same size, then

$A + B = B + A$ [Commutative law]

$(A + B) + C = A + (B + C)$ [Associative law]

$A + O = O + A$ [Additive property of zero]

$A + (-A) = O$

where O is the null or zero matrix of the same size as that of A.

Scalar Multiplication If A is a matrix and α is a scalar, then αA is defined as the matrix obtained by multiplying every element of A by α. For example

$$3\begin{bmatrix} 1 & -2 & 5 \\ 7 & 8 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -6 & 15 \\ 21 & 24 & 3 \end{bmatrix}$$

Properties of Scalar Multiplication If A and B are two matrices of the same size, and α, β are two scalars, then

$$(\alpha+\beta)A = \alpha A + \beta A$$
$$(\alpha\beta)A = \alpha(\beta A)$$
$$\alpha(A+B) = \alpha A + \alpha B$$

Matrix Multiplication Let $A = (a_{ij})_{m\times n}$ and $B = (b_{ij})_{r\times s}$ be two matrices. We say that A and B are *comparable for the product AB* if $n = r$, that is, if the number of columns of A is equal to the number of rows of B.

Definition: Let $A = (a_{ij})_{m\times n}$ and $B = (b_{ij})_{n\times p}$ be two matrices. Their product AB is the matrix $C = (c_{ij})_{m\times p}$ such that $c_{ij} = a_{i1}\,b_{1j} + a_{i2}\,b_{2j} + a_{i3}\,b_{3j} + \ldots + a_{in}\,b_{nj}$ for $1 \le i \le m$, $1 \le j \le p$. Note that c_{ij}, the (i, j)th element of AB, has been obtained by multiplying ith row of A, namely $(a_{i1}\;a_{i2}\;a_{i3}\;\ldots\;a_{in})$

with the jth column of B, namely $\begin{pmatrix} b_{1j} \\ b_{2j} \\ b_{3j} \\ . \\ . \\ . \\ b_{nj} \end{pmatrix} = (b_{1j}\;b_{2j}\ldots b_{nj})'$

where A' denotes the transpose of matrix A.

Properties of Matrix Multiplication

If $A = (a_{ij})_{m\times n}$, $B = (b_{ij})_{n\times p}$ and $C = (c_{ij})_{p\times q}$ then

1. $(AB)C = A(BC)$ [Associative law]
2. $AI_n = I_mA = A$
3. AB may not be equal to BA
4. $k(AB) = (kA)B = A(kB)$ where k is a scalar
5. If A is a square matrix, then
   $A^m\,A^n = A^{m+n}\;\forall\; m, n \in \mathbf{N}$
   $(A^m)^n = A^{mn}\quad \forall\; m, n \in \mathbf{N}$.
6. If A is an invertible matrix then
   $(A^{-1}\,B\,A)^m = A^{-1}\,B^m\,A$
   and $A^{-m} = (A^{-1})^m\;\forall\; m \in \mathbf{N}$.

TRANSPOSE OF A MATRIX

Definition: Let $A = (a_{ij})_{m\times n}$ be a matrix. The transpose of A, denoted by A' or by A^t is the matrix $A' = (b_{ij})_{n\times m}$ where $b_{ij} = a_{ji}\;\forall\; i$ and j.

By $\bar{A}$ we mean a matrix $B = (b_{ij})_{m\times n}$ where $b_{ij} = \bar{a}_{ij}$ where $\bar{a}$ denotes the conjugate of a. By A^* we mean

$$A^* = (\bar{A})' = (\bar{A}')$$

Properties of Transpose of Matrix

1. $(A+B)' = A' + B'$
2. $(kA)' = kA'$ where k is a scalar
3. $(AB)' = B'A'$ [Reversal law]
4. If A is an invertible matrix, then $(A^{-1})' = (A')^{-1}$.

ADJOINT AND INVERSE OF A MATRIX

Let $A = (a_{ij})_{n\times n}$ be square matrix. The adjoint of A is defined to be the matrix adj $A = (b_{ij})_{n\times n}$ where $b_{ij} = A_{ji}$ where A_{ji} is the cofactor of (j, i)th element of A.

Properties of Adjoint

1. $A(\text{adj } A) = (\text{adj } A)A = |A|I_n$
2. $\text{adj}(kA) = k^{n-1}\,(\text{adj } A)$
3. $\text{adj}(AB) = (\text{adj } B)\,(\text{adj } A)$

Definition: A square matrix A is said to be *singular* if $|A| = 0$ and *non-singular* if $|A| \ne 0$.

Definition: Inverse of a square matrix $A = (a_{ij})_{n\times n}$ is the matrix $B = (b_{ij})_{n\times n}$ such that

$$AB = BA = I_n.$$

In fact $\quad A^{-1} = \dfrac{1}{|A|}\,(\text{adj } A) \qquad \text{if } |A| \ne 0.$

Properties of Inverse

Let A and B be two invertible matrices of the same size.

1. Inverse of a matrix if it exists is unique.
2. $AA^{-1} = A^{-1}A = I_n$
3. $(A^{-1})^{-1} = A$
4. $(kA)^{-1} = k^{-1}\,A^{-1}$ if $k \ne 0$
5. $(AB)^{-1} = B^{-1}\,A^{-1}$ [Reversal law]
6. For a matrix $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, adj $A = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$
   and $A^{-1} = \dfrac{1}{ad-bc}\begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$ if $ad - bc \ne 0$
7. If A is a triangular matrix, then A^{-1}, if it exists is a triangular matrix of the same kind.
   In fact if $A = \begin{pmatrix} a_{11} & 0 & 0 \\ a_{21} & a_{22} & 0 \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$ and $a_{11}a_{22}a_{33} \ne 0$,
   then
   $$A^{-1} = \frac{1}{a_{11}a_{22}a_{33}}\begin{pmatrix} a_{22}a_{33} & 0 & 0 \\ -a_{21}a_{33} & a_{33}a_{11} & 0 \\ A_{13} & -a_{32}a_{11} & a_{11}a_{22} \end{pmatrix}$$
   where A_{13} = cofactor of (1, 3)th element in A i.e.
   $$A_{13} = \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$
8. If $A = \text{diag}\,(\lambda_1, \lambda_2, \ldots, \lambda_n)$ then A^{-1} exists if and only if $\lambda_i \ne 0\;\forall\; i$ and
   $A^{-1} = \text{diag}\,(\lambda_1^{-1}, \lambda_2^{-1}, \ldots, \lambda_n^{-1})$
   Also, $A^m = \text{diag}\,(\lambda_1^m, \lambda_2^m \ldots \lambda^m_n)$ if $m \in \mathbf{N}$
9. If a square matrix A satisfies the equation $a_0 + a_1x + a_2\,x^2 + \cdots + a_r\,x^r = 0$, then A is invertible if $a_0 \ne 0$ and its inverse is given by

$$A^{-1} = -\frac{1}{a_0}\,[a_1 I + a_2 A + \cdots + a_r A^{r-1}]$$

10. If $AB = I$, then $BA = I$ and $B = A^{-1}$
11. If $AB = CA = I$, then $B = C$.

SOME DEFINITIONS AND RESULTS

A **square matrix** A is said to be

1. *Symmetric* if $A' = A$
2. *Skew-symmetric* if $A' = -A$
3. *Hermitian if* $A^* = A$
4. *Skew Hermitian* if $A^* = -A$
5. *Orthogonal* if $AA' = A'A = I$ or if $A' = A^{-1}$
6. *Unitary* if $AA^\theta = A^\theta A = I$

Illustration 1

1. $A = \begin{pmatrix} 2 & 5 & -1 \\ 5 & 7 & -2 \\ -1 & -2 & 0 \end{pmatrix}$ is a symmetric matrix
2. $A = \begin{pmatrix} 0 & 5 & 2 \\ -5 & 0 & 7 \\ -2 & -7 & 0 \end{pmatrix}$ is a skew symmetric matrix
3. $A = \begin{pmatrix} 3 & 2-i \\ 2+i & 7 \end{pmatrix}$ is a Hermitian matrix
4. $A = \begin{pmatrix} 2i & 6-5i \\ -6-5i & 4i \end{pmatrix}$ is a skew Hermitian matrix
5. $A = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$ is an orthogonal matrix
6. $A = \frac{1}{\sqrt{5}}\begin{pmatrix} 2i & 1 \\ 1 & 2i \end{pmatrix}$ is a unitary matrix.

TIP

If A is a skew symmetric matrix, the $I + A$ and $I - A$ are non-singular matrices.

Some Results

1. The main diagonal elements of a skew-symmetric matrix are zeros, i.e. $a_{ii} = 0 \ \forall\ i$.
2. Determinant of a skew-symmetric matrix of odd order is zero and determinant of a skew-symmetric matrix of even order is a perfect square.
3. Every square matrix can be written uniquely as a sum of symmetric and a skew-symmetric matrix, i.e. if A is a square matrix, then there exists a symmetric matrix P and a skew-symmetric matrix Q such that
$$A = P + Q$$
In fact
$$P = \frac{1}{2}(A + A') \text{ and } Q = \frac{1}{2}(A - A').$$
4. For every square matrix A, matrices $A + A'$, AA' and $A'A$ are symmetric and matrices $A - A'$ and $A' - A$ are skew-symmetric.

Results 1. If A is an orthogonal matrix, then $|A| \neq 0$. In fact $|A| = \pm 1$ and $\bar{A}$, A', A^* are also orthogonal.

2. If A and B are two orthogonal matrices, then AB and BA are both orthogonal matrices.

A square matrix A is said to be

1 *nilpotent* if $A^m = O$ for some $m \in \mathbf{N}$.
2. *idempotent* if $A^2 = A$
3. *involutory* if $A^2 = I$.

Illustration 2

1. $A = \begin{pmatrix} 1 & -1 \\ 1 & -1 \end{pmatrix}$ is a nilpotent matrix as $A^2 = 0$
2. $A = \begin{pmatrix} 1 & -1 & 1 \\ 1 & -1 & 1 \\ 1 & -1 & 1 \end{pmatrix}$ is an idempotent matrix as $A^2 = A$
3. $A = \begin{pmatrix} 1/\sqrt{2} & 1/\sqrt{2} \\ 1/\sqrt{2} & -1/\sqrt{2} \end{pmatrix}$ is an involutory as $A^2 = I$.

Remark

❑ The least value of m for which $A^m = O$, is called the *index* of the nilpotent matrix.

Definition: If $A = (a_{ij})_{n \times n}$ is a square matrix, the trace of A denoted by tr (A) is sum of all the main diagonal elements, i.e.

$$\text{tr}(A) = a_{11} + a_{22} + \ldots + a_{nn}$$

Properties of Trace

Let A, B be two $n \times n$ matrices, and $k \in \mathbf{R}$.

1. $\text{tr}(kA) = k\,\text{tr}(A)$
2. $\text{tr}(A + B) = \text{tr}(A) + \text{tr}(B)$
3. $\text{tr}(AB) = \text{tr}(BA)$

RANK OF A MATRIX

If $A = (a_{ij})_{m \times n}$ is a matrix, and B is its submatrix of order r, then $|B|$, the determinant is called as *r-rowed minor of A*.

Definition Let $A = (a_{ij})_{m \times n}$ be a matrix. A positive integer r is said to be rank of A if

(i) A possesses at least one r-rowed minor which is different from zero; and
(ii) every $(r + 1)$ rowed minor of A is zero.

From (ii), it automatically follows that all minors of higher order are zeros.

We denote rank of A by $\rho(A)$

Result The rank of a matrix does not change when the following *elementary row operations* are applied to the matrix.

(a) Two rows are interchanged ($R_i \leftrightarrow R_j$)

(b) A row is multiplied by a non-zero constant, ($R_i \to kR_i$, with $k \neq 0$)

(c) a constant multiple of another row is added to a given row ($R_i \to R_i + kR_j$) where $i \neq j$

Note : The arrow → means "replaced by".

Note that the application of these elementary row operations does not change a singular matrix to a non-singular matrix or a non-singular matrix to a singular matrix. Therefore, the order of the largest non-singular square submatrix is not affected by application of any of the elementary row operations. Thus, the rank of a matrix does not change by application of any of the elementary row operations.

A matrix obtained from a given matrix by applying any of the elementary row operations is said to be equivalent to it. If A and B are two equivalent matrices, we write $A \sim B$.

Note that if $A \sim B$, then $\rho(A) = \rho(B)$.

By using the elementary row operations, we shall try to transform the given matrix in the following form

$$\begin{pmatrix} 1 & * & * & * \\ 0 & 1 & * & * \\ 0 & 0 & 1 & * \\ . & . & . & . \\ . & . & . & . \\ . & . & . & . \\ 0 & 0 & 0\cdots & * \end{pmatrix}$$

where * stands for zero or non-zero element. That is, we shall try to make a_{ii} as 1 and all the elements below a_{ii} as zero.

We illustrate the above procedure by the following illustration.

Illustration 3

Find the rank of the matrix

$$A = \begin{pmatrix} 2 & -3 & 1 \\ 3 & 5 & 7 \\ 5 & 3 & 8 \end{pmatrix}$$

Solution

Step 1: As a first step we must get a 1 in the first column of A. For this we subtract Row 1 from the Row 2.

$$\begin{pmatrix} 2 & -3 & 1 \\ 3 & 5 & 7 \\ 5 & 3 & 8 \end{pmatrix} [R_2 \to R_2 - R_1] \begin{pmatrix} 2 & -3 & 1 \\ 1 & 8 & 6 \\ 5 & 3 & 8 \end{pmatrix}$$

Step 2: We must get a 1 in the upper left corner. For this we interchange Row 1 and Row 2.

$$\begin{pmatrix} 2 & -3 & 1 \\ 1 & 8 & 6 \\ 5 & 3 & 8 \end{pmatrix} [R_1 \leftrightarrow R_2] \begin{pmatrix} 1 & 8 & 6 \\ 2 & -3 & 1 \\ 5 & 3 & 8 \end{pmatrix}$$

Step 3: We must get zeros at the two remaining two places in the first column. For this we multiply R_1 by – 2 and add it to R_2 and multiply R_1 by – 5 and add it to R_3.

$$\begin{pmatrix} 1 & 8 & 6 \\ 2 & -3 & 1 \\ 5 & 3 & 8 \end{pmatrix} [R_2 \to R_2 - 2R_1,$$

$$R_3 \to R_3 - 5R_1] \begin{pmatrix} 1 & 8 & 6 \\ 0 & -19 & -11 \\ 0 & -37 & -22 \end{pmatrix}$$

Step 4: We must have 1 in the second column. This 1 should *not be* in the first row. Also, you should not be tempted to use R_1 to obtain this 1. For, if we try to use R_1, then two zeros obtained in the first column will be destroyed. We multiply R_2 by – 2 and add it to R_3.

$$\begin{pmatrix} 1 & 8 & 6 \\ 0 & -19 & -11 \\ 0 & -37 & -22 \end{pmatrix} [R_3 \to R_3 - 2R_1] \begin{pmatrix} 1 & 8 & 6 \\ 0 & -19 & -11 \\ 0 & 1 & 0 \end{pmatrix}$$

Step 5: We now obtain a 1 at the $(2, 2)^{\text{th}}$ place. For this we interchange R_2 and R_3.

$$\begin{pmatrix} 1 & 8 & 6 \\ 0 & -19 & -11 \\ 0 & 1 & 0 \end{pmatrix} [R_2 \leftrightarrow R_3] \begin{pmatrix} 1 & 8 & 6 \\ 0 & 1 & 0 \\ 0 & -19 & -11 \end{pmatrix}$$

Step 6: We must get a zero at $(3, 2)^{\text{th}}$ place. For this we multiply R_2 by 19 and add it to R_3.

$$\begin{pmatrix} 1 & 8 & 6 \\ 0 & 1 & 0 \\ 0 & -19 & -11 \end{pmatrix} [R_3 \to R_3 + 19R_2] \begin{pmatrix} 1 & 8 & 6 \\ 0 & 1 & 0 \\ 0 & 0 & -11 \end{pmatrix}$$

This matrix is in the desired triangular form. Recall if $A \sim B$ then $\rho(A) = \rho(B)$. Thus, rank of the given matrix A is equal to the rank of the matrix

$$B = \begin{pmatrix} 1 & 8 & 6 \\ 0 & 1 & 0 \\ 0 & 0 & -11 \end{pmatrix}. \text{ Since } |B| = \begin{vmatrix} 1 & 8 & 6 \\ 0 & 1 & 0 \\ 0 & 0 & -11 \end{vmatrix}$$

$$= -11 \neq 0, \rho(B) = 3.$$

Hence, $\rho(A) = 3$.

Some Tips

- ❑ After obtaining 1 at (1, 1)th place and zeros at the remaining places in the first column, forget the first row. Do not use the first row to manipulate elements in the second or any other column. If you try to do so the zeros in the first column will be destroyed.
- ❑ After obtaining 1 at (2, 2)th place and zeros at the remaining places in the second column, forget the second row. Do not use it for manipulating elements in the remaining columns. The same remark applies to the remaining columns.
- ❑ If A is a non-singular matrix of order $n \times n$, then $\rho(A) = n$.

SYSTEM OF LINEAR EQUATIONS

Let us consider the following m linear equations in n unknowns:

$$\begin{aligned} &a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1 \\ &a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2 \qquad \dots(1) \\ &. \\ &. \\ &. \\ &a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m \end{aligned}$$

where $b_1, b_2, \dots b_m$ are not all zero.

The $m \times n$ matrix $\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ . & . & & . \\ . & . & . & . \\ . & . & & . \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}$ is called the *coefficient matrix* of the system of linear equations. Using it, we can now write these equations as follows:

$$\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ . & . & & . \\ . & . & . & . \\ . & . & & . \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ . \\ . \\ . \\ x_n \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \\ . \\ . \\ . \\ b_m \end{pmatrix}$$

We can abbreviate the above matrix equation as $AX = B$, where

$$A = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ . & . & & . \\ . & . & . & . \\ . & . & & . \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix},$$

$$X = \begin{pmatrix} x_1 \\ x_2 \\ . \\ . \\ . \\ x_n \end{pmatrix} \text{ and } B = \begin{pmatrix} b_1 \\ b_2 \\ . \\ . \\ . \\ b_n \end{pmatrix}$$

By a **solution** of (1) we mean a set of values $x_1, x_2, \dots, x_n$ such that (1) reduces to an identity.

The **augmented matrix** for system of equations

$$AX = B$$

is the matrix $(A \mid B)$. This matrix is obtained by adding $(n + 1)$th column to A. The elements of this column are the constants $b_1, \dots, b_m$.

Result The system of equations

$$\begin{aligned} &a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1 \\ &a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2 \qquad \dots(1) \\ &\dots\dots\dots\dots\dots\dots\dots\dots \\ &a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m \end{aligned}$$

is consistent (that is, possesses a solution) if and only if the coefficient matrix

$$A = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}$$

and the augmented matrix

$$(A \mid B) = \left(\begin{array}{cccc|c} a_{11} & a_{12} & \cdots & a_{1n} & b_1 \\ a_{21} & a_{22} & \cdots & a_{2n} & b_2 \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} & b_m \end{array}\right)$$

have the same rank.

We split the remaining result in two cases.

Case 1. If the system of equations in (1) is consistent and $m \geq n$, then

(*i*) if $\rho(A) = \rho(A \mid B) = n$, then the system of equations has a unique solution and $(m - n)$ equations are superfluous in the sense that any solution that satisfies other n equations will satisfy these $(m - n)$ equations.

(*ii*) if $\rho(A) = \rho(A \mid B) = r < n$, then the $(n - r)$ unknowns are assigned arbitrary values and the remaining r unknowns can be found in terms of those $(n - r)$ unknowns which have already been assigned values.

Case 2. If the system of equations in (1) is consistent and $m < n$, then (*i*) if $\rho(A) = \rho(A \mid B) = m$, then $(n - m)$ unknowns can be assigned arbitrary values and the values of the remaining m unknowns can be found in terms of those $(n - m)$ unknowns which have already been assigned values. Also, $(m - r)$ equations are superfluous.

(*ii*) if $\rho(A) = \rho(A \mid B) = r < m$ then $(n - r)$ unknowns can be assigned arbitrary values and the values of the remaining r unknowns can be found in terms of those $(n - r)$ unknowns which have already been assigned values. Also, $(m - r)$ equations are superfluous.

Finding Inverse by Elementary Row Operations

To find inverse of a square matrix A we begin with the augmented matrix $[A \mid I_n]$. If a sequence of elementary row operations transforms this matrix to $[I_n \mid B]$, then B is A^{-1}. However, if at any step we obtain all zeros in a row on the left of the vertical line, the matrix A is not invertible.

SOLUTION OF A SYSTEM OF EQUATION *AX* = *B* WHEN *A* IS A SQUARE MATRIX

Unique Solution

The system of equations

$$AX = B$$

has a unique solution if $|A| \neq 0$ and it is given by $X = A^{-1} B$

No Solution

If $|A| = 0$ and $(\text{Adj } A)B \neq O$, the system of equations has no solution.

Infinite Number of Solution or no Solution

If $|A| = 0$, and $(\text{Adj } A)B = O$, the system of equations has *infinite number of solutions* or *no solution*.

Illustration 4

Consider the system of equations

$$x + y + z = 1$$
$$2x + 2y + 2z = 2$$
$$3x + 3y + 3z = k$$

Here

$$A = \begin{pmatrix} 1 & 1 & 1 \\ 2 & 2 & 2 \\ 3 & 3 & 3 \end{pmatrix}, \quad B = \begin{pmatrix} 1 \\ 2 \\ k \end{pmatrix}, \text{ and}$$

$$adj\ A = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

Note that

$$(\text{adj } A)\, B = O$$

Also, note that the system of equations has

(1) infinite number of solutions if $k = 3$

(2) no solution if $k \neq 3$.

Remark

- ☐ Note this case carefully. Mostly students commit mistake in this case.

SOLUTION OF A SYSTEM OF HOMOGENEOUS LINEAR EQUATIONS *AX* = 0

The system

$$AX = 0$$

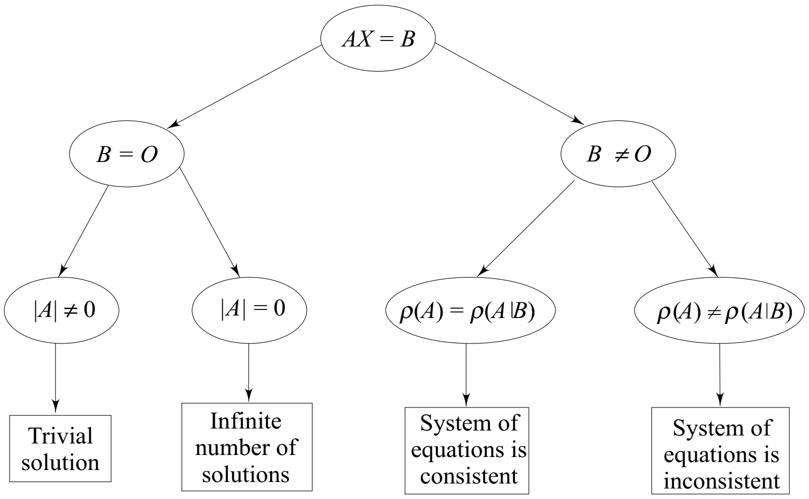
has a unique solution if $|A| \neq 0$ and it is the trivial solution viz.

$$x_1 = x_2 = \cdots = x_n = 0.$$

If $|A| = 0$, the system has infinite number of solutions.

Also if $AX = 0$ has at least one non-zero solution, then $|A| = 0$.

The following tree diagram is helpful.



SOLVED EXAMPLES

Concept-based
Straight Objective Type Questions

Example 1: The number of 2 × 2 matrices $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ for which

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \begin{bmatrix} 1/a & 1/b \\ 1/c & 1/d \end{bmatrix}, (a, b, c, d \in \mathbf{R}) \text{ is}$$

(a) 0 (b) 1

(c) 2 (d) infinite

Ans. (a)

Solution: If $ad - bc \neq 0$, then

$$A^{-1} = \frac{1}{ad-bc}\begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

Thus, $$\frac{d}{ad-bc} = \frac{1}{a} \Leftrightarrow ad = ad - bc$$

$$\Leftrightarrow bc = 0 \Leftrightarrow b = 0 \text{ or } c = 0$$

Therefore,

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \begin{bmatrix} 1/a & 1/b \\ 1/c & 1/d \end{bmatrix}$$

is never possible.

TIP

If $n > 1$, then a $n \times n$ matrix cannot have inverse in the above form.

Example 2: Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, $a, b, c, d \in \mathbf{R}$

If $A^5 = A^3 + I$, then A is

(a) a symmetric matrix

(b) a skew symmetric matrix

(c) an invertible matrix

(d) none of these

Ans. (c)

Solution: $A^5 = A^3 + I$

$\Rightarrow$ $A(A^4 - A^2) = (A^4 - A^2)\,A = I$

$\Rightarrow$ A is invertible and $A^{-1} = A^4 - A^2$.

TIP

If $P(x)$ is a polynomial such that $P(0) \neq 0$ and $P(A) = O$, then A is invertible.

Example 3: Let A and B be two 3 × 3 invertible matrices. If $A + B = AB$, then

(a) $A^{-1} + B^{-1} = O$

(b) $A^{-1} + B^{-1} = B^{-1}A^{-1}$

(c) $I - A^{-1}$ is invertible

(d) $B^{-1} + I$ is invertible

Ans. (c)

Solution: $A + B = AB \Rightarrow A = AB - B = (A - I)B$. Premultiplying by A^{-1} we get

$$I = A^{-1}A = (I - A^{-1})B$$

$\Rightarrow$ $I - A^{-1}$ is invertible.

Example 4: Let A be a 3 × 3 matrix and

$$S = \left\{ \begin{pmatrix} x \\ y \\ z \end{pmatrix} \middle| \, x, y, z \in \mathbf{R} \right\}$$

Define $f : S \to S$ by

$$f\begin{pmatrix} x \\ y \\ z \end{pmatrix} = A\begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

Suppose $f\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \Rightarrow x = y = z = 0.$

Then

(a) f is one-to-one (b) f cannot be onto

(c) A is not invertible (d) $A = O$

Ans. (a)

Solution: Let $\begin{pmatrix} x_1 \\ y_1 \\ z_1 \end{pmatrix}$ and $\begin{pmatrix} x_2 \\ y_2 \\ z_2 \end{pmatrix}$ be such

that $$f\begin{pmatrix} x_1 \\ y_1 \\ z_1 \end{pmatrix} = f\begin{pmatrix} x_2 \\ y_2 \\ z_2 \end{pmatrix}$$

$$\Rightarrow \quad A\begin{pmatrix} x_1 \\ y_1 \\ z_1 \end{pmatrix} = A\begin{pmatrix} x_2 \\ y_2 \\ z_2 \end{pmatrix}$$

$$\Rightarrow \quad A\begin{pmatrix} x_1 - x_2 \\ y_1 - y_2 \\ z_1 - z_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\Rightarrow \quad f\begin{pmatrix} x_1 - x_2 \\ y_1 - y_2 \\ z_1 - z_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\Rightarrow \quad x_1 - x_2 = 0,\ y_1 - y_2 = 0,\ z_1 - z_2 = 0$$

$$\Rightarrow \quad x_1 = x_2,\ y_1 = y_2,\ z_1 = z_2$$

or
$$\begin{pmatrix} x_1 \\ y_1 \\ z_1 \end{pmatrix} = \begin{pmatrix} x_2 \\ y_2 \\ z_2 \end{pmatrix}$$

Thus, f is one-to-one.

Example 5: Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, where $a, b, c, d \in \mathbf{R}$.

If $|a|, |b|, |c|, |d| \le k$, where $k > 0$, then

(a) $\det(A) \ge 2k^2$ (b) $\det(A) \ge k^2$

(c) $\det(A) \le 2k^2$ (d) $\det(A) \le k$

Ans. (c)

Solution: $\det(A) = ad - bc \le |ad - bc|$

$$\Rightarrow \quad \det(A) \le |a||d| + |b||c| \le 2k^2$$

Example 6: Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, where $a, b, c, d \in \mathbf{R}$.

Then

(a) $\det(A) \le \sqrt{a^2 + b^2}\sqrt{c^2 + d^2}$

(b) $\det(A) \le (a + b)(c + d)$

(c) $\det(A) \le ac + bd$

(d) $\det(A) \le (|a| - |b|)(|c| - |d|)$

Ans. (a)

Solution: $\det(A) = ad - bc \le |ad - bc|$
$$\le |a||d| + |b||c|$$

Now,
$$\begin{aligned} &(a^2 + b^2)(c^2 + d^2) - (|a||d| + |b||c|)^2 \\ &= a^2c^2 + b^2c^2 + a^2d^2 + b^2d^2 \\ &\quad - (a^2d^2 + b^2c^2 + 2|a||d||b||c|) \\ &= (|ac| - |bd|)^2 \ge 0 \end{aligned}$$

$$\Rightarrow \quad |a||d| + |b||c| \le \sqrt{a^2 + b^2}\sqrt{c^2 + d^2}$$

Example 7: Let A be a 3×3 matrix such that $\det(A) = -2$. Then $\det(-2A^{-1})$ is equal to

(a) 4 (b) −4

(c) 8 (d) −2

Ans. (a)

Solution: As A^{-1} is a 3×3 matrix,
$$\begin{aligned} \det(-2A^{-1}) &= (-2)^3 \det(A^{-1}) \\ &= (-2)^3 (\det(A))^{-1} \\ &= (-8)\left(-\frac{1}{2}\right) = 4 \end{aligned}$$

Example 8: For $1 \le i, j \le 3$, let
$$a_{ij} = \int_{-\pi/2}^{\pi/2} \cos(ix)\cos(jx)\,dx$$
and let $A = (a_{ij})_{3\times3}$. Then

(a) A is a singular matrix

(b) $AX = B$ has a unique solution for every 3×3 matrix B

(c) A is a skew-symmetric matrix.

(d) $A^2 = I$

Ans. (b)

Solution: For $1 \le i \le 3$,
$$a_{ii} = 2\int_0^{\pi/2} \cos(ix)\cos(ix)\,dx$$
[integrand is an even function]
$$= \int_0^{\pi/2} [1 + \cos(2ix)]\,dx$$
$$= \left(x + \frac{\sin(2ix)}{2i}\right)\Bigg]_0^{\pi/2} = \frac{\pi}{2} + 0 = \frac{\pi}{2}$$

For $1 \le i, j \le 3$, $i \ne j$,
$$a_{ij} = 2\int_0^{\pi/2} \cos(ix)\cos(jx)\,dx$$
$$= \int_0^{\pi/2} [\cos((i + j)x) + \cos((i - j)x)]\,dx$$
$$= \frac{\sin((i + j)\pi/2)}{i + j} + \frac{\sin((i - j)\pi/2)}{i - j}$$

$$\therefore \quad a_{12} = -\frac{1}{3} + 1 = \frac{2}{3} = a_{21}$$
$$a_{13} = 0 = a_{31}, \text{ and}$$
$$a_{23} = \frac{1}{5} + 1 = \frac{6}{5} = a_{32}$$

Thus,
$$A = \begin{pmatrix} 1 & 2/3 & 0 \\ 2/3 & 1 & 6/5 \\ 0 & 6/5 & 1 \end{pmatrix}$$

Using $C_2 \to C_2 - \frac{2}{3}C_1$, we get
$$\det(A) = \begin{vmatrix} 1 & 0 & 0 \\ 2/3 & 5/9 & 6/5 \\ 0 & 6/5 & 1 \end{vmatrix}$$
$$= \frac{5}{9} - \frac{36}{25} = -\frac{199}{225} \ne 0$$

As $\det(A) \ne 0$, A^{-1} exists. Therefore, $AX = B$ has a unique solution viz. $X = A^{-1}B$.

Example 9: The number of values of λ for which there exist a non-zero 3×3 matrix A such that $A' = \lambda A$ is:

(a) 0 (b) 1
(c) 2 (d) infinite

Ans. (c)

Solution: We have

$$A = (A')' = (\lambda A)' = \lambda A' = \lambda^2 A.$$

As $A \neq 0$, $\lambda^2 = 1 \Rightarrow \lambda = \pm 1$.

For $\lambda = 1$ all non-zero symmetric matrices can work as A. For $\lambda = -1$, all non-zero skew symmetric matrices can work as A.

Example 10: Let $A = \begin{bmatrix} 1 & a \\ 0 & 1 \end{bmatrix}$, where $a > 0$. Sum of the series $S = \text{trace}(A) + \text{trace}\left(\frac{1}{2}A\right) + \text{trace}\left(\frac{1}{2^2}A^2\right) + \text{trace}\left(\frac{1}{2^3}A^3\right) + \dots$ is

(a) 3 (b) 4
(c) 6 (d) 8

Ans. (b)

Solution: $A = I + B$, where $B = \begin{bmatrix} 0 & a \\ 0 & 0 \end{bmatrix}$

As $B^2 = O$, we get $B^r = O \quad \forall\, r \geq 2.$

Thus, $A^r = (I + B)^r = I + rB$

$$= \begin{bmatrix} 1 & ra \\ 0 & 1 \end{bmatrix} \quad \forall\, r \geq 1.$$

$$\Rightarrow \quad \text{trace}\left(\frac{1}{2^r}A^r\right) = \frac{1}{2^r}(2) = \frac{1}{2^{r-1}} \quad \forall\, r \geq 1.$$

$$\therefore \quad S = 2 + 1 + \frac{1}{2^2} + \frac{1}{2^3} + \dots = \frac{2}{1 - \frac{1}{2}} = 4$$

LEVEL 1

Straight Objective Type Questions

Example 11: If $\begin{bmatrix} 1 & 4 \\ 2 & 0 \end{bmatrix} = \begin{bmatrix} x & y^2 \\ z & 0 \end{bmatrix}$, $y < 0$ then $x - y + z$ is equal to

(a) 5 (b) 2
(c) 1 (d) – 3

Ans. (a)

Solution: By the equality of two matrices, $x = 1$, $y^2 = 4$, $z = 2$

$\Rightarrow \quad x = 1, y = -2, z = 2$ as $y < 0$.

$\therefore \quad x - y + z = 1 + 2 + 2 = 5$

Example 12: If $A = [1 \; -2 \;\; 3]$, $B = \begin{bmatrix} 2 \\ -3 \\ -1 \end{bmatrix}$, then AB is equal to

(a) $\begin{bmatrix} 2 \\ -3 \\ -1 \end{bmatrix}$ (b) $\begin{bmatrix} 2 \\ 6 \\ -3 \end{bmatrix}$

(c) $[2 \; 6 \; -3]$ (d) none of these

Ans. (d)

Solution: $AB = [1 \quad -2 \quad 3]\begin{bmatrix} 2 \\ -3 \\ -1 \end{bmatrix} = [2 + 6 - 3] = [5]$

Example 13: If $A = \begin{bmatrix} -i & 0 \\ 0 & i \end{bmatrix}$, then $A'A$ is equal to

(a) I (b) $-iA$
(c) $-I$ (d) iA

Ans. (c)

Solution: We have

$$A'A = \begin{bmatrix} -i & 0 \\ 0 & i \end{bmatrix}\begin{bmatrix} -i & 0 \\ 0 & i \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} = -I$$

Example 14: If $A_\alpha = \begin{bmatrix} \cos\alpha & \sin\alpha \\ -\sin\alpha & \cos\alpha \end{bmatrix}$, then $A_\alpha A_\beta$ is equal to

(a) $A_{\alpha+\beta}$ (b) $A_{\alpha\beta}$
(c) $A_{\alpha-\beta}$ (d) none of these

Ans. (a)

Solution: We have

$$A_\alpha A_\beta = \begin{bmatrix} \cos\alpha & \sin\alpha \\ -\sin\alpha & \cos\alpha \end{bmatrix}\begin{bmatrix} \cos\beta & \sin\beta \\ -\sin\beta & \cos\beta \end{bmatrix}$$

$$= \begin{bmatrix} \cos\alpha\cos\beta - \sin\alpha\sin\beta & \cos\alpha\sin\beta + \sin\alpha\cos\beta \\ -\sin\alpha\cos\beta - \cos\alpha\sin\beta & -\sin\alpha\sin\beta + \cos\alpha\cos\beta \end{bmatrix}$$

$$= \begin{bmatrix} \cos(\alpha+\beta) & \sin(\alpha+\beta) \\ -\sin(\alpha+\beta) & \cos(\alpha+\beta) \end{bmatrix} = A_{\alpha+\beta}$$

Example 15: Let A and B be two 2 × 2 matrices. Consider the statements

(i) $AB = O \Rightarrow A = O$ or $B = O$
(ii) $AB = I_2 \Rightarrow A = B^{-1}$
(iii) $(A + B)^2 = A^2 + 2AB + B^2$

Then

(a) (i) is false, (ii) and (iii) are true
(b) (i) and (iii) are false, (ii) is true
(c) (i) and (ii) are false, (iii) is true
(d) (ii) and (iii) are false, (i) is true

Ans. (b)

Solution: (i) is false.

If $A = \begin{bmatrix} 0 & 1 \\ 0 & -1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}$, then

$$AB = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O$$

Thus, $AB = O \not\Rightarrow A = O$ or $B = O$

(iii) is false since matrix multiplication is not commutative.

(ii) is true as product AB is an identity matrix, if and only if B is inverse of the matrix A.

Example 16: If $A - 2B = \begin{bmatrix} 1 & 5 \\ 3 & 7 \end{bmatrix}$ and $2A - 3B = \begin{bmatrix} -2 & 5 \\ 0 & 7 \end{bmatrix}$, then matrix B is equal to

(a) $\begin{bmatrix} -4 & -5 \\ -6 & -7 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 6 \\ -3 & 7 \end{bmatrix}$

(c) $\begin{bmatrix} 2 & -1 \\ 3 & 2 \end{bmatrix}$ (d) $\begin{bmatrix} 6 & -1 \\ 0 & 1 \end{bmatrix}$

Ans. (a)

Solution: We have

$$B = (2A - 3B) - 2(A - 2B) = \begin{bmatrix} -4 & -5 \\ -6 & -7 \end{bmatrix}$$

Example 17: If A and B two are 3×3 matrices, then which one of the following is **not** true:

(a) $(A + B)' = A' + B'$
(b) $(AB)' = A'B'$
(c) $\det(AB) = \det(A)\det(B)$
(d) $A(\text{adj } A) = |A|\, I_3$

Ans. (b)

Solution: If A and B are two 3×3 matrices, then

$(AB)' = B'A'$ [Reversal Law]

and not $(AB)' = A'B'$.

Example 18: If $A = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}$, then

(a) A is an orthogonal matrix
(b) A is a symmetric matrix
(c) A is a skew-symmetric matrix
(d) none of these

Ans. (a)

Solution: We have

$$AA' = \begin{pmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{pmatrix}\begin{pmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{pmatrix}$$

$$= \begin{pmatrix} \cos^2\theta + \sin^2\theta & \cos\theta\sin\theta - \sin\theta\cos\theta \\ \cos\theta\sin\theta - \sin\theta\cos\theta & \sin^2\theta + \cos^2\theta \end{pmatrix}$$

$$= \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} = I_2$$

Similarly, $A'A = I_2$

Thus, A is an orthogonal matrix.

Example 19: If

$A = \begin{bmatrix} a^2 & ab & ac \\ ab & b^2 & bc \\ ac & bc & c^2 \end{bmatrix}$ and $B = \begin{bmatrix} 0 & c & -b \\ -c & 0 & a \\ b & -a & 0 \end{bmatrix}$ then the product AB is equal to

(a) O (b) A
(c) B (d) I

Ans. (a)

Solution: We have

$$AB = \begin{bmatrix} 0 - abc + abc & a^2c + 0 - a^2c & -a^2b + a^2b + 0 \\ 0 - b^2c + b^2c & abc + 0 - abc & -ab^2 + ab^2 + 0 \\ 0 - bc^2 + bc^2 & ac^2 + 0 - ac^2 & -abc + abc + 0 \end{bmatrix} = O$$

Example 20: If A is an invertible matrix and B is an orthogonal matrix, of the order same as that of A, then $C = A^{-1}BA$ is

(a) an orthogonal matrix
(b) symmetric matrix
(c) skew-symmetric matrix
(d) none of these

Ans. (d)

Solution: Let $B = \begin{pmatrix} \cos(\pi/2) & \sin(\pi/2) \\ -\sin(\pi/2) & \cos(\pi/2) \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$

and $A = \begin{pmatrix} 1 & 3 \\ 0 & 1 \end{pmatrix}$, $A^{-1} = \begin{pmatrix} 1 & -3 \\ 0 & 1 \end{pmatrix}$

Note that B is an orthogonal matrix.

$$C = A^{-1}BA = \begin{pmatrix} 1 & -3 \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}\begin{pmatrix} 1 & 3 \\ 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} 3 & 10 \\ -1 & -3 \end{pmatrix}$$

Note that C is neither symmetric, nor skew-symmetric and nor-orthogonal.

Example 21: Let $E(\alpha) = \begin{bmatrix} \cos^2\alpha & \cos\alpha\sin\alpha \\ \cos\alpha\sin\alpha & \sin^2\alpha \end{bmatrix}$. If α and β differs by an odd multiple of $\pi/2$, then $E(\alpha)\,E(\beta)$ is a

(a) null matrix
(b) unit matrix
(c) diagonal matrix
(d) orthogonal matrix

Ans. (a)

◎ **Solution:** We have

$$E(\alpha)\,E(\beta)$$

$$= \begin{bmatrix} \cos^2\alpha & \cos\alpha\sin\alpha \\ \cos\alpha\sin\alpha & \sin^2\alpha \end{bmatrix} \begin{bmatrix} \cos^2\beta & \cos\beta\sin\beta \\ \cos\beta\sin\beta & \sin^2\beta \end{bmatrix}$$

$$= \begin{bmatrix} \cos\alpha\cos\beta\cos(\alpha-\beta) & \cos\alpha\sin\beta\cos(\alpha-\beta) \\ \sin\alpha\cos\beta\cos(\alpha-\beta) & \sin\alpha\sin\beta\cos(\alpha-\beta) \end{bmatrix}$$

As α and β differ by an odd multiple of $\pi/2$, $\alpha - \beta = (2n+1)\pi/2$ for some integer n. Thus, $\cos[(2n+1)\pi/2] = 0$

$$\therefore \quad E(\alpha)\,E(\beta) = O$$

◉ **Example 22:** If $\begin{bmatrix} 2 & 1 \\ 7 & 4 \end{bmatrix} A \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then matrix A equals

(a) $\begin{bmatrix} 7 & 5 \\ -11 & -8 \end{bmatrix}$ (b) $\begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix}$

(c) $\begin{bmatrix} 7 & 1 \\ 34 & 5 \end{bmatrix}$ (d) $\begin{bmatrix} 5 & 3 \\ 13 & 8 \end{bmatrix}$

Ans. (a)

◎ **Solution:** If $XAY = I$, then $A = X^{-1}Y^{-1} = (YX)^{-1}$

In this case $$YX = \begin{bmatrix} -3 & 2 \\ 5 & -3 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ 7 & 4 \end{bmatrix} = \begin{bmatrix} 8 & 5 \\ -11 & -7 \end{bmatrix}$$

$$\therefore \quad A = \begin{bmatrix} 8 & 5 \\ -11 & -7 \end{bmatrix}^{-1} = \begin{bmatrix} 7 & 5 \\ -11 & -8 \end{bmatrix}$$

◉ **Example 23:** The matrix A satisfying

$$A \begin{bmatrix} 1 & 5 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -1 \\ 6 & 0 \end{bmatrix} \text{ is}$$

(a) $\begin{bmatrix} 3 & 2 \\ 6 & -3 \end{bmatrix}$ (b) $\begin{bmatrix} 3 & -16 \\ 6 & -30 \end{bmatrix}$

(c) $\begin{bmatrix} 3 & -16 \\ 6 & 30 \end{bmatrix}$ (d) $\begin{bmatrix} 3 & -3 \\ 6 & 2 \end{bmatrix}$

Ans. (b)

◎ **Solution:** We know that if $AC = B$, then $A = BC^{-1}$.

$$\therefore \quad A = \begin{bmatrix} 3 & -1 \\ 6 & 0 \end{bmatrix} \begin{bmatrix} 1 & 5 \\ 0 & 1 \end{bmatrix}^{-1} = \begin{bmatrix} 3 & -1 \\ 6 & 0 \end{bmatrix} \begin{bmatrix} 1 & -5 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 3 & -16 \\ 6 & -30 \end{bmatrix}$$

◉ **Example 24:** If product $A \begin{bmatrix} 1 & 1 \\ 2 & 0 \end{bmatrix}$ is the matrix $\begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}$, then A^{-1} is given by

(a) $\begin{bmatrix} 0 & -1 \\ 2 & -4 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & -1 \\ -2 & -4 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 1 \\ 2 & -4 \end{bmatrix}$ (d) none of these

Ans. (c)

◎ **Solution:** If $AB = C$, then $B^{-1}A^{-1} = C^{-1}$

$$\Rightarrow \quad A^{-1} = BC^{-1}$$

Here $$A \begin{bmatrix} 1 & 1 \\ 2 & 0 \end{bmatrix} = \begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}$$

$$\Rightarrow \quad A^{-1} = \begin{bmatrix} 1 & 1 \\ 2 & 0 \end{bmatrix} \begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}^{-1}$$

$$= \begin{bmatrix} 1 & 1 \\ 2 & 0 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ -1 & 3 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ 2 & -4 \end{bmatrix}$$

◉ **Example 25:** If A and B are two skew-symmetric matrices of order n, then

(a) AB is a skew-symmetric matrix
(b) AB is a symmetric matrix
(c) AB is a symmetric matrix if A and B commute
(d) none of these

Ans. (c)

◎ **Solution:** We are given

$$A' = -A \text{ and } B' = -B$$

Now, $$(AB)' = B'A' = (-B)(-A) = BA$$
$$= AB \text{ if } A \text{ and } B \text{ commute.}$$

◉ **Example 26:** Which of the following statements is false:

(a) If $|A| = 0$, then $|\text{adj } A| = 0$
(b) Adjoint of a diagonal matrix of order 3 × 3 is a diagonal matrix
(c) Product of two upper triangular matrices is a upper triangular matrix
(d) adj (AB) = adj (A) adj (B)

Ans. (d)

◎ **Solution:** We have

$$\text{adj}(AB) = \text{adj}(B)\,\text{adj}(A)$$

and *not* $$\text{adj}(AB) = \text{adj}(A)\,\text{adj}(B)$$

◉ **Example 27:** If A and B are symmetric matrices, then $AB - BA$ is a

(a) symmetric matrix
(b) skew-symmetric matrix
(c) diagonal matrix
(d) null matrix

Ans. (b)

◎ **Solution:** We are given $A' = A$, $B' = B$

Now $$(AB - BA)' = (AB)' - (BA)' = B'A' - A'B'$$
$$= BA - AB = -(AB - BA)$$

i.e. $$(AB - BA)' = -(AB - BA)$$

Hence, $AB - BA$ is a skew-symmetric matrix.

◉ **Example 28:** Let A and B be two 3 × 3 matrices, such that $A + B = 2B'$ and $3A + 2B = I$, then

(a) $A - B = O$ (b) $A + B = I$

(c) $A - B = I$ (d) $A + 2B = O$

Ans. (a)

◎ **Solution:** $A + B = 2B'$

$3A + 2B = I$

⇒ $B = 6B' - I$

⇒ $B' = (6B' - I)' = 6B - I$

Therefore, $B = 6(6B - I) - I$

⇒ $(1 - 36)B = -7I$

⇒ $B = \frac{1}{5}I$

∴ $3A = I - \frac{2}{5}I = \frac{3}{5}I$

⇒ $A = \frac{1}{5}I$

∴ $A = B$

◉ **Example 29:** Let A and B be two non-zero 3×3 matrices such that $AB = O$. Then

(a) Both A and B are non-singular
(b) Exactly one of A, B is singular
(c) Both A and B are singular
(d) Both $A + B$ and AB are singular

Ans. (c)

◎ **Solution:** Suppose A is non-singular, then

$$A^{-1}(AB) = A^{-1}(O) \Rightarrow B = O$$

A contradiction.

∴ A is singular

Similarly, B is singular.

◉ **Example 30:** Suppose A is a 3×3 skew-symmetric matrix. Let $B = (I + A)^{-1}(I - A)$. Then

(a) B is orthogonal
(b) B is skew symmetric
(c) $B^2 = O$
(d) B is a diagonal matrix

Ans. (a)

◎ **Solution:** We have

$$\begin{aligned} BB' &= (I + A)^{-1}(I - A)\,[(I + A)^{-1}(I - A)]' \\ &= (I + A)^{-1}(I - A)\,(I - A)'\,((I + A)')^{-1} \\ &= (I + A)^{-1}(I - A)\,(I + A)\,(I - A)^{-1} \\ &\qquad\qquad [\because\ A' = -A] \\ &= (I + A)^{-1}(I + A)\,(I - A)\,(I - A)^{-1} \\ &\qquad\qquad [I + A \text{ and } I - A \text{ commute}] \\ &= (I)(I) = I \end{aligned}$$

Thus, B is orthogonal.

◉ **Example 31:** Let $a_n = 3^n + 5^n$, $n \in \mathbf{N}$, and let

$$A = \begin{pmatrix} a_n & a_{n+1} & a_{n+2} \\ a_{n+1} & a_{n+2} & a_{n+3} \\ a_{n+2} & a_{n+3} & a_{n+4} \end{pmatrix}$$

Then

(a) 0 is a root of the equation $\det(A - xI) = 0$
(b) $\det(A) = a_n\, a_{n+2}\, a_{n+4}$
(c) $\det(A) < 0$
(d) $\det(A) = a_n + a_{n+2} + a_{n+4}$

Ans. (a)

◎ **Solution:** Using $C_2 \to C_2 - 3C_1$, $C_3 \to C_3 - 3^2C_1$, we get

$$\det(A) = \begin{vmatrix} a_n & 2(5^n) & 16(5^n) \\ a_{n+1} & 2(5^{n+1}) & 16(5^{n+1}) \\ a_{n+2} & 2(5^{n+2}) & 16(5^{n+2}) \end{vmatrix}$$

$$= 0 \qquad [\because\ C_2 \text{ and } C_3 \text{ are proportional}]$$

Thus, $x = 0$ is a root of $\det(A - xI) = 0$

◉ **Example 32:** First row of a matrix A is [1 3 2]. If

$$\text{adj}\, A = \begin{bmatrix} -2 & 4 & \alpha \\ -1 & 2 & 1 \\ 3\alpha & -5 & -2 \end{bmatrix}$$

then a possible value of $\det(A)$ is

(a) 1
(b) 2
(c) –1
(d) –2

Ans. (a)

◎ **Solution:** We know that

$$\begin{aligned} \det(A) &= a_{11}A_{11} + a_{12}A_{12} + a_{13}A_{13} \\ &= (1)(-2) + (3)(-1) + (2)(3\alpha) \\ &= 6\alpha - 5 \end{aligned}$$

and $(\det(A))^2 = \det(\text{adj}\, A) = 11\alpha - 10$

Thus, $(6\alpha - 5)^2 = 11\alpha - 10$

⇒ $36\alpha^2 - 71\alpha + 35 = 0$

⇒ $\alpha = 1,\ 35/36$

Therefore, a possible value of $\det(A)$ is 1.

◉ **Example 33:** Suppose ABC is a triangle with sides a, b, c and semiperimeter s. Then matrix

$$A = \begin{bmatrix} s & s-c \\ s(s-b)^2 & (s-a)^2(s-c) \\ s(s-c) & (s-a)^2 \end{bmatrix}_{3\times 2} \begin{bmatrix} s-a \\ s-b \end{bmatrix}_{2\times 1} - \begin{bmatrix} bc \\ ca(s-a)(s-b) \\ ab(s-a) \end{bmatrix}_{3\times 1}$$

is equal to:

(a) $\begin{bmatrix} a \\ b \\ c \end{bmatrix}$
(b) $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$
(c) $\begin{bmatrix} s \\ s \\ s \end{bmatrix}$
(d) $\begin{bmatrix} s-a \\ s-b \\ s-c \end{bmatrix}$

Ans. (b)

◎ **Solution:**

$$A = \begin{bmatrix} s(s-a)+(s-c)(s-b)-bc \\ (s-a)(s-b)(s(s-b)+(s-a)(s-c)-ca) \\ (s-a)(s(s-c)+(s-a)(s-b)-ab) \end{bmatrix}$$

But $s(s-a)+(s-c)(s-b)-bc$

$$= s(s-a)+s(s-b-c)$$
$$= s(2s-a-b-c)=0 \text{ etc.}$$

Thus, $A = \begin{bmatrix}0\\0\\0\end{bmatrix}$

Example 34: The number of matrices

$$A = \begin{bmatrix}a & b\\ c & d\end{bmatrix} \text{ (where } a, b, c, d \in \mathbf{R}\text{)}$$

such that $A^{-1} = -A$ is :

(a) 0 (b) 1
(c) 2 (d) infinite

Ans. (d)

Solution: As A^{-1} exists, $\det(A) = ad - bc \neq 0$.

Also, $\det(-A) = \det\begin{bmatrix}-a & -b\\ -c & -d\end{bmatrix} = ad - bc$

$$= \det(A)$$

since $\det(A^{-1}) = \dfrac{1}{\det(A)}$, $A^{-1} = -A$ implies

$$\frac{1}{ad-bc} = ad - bc$$

$\Rightarrow \quad (ad-bc)^2 = 1 \quad \Rightarrow \quad ad - bc = \pm 1.$

If $ad - bc = 1$, then $A^{-1} = -A$

gives

$$A^{-1} = \begin{bmatrix}d & -b\\ -c & a\end{bmatrix} = \begin{bmatrix}-a & -b\\ -c & -d\end{bmatrix}$$

$\Rightarrow \quad a + d = 0.$

$\therefore \quad a(-a) - bc = 1$

$\Rightarrow \quad bc = -(1+a^2) \Rightarrow bc \neq 0$ and

$$b = -\frac{1+a^2}{c}$$

$\therefore \quad A = \begin{bmatrix}a & -\dfrac{(1+a^2)}{c}\\ c & -a\end{bmatrix}$, where $c \neq 0$.

Thus, there are infinite number of such matrices.

TIP

It is unnecessary to consider the case $ad - bc = -1$

Example 35: Let A be a 3×3 matrix with entries from the set of real numbers, If the system of equations $A^2X = 0$ has a non-trivial solution, then

(a) $AX = 0$ has a non-trivial solution.
(b) $AX = 0$ does not have a non-trivial solution.
(c) A is a non-singular matrix.
(d) none of these.

Ans. (a)

Solution: As $A^2X = 0$ has a non-trivial solution,

$$\det(A^2) = 0 \quad \Rightarrow \quad (\det(A))^2 = 0$$

$\Rightarrow \quad \det(A) = 0$

$\therefore \quad AX = 0$ has a non-trivial solution.

Example 36: Suppose $a, b \in \mathbf{R}$ and $a \neq b$.

Let $\quad A = \begin{bmatrix}a & b\\ b & -a\end{bmatrix}$.

Let M be a matrix such that $MA = A^{2m}$ for some $m \in \mathbf{N}$, then M is equal to

(a) $(a^2+b^2)^m I$ (b) $(a^2+b^2)^{m-1} A$
(c) $-(a^2+b^2)^{m-1} A$ (d) $(a^2+b^2)^m A$

Ans. (b)

Solution: We have

$$A^2 = \begin{bmatrix}a^2+b^2 & 0\\ 0 & a^2+b^2\end{bmatrix} = (a^2+b^2)I$$

$\Rightarrow \quad A^{2m} = ((a^2+b^2)I)^m = (a^2+b^2)^m I$

Also, $\quad A^{-1} = \dfrac{-1}{a^2+b^2}\begin{bmatrix}-a & -b\\ -b & a\end{bmatrix}$

$$= \frac{1}{a^2+b^2}\begin{bmatrix}a & b\\ b & -a\end{bmatrix}$$

Now, $\quad MA = A^{2m} = (a^2+b^2)^m I$

$\Rightarrow \quad M = (a^2+b^2)^m A^{-1}$

$$= (a^2+b^2)^{m-1} A$$

Example 37: Let $A = \begin{bmatrix}a & b\\ c & d\end{bmatrix}$, be a 2 × 2 matrix where $a, b, c, d \in \{0, 1\}$. The number of such matrices which have inverse is

(a) 5 (b) 6
(c) 7 (d) 8

Ans. (b)

Solution: $\det(A) = ad - bc$

Note that $\det(A)$ can take value –1, 0 or 1. We have

$\det(A) = 1 \Leftrightarrow ad = 1, bc = 0$

$\Leftrightarrow a = 1, d = 1$ or $(b = 0, c = 0, b = 0; c = 1; b = 1, c = 0)$

and $\quad \det(A) = -1 \Leftrightarrow ad = 0 \quad$ or $\quad bc = 1$

This is also possible in 3 cases.

$\therefore \quad A^{-1}$ exists in 6 cases.

Example 38: If $D = \text{diag}(d_1, d_2, \ldots, d_n)$ where $d_i \neq 0$, for $i = 1, 2, \ldots, n$, then D^{-1} is equal to

(a) D
(b) $2D$
(c) $\text{diag}(d_1^{-1}, d_2^{-1}, \ldots, d_n^{-1})$
(d) Adj D

Ans. (c)

Solution: See Theory.

Example 39: The inverse of a symmetric matrix (if it exists) is

(a) a symmetric matrix
(b) a skew-symmetric matrix
(c) a diagonal matrix
(d) none of these

Ans. (a)

Solution: Let A be an invertible symmetric matrix.

We have $AA^{-1} = A^{-1}A = I_n$

$\Rightarrow \quad (AA^{-1})' = (A^{-1}A)' = (I_n)'$

$\Rightarrow \quad (A^{-1})'A' = A'(A^{-1})' = I_n$

$\Rightarrow \quad (A^{-1})'A = A(A^{-1})' = I_n$

$(A^{-1})' = A^{-1}$ [inverse of a matrix is unique]

Example 40: The inverse of a skew-symmetric matrix (if it exists) is

(a) a symmetric matrix
(b) a skew-symmetric matrix
(c) a diagonal matrix
(d) none of these

Ans. (b)

Solution: We have $A' = -A$

Now, $AA^{-1} = A^{-1}A = I_n$

$\Rightarrow \quad (AA^{-1})' = (A^{-1}A)' = (I_n)'$

$\Rightarrow \quad (A^{-1})'A' = A'(A^{-1})' = I_n$

$\Rightarrow \quad (A^{-1})'(-A) = (-A)(A^{-1})' = I_n$

Thus, $(A^{-1})' = -(A^{-1})$ [inverse of a matrix is unique]

Example 41: The inverse of a skew-symmetric matrix of odd order is

(a) a symmetric matrix
(b) a skew-symmetric matrix
(c) diagonal matrix
(d) does not exist

Ans. (d)

Solution: Let A be a skew-symmetric, matrix of order n. By definition

$A' = -A$

$\Rightarrow \quad |A'| = |-A| \quad \Rightarrow \quad |A| = (-1)^n|A|$

$\Rightarrow \quad |A| = -|A| \qquad [\because n \text{ is odd}]$

$\Rightarrow \quad 2|A| = 0 \quad \Rightarrow \quad |A| = 0$

$\therefore$ A^{-1} does not exist.

Example 42: If A is an orthogonal matrix, then $|A|$ is

(a) 1 (b) -1
(c) ± 1 (d) 0

Ans. (c)

Solution: As A is an orthogonal matrix,

$A'A = AA' = I_n$

$\Rightarrow \quad |A'A| = |AA'| = |I_n|$

$\Rightarrow \quad |A'|\,|A| = 1 \quad \Rightarrow \quad |A|\,|A| = 1$

$\Rightarrow \quad |A|^2 = 1 \quad \Rightarrow \quad |A| = \pm 1$

Example 43: If $A = \begin{bmatrix} 1 & 0 & 2 \\ 5 & 1 & x \\ 1 & 1 & 1 \end{bmatrix}$ is a singular matrix, then x is equal to

(a) 3 (b) 5
(c) 9 (d) 11

Ans. (c)

Solution: As A is a singular matrix,

$$|A| = 0 \quad \Rightarrow \quad \begin{vmatrix} 1 & 0 & 0 \\ 5 & 1 & x-10 \\ 1 & 1 & -1 \end{vmatrix} = 0$$

[using $C_3 \to C_3 - 2C_1$]

$$\Rightarrow \quad \begin{vmatrix} 1 & x-10 \\ 1 & -1 \end{vmatrix} = 0 \quad \Rightarrow \quad -1 - x + 10 = 0$$

$\Rightarrow \quad x = 9.$

Example 44: The value of x for which the matrix

$$A = \begin{bmatrix} 2/x & -1 & 2 \\ 1 & x & 2x^2 \\ 1 & 1/x & 2 \end{bmatrix} \text{ is singular is}$$

(a) ± 1 (b) ± 2
(c) ± 3 (d) none of these

Ans. (a)

Solution: We have

$$|A| = \left(\frac{2}{x}\right)\begin{vmatrix} x & 2x^2 \\ 1/x & 2 \end{vmatrix} + \begin{vmatrix} 1 & 2x^2 \\ 1 & 2 \end{vmatrix} + 2\begin{vmatrix} 1 & x \\ 1 & 1/x \end{vmatrix}$$

$$= \frac{2}{x}(0) + 2 - 2x^2 + 2\left(\frac{1}{x} - x\right)$$

$$= \frac{2x(1-x^2) + 2(1-x^2)}{x} = \frac{2(x+1)^2(1-x)}{x}$$

Now, $|A| = 0 \quad \Rightarrow \quad x = \pm 1.$

Example 45: If square matrix A is such that $3A^3 + 2A^2 + 5A + I = O$, then A^{-1} is equal to

(a) $3A^2 + 2A + 5I$
(b) $-(3A^2 + 2A + 5I)$
(c) $3A^2 - 2A - 5I$
(d) none of these

Ans. (b)

Solution: We have $A(3A^2 + 2A + 5I) = -I$

$\therefore \quad A^{-1} = -(3A^2 + 2A + 5I).$ [$\therefore$ Inverse of a matrix is unique]

Example 46: If $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ then which one of the following holds for all $n \geq 1$, by the principle of mathematical induction.

(a) $A^n = nA + (n-1)I$
(b) $A^n = 2^{n-1}A + (n-1)I$
(c) $A^n = nA - (n-1)I$
(d) $A^n = 2^{n-1}A - (n-1)I.$

Ans. (c)

◎ **Solution:** For $n = 2$, $A^2 = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}$

For $n = 2$, RHS of (a) $= 2A + I = 3\begin{bmatrix} 3 & 0 \\ 2 & 3 \end{bmatrix} \neq A^2$

For $n = 2$, RHS of (b) $= 2A + I \neq A^2$
So possible answer is (c) or (d).

In fact $A^n = \begin{bmatrix} 1 & 0 \\ n & 1 \end{bmatrix}$ which equals $nA - (n-1)I.$

Alternatively. Write $A = I + B$

where $B = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}$

As $B^2 = 0$, we get $B^r = 0\ \forall\ r \geq 2$.
By the binomial theorem

$$A^n = I + nB = I + n(A - I) = nA - (n-1)I.$$

◉ **Example 47:** Let A, B, C be three square matrices of the same order, such that whenever $AB = AC$ then $B = C$, if A is

(a) singular
(b) non-singular
(c) symmetric
(d) skew-symmetric

Ans. (b)

◎ **Solution:** If A is non-singular, A^{-1} exists.

Thus, $\quad AB = AC \quad \Rightarrow \quad A^{-1}(AB) = A^{-1}(AC)$

$\Rightarrow \quad (A^{-1}A)B = (A^{-1}A)C \quad \Rightarrow \quad IB = IC$

$\Rightarrow \quad B = C.$

◉ **Example 48:** Let $B = \begin{bmatrix} 2 & 6 & 4 \\ 1 & 0 & 1 \\ -1 & 1 & -1 \end{bmatrix}$. If the product BA has inverse $C = \begin{bmatrix} -1 & 0 & 1 \\ 1 & 1 & 3 \\ 2 & 0 & 2 \end{bmatrix}$, then A^{-1} equals

(a) $\begin{bmatrix} -3 & -5 & 5 \\ 0 & 9 & 14 \\ 2 & 2 & 6 \end{bmatrix}$ (b) $\begin{bmatrix} -3 & 5 & 5 \\ 0 & 0 & 9 \\ 2 & 14 & 16 \end{bmatrix}$

(c) $\begin{bmatrix} -3 & -5 & -5 \\ 0 & 0 & 2 \\ 2 & 14 & 6 \end{bmatrix}$ (d) $\begin{bmatrix} -3 & -3 & -5 \\ 0 & 9 & 2 \\ 2 & 14 & 6 \end{bmatrix}$

Ans. (c)

◎ **Solution:** We have $(BA)^{-1} = C \quad \Rightarrow \quad A^{-1}B^{-1} = C$
$\Rightarrow A^{-1} = CB$

$$\therefore \quad A^{-1} = \begin{bmatrix} -1 & 0 & 1 \\ 1 & 1 & 3 \\ 2 & 0 & 2 \end{bmatrix}\begin{bmatrix} 2 & 6 & 4 \\ 1 & 0 & 1 \\ -1 & 1 & -1 \end{bmatrix} = \begin{bmatrix} -3 & -5 & -5 \\ 0 & 9 & 2 \\ 2 & 14 & 6 \end{bmatrix}$$

◉ **Example 49:** If ω is a complex cube root of unity, then the matrix $A = \begin{bmatrix} 1 & \omega^2 & \omega \\ \omega^2 & \omega & 1 \\ \omega & 1 & \omega^2 \end{bmatrix}$ is a

(a) singular matrix
(b) non-singular matrix
(c) skew-symmetric matrix
(d) none of these

Ans. (a)

◎ **Solution:** We have

$$|A| = \begin{vmatrix} 1 & \omega^2 & \omega \\ \omega^2 & \omega & 1 \\ \omega & 1 & \omega^2 \end{vmatrix} = \begin{vmatrix} 1+\omega^2+\omega & \omega^2 & \omega \\ \omega^2+\omega+1 & \omega & 1 \\ \omega+1+\omega^2 & 1 & \omega^2 \end{vmatrix} = 0$$

using $C_1 \to C_1 + C_2 + C_3$ and $1 + \omega + \omega^2 = 0$

$\therefore \quad A$ is a singular matrix.

◉ **Example 50:** If $A = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & x & 1 \end{bmatrix}$ and

$$A^{-1} = \begin{bmatrix} 1/2 & -1/2 & 1/2 \\ -4 & 3 & y \\ 5/2 & -3/2 & 1/2 \end{bmatrix}, \text{ then}$$

(a) $x = 1, y = -1$ (b) $x = -1, y = 1$
(c) $x = 2, y = -1/2$ (d) $x = 1/2, y = 1/2$

Ans. (a)

◎ **Solution:** We have

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = AA^{-1} = \begin{bmatrix} 0 & 1 & 2 \\ 1 & 2 & 3 \\ 3 & x & 1 \end{bmatrix}\begin{bmatrix} 1/2 & -1/2 & 1/2 \\ -4 & 3 & y \\ 5/2 & -3/2 & 1/2 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & y+1 \\ 0 & 1 & 2(y+1) \\ 4(1-x) & 3(x-1) & 2+xy \end{bmatrix}$$

$\Rightarrow \quad 1 - x = 0, \quad x - 1 = 0,$
$\quad y + 1 = 0, \quad y + 1 = 0, 2 + xy = 1$

$\therefore \quad x = 1, \quad y = -1.$

◉ **Example 51:** Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, where $a, b, c, d \in \mathbf{R}$. If $A - \alpha I$ is invertible for all $\alpha \in \mathbf{R}$, then

(a) $bc > 0$ (b) $bc = 0$
(c) $bc > \min\left(0, \dfrac{1}{2}ad\right)$ (d) $a = 0$

Ans. (c)

◎ **Solution:** As $A - \alpha I$ is invertible for all $\alpha \in \mathbf{R}$.

$$\det(A - \alpha I) \neq 0 \qquad \forall\ \alpha \in \mathbf{R}.$$

$$\Rightarrow \quad (a - \alpha)(d - \alpha) - bc \neq 0 \qquad \forall\ \alpha \in \mathbf{R}.$$

$$\Rightarrow \quad \alpha^2 - (a + d)\alpha + ad - bc \neq 0 \qquad \forall\ \alpha \in \mathbf{R}.$$

Therefore

$$(a + d)^2 - 4(ad - bc) < 0$$

$$\Rightarrow \quad (a - d)^2 + 4\,bc < 0$$

Therefore, $bc < 0$.

Also, $\quad a^2 + d^2 - 2ad + 4bc < 0$

$$\Rightarrow \quad 0 \leq a^2 + d^2 < 2ad - 4bc$$

$$\Rightarrow \quad bc < \frac{1}{2}ad.$$

Thus, $\quad bc < \min\left(0, \frac{1}{2}ad\right)$

◉ **Example 52:** If $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$, then $A^2 - 5A - I$ equals

(a) O (b) I

(c) $2I$ (d) none of these

Ans. (b)

◎ **Solution:** $A^2 = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 7 & 10 \\ 15 & 22 \end{bmatrix}$

We have

$$A^2 - 5A = \begin{bmatrix} 7 & 10 \\ 15 & 22 \end{bmatrix} - 5\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix} = 2I$$

$$\Rightarrow \quad A^2 - 5A - I = I$$

◉ **Example 53:** Let $A = \begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}$ satisfies $A^2 + aA + bI = O$, then a, b are respectively equal to

(a) $-4, 2$ (b) $-3, 3$

(c) $-4, 1$ (d) $-3, 1$

Ans. (c)

◎ **Solution:** $A^2 = \begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix}\begin{bmatrix} 3 & 2 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 11 & 8 \\ 4 & 3 \end{bmatrix}$

Now

$$O = A^2 + aA + bI = \begin{bmatrix} 11 + 3a + b & 8 + 2a \\ 4 + a & 3 + a + b \end{bmatrix}$$

$$\Rightarrow \quad 3a + b = -11,\ 4 + a = 0,\ a + b = -3$$

$$\Rightarrow \quad a = -4,\ b = 1.$$

◉ **Example 54:** Let $A^2 - A + I = O$, then inverse of A is

(a) $I - A$ (b) $A - I$

(c) $A + I$ (d) A

Ans. (b)

◎ **Solution:** $A^2 - A + I = 0 \Rightarrow I = A - A^2 = A(I - A)$.

Thus, $A^{-1} = I - A$.

◉ **Example 55:** Let $A = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{pmatrix}$ and

$$(10)B = \begin{pmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & 2 & 3 \end{pmatrix}$$

If B is the inverse of matrix A, then α equals

(a) 2 (b) -1

(c) -2 (d) 5

Ans. (d)

◎ **Solution:** $10I = 10(AB) = A(10B)$

$$\Rightarrow \quad \begin{pmatrix} 10 & 0 & 0 \\ 0 & 10 & 0 \\ 0 & 0 & 10 \end{pmatrix} = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{pmatrix}\begin{pmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{pmatrix}$$

$$= \begin{pmatrix} 10 & 0 & 5 - \alpha \\ 0 & 10 & \alpha - 5 \\ 0 & 0 & 5 + \alpha \end{pmatrix}$$

$$\Rightarrow \quad \alpha = 5.$$

◉ **Example 56:** If $A = \begin{bmatrix} a & b \\ b & a \end{bmatrix}$ and $A^2 = \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix}$, then

(a) $\alpha = a^2 + b^2\ \beta = 2ab$

(b) $\alpha = a^2 + b^2,\ \beta = a^2 - b^2$

(c) $\alpha = 2ab,\ \beta = a^2 + b^2$

(d) $\alpha = a^2 + b^2,\ \beta = -2ab$

Ans. (a)

◎ **Solution:** $A^2 = \begin{bmatrix} a & b \\ b & a \end{bmatrix}\begin{bmatrix} a & b \\ b & a \end{bmatrix} = \begin{bmatrix} a^2 + b^2 & 2ab \\ 2ab & a^2 + b^2 \end{bmatrix}$

$$\therefore \quad \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix} = \begin{bmatrix} a^2 + b^2 & 2ab \\ 2ab & a^2 + b^2 \end{bmatrix}$$

$$\Rightarrow \quad \alpha = a^2 + b^2,\ \beta = 2ab$$

◉ **Example 57:** Let $\omega \neq 1$ be a cube root of unity and S be the set of all non-singular matrices of the form

$$A = \begin{bmatrix} 1 & a & b \\ \omega & 1 & c \\ \omega^2 & \omega & 1 \end{bmatrix}$$

where a, b, c are either ω or ω^2. Then number of distinct matrices in the set S is

(a) 2 (b) 6

(c) 4 (d) 8

Ans. (a)

◎ **Solution:** We have

$$|A| = 1\begin{vmatrix}1 & c\\ \omega & 1\end{vmatrix} - a\begin{vmatrix}\omega & c\\ \omega^2 & 1\end{vmatrix} + b\begin{vmatrix}\omega & 1\\ \omega^2 & \omega\end{vmatrix}$$

$$= 1 - c\omega - a\omega + ac\omega^2 = (1 - a\omega)(1 - c\omega)$$

A is non-singular ⇔ $|A| \neq 0 \Leftrightarrow a = c = \omega$.

Note that b can take any value ω or ω^2.

Thus, there are two non-singular matrices.

◉ **Example 58:** If a matrix A is both symmetric and skew-symmetric, then

(a) A is a diagonal matrix
(b) A is a scalar matrix
(c) A is a zero matrix
(d) none of these

Ans. (c)

◎ **Solution:** We are given $A' = A$ and $A' = -A$.

$$\therefore \quad A = -A \Rightarrow 2A = O \Rightarrow A = O$$

◉ **Example 59:** Let $A = \begin{bmatrix}2 & -1\\ 3 & 4\end{bmatrix}, B = \begin{bmatrix}5 & 2\\ 7 & 4\end{bmatrix}, C = \begin{bmatrix}2 & 5\\ 3 & 8\end{bmatrix}$.

Let D be a matrix such that $CD = AB$, then D equals

(a) I (b) O
(c) $-A$ (d) none of these

Ans. (d)

◎ **Solution:** $CD = AB \quad \Rightarrow \quad D = C^{-1}(AB)$

Now $$AB = \begin{bmatrix}2 & -1\\ 3 & 4\end{bmatrix}\begin{bmatrix}5 & 2\\ 7 & 4\end{bmatrix} = \begin{bmatrix}3 & 0\\ 43 & 22\end{bmatrix}$$ and

$$C^{-1} = \begin{bmatrix}8 & -5\\ -3 & 2\end{bmatrix}$$

$$\therefore \quad D = \begin{bmatrix}8 & -5\\ -3 & 2\end{bmatrix}\begin{bmatrix}3 & 0\\ 43 & 22\end{bmatrix} = \begin{bmatrix}-191 & -110\\ 77 & 44\end{bmatrix}$$

◉ **Example 60:** If $A^2 = A$, the $(I + A)^4$ equals

(a) $I + 15A$ (b) $I + 7A$
(c) $I + 8A$ (d) $I + 11A$

Ans. (a)

◎ **Solution:** As I and A commute, we can apply binomial theorem to expand $(I + A)^4$. We have

$$(I + A)^4 = I + 4A + 6A^2 + 4A^3 + A^4.$$

But $\quad A^3 = A^2 = A, A^4 = A^3 = A$

$$\therefore \quad (I + A)^4 = I + 4A + 6A + 4A + A = I + 15A$$

◉ **Example 61:** The matrix $A = \begin{bmatrix}0 & 0 & -7\\ 0 & -7 & 0\\ -7 & 0 & 0\end{bmatrix}$ is a

(a) scalar matrix (b) diagonal matrix
(c) unit matrix (d) non-singular

Ans. (d)

◎ **Solution:** Note that $A^2 = 49I$

$$\Rightarrow \quad A^{-1} = \frac{1}{49}A \qquad [\therefore A \text{ is non-singular}]$$

◉ **Example 62:** Let $A = [5 \quad 3]$ and $B = [3 \quad 7]$

The number of non-zero matrices C such that $AC = BC$ is

(a) 0 (b) 1
(c) infinitely many (d) none of these

Ans. (c)

◎ **Solution:** Note that every matrix of the form $\begin{bmatrix}2x\\ x\end{bmatrix}, x \in \mathbf{R}$ satisfies the required condition.

◉ **Example 63:** If $A = \begin{bmatrix}0 & 2y & z\\ x & y & -z\\ x & -y & z\end{bmatrix}$ satisfies $A' = A^{-1}$, then

(a) $x = \pm 1/\sqrt{6}$, $y = \pm 1/\sqrt{6}$, $z = \pm 1/\sqrt{3}$
(b) $x = \pm 1/\sqrt{2}$, $y = \pm 1/\sqrt{6}$, $z = \pm 1/\sqrt{3}$
(c) $x = \pm 1/\sqrt{2}$, $y = \pm 1/\sqrt{6}$, $z = \pm 1/\sqrt{3}$
(d) $x = \pm 1/\sqrt{2}$, $y = \pm 1/3$, $z = \pm 1/\sqrt{2}$

Ans. (b)

◎ **Solution:** $A' = A^{-1} \Leftrightarrow AA' = I$

Now, $$AA' = \begin{bmatrix}0 & 2y & z\\ x & y & -z\\ x & -y & z\end{bmatrix}\begin{bmatrix}0 & x & x\\ 2y & y & -y\\ z & -z & z\end{bmatrix}$$

$$= \begin{bmatrix}4y^2 + z^2 & 2y^2 - z^2 & -2y^2 + z^2\\ 2y^2 - z^2 & x^2 + y^2 + z^2 & x^2 - y^2 - z^2\\ -2y^2 + z^2 & x^2 - y^2 - z^2 & x^2 + y^2 + z^2\end{bmatrix}$$

Thus, $\quad AA' = I$

$$\Rightarrow \quad 4y^2 + z^2 = 1, \quad 2y^2 - z^2 = 0$$

$$x^2 + y^2 + z^2 = 1, \quad x^2 - y^2 - z^2 = 0$$

$$\therefore \quad x = \pm 1/\sqrt{2}, \quad y = \pm 1/\sqrt{6}, \quad z = \pm 1/\sqrt{3}$$

◉ **Example 64:** Suppose A is square matrix such that $A^3 = I$, then $(A + I)^3 + (A - I)^3 - 6A$ equals

(a) I (b) $2I$
(c) A (d) $3A$

Ans. (b)

◎ **Solution:** Since $AI = IA$, we have

$$(A + I)^3 + (A - I)^3 - 6A$$

$$= 2A^3 + 2(3AI^2) - 6A = 2I + 6A - 6A = 2I$$

Example 65: The number of 3 × 3 matrices A whose entries are either 0 or 1 and for which the system of equations $A\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix}$ has exactly five distinct solutions is

(a) 0 (b) 511
(c) 1024 (d) 5

Ans. (a)

Solution: We know that the system of equation

$$AX = B$$

has either (i) unique solution
or (ii) infinite number of solutions
or (iii) no solution.

Hence, there cannot exist any matrix A such that

$$A\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix}$$

has five distinct solutions.

Example 66: The number of 3 × 3 non-singular matrices, with four entries as 1 and all other entries as 0 is

(a) 6 (b) at least 7
(c) less than 4 (d) 5

Ans. (b)

Solution: The matrix

$$\begin{bmatrix} 1 & a & b \\ c & 1 & d \\ e & f & 1 \end{bmatrix}$$

where exactly one of a, b, c, d, e, f is 1 and rest of them are zeros, is invertible.

There are six such matrices.

Also, the matrix $\begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$ is invertible.

Thus, there are at least 7 such matrices which are invertible.

Example 67: Consider the system of linear equations:

$$x_1 + 2x_2 + x_3 = 3$$
$$2x_1 + 3x_2 + x_3 = 3$$
$$3x_1 + 5x_2 + 2x_3 = 1$$

The system has

(a) a unique solution
(b) no solution
(c) infinite number of solutions
(d) exactly 3 solutions

Ans. (b)

Solution: Adding the first two equations and subtracting the third from the sum, we obtain

$$(x_1 + 2x_2 + x_3) + (2x_1 + 3x_2 + x_3) - (3x_1 + 5x_2 + 2x_3) = 3 + 3 - 1$$

$$\Rightarrow \qquad 0 = 5$$

Thus, the system of equations has no solution.

Example 68: Let a, b and c be three real numbers satisfying

$$[a \ b \ c]\begin{bmatrix} 1 & 9 & 7 \\ 8 & 2 & 7 \\ 7 & 3 & 7 \end{bmatrix} = [0\ 0\ 0] \qquad (1)$$

If the point $P(a, b, c)$ with reference to (1), lies on the plane $2x + y + z = 1$, then the value of $7a + b + c$ is

(a) 0 (b) 12
(c) 7 (d) 6

Ans. (d)

Solution: We have

$$a + 8b + 7c = 0, \quad 9a + 2b + 3c = 0, \quad 7a + 7b + 7c = 0$$

Subtracting the last equation from first and multiplying the last equation by (9/7) and subtracting from the second equation we obtain $-6a + b = 0$, $7b + 6c = 0$

$$\Rightarrow \qquad \frac{a}{1} = \frac{b}{6} = \frac{c}{-7} = k \text{ (say)}$$

Thus, $a = k$, $b = 6k$, $c = -7k$.

As $(a, b, c) = (k, 6k, -7k)$ lies on $2x + y + z = 1$, we get $k = 1$.

Thus, $7a + b + c = 7k + 6k - 7k = 6k = 6$

Example 69: Let P and Q be 3 × 3 matrices with $P \neq Q$ If $P^3 = Q^3$ and $P^2 Q = Q^2 P$, then determinant of$(P^2 + Q^2)$ is equal to

(a) 1 (b) 0
(c) – 1 (d) –2

Ans. (d)

Solution: $P^3 = Q^3$ and $P^2Q = Q^2P$ gives

$$P^3 - P^2Q = Q^3 - Q^2P$$

$$\Rightarrow \qquad P^2(P - Q) = -Q^2(P - Q)$$

$$\Rightarrow \quad (P^2 + Q^2)(P - Q) = 0$$

If det $(P^2 + Q^2) \neq 0$, then $P^2 + Q^2$ is invertible and hence $P = Q$. Therefore, det $(P^2 + Q^2) = 0$.

Example 70: Let $A = \begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{pmatrix}$. If u_1 and u_2 are column matrices such that $Au_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$ and $Au_2 = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$, then $u_1 + u_2$ equals

(a) $\begin{pmatrix} -1 \\ 1 \\ -1 \end{pmatrix}$ (b) $\begin{pmatrix} -1 \\ -1 \\ 0 \end{pmatrix}$

(c) $\begin{pmatrix} 1 \\ -1 \\ -1 \end{pmatrix}$ (d) $\begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix}$

Ans. (c)

◎ **Solution:** We have

$$A(u_1+u_2)=Au_1+Au_2=\begin{pmatrix}1\\0\\0\end{pmatrix}+\begin{pmatrix}0\\1\\0\end{pmatrix}=\begin{pmatrix}1\\1\\0\end{pmatrix}$$

We solve the above equation for $u_1 + u_2$.
We consider the augmented matrix

$$(A|B)=\left(\begin{array}{ccc|c}1&0&0&1\\2&1&0&1\\3&2&1&0\end{array}\right)$$

Applying $R_3 \to R_3 - 2R_2 + R_1$ and $R_2 \to R_2 - 2R_1$, we get

$$(A|B)\sim\left(\begin{array}{ccc|c}1&0&0&1\\0&1&0&-1\\0&0&1&-1\end{array}\right) \quad\Rightarrow\quad u_1+u_2=\begin{pmatrix}1\\-1\\-1\end{pmatrix}$$

◉ **Example 71:** If P is a 3×3 matrix such that $P' = 2P + I$, then there exists a column matrix

$$X=\begin{pmatrix}x\\y\\z\end{pmatrix}\neq O \text{ such that}$$

(a) $PX = O$ (b) $PX = X$
(c) $PX = 2X$ (d) $PX = -X$

Ans. (d)

◎ **Solution:** We have

$$P = (P')' = (2P + I)' = 2P' + \mathrm{I}$$
$$P = 2(2P + I) + \mathrm{I} \quad\Rightarrow\quad P = -I$$

Thus, there exists $X \neq 0$ such that $PX = -X$

◉ **Example 72:** Let $A = \begin{pmatrix}4&3\\2&5\end{pmatrix}$ and $x, y \in \mathbf{R}$ are such that $A^2 + xA + yI = 0$ then (x, y) equals

(a) $(-9, -14)$ (b) $(9, -14)$
(c) $(-9, 14)$ (d) $(9, 14)$

Ans. (c)

◎ **Solution:** We have $A^2 = \begin{pmatrix}22&27\\18&31\end{pmatrix}$

$$\therefore \quad A^2 + xA + yI = O$$
$$\Rightarrow \quad 22 + 4x + y = 0, \quad 27 + 3x = 0$$
$$18 + 2x = 0, \quad 31 + 5x + y = 0$$
$$\Rightarrow \quad x = -9, y = 14$$

◉ **Example 73:** The system of equations

$$\begin{pmatrix}3&-2&1\\5&-8&9\\2&1&a\end{pmatrix}\begin{pmatrix}x\\y\\z\end{pmatrix}=\begin{pmatrix}b\\3\\-1\end{pmatrix}$$

has no solution if a and b are

(a) $a = -3, b \neq 1/3$ (b) $a = 2/3, b \neq 1/3$
(c) $a \neq 1/4, b = 1/3$ (d) $a \neq -3, b \neq 1/3$

Ans. (a)

◎ **Solution:** The augmented matrix is given by

$$(A|B)=\left(\begin{array}{ccc|c}3&-2&1&b\\5&-8&9&3\\2&1&a&-1\end{array}\right)$$

Applying $R_1 \to 2R_1 - R_2$, we get

$$(A|B)\sim\left(\begin{array}{ccc|c}1&4&-7&2b-3\\5&-8&9&3\\2&1&a&-1\end{array}\right)$$

Applying $R_2 \to R_2 - 5R_1$, $R_3 \to R_3 - 2R_1$, we get

$$(A|B)\sim\left(\begin{array}{ccc|c}1&4&-7&2b-3\\0&-28&44&18-10b\\0&-7&a+14&5-4b\end{array}\right)$$

The system of equations will have no solution if

$$\frac{-28}{-7}=\frac{44}{a+14}\neq\frac{18-10b}{5-4b}$$
$$\Rightarrow \quad a + 14 = 11 \quad \text{and} \quad 20 - 16b \neq 18 - 10b$$
$$\Rightarrow \quad a = -3 \text{ and } b \neq -1/3$$

◉ **Example 74:** Suppose $I + A$ is non-singular. Let $B = (I + A)^{-1}$ and $C = I - A$, then

(a) $BC = CB$ (b) $BC = O$
(c) $BC = I$ (d) none of these

Ans. (a)

◎ **Solution:** Write $C = 2I - (I + A)$, then $BC = 2(I + A)^{-1} - I = CB$

◉ **Example 75:** Let $A = \begin{pmatrix}a&b\\c&d\end{pmatrix}$ be such that $A^3 = O$, but $A \neq O$, then

(a) $A^2 = O$ (b) $A^2 = A$
(c) $A^2 = I - A$ (d) none of these

Ans. (a)

◎ **Solution:** As $A^3 = O$, we get $|A^3| = 0$

$$|A|^3 = 0 \quad\Rightarrow\quad |A| \Rightarrow ad - bc = 0.$$

Also,

$$A^2=\begin{pmatrix}a^2+bc&(a+d)\,b\\(a+d)c&bc+d^2\end{pmatrix}$$
$$=\begin{pmatrix}a^2+ad&(a+d)b\\(a+d)c&ad+d^2\end{pmatrix}$$
$$= (a + d)A$$

If $a + d = 0$, we get $A^2 = O$.

Suppose $a + d \neq 0$, then

$$A^3 = A^2A = (a + d)A^2$$
$$\Rightarrow \quad O = (a + d)A^2 \Rightarrow A^2 = O$$

Assertion-Reason Type Questions

Example 76: Let A be a 2×2 matrix.
Statement-1: $adj(adj\,A) = A$
Statement-2: $|adj\,A| = |A|$

Ans. (b)

Solution: Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ then $adj\,A = \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$

$$\Rightarrow \qquad adj\,(adj\,A) = \begin{bmatrix} a & b \\ c & d \end{bmatrix} = A$$

∴ Statement-1 is true.
Also, $|adj\,A| = ad - bc = |A|$
∴ Statement-2 is true
But statement-2 is not a correct explanation for statement-1.

Example 77: Let A be a 2×2 matrix with non-zero entries and let $A^2 = I$, where I is 2×2 identity matrix. Define

$Tr\,(A)$ = sum of diagonal elements of A, and
$|A|$ = determinant of matrix A.

Statement-1: $Tr\,(A) = 0$
Statement-2: $|A| = 1$.
Ans. (c)

Solution: Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Now, $\quad A^2 = I \;\Rightarrow\; |A^2| = |I\,|$

$\Rightarrow \quad |A|^2 = 1 \;\Rightarrow\; |A| = \pm 1$.

Suppose $|A| = 1$.

In this case, $A^2 = I \;\Rightarrow\; A = A^{-1}$

$$\Rightarrow \quad \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

$$\Rightarrow \quad a = d, \quad b = 0, \quad c = 0$$

$$Tr\,(A) = 0 \;\Rightarrow a + d = 0$$

$$\Rightarrow \quad 2a = 0 \;\Rightarrow\; a = 0$$

In this case $A = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$

Thus, if we assume statement-2 is true then we get statement-2 is false.

In case $|A| = -1$, then

$$A = -A^{-1}$$

$$\Rightarrow \quad \begin{pmatrix} a & b \\ c & d \end{pmatrix} = -\begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \Rightarrow \; a + d = 0$$

$$\therefore \quad |A| = -1 \;\Rightarrow\; Tr(A) = 0.$$

Therefore statement-1 is true and statement-2 is false.

Example 78: Let A be a 2×2 matrix with real entries. Let I be the 2×2 identity matrix. Denote by $Tr\,(A)$, the sum of diagonal entries of A. Assume that $A^2 = I$.

Statement-1: If $A \neq I$ and $A \neq -I$, then $\det(A) = -1$.
Statement-1: If $A \neq I$ and $A \neq -I$, then $Tr\,(A) \neq 0$.
Ans. (c)

Solution: Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$

Now, $\quad A^2 = I \;\Rightarrow\; \det(A^2) = 1$

$$\Rightarrow (\det A)^2 = 1 \;\Rightarrow\; \det A = \pm 1.$$

Also, $\quad A^2 = I \;\Rightarrow\; A = A^{-1}$

$$\Rightarrow \quad \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \det A \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

If $\det A = 1$, then

$$a = d,\, b = -b,\, c = -c \;\Rightarrow\; a = d,\, b = c = 0.$$

In this case $A = \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix}$.

$$|A| = 1 \;\Rightarrow\; a^2 = 1 \;\Rightarrow\; a = \pm 1.$$

∴ $\quad A = I$ or $A = -I$. A contradiction.

Thus, $\det(A) = -1$.

$$\therefore \begin{pmatrix} a & b \\ c & d \end{pmatrix} = -1 \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} = \begin{pmatrix} -d & b \\ c & -a \end{pmatrix}$$

$$\Rightarrow \quad a = -d \;\Rightarrow\; Tr\,(A) = a + d = 0.$$

∴ Statement-1 is true and Statement-2 is false.

Example 79: Let

$$A(\theta) = \begin{pmatrix} \cos\theta + \sin\theta & \sqrt{2}\sin\theta \\ -\sqrt{2}\sin\theta & \cos\theta - \sin\theta \end{pmatrix}$$

Statement-1: $A(\pi/3)^3 = -I$
Statement-2: $A(\theta)\,A(\varphi) = A(\theta + \varphi)$

Ans. (a)

Solution: $A(\theta)\,A(\varphi) = \begin{pmatrix} a & b \\ -b & c \end{pmatrix}$ where

$$a = (\cos\theta + \sin\theta)(\cos\varphi + \sin\varphi) - 2\sin\theta\sin\varphi$$
$$= (\cos\theta\cos\varphi - \sin\theta\sin\varphi) + (\sin\theta\cos\varphi + \cos\theta\sin\varphi)$$
$$= \cos(\theta + \varphi) + \sin(\theta + \varphi)$$

$$b = \sqrt{2}\,[\sin\varphi(\cos\theta + \sin\theta) + \sin\theta(\sin\varphi - \cos\phi)]$$
$$= \sqrt{2}\sin(\theta + \varphi)$$

and $\quad c = -2\sin\theta\sin\varphi + (\cos\theta - \sin\theta)(\cos\varphi - \sin\varphi)$
$$= \cos\theta\cos\varphi - \sin\theta\sin\varphi - (\sin\theta\cos\varphi + \cos\varphi\sin\theta)$$
$$= \cos(\theta + \varphi) - \sin(\theta + \varphi)$$

Thus, $A(\theta)\,A(\varphi) = A(\theta + \varphi)$

$$A(\theta)^2 = A(2\theta)$$
$$A(\theta)^3 = A(2\theta)\,A(\theta) = A(3\theta).$$
$$\therefore \quad A(\pi/3)^3 = A(\pi) = -I.$$

◉ **Example 80:** Suppose $X = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ satisfies the equation $X^2 - 4X + 3I = O$

Statement-1: If $a + d \neq 4$, then there are just two such matrices X.

Statement-2: There are infinite number of matrices X, satisfying $X^2 - 4X + 3I = 0$.

Ans. (b)

◎ **Solution:** $X^2 - 4X + 3I = O \;\Rightarrow\; (X - I)(X - 3I) = O$

$$\Rightarrow \begin{pmatrix} (a-1)(a-3)+bc & b(a+d-4) \\ c(a+d-4) & (d-1)(d-3)+bc \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$

If $a + d \neq 4$, then $b = 0$, $c = 0$.

$$(a-1)(a-3) = 0,\ (d-1)(d-3) = 0.$$
$$\Rightarrow \quad a = 1, 3,\ d = 1, 3$$

As $a + d \neq 4$, $a = 1$, $d = 1$ or $a = 3$, $d = 3$.

$$\text{Thus,} \quad X = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \text{ or } X = \begin{pmatrix} 3 & 0 \\ 0 & 3 \end{pmatrix}$$

If $a + d = 4$, we get

$$\begin{pmatrix} (a-1)(a-3)+bc & 0 \\ 0 & (1-a)(3-a)+bc \end{pmatrix} = O.$$

∴ There are infinite number of matrices satisfying $X^2 - 4X + 3I = 0$ as there are infinite number of values of a, b, c satisfying the relation $a^2 - 4a + 3 + bc = 0$.

◉ **Example 81:** Suppose $A = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$ and $B = \begin{pmatrix} 0 & 2 \\ 2 & 0 \end{pmatrix}$.

Let X be a 2×2 matrix such that

$$X'AX = B.$$

Statement-1: X is non-singular and $\det(X) = \pm 2$

Statement-2: X is a singular matrix.

Ans. (c)

◎ **Solution:** If $X = O$, then $X'AX = O \;\Rightarrow\; B = O$.

A contradiction.

Let $\quad \det(X) = a$, then $\det(X') = a$

$\therefore \quad \det(X'AX) = \det(B)$

$\Rightarrow \quad a(-1)a = -4 \;\Rightarrow\; a = \pm 2$.

As $\det(X) \neq 0$, X cannot be a singular matrix.

◉ **Example 82:** Let $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$, $X = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$, $Y = \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}$

Statement-1: If $X'AX = O$ for each X, then A must be a skew-symmetric matrix.

Statement-2: If A is symmetric and $X'AX = O$ for each X, then $A = O$

Ans. (b)

◎ **Solution:** Let $E_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$, $E_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$.

As $\quad X'AX = O \;\forall\; X$,

$$E_1'AE_1 = O \;\Rightarrow\; a_{11} = 0$$
$$E_2'AE_2 = O \;\Rightarrow\; a_{22} = 0.$$

Next, $\quad (E_1 + E_2)'\,A(E_1 + E_2) = O$

$\Rightarrow \quad a_{12} + a_{21} = 0$

Thus, $A = \begin{bmatrix} 0 & a_{12} \\ -a_{12} & 0 \end{bmatrix}$ is a skew-symmetric matrix.

In case A is symmetric, $a_{12} = a_{21}$

$\therefore \quad 2a_{12} = 0 \;\Rightarrow\; a_{12} = 0$.

Thus, $A = O$, in this case.

◉ **Example 83:** Suppose A, B and C are three 3×3 matrices, such that AB is invertible.

Statement-1: If $AB = AC$ then $B = C$.

Statement-2: A is a invertible.

Ans. (a)

◎ **Solution:** AB is invertible

$$\Rightarrow \quad \det(AB) \neq 0$$
$$\Rightarrow \quad \det(A)\det(B) \neq 0$$
$$\Rightarrow \quad \det(A) \neq 0$$

$\Rightarrow \quad A$ is invertible

Premultiplying both the sides of

$$AB = AC$$

by A^{-1}, we get

$$A^{-1}(AB) = A^{-1}(AC)$$
$$\Rightarrow \quad (A^{-1}A)B = (A^{-1}A)C$$
$$\Rightarrow \quad IB = IC \quad \text{or} \quad B = C.$$

◉ **Example 84:** Suppose α, β, γ are real numbers such that

$\cos(\beta - \gamma) + \cos(\gamma - \alpha) + \cos(\alpha - \beta) = -3/2 \qquad (1)$

Statement-1: The matrix

$$A = \begin{pmatrix} \cos\alpha & \sin\alpha & -2 \\ \cos\beta & \sin\beta & 1 \\ \cos\gamma & \sin\gamma & 1 \end{pmatrix}$$

is a singular matrix.

Statement-2: $\cos\alpha + \cos\beta + \cos\gamma = 0$

and $\quad \sin\alpha + \sin\beta + \sin\gamma = 0$

Ans. (a)

◎ **Solution:** Write (1) as

$$\begin{aligned} &\cos^2\alpha + \cos^2\beta + \cos^2\gamma \\ &+ \sin^2\alpha + \sin^2\beta + \sin^2\gamma \\ &+ 2\cos\beta\cos\gamma + 2\sin\beta\sin\gamma \\ &+ 2\cos\gamma\cos\alpha + 2\sin\gamma\sin\alpha \\ &+ 2\cos\alpha\cos\beta + 2\sin\alpha\sin\beta = 0 \end{aligned}$$

$$\Rightarrow \quad (\cos\alpha + \cos\beta + \cos\gamma)^2 + (\sin\alpha + \sin\beta + \sin\gamma)^2 = 0$$

$$\Rightarrow \quad \cos\alpha + \cos\beta + \cos\gamma = 0$$

$$\text{and } \sin\alpha + \sin\beta + \sin\gamma = 0$$

Using $R_1 \to R_1 + R_2 + R_3$, we get R_1 consists of all zeros, therefore $\det(A) = 0$.

Thus, A is a singular matrix.

◉ **Example 85:** Let $A = (a_{ij})_{3\times 3}$ be a 3×3 matrix with $a_{ij} \in \mathbf{R}$ for $1 \le i \le 3$, $1 \le j \le 3$. Let X be a 3×1 matrix.

Statement-1: If A is skew-symmetric, then $I + A$ is non-singular.

Statement-2: If $AX = O$ implies $X = O$, then A is non-singular.

Ans. (a)

◎ **Solution:** If A is not non-singular, then $AX = O$ has infinitely many solutions.

Thus, if $AX = O \Rightarrow X = O$, then A must be non-singular.

Next, consider

$$(I + A)X = O$$

$$\Rightarrow \quad AX = -X \quad \Rightarrow \quad (AX) = (-X)'$$

$$\Rightarrow \quad X'A' = -X' \quad \Rightarrow \quad X'(-A) = -X'$$

$$\Rightarrow \quad X'A = X' \quad \Rightarrow \quad X'AX = X'X$$

$$\Rightarrow \quad X'(-X) = X'X \quad \Rightarrow \quad X'X = O \quad \Rightarrow \quad X = O.$$

$\therefore$ $I + A$ is non-singular.

LEVEL 2

Straight Objective Type Questions

◉ **Example 86:** Let $A = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$ and $B = \begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$, $a, b \in \mathbf{N}$.

(a) Then there exists infinitely many B's such that $AB = BA$
(b) there cannot exist B such that $AB = BA$
(c) there exist more than one but finite number of B's such that $AB = BA$
(d) there exists exactly one B such that $AB = BA$

Ans. (a)

◎ **Solution:** If $b = a$, $B = aI$ and B commutes with every matrix A.

◉ **Example 87:** Let $A = \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix}$. If $|A^2| = 25$ then $|\alpha|$ equals

(a) 5^2 (b) 1
(c) 1/5 (d) 5

Ans. (c)

◎ **Solution:** $|A^2| = 25 \Rightarrow |A|^2 = 25$

$$\therefore \quad (25\alpha)^2 = 25 \Rightarrow 25\alpha^2 = 1 \quad \Rightarrow \quad |\alpha| = 1/5$$

◉ **Example 88:** If $A = \begin{pmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{pmatrix}$ and $A + A' = I$, then α equals

(a) $2n\pi \pm \dfrac{\pi}{2}$, $n \in \mathbf{I}$ (b) $2n\pi \pm \dfrac{\pi}{3}$, $n \in \mathbf{I}$
(c) $2n\pi \pm \dfrac{2\pi}{3}$, $n \in \mathbf{I}$ (d) $2n\pi \pm \dfrac{4\pi}{3}$, $n \in \mathbf{I}$

Ans. (b)

◎ **Solution:**

$$\Rightarrow \quad \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 2\cos\alpha & 0 \\ 0 & 2\cos\alpha \end{bmatrix}$$

$$\Rightarrow \quad 2\cos\alpha = 1 \quad \Rightarrow \quad \cos\alpha = \frac{1}{2} = \cos\frac{\pi}{3}$$

$$\Rightarrow \quad \alpha = 2n\pi \pm \frac{\pi}{3},\ n \in \mathbf{I}$$

◉ **Example 89:** Let $A = \begin{bmatrix} 0 & -\tan(\alpha/2) \\ \tan(\alpha/2) & 0 \end{bmatrix}$

$\alpha \ne (2n + 1)\pi$, $n \in \mathbf{I}$, $(I + A)(I - A)^{-1}$ equals

(a) $\begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix}$ (b) $\begin{bmatrix} \cos\alpha & \sin\alpha \\ -\sin\alpha & \cos\alpha \end{bmatrix}$

(c) $\begin{bmatrix} \tan\alpha & 0 \\ 0 & \tan\alpha \end{bmatrix}$ (d) $\begin{bmatrix} \tan\alpha & 0 \\ 0 & -\tan\alpha \end{bmatrix}$

Ans. (a)

◎ **Solution:** $I - A = \begin{bmatrix} 1 & \tan(\alpha/2) \\ -\tan(\alpha/2) & 1 \end{bmatrix}$

$$\text{then} \quad (I - A)^{-1} = \frac{1}{\sec^2(\alpha/2)} \begin{bmatrix} 1 & -\tan(\alpha/2) \\ \tan(\alpha/2) & 1 \end{bmatrix}$$

Now, $(I + A)(I - A)^{-1}$

$$= \frac{1}{\sec^2(\alpha/2)} \begin{bmatrix} 1 & -\tan(\alpha/2) \\ \tan(\alpha/2) & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -\tan(\alpha/2) \\ \tan(\alpha/2) & 1 \end{bmatrix}$$

$$= \begin{bmatrix} \dfrac{1-\tan^2(\alpha/2)}{1+\tan^2(\alpha/2)} & \dfrac{-2\tan(\alpha/2)}{1+\tan^2(\alpha/2)} \\ \dfrac{2\tan(\alpha/2)}{1+\tan^2(\alpha/2)} & \dfrac{1-\tan^2(\alpha/2)}{1+\tan^2(\alpha/2)} \end{bmatrix} = \begin{bmatrix} \cos\alpha & -\sin\alpha \\ \sin\alpha & \cos\alpha \end{bmatrix}$$

◉ **Example 90:** Let $P = \begin{bmatrix} \sqrt{3}/2 & 1/2 \\ -1/2 & \sqrt{3}/2 \end{bmatrix}$, $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $Q = PAP'$, then $P'Q^{2015}P$ is

(a) $\begin{bmatrix} 1 & -2015 \\ 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 2015 & 1 \\ 0 & 2015 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 2015 \\ 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 2015 & 2015 \\ 0 & 2015 \end{bmatrix}$

Ans. (c)

◎ **Solution:** $P = \begin{bmatrix} \cos(\pi/6) & \sin(\pi/6) \\ -\sin(\pi/6) & \cos(\pi/6) \end{bmatrix}$

$$\Rightarrow \quad P' = \begin{bmatrix} \cos(\pi/6) & -\sin(\pi/6) \\ \sin(\pi/6) & \cos(\pi/6) \end{bmatrix}$$

Since $PP' = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \Rightarrow P' = P^{-1}$

We have $Q = PAP' = PAP^{-1}$

$\Rightarrow$ $Q^{2015} = (PAP^{-1})^{2015} = PA^{2015}P^{-1}$

Thus, $P'Q^{2015}P = P^{-1}(PA^{2015}P^{-1})P$

$= (P^{-1}P)A^{2015}(P^{-1}P)$

Now, $A = I + B$ where $B = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$

Since, $B^2 = O$, we get $B^r = O \ \forall\ r \geq 2$.

Thus, $A^{2015} = I + 2015B = \begin{bmatrix} 1 & 2015 \\ 0 & 1 \end{bmatrix}$

◉ **Example 91:** If $A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix}$, $6A^{-1} = A^2 + cA + dI$, then (c, d) is

(a) (–6, 11) (b) (–11, 6)

(c) (11, 6) (d) (6, 11)

Ans. (a)

◎ **Solution:** $6A^{-1} = A^2 + cA + dI$

$\Rightarrow$ $6I = A^3 + cA^2 + dA$

We have

$$A^2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 5 \\ 0 & -10 & 14 \end{bmatrix}$$

and $A^3 = A^2A$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 5 \\ 0 & -10 & 14 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & -2 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -11 & 19 \\ 0 & -38 & 46 \end{bmatrix}$$

Now,

$6I = A^3 + cA^2 + dA$

$6 = 1 + c + d, \quad 0 = 19 + 5c + d$

$6 = -11 - c + d$

$6 = 46 + 14c + 4d, \quad 0 = -38 - 10c - 2d$

$\Rightarrow$ $d = 11, \quad c = -6$

◉ **Example 92:** If a, b, c are non-zero, then number of solutions of

$$\frac{2x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0 \qquad (1)$$

$$-\frac{x^2}{a^2} + \frac{2y^2}{b^2} - \frac{z^2}{c^2} = 0 \qquad (2)$$

$$-\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{2z^2}{c^2} = 0 \qquad (3)$$

is

(a) 6 (b) 8

(c) 9 (d) infinite

Ans. (d)

◎ **Solution:** From (2), (3), we get

$$\frac{3y^2}{b^2} - \frac{3z^2}{c^2} = 0 \Rightarrow \frac{y^2}{b^2} = \frac{z^2}{c^2}$$

Putting this in (1) we get

$$\frac{2x^2}{a^2} - \frac{2y^2}{b^2} = 0 \Rightarrow \frac{x^2}{a^2} = \frac{y^2}{b^2}$$

$$\therefore \quad \frac{x^2}{a^2} = \frac{y^2}{b^2} = \frac{z^2}{c^2} = k^2 \quad \text{(say)}$$

$\Rightarrow$ $x = \pm\, ka, \quad y = \pm\, kb, \quad z = \pm\, kc,$

where $k \in \mathbf{R}$.

◉ **Example 93:** If A and B are two matrices such that $AB = B$ and $BA = A$, then $A^2 + B^2$ is equal to

(a) $2AB$ (b) $2BA$

(c) $A + B$ (d) AB

Ans. (c)

◎ **Solution:** We have

$A^2 + B^2 = (BA)^2 + (AB)^2$

$= (BA)(BA) + (AB)(AB)$

$= B(AB)A + A(BA)B$

$= B(BA) + A(AB) = BA + AB = A + B.$

Example 94: If $A = \begin{bmatrix} 2 & 0 & 1 \\ 2 & 1 & 3 \\ 1 & -1 & 0 \end{bmatrix}$, then $A^2 - 5A + 6I$ is equal to

(a) $\begin{bmatrix} 1 & -1 & -3 \\ -1 & -1 & -10 \\ -5 & 4 & 4 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 1 & -5 \\ -1 & -1 & 4 \\ -3 & -10 & 4 \end{bmatrix}$

(c) O (d) I

Ans. (a)

Solution: $A^2 = \begin{bmatrix} 2 & 0 & 1 \\ 2 & 1 & 3 \\ 1 & -1 & 0 \end{bmatrix}\begin{bmatrix} 2 & 0 & 1 \\ 2 & 1 & 3 \\ 1 & -1 & 0 \end{bmatrix} = \begin{bmatrix} 5 & -1 & 2 \\ 9 & -2 & 5 \\ 0 & -1 & -2 \end{bmatrix}$

Now, $A^2 - 5A + 6I$

$$= \begin{bmatrix} 5 & -1 & 2 \\ 9 & -2 & 5 \\ 0 & -1 & -2 \end{bmatrix} - 5\begin{bmatrix} 2 & 0 & 1 \\ 2 & 1 & 3 \\ 1 & -1 & 0 \end{bmatrix} + 6\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 5-10+6 & -1-0+0 & 2-5+0 \\ 9-10+0 & -2-5+6 & 5-15+0 \\ 0-5+0 & -1+5+0 & -2-0+6 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & -1 & -3 \\ -1 & -1 & -10 \\ -5 & 4 & 4 \end{bmatrix}$$

Example 95: The inverse of the matrix $A = \begin{bmatrix} 1 & 0 & 0 \\ a & 1 & 0 \\ b & c & 1 \end{bmatrix}$ is

(a) $\begin{bmatrix} 1 & 0 & 0 \\ -a & 1 & 0 \\ ac-b & -c & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 & 0 \\ -a & 0 & 0 \\ b & -c & 1 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 0 & 0 \\ -a & 0 & 0 \\ ac & b & 1 \end{bmatrix}$ (d) none of these

Ans. (a)

Solution: Using the formula for inverse of a 3 × 3 triangular matrix given in theory, A^{-1} is the matrix given in (a).

Example 96: If $A = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}$ then A^{-1} is

(a) A (b) A^2
(c) A^3 (d) A^4

Ans. (c)

Solution: To show that $A^{-1} = B \Leftrightarrow AB = I$. We have

$$A^2 = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}\begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -4 & 4 \\ 0 & -1 & 0 \\ -2 & 2 & -3 \end{bmatrix}$$

$$A(A^2) = \begin{bmatrix} 3 & -3 & 4 \\ 2 & -3 & 4 \\ 0 & -1 & 1 \end{bmatrix}\begin{bmatrix} 3 & -4 & 4 \\ 0 & -1 & 0 \\ -2 & 2 & -3 \end{bmatrix} = \begin{bmatrix} 1 & * & * \\ -2 & * & * \\ * & * & * \end{bmatrix}$$

TIP

[Need not evaluate the remaining terms as $A^3 \neq I_3$]

Next

$$A^4 = (A^2)(A^2) = \begin{bmatrix} 3 & -4 & 4 \\ 0 & -1 & 0 \\ -2 & 2 & -3 \end{bmatrix}\begin{bmatrix} 3 & -4 & 4 \\ 0 & -1 & 0 \\ -2 & 2 & -3 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I_3$$

Thus, $A^{-1} = A^3$.

EXERCISES

Concept-based Straight Objective Type Questions

1. Let A be a 2×2 invertible matrix. For which of the following functions $\det(f(A)) = f(\det(A))$ is **not** true?
(a) $f(x) = x^3$ (b) $f(x) = x^{-1}, x \neq 0$
(c) $f(x) = 1 + x$ (d) $f(x) = x^{-3}, x \neq 0$

2. Suppose $a, b, c, d \in \mathbf{C}$, and let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$. Then which one of the following is **not** true?
(a) $|\det(A)| \le |a| + |b| + |c| + |d|$
(b) $|\det(A)| \le (|a| + |b|)(|c| + |d|)$
(c) $|\det(A)| \le (|a| + |c|)(|b| + |d|)$
(d) $|\det(A)| \le \sqrt{|a|^2 + |b|^2}\sqrt{|c|^2 + |d|^2}$

3. Let A, B be two 3 × 3 matrices with entries from real numbers. Which one of the following is true?

(a) $(A + B)^3 = A^3 + 3A^2B + 3AB^2 + B^3$
(b) $(AB)^2 = O \quad \Rightarrow \quad AB = O$
(c) $(A + B)(A - B) = A^2 - B^2$
(d) $(A + B)A = BA + A^2$

4. Suppose A and B are two 3×3 matrices with entries from complex numbers such that $ABA = I$. Which one of the following is **not** true?
(a) B is invertible (b) $B^{-1} = A^2$
(c) A is not invertible (d) $A^4B^2 = I$

5. Let A be a 3×3 matrix with entries from the set of real numbers. Suppose the equation $AX = B$ has a solution for every 3×1 matrix B with entries from the set of real numbers. Then
(a) $A'Y = B$ has no solution
(b) $A'Y = O \Rightarrow Y = O$
(c) $AX = O$ has a non-trivial solution
(d) A is a singular matrix

6. Suppose $A = \begin{bmatrix} \cos\theta & i\sin\theta \\ i\sin\theta & \cos\theta \end{bmatrix}$ for some $\theta \in \mathbf{R}$. Let B, C, D be three 2×2 matrices such that $AB = AC - AD$, then
(a) $C' = B' - D'$ (b) $C + D = B$
(c) $C' = B' + D'$ (d) none of these

7. Suppose A, B are two 3×3 matrices such that A^{-1} exists. Then $(A - B)A^{-1}(A + B)$ is equal to
(a) $(A + B)A^{-1})(A - B)$ (b) $A^{-1}B + B^2$
(c) $(I - BAB^{-1})(A - B)$ (d) $(I + BAB^{-1})(A + B)$

8. Let A be 3×3 matrix such that A is orthogonal and idempotent, then
(a) A must be symmetric
(b) $\det(A) = -1$
(c) $A + A^{-1} = 1$
(d) none of these

9. Suppose A and B are two orthogonal matrices of the same size such that $\det(A) + \det(B) = 0$. Then
(a) $A + B = -I$ (b) $A + B = I$
(c) $\det(A + B) = 0$ (d) $A + B = O$

10. Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, where $a, b, c, d \in \mathbf{R}$. $ad \neq 0$
If $(a + d)A - A^2 = A'$, then
(a) $a = d$ (b) $a = d = 1$
(c) $a + d = 0$ (d) $a + d = 1$

LEVEL 1

Straight Objective Type Questions

11. Let $S_k = \begin{pmatrix} 1 & k \\ 0 & 1 \end{pmatrix}$, $k \in \mathbf{N}$. Then $(S_2)^n (S_k)^{-1}$ (where $n \in \mathbf{N}$) is equal to:
(a) S_{2n+k} (b) S_{2n-k}
(c) S_{2^n+k-1} (d) S_{2^n-k}

12. Let S be the set of all 2×2 real matrices $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ such that $a + d = 3$ and $A' = A^2 - 3A$. Then
(a) S contains infinite number of elements
(b) $S = Q$
(c) S contains exactly two elements
(d) S contains exactly 2^4 elements

13. Let $A = (a_{ij})_{3\times2}$ be a 3×2 matrix with real entries and $B = AA'$. Then
(a) B^{-1} is a 3 × 3 matrix
(b) B^{-1} is a 2 × 2 matrix
(c) B^{-1} does not exist
(d) B^{-1} exists if and only if exactly one row of A consists of zeros

14. Let $A = (a_{ij})_{3\times3}$ be a matrix with $a_{ij} \in \mathbf{C}$. Let B be a matrix obtained by interchanging two columns of A. Then $\det(A + B)$ is equal to
(a) $\det(A) + \det(B)$
(b) 0
(c) $2\det(A)$
(d) $\det(A) - \det(B)$

15. If $I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$, $J = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$, and

$$B = \begin{pmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{pmatrix},$$ then B equals

(a) $(\cos\theta)I + (\sin\theta)J$
(b) $(\sin\theta)I + (\cos\theta)J$
(b) $(\cos\theta)I - (\sin\theta)J$
(d) $-(\cos\theta)I + (\sin\theta)J$

16. If A is both diagonal and skew-symmetric, then
(a) A is a symmetric matrix
(b) A is a null matrix
(c) A is a unit matrix
(d) none of these matrix

17. If $A^2 - 3A + 2I = 0$, then A^{-1} equals

    (a) $\frac{1}{2}(A - 3I)$ (b) $\frac{1}{2}(3I - A)$
    (c) $A + 3I$ (d) none of these

18. If A is a square matrix of order 3 such that $A^2 = 2A$, then $|A|^2$ is equal to

    (a) $2\,|A|$ (b) $8\,|A|$
    (c) $16\,|A|$ (d) 0

19. If A is a square matrix then which one of the following is *not* a symmetric matrix

    (a) $A + A'$ (b) AA'
    (c) $A'A$ (d) $A - A'$

20. If $A = (a_{ij})_{3\times 3}$ where $a_{ij} = \cos(i + j)$, then

    (a) A is symmetric
    (b) A is skew-symmetric
    (c) A is a triangular matrix
    (d) A is a singular matrix

21. If $A = (a_{ij})_{3\times 3}$ is a matrix satisfying the equation $x^3 - 3x + 1 = 0$, then

    (a) A is a unit matrix
    (b) A is singular matrix
    (c) A is non-singular matrix
    (d) none of these

22. If A and B are two square matrices of the same size, then $(A + B)^2 = A^2 + 2AB + B^2$ can hold if and only if

    (a) $AB = BA$ (b) $AB + BA = O$
    (c) $|AB| \neq 0$ (d) $|AB| = 0$

23. If $\begin{bmatrix} i & 0 \\ 3 & -i \end{bmatrix} + X = \begin{bmatrix} i & 2 \\ 3 & 4+i \end{bmatrix} - X$, then X is equal to

    (a) $\begin{bmatrix} 0 & -1 \\ 3 & i \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 1 \\ 0 & 2+i \end{bmatrix}$

    (c) $\begin{bmatrix} 1 & 0 \\ 0 & 2-i \end{bmatrix}$ (d) $\begin{bmatrix} i & 2 \\ 0 & 2+i \end{bmatrix}$

24. If $A = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$, $B = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$, then $AB + BA$ is

    (a) null matrix (b) unit matrix
    (c) invertible matrix (d) none of these

25. $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ -1 & -2 & -3 \end{bmatrix}$, then A is a nilpotent matrix of index

    (a) 2 (b) 3
    (c) 4 (d) 5

26. If A is a 2×2 unitary matrix, then $|A|$ is equal to

    (a) 1 (b) -1
    (c) ± 1 (d) none of these

27. If $A = \frac{1}{2}\begin{pmatrix} -1 & -\sqrt{3} \\ \sqrt{3} & -1 \end{pmatrix}$, then $A^{-1} - A^2$ is equal to a

    (a) null matrix (b) invertible matrix
    (c) unit matrix (d) none of these

28. If C is a 3×3 matrix satisfying the relation $C^2 + C = I$, then C^{-2} is given by

    (a) $2\,C$ (b) $3\,C - I$
    (c) C (d) $2I + C$

29. If A, B and C are three square matrices of the same size such that $B = CA\,C^{-1}$, then CA^3C^{-1} is equal to

    (a) B (b) B^2
    (c) B^3 (d) B^9

30. If X is a 2×3 matrix such that $|X'X| \neq 0$, and $A = I - X(X'X)^{-1}X'$ then A^2 is equal to

    (a) A (b) I
    (c) A^{-1} (d) none of these

31. The matrix $A = \begin{pmatrix} p & -q \\ q & p \end{pmatrix}$ is orthogonal if and only if

    (a) $p^2 + q^2 = 1$ (b) $p^2 = q^2$
    (c) $p^2 = q^2 + 1$ (d) none of these

32. The values of λ for which the matrix
    $A = \begin{pmatrix} \lambda & 0 & \lambda \\ \lambda & 0 & -\lambda \\ 0 & 1 & 0 \end{pmatrix}$ is orthogonal is

    (a) ± 1 (b) $\pm 1/\sqrt{3}$
    (c) $\pm 1/2$ (d) $\pm 1/\sqrt{2}$

33. The values of a for which the matrix
    $A = \begin{pmatrix} a & a^2-1 & -3 \\ a+1 & 2 & a^2+4 \\ -3 & 4a & -1 \end{pmatrix}$ is symmetric are

    (a) -1 (b) -2
    (c) 3 (d) 2

34. Let $A_t = \begin{pmatrix} 1 & 3 & 2 \\ 2 & 5 & t \\ 4 & 7-t & -6 \end{pmatrix}$, then the value(s) of t for which inverse of A_t does not exist.

    (a) $-2, 1$ (b) $3, 2$
    (c) $2, -3$ (d) $3, -1$

35. If $A = \begin{bmatrix} a+ib & c+id \\ -c+id & a-ib \end{bmatrix}$, where $a^2 + b^2 + c^2 + d^2 = 1$, then A^{-1} is equal to

(a) $\begin{bmatrix} a-ib & -c+id \\ c+id & a+ib \end{bmatrix}$
(b) $\begin{bmatrix} a-ib & c-id \\ -c-id & a+ib \end{bmatrix}$
(c) $\begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix}$
(d) none of these

36. If $A = \begin{bmatrix} \frac{1}{2}\left(e^{ix}+e^{-ix}\right) & \frac{1}{2}\left(e^{ix}-e^{-ix}\right) \\ \frac{1}{2}\left(e^{ix}-e^{-ix}\right) & \frac{1}{2}\left(e^{ix}+e^{-ix}\right) \end{bmatrix}$ then A^{-1} exists

(a) for all real x
(b) for positive real x only
(c) for negative real x only
(d) none of these

37. If $A = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix}$, then A^2 is equal

(a) O
(b) I
(c) $-I$
(d) none of these

38. If A is 2×2 matrix such that $A^2 = O$, then $tr\,(A)$ is

(a) 1
(b) -1
(c) 0
(d) none of these

39. If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ such that A satisfies the relation $A^2 - (a + d)A = O$, then inverse of A is

(a) I
(b) A
(c) $(a + d)A$
(d) none of these

40. If $A = \begin{bmatrix} 3 & 2 \\ 0 & 1 \end{bmatrix}$, then A^{-3} is

(a) $\frac{1}{27}\begin{bmatrix} 1 & -26 \\ 0 & -27 \end{bmatrix}$
(b) $\frac{1}{27}\begin{bmatrix} -1 & -26 \\ 0 & -27 \end{bmatrix}$
(c) $\frac{1}{27}\begin{bmatrix} 1 & -26 \\ 0 & 27 \end{bmatrix}$
(d) $\frac{1}{27}\begin{bmatrix} -1 & 26 \\ 0 & -27 \end{bmatrix}$

41. If A is a skew Hermitian matrix, then the main diagonal elements of A are all

(a) purely real
(b) positive
(c) negative
(d) purely imaginary

42. If $A = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix}$ then $A^3 - 3A^2 - A + 9I$ is equal to

(a) O
(b) I
(c) A
(d) A^2

43. If $3A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ x & 2 & y \end{bmatrix}$ and $AA' = I$, then $x + y$ is equal to

(a) -3
(b) -2
(c) -1
(d) 0

44. If the system of equations $ax + y = 3$, $x + 2y = 3$, $3x + 4y = 7$ is consistent, then value of a is given by

(a) 2
(b) 1
(c) -1
(d) 0

45. If the system of equations $x + 2y - 3z = 1$, $(p + 2)z = 3$, $(2p + 1)\,y + z = 2$ is inconsistent, then the value of p is

(a) -2
(b) $-1/2$
(c) 0
(d) 2

46. The system of linear equations $x + y + z = 2$, $2x + y - z = 3$, $3x + 2y + kz = 4$ has a unique solution if

(a) $k \neq 0$
(b) $-1 < k < 1$
(c) $-2 < k < 2$
(d) $k = 0$

47. If $A = \begin{bmatrix} 4 & x+2 \\ 2x-3 & x+1 \end{bmatrix}$ is an invertible matrix, then x cannot take value

(a) -1
(b) 2
(c) 3
(d) none of these

48. If A and B are two square matrices of the same order, then which of the following is true.

(a) $(AB)' = A'B'$
(b) $(AB)' = B'A'$
(c) $|AB| = 0 \Rightarrow |A| = 0$ and $|B| = 0$
(d) none of these

49. The values of α for which the system of equations $x + y + z = 1$, $x + 2y + 4z = \alpha$, $x + 4y + 10z = \alpha^2$ is consistent, are given by

(a) $1, -2$
(b) $-1, 2$
(c) $1, 2$
(d) none of these

50. The system of homogeneous equations

$$tx + (t+1)\,y + (t-1)\,z = 0$$
$$(t+1)\,x + ty + (t+2)\,z = 0$$
$$(t-1)\,x + (t+2)\,y + tz = 0$$

has a non-trivial solution for

(a) three values of t
(b) two values of t
(c) one value of t
(d) infinite number of values of t

51. If A and B are two 3×3 matrices and $|A| \neq 0$, then which of the following are **not** true?

(a) $|AB| = 0 \Rightarrow |B| = 0$
(b) $|AB| \neq 0 \Rightarrow |B| \neq 0$
(c) $|A^{-1}| = |A|^{-1}$
(d) $|A + A| = 2|A|$

52. If $A = \begin{pmatrix} i & -i \\ -i & i \end{pmatrix}$ and $B = \begin{pmatrix} 1 & -1 \\ -1 & 1 \end{pmatrix}$, then A^8 equals

(a) $128\,B$ (b) $32\,B$
(c) $16\,B$ (d) $64\,B$

53. If $A = \begin{pmatrix} 2 & 3-i & -i \\ 3+i & \pi & 7+i \\ i & 7-i & e \end{pmatrix}$, then A is

(a) symmetric (b) Hermitian
(c) skew Hermitian (d) none of these

Assertion-Reason Type Questions

54. **Statement-1:** If A and B are two 3×3 matrices such that $AB = O$, then $A = O$ or $B = O$.

Statement-2: If A, B and X are three 3×3 matrices such that $AX = B$, $|A| \neq 0$, then $X = A^{-1}B$.

55. **Statement-1:** If $A = \begin{bmatrix} 1 & \pi \\ 0 & 1 \end{bmatrix}$, then $A^{100} = \begin{bmatrix} 1 & 100\pi \\ 0 & 1 \end{bmatrix}$.

Statement-2: If B is a 2×2 matrix such that $B^2 = O$, then $(I + B)^n = I + nB$ for each $n \in \mathbf{N}$.

56. **Statement-1:** As $A = \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix}$ satisfies the equation $x^3 - 5x^2 + 7x - 3 = 0$, then A is invertible.

Statement-2: If a square matrix A satisfies the equation $a_0x^n + a_1x^{n-1} + \ldots + a_{n-1}x + a_n = 0$, and $a_n \neq 0$, then A is invertible.

57. **Statement-1:** If a, b, c are in A.P. the system of equations

$3x + 4y + 5z = a$ (1)
$4x + 5y + 6z = b$ (2)
$5x + 6y + 7z = c$ (3)

is consistent.

Statement-2: If $|A| \neq 0$, the system of equations $AX = B$ is consistent.

58. Let $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$, $X = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$, $Y = \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}$

Statement-1: If A is symmetric, then $X'AY = Y'AX$ for each pair of X and Y.

Statement-2: If $X'AY = Y'AX$ for each pair of X and Y, then A is symmetric.

59. For any $n \geq 2$. Let $M_n(\mathbf{R})$ denote the set of all. $n \times n$ matrices over the set of real numbers.

Statement-1: If $A \in M_n(\mathbf{R})$, $A \neq O$ with det $(A) = 0$, then det (Adj A) = 0

Statement-2: For $A \in M_n(\mathbf{R})$, det (Adj A) = (det $A)^{n-1}$

60. Let B be a 3×3 matrix such that $(I - B)^{-1}$ exists.

Statement-1: If $BX = X$ then $X = O$

Statement-2: $I + B + B^2 + \ldots + B^k = (I - B^{k+1})(I - B)^{-1}$ for all $k \in \mathbf{N}$.

LEVEL 2

Straight Objective Type Questions

61. If $\begin{pmatrix} 1 & -\tan\theta \\ \tan\theta & 1 \end{pmatrix}\begin{pmatrix} 1 & \tan\theta \\ -\tan\theta & 1 \end{pmatrix}^{-1} = \begin{pmatrix} a & -b \\ b & a \end{pmatrix}$, then

(a) $a = b = 1$
(b) $a = \cos 2\theta$, $b = \sin 2\theta$
(c) $a = \sin 2\theta$, $b = \cos 2\theta$
(d) $a = 1$, $b = \sin 2\theta$

62. If a, b, $c \neq 0$ and $a + b + c = 0$, then the matrix

$$\begin{bmatrix} 1+\frac{1}{a} & 1 & 1 \\ 1 & 1+\frac{1}{b} & 1 \\ 1 & 1 & 1+\frac{1}{c} \end{bmatrix}$$

is

(a) singular
(b) non-singular
(c) skew-symmetric
(d) orthogonal

63. Suppose matrix A satisfies the equation $A^2 - 5A + 7I = O$. If $A^8 = aA + bI$, then value of a is

(a) 1265 (b) 2599
(c) –2599 (d) 0

64. Let α, β, γ be three real numbers and

$$A = \begin{bmatrix} 1 & \cos(\beta-\alpha) & \cos(\gamma-\alpha) \\ \cos(\alpha-\beta) & 1 & \cos(\gamma-\beta) \\ \cos(\alpha-\gamma) & \cos(\beta-\gamma) & 1 \end{bmatrix}$$

then
(a) A is singular
(b) A is non-singular
(c) A is orthogonal
(d) none of these

65. Let $A(\theta) = \begin{pmatrix} \sin\theta & i\cos\theta \\ i\cos\theta & \sin\theta \end{pmatrix}$, then

(a) $A(\theta)^{-1} = A(-\theta)$
(b) $A(\theta)^{-1} = A(\pi - \theta)$
(c) $A(\theta)^{-1}$ does not exist
(d) $A(\theta)^2 = A(2\theta)$

66. Let A and B be two matrices such that $AB = BA$, then which one of the following **does not** hold for each $n \in \mathbf{N}$.

(a) $A^n B = BA^n$
(b) $(AB)^n = A^nB^n$
(c) $A^nB = B^nA$
(d) $A^nB^n = B^nA^n$

67. Let $A = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & 1 & 1 \end{bmatrix}$. The sum of all values of λ for which there exists a column vector $X \neq O$ such that $AX = \lambda X$, is

(a) 0 (b) 1
(c) 2 (d) 3

68. Let $a, b, c \in \mathbf{R}$ be such that $a + b + c > 0$ and $abc = 2$. Let

$$A = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}$$

If $A^2 = I$, then value of $a^3 + b^3 + c^3$ is

(a) 7 (b) 2
(c) 0 (d) –1

69. If A is a 3×3 skew-symmetric matrix with real entries and trace of A^2 equals zero, then

(a) $A = O$ (b) $2A = I$
(c) A is orthogonal (d) none of these

70 Suppose A and B are two 3×3 non-singular matrices such that

$$(AB)^k = A^kB^k$$

for $k = 2015, 2016, 2017$, then
(a) $AB = O$
(b) $BA = O$
(c) $AB = BA$
(d) $AB + BA = O$

71. Let A be a square matrix of order 3 such that $|\text{Adj } A| = 100$, then $|A|$ equals
(a) ±10 (b) –100
(c) 100 (d) 25

72. Let M be a 3×3 matrix satisfying

$$M\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix}, \quad M\begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix}, \quad \text{and} \quad M\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 12 \end{bmatrix}$$

then sum of the diagonal entries of M is

(a) 0 (b) –3
(c) 6 (d) 9

73. If A, B and $A + B$ are non-singular matrices, then

$$(A^{-1} + B^{-1})\,[A - A\,(A + B)^{-1}\,A]$$

equals

(a) O (b) I
(c) A (d) B

74. If $A + B$ is a non-singular matrix, then

$$A - B - A\,(A + B)^{-1}A + B\,(A + B)^{-1}B$$

equals

(a) O (b) I
(c) A (d) B

75. If A and B are two matrices such that

$A + B = AB$, then

(a) $A = I$ (b) $B = I$
(c) $AB = BA$ (d) $AB = I$

76. Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ such that $A^3 = O$, then $a + d$ equals

(a) ad (b) bc
(c) 1 (d) 0

77. Let $A = \begin{pmatrix} 0 & x & 0 \\ y & 0 & -x \\ 0 & y & 0 \end{pmatrix}$, then A^3 equals

(a) O (b) x^2I
(c) $(x^2 + y^2)\,I$ (d) none of these

Previous Years' AIEEE/JEE Main Questions

1. If $A = \begin{bmatrix} a & b \\ b & a \end{bmatrix}$ and $A^2 = \begin{bmatrix} \alpha & \beta \\ \beta & \alpha \end{bmatrix}$, then

(a) $\alpha = a^2 + b^2, \quad \beta = 2ab$

(b) $\alpha = a^2 + b^2, \quad \beta = a^2 - b^2$

(c) $\alpha = 2ab, \quad \beta = a^2 + b^2$

(d) $\alpha = a^2 + b^2, \beta = 2ab$ **[2003]**

2. Let $A = \begin{pmatrix} 0 & 0 & -1 \\ 0 & -1 & 0 \\ -1 & 0 & 0 \end{pmatrix}$. The only correct statement about matrix A is

(a) A^{-1} does not exist

(b) $A = (-1)I$, where I is a unit matrix

(c) A is a zero matrix

(d) $A^2 = I$ **[2004]**

3. Let $A = \begin{pmatrix} 1 & -1 & 1 \\ 2 & 1 & -3 \\ 1 & 1 & 1 \end{pmatrix}$ and $(10)B = \begin{pmatrix} 4 & 2 & 2 \\ -5 & 0 & \alpha \\ 1 & -2 & 3 \end{pmatrix}$.

If B is the inverse of matrix A, then α is

(a) 2 (b) –1

(c) –2 (d) 5 **[2004]**

4. If $A^2 - A + I = O$, then the inverse of A is

(a) $A - I$ (b) $I - A$

(c) $A + I$ (d) A **[2005]**

5. If $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, then which one of the following holds for all $n \geq 1$, by the principle of mathematical induction

(a) $A^n = nA + (n - 1)I$

(b) $A^n = (2n - 1)A + (n - 1)I$

(c) $A^n = nA - (n - 1)I$

(d) $A^n = (2n - 1)A - (n - 1)I$ **[2005]**

6. If A and B are square matrices of size $n \times n$ such that

$A^2 - B^2 = (A - B)(A + B)$, then which of the following will be always true?

(a) either A or B is an identity matrix

(b) $A = B$

(c) $AB = BA$

(d) either A or B is a zero matrix **[2006]**

7. Let $A = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$ and $B = \begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$ $a, b \in \mathbf{N}$. Then

(a) there exist infinitely many B's such that $AB = BA$

(b) there cannot exist B such that $AB = BA$

(c) there exist more than one but finite number of B's such that $AB = BA$

(d) there exists exactly one B such that $AB = BA$ **[2006]**

8. Let $A = \begin{bmatrix} 5 & 5\alpha & \alpha \\ 0 & \alpha & 5\alpha \\ 0 & 0 & 5 \end{bmatrix}$. If $|A^2| = 25$ then $|\alpha|$ equals

(a) 5^2 (b) 1

(c) 1/5 (d) 5 **[2007]**

9. Let A be a 2×2 matrix with real entries. Let I be the 2×2 identity matrix. Denote by tr(A), the sum of diagonal entries of A. Assume that $A^2 = I$.

Statement-1: If $A \neq I$ and $A \neq -I$, then det $(A) = -1$.

Statement-2: If $A \neq I$ and $A \neq -I$, then tr$(A) \neq O$. **[2008]**

10. Let A be a 2×2 matrix.

Statement-1: $adj\,(adj\,A) = A$

Statement-2: $|adj\,A| = |A|$ **[2009]**

11. Let A be a 2×2 matrix with non-zero entries and let $A^2 = I$, where I is 2×2 identity matrix. Define

$Tr(A)$ = Sum of diagonal elements of A,

$|A|$ = determinant of matrix A.

Statement-1: $Tr\,(A) = 0$

Statement-2: $|A| = 1$ **[2010]**

12. The number of 3×3 non-singular matrices with four entries as 1 and all other entries 0, is

(a) 6 (b) at least 7

(c) less than 4 (d) 5 **[2010]**

13. Consider the system of linear equations

$$x_1 + 2x_2 + x_3 = 3$$
$$2x_1 + 3x_2 + x_3 = 3$$
$$3x_1 + 5x_2 + 2x_3 = 1$$

The system has

(a) a unique solution
(b) no solution
(c) infinite number of solutions
(d) exactly 3 solutions **[2010]**

14. The number of values of k for which the linear equations

$$4x + ky + 2z = 0$$
$$kx + 4y + z = 0$$
$$2x + 2y + z = 0$$

possess a non zero solution is

(a) 0 (b) 3
(c) 2 (d) 1 **[2011]**

15. If $\omega \neq 1$ is cube root of unity and $H = \begin{bmatrix} \omega & 0 \\ 0 & \omega \end{bmatrix}$ then H^{70} equals to

(a) O (b) $-H$
(c) H^2 (d) H **[2011]**

16. If trivial solution is the only solution of the system of linear equations:

$$x - ky + z = 0$$
$$kx + 3y - kz = 0$$
$$3x + y - z = 0$$

then set of all values of k is

(a) $\mathbf{R} - \{2, -3\}$ (b) $\mathbf{R} - \{2\}$
(c) $\mathbf{R} - \{-3\}$ (d) $\{2, -3\}$ **[2011]**

17. Let A and B be two symmetric matrices of order 3.

Statement-1: $A(BA)$ and $(AB)A$ are symmetric matrices

Statement-2: AB is symmetric if matrix multiplication of A with B is commutative **[2011]**

18. Let P and Q be 3×3 matrices such that $P \neq Q$. If $P^3 = Q^3$ and $P^2Q = Q^2P$, then det $(P^2 + Q^2)$ is equal to

(a) 1 (b) 0
(c) -1 (d) -2 **[2012]**

19. Let $A = \begin{pmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 3 & 2 & 1 \end{pmatrix}$. If u_1 and u_2 are column matrices such that $Au_1 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$ and $Au_2 = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$, then $u_1 + u_2$ is equal to

(a) $\begin{pmatrix} -1 \\ 1 \\ -1 \end{pmatrix}$ (b) $\begin{pmatrix} -1 \\ -1 \\ 0 \end{pmatrix}$

(c) $\begin{pmatrix} 1 \\ -1 \\ -1 \end{pmatrix}$ (d) $\begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix}$ **[2012]**

20. If $P = \begin{bmatrix} 1 & \alpha & 3 \\ 1 & 3 & 3 \\ 2 & 4 & 4 \end{bmatrix}$ is the adjoint of a 3×3 matrix A and $|A| = 4$, then α is equal to

(a) 11 (b) 5
(c) 0 (d) 4 **[2013]**

21. The number of values of k for which the system of equations

$$(k + 1)x + 8y = 4k$$
$$kx + (k + 3)y = 3k - 1$$

has no solution, is

(a) 1 (b) 2
(c) 3 (d) infinite **[2013]**

22. If the system of linear equations

$$x_1 + 2x_2 + 3x_3 = 6$$
$$x_1 + 3x_2 + 5x_3 = 9$$
$$2x_1 + 5x_2 + ax_3 = b$$

is consistent and has infinite number of solutions, then

(a) $a = 8$, b can be any real number
(b) $b = 15$, a can be any real number
(c) $a \in \mathbf{R} - \{8\}$ and $b \in \mathbf{R} - \{15\}$
(d) $a = 8, b = 15$ **[2013, online]**

23. If p, q, r are 3 real numbers satisfying the matrix equation,

$$[p\ \ q\ \ r]\begin{bmatrix} 3 & 4 & 1 \\ 3 & 2 & 3 \\ 2 & 0 & 2 \end{bmatrix} = [3\ \ 0\ \ 1]$$

then $2p + q - r$ equal

(a) -3 (b) -1
(c) 4 (d) 2 **[2013, online]**

24. Consider the system of equations:
$x + ay = 0$, $y + az = 0$, and $z + ax = 0$.
Then the set of all values of a for which the system has a unique solution is

(a) $\mathbf{R} - \{1\}$ (b) $\mathbf{R} - \{-1\}$
(c) $\{1, -1\}$ (d) $\{1, 0, -1\}$
[2013, online]

25. Let $S = \left\{ \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \middle| a_{ij} \in \{0, 1, 2\},\ a_{11} = a_{22} \right\}$

Then the number of non-singular matrices in the set S is

(a) 27 (b) 24
(c) 10 (d) 20 **[2013, online]**

26. The matrix $A^2 + 4A - 5I$, where I is the identity matrix and $A = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}$, equals:

(a) $4\begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (b) $4\begin{bmatrix} 0 & -1 \\ 2 & 2 \end{bmatrix}$

(c) $32\begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$ (d) $32\begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}$

[2013, online]

27. Let A, other than I or $-I$, be a 2×2 real matrix such that $A^2 = I$, I being the unit matrix. Let Tr(A) be the sum of diagonal elements of A.

Statement-1: Tr$(A) = 0$

Statement-2: det$(A) = -1$ **[2013, online]**

28. If A is an 3×3 non-singular matrix such that $AA' = A'A$ and $B = A^{-1}A'$, then BB' equals:

(a) I (b) B^{-1}

(c) $(B^{-1})'$ (d) $I + B$ **[2014]**

29. If B is a 3×3 matrix such that $B^2 = O$, then det $[(I + B)^{50} - 50B]$ is equal to:

(a) 1 (b) 2

(c) 3 (d) 50 **[2014, online]**

30. Let A be a 3×3 matrix such that

$$A\begin{bmatrix} 1 & 2 & 3 \\ 0 & 2 & 3 \\ 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$$

then A^{-1} is :

(a) $\begin{bmatrix} 3 & 1 & 2 \\ 3 & 0 & 2 \\ 1 & 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 3 & 2 & 1 \\ 3 & 2 & 0 \\ 1 & 1 & 0 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 1 & 3 \\ 0 & 2 & 3 \\ 1 & 1 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 1 \\ 0 & 2 & 3 \end{bmatrix}$

[2014, online]

31. If $A = \begin{bmatrix} 1 & 2 & x \\ 3 & -1 & 2 \end{bmatrix}$ and $B = \begin{bmatrix} y \\ x \\ 1 \end{bmatrix}$ be such that $AB = \begin{bmatrix} 6 \\ 8 \end{bmatrix}$, then:

(a) $y = 2x$ (b) $y = -2x$

(c) $y = x$ (d) $y = -x$ **[2014, online]**

32. Let A and B be any two 3×3 matrices. If A is symmetric and B is skew-symmetric, then the matrix $AB - BA$ is:

(a) skew-symmetric

(b) symmetric

(c) neither symmetric nor skew-symmetric

(d) I or $-I$, where I is an identity matrix.

[2014, online]

33. If $A = \begin{bmatrix} 1 & 2 & 2 \\ 2 & 1 & -2 \\ a & 2 & b \end{bmatrix}$ is a matrix satisfying the equation $AA^T = 9I$, where I is 3×3 identity matrix, then the ordered pair (a, b) is equal to:

(a) $(2, -1)$ (b) $(-2, 1)$

(c) $(2, 1)$ (d) $(-2, -1)$ **[2015]**

34. If A is 3×3 matrix such that $|5\,\text{adj}\, A| = 5$, then $|A|$ is equal to:

(a) $\pm\frac{1}{5}$ (b) ± 5

(c) ± 1 (d) $\pm\frac{1}{25}$ **[2015, online]**

35. If $A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$, then which one of the following statement is **not** correct?

(a) $A^4 - I = A^2 + I$ (b) $A^3 - I = A(A - I)$

(c) $A^2 + I = A(A^2 - I)$ (d) $A^3 + I = A(A^3 - I)$

[2015, online]

36. If $A = \begin{bmatrix} 5a & -b \\ 3 & 2 \end{bmatrix}$ and $A\,\text{adj}\, A = AA'$, then $5a + b$ is equal to

(a) -1 (b) 5

(c) 4 (d) 13 **[2016]**

37. If $P = \begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{2} \\ -\frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}$, $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $Q = PAP'$, then $P'Q^{2015}P$ is:

(a) $\begin{bmatrix} 0 & 2015 \\ 0 & 0 \end{bmatrix}$ (b) $\begin{bmatrix} 2015 & 0 \\ 1 & 2015 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 2015 \\ 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} 2015 & 1 \\ 0 & 2015 \end{bmatrix}$

[2016, online]

38. If $A = \begin{bmatrix} -4 & -1 \\ 3 & 1 \end{bmatrix}$, then the determinant of the matrix $(A^{2016} - 2A^{2015} - A^{2014})$ is:

(a) -175 (b) 2014

(c) 2016 (d) -25 **[2016, online]**

39. Let A be a 3×3 matrix such that $A^2 - 5A + 7I = 0$.

Statement-1: $A^{-1} = \frac{1}{7}(5I - A)$

Statement-2: The polynomial $A^3 - 2A^2 - 3A + I$ can be reduced to $5(A + 4I)$. Then

(a) Both the statements are true.

(b) Both the statements are false.

(c) Statement-1 is true, but Statement-2 is false.

(d) Statement-1 is false, but Statement-2 is true.

[2016, online]

Previous Years' B-Architecture Entrance Examination Questions

1. If A and B are square matrices of the same order then which one of the following is always true?
   (a) $(A+B)^{-1} = A^{-1} + B^{-1}$
   (b) adj (AB) = (adj B) (adj A)
   (c) A and B are non-zero and $|AB| = 0 \Leftrightarrow |A| = 0$ and $|B| = 0$
   (d) $(AB)^{-1} = A^{-1}B^{-1}$ **[2006]**

2. Let $A = \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$, and let I denote the 3×3 identity matrix. Then $2A^2 - A^3 =$
   (a) $A + I$ (b) $A - I$
   (c) $I - A$ (d) A **[2008]**

3. Let A and B be 2×2 matrices with real entries. Let I be the 2×2 identity matrix. Denote by tr(A) the sum of diagonal entries of A.
   Statement-1: $AB - BA \neq I$
   Statement-2: $\text{tr}(A + B) = \text{tr}(A) + \text{tr}(B)$ and $\text{tr}(AB) = \text{tr}(BA)$ **[2009]**

4. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ be a 2×2 real matrix. If $A - \alpha I$ is invertible for every real number α, then
   (a) $bc > 0$ (b) $bc = 0$
   (c) $bc < \min\left(0, \frac{1}{2}ad\right)$ (d) $a = 0$ **[2010]**

5. Let A and B be two 2×2 matrices.
   Statement-1: $A\,(\text{adj}A) = |A|\,I_2$
   Statement-2: $\text{adj}(AB) = (\text{adj}A)(\text{adj}B)$
   [2011]

6. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, be a 2×2 matrix, where a, b, c, d take values 0 or 1 only. The number of such matrices which have inverses is:
   (a) 8 (c) 7
   (c) 6 (d) 5 **[2012]**

7. Let S be the set of all real matrices $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ such that $a + d = 2$ and $A' = A^2 - 2A$. Then S:
   (a) is an empty set
   (b) has exactly one element
   (c) has exactly two elements
   (d) has exactly four elements **[2013]**

8. Let $S_k = \begin{bmatrix} 1 & k \\ 0 & 1 \end{bmatrix}$ $k \in \mathbf{N}$, where $\mathbf{N}$ is the set of natural numbers, then $(S_2)^n\,(S_k)^{-1}$, for $n \in \mathbf{N}$ is:
   (a) S_{2n+k-1} (b) S_{2^n+k-1}
   (c) S_{2^n-k} (d) S_{2n-k} **[2014]**

9. Let $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix}$. If $10A^{10} + \text{Adj}(A^{10}) = B$, then $b_1 + b_2 + b_3 + b_4$ is equal to:
   (a) 91 (b) 92
   (c) 111 (d) 112 **[2015]**

10. If for a matrix A, $|A| = 6$ and adj $A = \begin{bmatrix} 1 & -2 & 4 \\ 4 & 1 & 1 \\ -1 & k & 0 \end{bmatrix}$, then k is equal to
    (a) 0 (b) 1
    (c) 2 (d) -1 **[2016]**

Hints and Solutions

Concept-based

1. If $f(x) = 1 + x$, then det $f(A) = 1 + \det(A)$ may not hold. Take $A = -I$.

2. $|\det(A)| = |ad - bc| \le |a||d| + |b||c|$

$$\le (|a| + |b|)(|c| + |d|)$$

Also, $|\det(A)| \le (|a| + |c|)(|b| + |d|)$

For truth of (c), see Example 6

$\left[\text{(a) does not hold in general. Take } A = \begin{bmatrix} 5 & -1 \\ 10 & 2 \end{bmatrix}\right]$

3. (a), (b), (c) cannot hold in general unless $AB = BA$.

4. $\det(ABA) = 1$

$\Rightarrow \det(A)\det(B)\det(A) = 1$

$\Rightarrow \det(A) \ne 0, \quad \det(B) \ne 0$

$\Rightarrow$ Both A^{-1} and B^{-1} exist

Also $ABA = I \Rightarrow BA = A^{-1} \Rightarrow B = A^{-1}A^{-1} = A^{-2}$

$\Rightarrow B^2 = (A^{-2})^2 = A^{-4} \Rightarrow A^4B^2 = I$

5. Let X_1, X_2 X_3 be solutions of $AX = B$, when $B = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$ respectively. Let C be the 3×3 matrix $[X_1\ X_2\ X_3]$, then $AC = I \Rightarrow A$ is invertible.

$\Rightarrow$ A' is invertible.

Thus $A'Y = O \Rightarrow Y = O$.

6. $\det(A) = \cos^2\theta + \sin^2\theta = 1 \ne 0$

$\therefore$ A^{-1} exist.

Now, $AB = A(C - D)$

$\Rightarrow$ $A^{-1}(AB) = A^{-1}(A(C - D))$

$B = C - D \Rightarrow C = B + D$

$\Rightarrow$ $C' = (B + D)' = B' + D'$

7. $(A - B)A^{-1}(A + B)$

$$\begin{aligned}
&= (I - BA^{-1})(A + B) \\
&= A + B - BA^{-1}A - BA^{-1}B \\
&= A - BA^{-1}B \\
&= A + B - BA^{-1}A - BA^{-1}B \\
&= (A + B) - BA^{-1}(A + B) \\
&= (A + B)(I - BA^{-1}) \\
&= (A + B)A^{-1}(A - B)
\end{aligned}$$

8. $AA' = I$ and $A^2 = I$

$\therefore$ $AA' = A^2 \Rightarrow A^{-1}(AA') = A^{-1}A^2$

$\Rightarrow$ $A' = A$

9. As A, B are orthogonal matrices, $AA' = BB' = I$, $\det(A) \ne 0$, $\det(B) \ne 0$. Let $C = A + B$.

$$C' = A' + B' \Rightarrow AC' = AA' + AB' = I + AB'$$

$\Rightarrow AC'B = B + AB'B = B + A$

Now,

$$\begin{aligned}
\det(A + B) &= \det(AC'B) = \det(A)\det(C')\det(B) \\
&= \det(A)\det(C)(-\det(A))
\end{aligned}$$

$\Rightarrow$ $\det(C) = -(\det(A))^2\det(C) = -\det(C)$

$\Rightarrow$ $\det(C) = 0$

10. $A^2 = \begin{pmatrix} a & b \\ c & d \end{pmatrix}\begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} a^2 + bc & b(a + d) \\ c(a + d) & bc + d^2 \end{pmatrix}$

$\therefore$ $(a + d)A - A^2 = A'$

$\Rightarrow$ $\begin{pmatrix} ad - bc & 0 \\ 0 & ad - bc \end{pmatrix} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \Rightarrow ad = a, d$

As $ad \ne 0$, we get $a = d = 1$.

Level 1

11. $S_2 = \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix} = I + B$ where

$$I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \text{and}\, B = \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix}$$

Note that $B^2 = O$, therefore, $B^r = O \quad \forall\ r \geq 2$.

Thus, $\quad (S_2)^n = (I + B)^n = I + nB$

$$= \begin{pmatrix} 1 & 2n \\ 0 & 1 \end{pmatrix}$$

Also, $\quad S_k^{-1} = \begin{pmatrix} 1 & -k \\ 0 & 1 \end{pmatrix}$

$$\therefore\ (S_2)^n (S_k)^{-1} = \begin{pmatrix} 1 & 2n \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & -k \\ 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} 1 & 2n-k \\ 0 & 1 \end{pmatrix} = S_{2n-k}$$

12. $A^2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix}\begin{bmatrix} a & b \\ c & d \end{bmatrix}$

$$= \begin{bmatrix} a^2 + bc & b(a+d) \\ c(a+d) & bc + d^2 \end{bmatrix}$$

$$= \begin{bmatrix} a^2 + bc & 3b \\ 3c & bc + d^2 \end{bmatrix}$$

$$\therefore \quad A^2 - 3A = \begin{bmatrix} a^2 - 3a + bc & 0 \\ 0 & d^2 - 3d + bc \end{bmatrix}$$

Since $\quad A' = A^2 - 3A$, we get

$$\begin{bmatrix} a & c \\ b & d \end{bmatrix} = \begin{bmatrix} a^2 - 3a + bc & 0 \\ 0 & d^2 - 3d + bc \end{bmatrix}$$

$\Rightarrow \qquad b = 0, c = 0, \quad a = a^2 - 3a, d = d^2 - 3d$

$\Rightarrow\ a\,(a - 4) = 0 \quad$ and $d(d - 4) = 0$

$\Rightarrow \qquad a = 0$ or $a = 4$ and $d = 0$ or $d = 4$

But then $a + d$ cannot be 3.

$\therefore \qquad S = \phi$

13. Let

$$A = \begin{pmatrix} a & p \\ b & q \\ c & r \end{pmatrix}, \text{ then}$$

$$B = AA' = \begin{pmatrix} a^2 + p^2 & ab + pq & ac + pr \\ ab + pq & b^2 + q^2 & bc + qr \\ ac + pr & bc + qr & c^2 + r^2 \end{pmatrix}$$

$$\det(B) = \begin{vmatrix} a & p & 0 \\ b & q & 0 \\ c & r & 0 \end{vmatrix}\begin{vmatrix} a & b & c \\ p & q & r \\ 0 & 0 & 0 \end{vmatrix} = 0$$

$\therefore \quad B^{-1}$ does not exist.

14. In $A + B$ two rows are identical.

15. $B = (\cos\,\theta)I + (\sin\,\theta)J$.

16. A is a diagonal matrix, $a_{ij} = 0\ \forall\ i \neq j$

As A is a skew-symmetric matrix,

$$a_{ii} = 0\ \forall\ i$$

$$\therefore \qquad A = O$$

17. $A^2 - 3A + 2I \Rightarrow 2I = A(3I - A)$

$$\Rightarrow \qquad I = A\, \left\{\frac{1}{2}(3I - A)\right\}$$

$$\Rightarrow \quad A^{-1} = \frac{1}{2}\ (3I - A)$$

18. $|\ A^2\ | = |\ 2A\ | = 2^3\ |\ A\ | \quad \Rightarrow \quad |\ A\ |^2 = 8\ |\ A\ |$

19. $(A - A')' = A' - (A')' = A' - A = -\,(A - A')$

$\therefore\ A - A'$ is skew-symmetric matrix.

20. $A = \begin{pmatrix} \cos 2 & \cos 3 & \cos 4 \\ \cos 3 & \cos 4 & \cos 5 \\ \cos 4 & \cos 5 & \cos 6 \end{pmatrix} = A'$

21. $A^3 - 3A + I = 0 \quad \Rightarrow \quad I = A(3I - A^2)$

$\Rightarrow \quad A$ is invertible and hence non-singular.

22. $(A + B)^2 = (A + B)\ (A + B) = A^2 + BA + AB + B^2$

$\therefore\ (A + B)^2 = A^2 + 2AB + B^2$ if and only if $AB = BA$

23. $2X = \begin{bmatrix} i & 2 \\ 3 & 4+i \end{bmatrix} - \begin{bmatrix} i & 0 \\ 3 & -i \end{bmatrix} = \begin{bmatrix} 0 & 2 \\ 0 & 4+2i \end{bmatrix}$

$$\Rightarrow \quad X = \begin{bmatrix} 0 & 1 \\ 0 & 2+i \end{bmatrix}$$

24. $AB = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} 0 & i \\ i & 0 \end{bmatrix}$

and $BA = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}\begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} = \begin{bmatrix} 0 & -i \\ -i & 0 \end{bmatrix}$

Thus, $AB + BA = O$

25. $A^2 = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ -1 & -2 & -3 \end{bmatrix}\begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ -1 & -2 & 3 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$

$\therefore\ A$ is a nilpotent matrix of index 2

26. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, $A^* = \begin{bmatrix} \bar{a} & \bar{c} \\ \bar{b} & \bar{d} \end{bmatrix}$

$AA^* = I \quad \Rightarrow \quad |\ A\ |\ |\ A^*| = 1$

$\Rightarrow (ad - bc)\ (\bar{a}\,\bar{d} - \bar{b}\,\bar{c}) = 1$

$\Rightarrow |\ ad - bc\ |^2 = 1$

$\Rightarrow ad - bc = e^{i\theta}$ for some $\theta \in \mathbf{R}$.

27. $A = \begin{pmatrix} -1/2 & -\sqrt{3}/2 \\ \sqrt{3}/2 & -1/2 \end{pmatrix} = \begin{pmatrix} \cos(4\pi/3) & \sin(4\pi/3) \\ -\sin(4\pi/3) & \cos(4\pi/3) \end{pmatrix}$

Note that $A^3 = I \Rightarrow A^2 - A^{-1} = O$

28. $C^2 + C = I \Rightarrow C(C + I) = I$

$\Rightarrow \quad C^{-1} = C + I$

Thus, $\quad C^{-2} = (C + I)^2 = C^2 + 2C + I$

$= I - C + 2C + I = 2I + C$

29. $CA^3C^{-1} = (CAC^{-1})\ (CAC^{-1})\ (CAC^{-1}) = B^3$

30. $A^2 = (I - X(X'X)^{-1} X')^2$

$= I - 2X\ (X'X)^{-1} X' + X(X'X)^{-1} X'\ X(X'X)^{-1} X'$

$= I - 2X(X'X)^{-1} X' + X(X'X)^{-1} X'$

$= I - X(X'X)^{-1} X' = A$

31. $AA' = I$

$$\Rightarrow \begin{pmatrix} p & -q \\ q & p \end{pmatrix} \begin{pmatrix} p & q \\ -q & p \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

$$\Rightarrow \begin{pmatrix} p^2+q^2 & 0 \\ 0 & p^2+q^2 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

$\therefore\ p^2 + q^2 = 1$

32. $AA' = I$

$$\Rightarrow \begin{pmatrix} \lambda & 0 & \lambda \\ \lambda & 0 & -\lambda \\ 0 & 1 & 0 \end{pmatrix} \begin{pmatrix} \lambda & \lambda & 0 \\ 0 & 0 & 1 \\ \lambda & -\lambda & 0 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$\Rightarrow \begin{pmatrix} 2\lambda^2 & 0 & 0 \\ 0 & 2\lambda^2 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$\therefore\ 2\lambda^2 = 1 \quad \Rightarrow \quad \lambda = \pm\, 1/\sqrt{2}$

33. $A' = A$

$$\Rightarrow \begin{pmatrix} a & a+1 & -3 \\ a^2-1 & 2 & 4a \\ -3 & a^2+4 & -1 \end{pmatrix} = \begin{pmatrix} a & a^2-1 & -3 \\ a+1 & 2 & a^2+4 \\ -3 & 4a & -1 \end{pmatrix}$$

$\Rightarrow a + 1 = a^2 - 1 \quad \text{and} \quad 4a = a^2 + 4$

$\Rightarrow a + 1 = 4a - 4 - 1 \quad \Rightarrow \quad 6 - 3a \quad \Rightarrow \quad a = 2.$

34. Since A_t^{-1} does not exist, $|\ A_t\ | = 0$

$\Rightarrow (-30 - t(7 - t)) - 3(-12 - 4t) + 2(14 - 2t - 20) = 0$

$\Rightarrow t^2 + t - 6 = 0 \quad \Rightarrow \quad t = -3,\ 2$

35. $A^{-1} = \begin{bmatrix} a-ib & -c-id \\ c-id & a+ib \end{bmatrix}$

36. $|\ A\ | = \dfrac{1}{4}\ [(e^{ix} + e^{-ix})^2 - (e^{ix} - e^{-ix})^2]$

$= \dfrac{1}{4}\ (4e^{ix}\ e^{-ix}) = 1 \neq 0$

Thus, A^{-1} exists for all $x \in \mathbf{R}$.

37. $A^2 = \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix} \begin{bmatrix} ab & b^2 \\ -a^2 & -ab \end{bmatrix}$

$$= \begin{bmatrix} a^2b^2 - a^2b^2 & ab^3 - ab^3 \\ -a^3b + a^3b & -a^2b^2 + a^2b^2 \end{bmatrix} = O$$

38. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then $A^2 = \begin{bmatrix} a^2+bc & ab+bd \\ ac+cd & bc+d^2 \end{bmatrix}$

Now, $A^2 = O$

$\Rightarrow a^2 + bc = 0, \quad (a + d)\ b = 0$

$(a + d)\ c = 0, \quad bc + d^2 = 0$

Suppose $a + d \neq 0$, then $b = 0$, $c = 0$.

$\therefore\ a^2 = 0,\ d^2 = 0 \quad \Rightarrow \quad a = 0,\ d = 0$

Contradiction.

Thus, $a + d = 0$ we get $\text{tr}(A) = 0$

39. Suppose A^{-1} exists, then

$A^{-1}\ A^2 - (a + d)A^{-1}\ A = O$

$\Rightarrow A - (a + d)I = O$

$$\Rightarrow \begin{bmatrix} -d & b \\ c & -a \end{bmatrix} = O$$

$\Rightarrow a = b = c = d = 0 \quad \Rightarrow |A| = 0$

A contradiction. Thus, A^{-1} does not exist.

40. We have $A^{-1} = \dfrac{1}{3}\begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}$

$$\Rightarrow A^{-3} = \frac{1}{27}\begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}\begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}\begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix}$$

$$= \frac{1}{27}\begin{bmatrix} 1 & -8 \\ 0 & 9 \end{bmatrix}\begin{bmatrix} 1 & -2 \\ 0 & 3 \end{bmatrix} = \frac{1}{27}\begin{bmatrix} 1 & -26 \\ 0 & 27 \end{bmatrix}$$

41. $A^* = -A = \Rightarrow (\bar{A})' = -A \Rightarrow \overline{a_{ii}} = -a_{ii}\ \forall\ i$

$\Rightarrow 2\text{Re}(a_{ii}) = 0 \Rightarrow a_{ii}$ is purely imaginary.

42. $A^2 = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix}\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & 3 & 0 \\ -3 & 2 & -2 \\ 6 & 4 & 5 \end{bmatrix}$

$$A^3 = \begin{bmatrix} 4 & 3 & 0 \\ -3 & 2 & -2 \\ 6 & 4 & 5 \end{bmatrix}\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & 11 & 1 \\ -9 & -2 & -7 \\ 21 & 11 & 7 \end{bmatrix}$$

Now, $A^3 - 3A^2 - A + 9I$

$$= \begin{bmatrix} 4 & 11 & 1 \\ -9 & -2 & -7 \\ 21 & 11 & 7 \end{bmatrix} - 3\begin{bmatrix} 4 & 3 & 0 \\ -3 & 2 & -2 \\ 6 & 4 & 5 \end{bmatrix}$$

$$- \begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \\ 3 & -1 & 1 \end{bmatrix} + \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix} = O$$

43. $(3A)' = \begin{bmatrix}1 & 2 & x\\ 2 & 1 & 2\\ 2 & -2 & y\end{bmatrix}$

Now, $9I = (3A)\,(3A)'$

$$= \begin{bmatrix}1 & 2 & 2\\ 2 & 1 & -2\\ x & 2 & y\end{bmatrix}\begin{bmatrix}1 & 2 & x\\ 2 & 1 & 2\\ 2 & -2 & y\end{bmatrix}$$

$$= \begin{bmatrix}9 & 0 & x+4+2y\\ 0 & 9 & 2x+2-2y\\ x+4+2y & 2x+2-2y & x^2+4+y^2\end{bmatrix}$$

$\Rightarrow\ x + 2y + 4 = 0$

$2x - 2y + 2 = 0$

$x^2 + y^2 + 4 = 9$

$\Rightarrow\ x = -2,\quad y = -1$

44. Solving $x + 2y = 3$, $3x + 4y = 7$, we get
$x = 1,\quad y = 1$
$\therefore\quad a + 1 = 3 \Rightarrow a = 2.$

45. If $p \neq -2,\ \dfrac{-1}{2}$ then $z = \dfrac{3}{p+2}$

and $y = \dfrac{1}{p+2}$ corresponding to this value we can get x.

If $p = -1/2$, we get $z = 2$.

Corresponding to which we get infinite number of value of x and y.

For $p = -2$, the system of equations is inconsistent.

46. The system of equations will have a unique solution if

$$\begin{vmatrix}1 & 1 & 1\\ 2 & 1 & -1\\ 3 & 2 & k\end{vmatrix} \neq 0 \Rightarrow \begin{vmatrix}1 & 0 & 0\\ 2 & -1 & -3\\ 3 & -1 & k-3\end{vmatrix} \neq 0$$

[using $C_1 \to C_1 - C_1$, $C_3 \to C_3 - C_1$]

$\Rightarrow (k - 3)(-1) -3 \neq 0 \Rightarrow k \neq 0.$

47. $|\,A\,| \neq 0 \Rightarrow 4(x + 1) - (2x - 3)(x + 2) \neq 0.$

$\Rightarrow 2x^2 - 3x - 10 \neq 0$

$\Rightarrow x \neq \dfrac{3 \pm \sqrt{89}}{4}$

48. See Theory.

49. Subtracting first equation from the second and third, we get

$y + 3z = \alpha - 1$

$3y + 9z = \alpha^2 - 1$

$\therefore\quad \alpha^2 - 1 = 3(\alpha - 1) \quad\Rightarrow\quad \alpha = 1 \quad\text{or}\quad \alpha = 2$

50. The system of equations will have a non-trivial solution if $\Delta = 0$ where

$$\Delta = \begin{vmatrix}t & t+1 & t-1\\ t+1 & t & t+2\\ t-1 & t+2 & t\end{vmatrix}$$

Applying $R_3 \to R_3 - R_2$, $R_2 \to R_2 - R_1$, we get

$$\Delta = \begin{vmatrix}t & t+1 & t-1\\ 1 & -1 & 3\\ -2 & 2 & -2\end{vmatrix} = \begin{vmatrix}2t+1 & t+1 & t-1\\ 0 & -1 & 3\\ 0 & 2 & -2\end{vmatrix}$$

[using $C_1 \to C_1 + C_2$]

$= (2t + 1)(2 - 6) = -4(2t - 1)$

Note that $\Delta = 0$ for $t = -1/2$ i.e., for just for one value of t.

51. Choice (d) is not true as $|\,A + A\,| = |\,2A\,| = 8|\,A\,|$

52. $A = iB$

$\Rightarrow A^2 = i^2B^2 = (-1)\begin{pmatrix}1 & -1\\ -1 & 1\end{pmatrix}\begin{pmatrix}1 & -1\\ -1 & 1\end{pmatrix} = -2B$

$\Rightarrow A^4 = (-2B)^2 = 4B^2 = 4(2B) = 8B$

$\Rightarrow A^8 = (8B)^2 = 64B^2 = 64(2B) = 128B$

53. We have

$$A' = \begin{pmatrix}2 & 3+i & i\\ 3-i & \pi & 7-i\\ -i & 7+i & e\end{pmatrix}$$

$$\Rightarrow A^* = (\overline{A'}) = \begin{pmatrix}2 & 3-i & -i\\ 3+i & \pi & 7-i\\ i & 7+i & e\end{pmatrix} = A$$

Thus A is a Hermitian matrix.

54. Statement-2 is true since $|A| \neq 0$, implies A^{-1} exists.

$$\begin{aligned}
\therefore\quad && AX &= B\\
\Rightarrow\quad && A^{-1}(AX) &= A^{-1}B\\
\Rightarrow\quad && (A^{-1}A)X &= A^{-1}B\\
\Rightarrow\quad && IX &= A^{-1}B\\
\Rightarrow\quad && X &= A^{-1}B
\end{aligned}$$

That statement-1 is false can be seen by the following example.

Let $A = \begin{bmatrix}0 & 0 & 1\\ 0 & 0 & 0\\ 0 & 0 & 0\end{bmatrix}$ and $B = \begin{bmatrix}0 & 1 & 0\\ 0 & 0 & 0\\ 0 & 0 & 0\end{bmatrix}$ then

$AB = O$ but neither $A = O$ nor $B = O$

55. Since B commutes with I, we can use binomial theorem to obtain

$$(I + B)^n = I + \binom{n}{1}B + \binom{n}{2}B^2 + \ldots + \binom{n}{n}B^n$$

Since $B^2 = O$, we get $B^r = O\ \forall\ r \geq 2$.

Thus,

$(I + B)^n = I + nB$

Now,

$$A = I + B \text{ where } B = \begin{bmatrix} 0 & \pi \\ 0 & 0 \end{bmatrix}$$

Since $B^2 = O$, we get

$$A^{100} = I + 100B = \begin{bmatrix} 1 & 100\pi \\ 0 & 1 \end{bmatrix}$$

56. Since $a_0 A^n + a_1 A^{n-1} + \cdots + a_{n-1} A + a_n I = O$, and $a_n \neq 0$, we get $AB = I$ where

$$B = -\frac{a_0}{a_n} A^{n-1} - \frac{a_1}{a_n} A^{n-2} - \cdots - \frac{a_{n-1}}{a_n} I$$

$\Rightarrow \quad B = A^{-1}$.

57. If $|A| \neq 0$, A is invertible and we can write $AX = B$ as $X = A^{-1} B$.

$\therefore$ $AX = B$ has a unique solution and hence is consistent.

Subtracting (2) from (3) and (1) and (2), we get the system of equations as

$$3x + 4y + 5z = a \qquad (4)$$
$$x + y + z = b - a \qquad (5)$$
$$x + y + z = c - b \qquad (6)$$

As a, b, c are in A.P. $b - a = c - b$

$\therefore$ the last two equations are identical.

From (4) and (5) we obtain

$$x = 4b - 5a + k$$
$$y = 4a - 3b - 2k$$
$$z = k$$

where k is an arbitrary complex number. Thus, the system of equations in statement-1 is consistent.

58. Suppose A is symmetric, then $A' = A$

Since $X'AY$ is a 1×1, matrix,

$$X'AY = (X'AY)' = Y'A'(X')' = Y'AX$$

Next, suppose $X'AY = Y'AX$ for each pair of X and Y.

Let $E_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$, $E_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$.

Taking $X = E_1$ and $Y = E_2$, then

$$E_1'AE_2 = E_2'AE_1 \quad \Rightarrow \quad a_{12} = a_{21}$$

Thus, A is symmetric.

59. For truth of statement-2, see theory

As det (Adj A) = (det $A)^{n-1} = O$ if det $A = O$

Thus, statement-1 is true and statement-2 is correct reason for it.

60. We have

$$(I + B + B^2 + \ldots + B^k)(I - B)$$
$$= (I - B) + (B - B^2) + (B^2 - B^3) + \ldots + (B^k - B^{k+1})$$
$$= I - B^{k+1}$$

$\Rightarrow \quad I + B + B^2 + \ldots + B^k = (I - B^{k+1})(I - B)^{-1}$

$\therefore$ Statement-2 is true

Also, $BX = X \quad \Rightarrow \quad (I - B)X = O$

$\Rightarrow \quad X = (I - B)^{-1} O = O$

Thus, both the statements are true but statement-2 is not a correct reason for it.

Level 2

61. $$\begin{pmatrix} a & -b \\ b & a \end{pmatrix} = \begin{pmatrix} 1 & -\tan\theta \\ \tan\theta & 1 \end{pmatrix} \begin{pmatrix} \cos^2\theta & -\sin\theta\cos\theta \\ \sin\theta\cos\theta & \cos^2\theta \end{pmatrix}$$

$$= \begin{pmatrix} \cos 2\theta & -\sin 2\theta \\ \sin 2\theta & \cos 2\theta \end{pmatrix}$$

$\Rightarrow a = \cos 2\theta$, $b = \sin 2\theta$

62. $$\begin{vmatrix} 1 + 1/a & 1 & 1 \\ 1 & 1 + 1/b & 1 \\ 1 & 1 & 1 + 1/c \end{vmatrix}$$

$$= \frac{1}{abc} \begin{vmatrix} a+1 & b & c \\ a & b+1 & c \\ a & b & c+1 \end{vmatrix}$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$|A| = \frac{1}{abc}(a+b+c+1) \begin{vmatrix} 1 & b & c \\ 1 & b+1 & c \\ 1 & b & c+1 \end{vmatrix}$$

Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$|A| = \frac{1}{abc}(a+b+c+1) \begin{vmatrix} 1 & b & c \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

$$= \frac{1}{abc}(a+b+c+1) \neq 0$$

63. $A^2 = 5A - 7I$

$$\Rightarrow A^4 = (A^2)^2 = (5A - 7I)(5A - 7I)$$
$$= 25A^2 - 70A + 49I$$
$$= 25(5A - 7I) - 70A + 49I$$
$$= 55A - 126I$$

$$\Rightarrow A^8 = (A^4)^2 = (55A - 126I)(55A - 126I)$$
$$= 3025A^2 - 13860A + 15876I$$
$$= 3025(5A - 7I) - 13860A + 158766I$$
$$= 1265A - 5299I$$

Thus, $a = 1265$.

64. $$|A| = \begin{vmatrix} 1 & \cos(\beta - \alpha) & \cos(\gamma - \alpha) \\ \cos(\alpha - \beta) & 1 & \cos(\gamma - \beta) \\ \cos(\alpha - \gamma) & \cos(\beta - \gamma) & 1 \end{vmatrix}$$

$$= \begin{vmatrix} \cos\alpha & \sin\alpha & 0 \\ \cos\beta & \sin\beta & 0 \\ \cos\gamma & \cos\gamma & 0 \end{vmatrix} \begin{vmatrix} \cos\alpha & \sin\alpha & 0 \\ \cos\beta & \sin\beta & 0 \\ \cos\gamma & \sin\gamma & 0 \end{vmatrix} = 0$$

$\Rightarrow A$ is singular.

65. $|A(\theta)| = \sin^2\theta - i^2 \cos^2\theta = 1.$

$$\therefore A(\theta)^{-1} = \begin{pmatrix} \sin\theta & -i\cos\theta \\ -i\cos\theta & \sin\theta \end{pmatrix}$$

$$= A(\pi - \theta)$$

66. $A^n B = A^{n-1}(AB) = A^{n-1}(BA)$

$$= A^{n-2}(AB)A$$

$$= A^{n-2}(BA)A = A^{n-2}BA^2$$

Continuing in this way, we get

$A^nB = BA^n$

Similarly, $AB^n = B^nA$, $(AB)^n = A^nB^n$

and $A^nB^n = B^nA^n$

However, $A^nB = B^nA$ does not hold.

67. $AX = \lambda X$

$\Rightarrow (A - \lambda I)X = 0$

As $X \neq 0$, $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 1-\lambda & 2 & 1 \\ 0 & 1-\lambda & -1 \\ 3 & 1 & 1-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda)\begin{vmatrix} 1-\lambda & -1 \\ 1 & 1-\lambda \end{vmatrix} + 3\begin{vmatrix} 2 & 1 \\ 1-\lambda & -1 \end{vmatrix} = 0$$

$= (1 - \lambda)[(1 - \lambda)^2 + 1] + 3[-2 - (1 - \lambda)] = 0$

$= (1 - \lambda)^3 - 2(1 - \lambda) - 6 = 0$

$\Rightarrow \lambda^3 - 3\lambda^2 + 5\lambda + 7 = 0$ (1)

If $\lambda_1, \lambda_2, \lambda_3$ are roots of (1), then

$$\lambda_1 + \lambda_2 + \lambda_3 = 3.$$

68. $$A^2 = \begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix}\begin{bmatrix} a & b & c \\ b & c & a \\ c & a & b \end{bmatrix} = \begin{bmatrix} \alpha & \beta & \beta \\ \beta & \alpha & \beta \\ \beta & \beta & \alpha \end{bmatrix}$$

where $\alpha = a^2 + b^2 + c^2$,

$\beta = bc + ca + ab.$

As $A^2 = I$, we get

$a^2 + b^2 + c^2 = \alpha = 1$

$bc + ca + ab = 0$

Now, $(a + b + c)^2 = \alpha + 2\beta = 1$

$\Rightarrow a + b + c = 1$

We have

$a^3 + b^3 + c^3 - 3abc$

$= (a + b + c)(a^2 + b^2 + c^2 - bc - ca - ab)$

$= 1$

$\Rightarrow a^3 + b^3 + c^3 = 7$

69. Let $A = \begin{bmatrix} a & b & c \\ b & d & e \\ c & e & f \end{bmatrix}$

Trace of $A^2 = (a^2 + b^2 + c^2) + (b^2 + d^2 + e^2)$

$+ (c^2 + e^2 + f^2)$

$\Rightarrow a^2 + 2b^2 + 2c^2 + d^2 + 2e^2 + f^2 = 0$

As a, b, c, d, e, f are real numbers, we get

$a = b = c = d = e = f = 0.$

$\therefore A = 0$

70. Let $k = 2015$. We are given

$(AB)^k = A^k B^k$ and $(AB)^{k+1} = A^{k+1}B^{k+1}$

We have

$A^{k+1}B^{k+1} = (AB)^{k+1} = (AB)^k(AB) = (A^kB^k)(AB)$

$\Rightarrow A^{k+1}B^{k+1} = A^k(B^kA)B$

As A, B are non-singular matrices, we get

$$AB^k = B^kA.$$

Similarly, using $(AB)^{k+1} = A^{k+1}B^{k+1}$

and $(AB)^{k+2} = A^{k+2}B^{k+2}$

we get $AB^{k+1} = B^{k+1}A$

Now, $AB^{k+1} = B^{k+1}A = B(B^kA)$

$= B(AB^k)$

$\Rightarrow \quad (AB)B^k = (BA)B^k$

As B is invertible, we get $AB = BA$.

71. $|\text{adj } A| = |A|^2 = 100 = |A|^2 \Rightarrow |A| = \pm 10$

72. $$M\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} = M\left(\begin{bmatrix} 1 \\ -1 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}\right)$$

$$= \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix} + \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix} = \begin{bmatrix} 0 \\ 3 \\ 2 \end{bmatrix}$$

and $$M\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} = M\left(\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} - \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} - \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}\right)$$

$$= \begin{bmatrix} 0 \\ 0 \\ 12 \end{bmatrix} - \begin{bmatrix} 0 \\ 3 \\ 2 \end{bmatrix} - \begin{bmatrix} -1 \\ 2 \\ 3 \end{bmatrix} = \begin{bmatrix} 1 \\ -5 \\ 7 \end{bmatrix}$$

$$M\begin{bmatrix}1\\0\\0\end{bmatrix}=\begin{bmatrix}0\\3\\0\end{bmatrix}\Rightarrow m_{11}=0$$

Similarly, $M\begin{bmatrix}0\\1\\0\end{bmatrix}=\begin{bmatrix}-1\\2\\3\end{bmatrix}\Rightarrow m_{22}=2$

and $m_{33} = 7$

Thus, $m_{11} + m_{22} + m_{33} = 9$

73. $(A^{-1} + B^{-1})\,[A - A\,(A + B)^{-1} A]$

$= B^{-1}\,(B + A)A^{-1}\,\mathrm{A}[I - (A + B)^{-1} A]$

$= B^{-1}(A + B)\,(A + B)^{-1}[A + B - A]$

$= B^{-1}\,I\,B = I$

74. $A - B - A\,(A + B)^{-1} A + B\,(A + B)^{-1} B$

$= A[I - (A + B)^{-1} A] - [I - B\,(A + B)^{-1}]\,B$

$= A(A + B)^{-1}[A + B - A]$

$- [A + B - B]\,(A + B)^{-1} B$

$= A\,(A + B)^{-1} B - A\,(A + B)^{-1} B$

$= O$

75. $A + B = AB$

$\Rightarrow I - (A + B) + AB = I$

$\Rightarrow (I - A)\,(I - B) = I$

$\Rightarrow (I - A)^{-1} = I - B$

$\Rightarrow (I - B)\,(I - A) = I$

$\Rightarrow I - (B + A) + BA = I$

$\Rightarrow A + B = BA$

Thus, $AB = BA$

76. Use

$O = A^3 = (a + d)^2 A$

77. $A^2 = \begin{pmatrix}xy & 0 & -x^2\\ 0 & 0 & 0\\ y^2 & 0 & -xy\end{pmatrix}$

$A^3 = O$

Previous Years' AIEEE/JEE Main Questions

1. $A^2=\begin{bmatrix}a & b\\ b & a\end{bmatrix}\begin{bmatrix}a & b\\ b & a\end{bmatrix}=\begin{bmatrix}a^2+b^2 & 2ab\\ 2ab & a^2+b^2\end{bmatrix}$

$\therefore\ \alpha = a^2 + b^2,\ \beta = 2ab$

2. We have $A^2=\begin{pmatrix}0 & 0 & -1\\ 0 & -1 & 0\\ -1 & 0 & 0\end{pmatrix}\begin{pmatrix}0 & 0 & -1\\ 0 & -1 & 0\\ -1 & 0 & 0\end{pmatrix}=I$

3. As B is inverse of A, $AB = I$

$$\therefore\quad \begin{pmatrix}1 & -1 & 1\\ 2 & 1 & -3\\ 1 & 1 & 1\end{pmatrix}\begin{pmatrix}4 & 2 & 2\\ -5 & 0 & \alpha\\ 1 & -2 & 3\end{pmatrix}=10I$$

$$\Rightarrow\quad \begin{pmatrix}10 & 0 & 5-\alpha\\ 0 & 10 & \alpha-5\\ 0 & 0 & 5+\alpha\end{pmatrix}=\begin{pmatrix}10 & 0 & 0\\ 0 & 10 & 0\\ 0 & 0 & 10\end{pmatrix}$$

$\Rightarrow\quad \alpha = 5$

4. $A^2 - A + I = O \Rightarrow I = A - A^2 = A(I - A)$

$\Rightarrow A^{-1} = I - A$

5. For $n = 1$, all (a), (b), (c) and (d) hold good. We have

$$A^2=\begin{bmatrix}1 & 0\\ 1 & 1\end{bmatrix}\begin{bmatrix}1 & 0\\ 1 & 1\end{bmatrix}=\begin{bmatrix}1 & 0\\ 2 & 1\end{bmatrix}$$

If (a) holds for some $n \geq 1$, then

$A^{n+1} = A^nA = [nA + (n - 1)I]\,A$

$= nA^2 + (n - 1)A$

$= n\begin{bmatrix}1 & 0\\ 2 & 1\end{bmatrix}-(n-1)\begin{bmatrix}1 & 0\\ 1 & 1\end{bmatrix}$

$= \begin{bmatrix}2n-1 & 0\\ 3n-1 & 2n-1\end{bmatrix}$

$\neq (n+1)\begin{bmatrix}1 & 0\\ 1 & 1\end{bmatrix}+n\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}=(n+1)A+nI$

Similarly (b) does not hold for $n + 1$.

For (c),

$A^{n+1} = A^nA = [nA - (n - 1)I]A$

$= nA^2 - (n - 1)A$

$= n\begin{bmatrix}1 & 0\\ 2 & 1\end{bmatrix}-(n-1)\begin{bmatrix}1 & 0\\ 1 & 1\end{bmatrix}$

$= \begin{bmatrix}1 & 0\\ n+1 & 1\end{bmatrix}=(n+1)A-nI$

Thus, (c) holds.

Alternatively

Put $B=\begin{bmatrix}0 & 0\\ 1 & 0\end{bmatrix}$ and note that $A = I + B$ and $B^2 = O$. As I and B commute.

$$A^n = (I + B)^n = I + nB \quad [\because\ B^2 = O]$$
$$= n(B + I) - (n - I)\,I = nA - (n - I)I$$

6. $$A^2 - B^2 = (A - B)(A + B)$$
$$= A^2 - BA + AB - B^2$$
$$\Rightarrow \quad BA = AB$$

7. Each matrix of the form $\begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix}$ commutes with A.

8. $$|A| = 25\alpha \Rightarrow |A^2| = |A|^2 = 25$$
$\Rightarrow (25\alpha)^2 = 25$
$$\Rightarrow \quad |\alpha| = \frac{1}{5}$$

9. Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$

Now, $A^2 = I \Rightarrow \det(A^2) = 1$

$\Rightarrow (\det A)^2 = 1 \Rightarrow \det A = \pm 1.$

Also, $A^2 = I \Rightarrow A = A^{-1}$

$$\Rightarrow \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \det A \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

If det A = 1, then

$a = d,\ b = -b,\ c = -c \Rightarrow a = d,\ b = c = 0.$

In this case $A = \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix}$

$|A| = 1 \Rightarrow a^2 = 1 \Rightarrow a = \pm 1.$

$\therefore A = I$ or $A = -I$. A contradiction.

Thus, det $(A) = -1$.

$$\therefore \begin{pmatrix} a & b \\ c & d \end{pmatrix} = -1\begin{pmatrix} d & -b \\ -c & a \end{pmatrix} = \begin{pmatrix} -d & b \\ c & -a \end{pmatrix}$$

$\therefore a = -d \Rightarrow \text{Tr}(A) = a + d = 0$

$\therefore$ Statement-1 is true and Statement-2 is false.

10. Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$

adj $A = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$

$|\text{adj } A| = ad - bc = |A|$

$\therefore$ Statement-2 is true.

adj (adj A) $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix} = A$

Statement-1 is also true but Statement-2 is not a correct reason for it.

11. Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Now, $A^2 = I \Rightarrow |A^2| = |I|$

$\Rightarrow \quad |A|^2 = 1 \Rightarrow |A| = \pm 1.$

Suppose $|A| = 1$.

In this case, $A^2 = I \Rightarrow A = A^{-1}$

$$\Rightarrow \begin{pmatrix} a & b \\ c & a \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

$\Rightarrow \quad a = d,\ b = 0,\ c = 0$

$\text{Tr}(A) = 0 \Rightarrow a + d = 0$

$\Rightarrow \quad 2a = 0 \Rightarrow a = 0$

In this case $A = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$

Thus, in this case, if we assume statement-2 is true then we get statement-2 is false.

In case $|A| = -1$, then

$$A = -A^{-1}$$

$$\Rightarrow \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \Rightarrow a + d = 0$$

$\therefore |A| = -1 \Rightarrow \text{Tr}(A) = 0.$

Therefore Statement-1 is true and Statement-2 is false.

12. The matrix

$$\begin{bmatrix} 1 & a & b \\ c & 1 & d \\ e & f & 1 \end{bmatrix}$$

where exactly one of a, b, c, d, e, f is 1 and rest of them are zeros, is invertible.

There are six such matrices.

Also, the matrix $\begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$ is invertible.

Thus, there are at least 7 such matrices which are invertible.

13. Adding the first two equations and subtracting the third from the sum, we obtain

$(x_1 + 2x_2 + x_3) + (2x_1 + 3x_2 + x_3) - (3x_1 + 5x_2 + 2x_3) = 3 + 3 - 1$

$\Rightarrow 0 = 5$

Thus, the system of equation has no solution.

14. The system of equations will have a non-zero solution if and only if

$$\begin{vmatrix} 4 & k & 2 \\ k & 4 & 1 \\ 2 & 2 & 1 \end{vmatrix} = 0$$

$$\Rightarrow 4\begin{vmatrix} 4 & 1 \\ 2 & 1 \end{vmatrix} - k\begin{vmatrix} k & 1 \\ 2 & 1 \end{vmatrix} + 2\begin{vmatrix} k & 4 \\ 2 & 2 \end{vmatrix} = 0$$

$\Rightarrow 4(2) - k(k - 2) + 2(2k - 8) = 0$

$\Rightarrow k^2 - 6k + 8 = 0 \Rightarrow k = 2, 4$

15. $H = \omega I \Rightarrow H^{70} = \omega^{70} I$

But $\omega^{70} = (\omega^3)^{23}\omega = \omega$

$\therefore H^{70} = \omega I = H$

16. The system of equations will have only trivial solution if and only if

$$\begin{vmatrix} 1 & -k & 1 \\ k & 3 & -k \\ 3 & 1 & -1 \end{vmatrix} \neq 0$$

$$\Leftrightarrow (1)\begin{vmatrix} 3 & -k \\ 1 & -1 \end{vmatrix} + k\begin{vmatrix} k & -k \\ 3 & -1 \end{vmatrix} + (1)\begin{vmatrix} k & 3 \\ 3 & 1 \end{vmatrix} \neq 0$$

$\Rightarrow 2(k^2 + k - 6) \neq 0 \Rightarrow k \neq -3, 2$

17. We have $A' = A$ and $B' = B$

Now, $(A(BA))' = (BA)'A' = (A'B')A'$

$= (AB)A = A(BA)$

[$\because$ matrix multiplication is associative]

$\Rightarrow A(BA)$ is symmetric.

Similarly, $(AB)\,A$ is a symmetric matrix

Also, $(AB)' = B'A' = BA$

Note that AB is symmetric if and only if $AB = BA$. Thus, both Statement-1 and Statement-2 are true but Statement-2 is not a correct explanation for the statement-1.

18. $P^3 = Q^3$ and $P^2Q = Q^2P$ gives

$$P^3 - P^2Q = Q^3 - Q^2P$$

$\Rightarrow P^2(P - Q) = -\,Q^2(P - Q)$

$\Rightarrow (P^2 + Q^2)\,(P - Q) = 0$

If det $(P^2 + Q^2) \neq 0$, then $P^2 + Q^2$ is invertible and hence $P = Q$. Therefore, det $(P^2 + Q^2) = 0$.

19. We have

$$A(u_1 + u_2) = Au_1 + Au_2 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$$

We solve the above equation for $u_1 + u_2$.

We consider the augmented matrix

$$(A/B) = \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 2 & 1 & 0 & 1 \\ 3 & 2 & 1 & 0 \end{array}\right)$$

Applying $R_3 \to R_3 - 2R_2 + R_1$ and $R_2 \to R_2 - 2R_1$, we get

$$(A/B) \sim \left(\begin{array}{ccc|c} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & -1 \end{array}\right) \Rightarrow u_1 + u_2 = \begin{pmatrix} 1 \\ -1 \\ -1 \end{pmatrix}$$

20. $|P| = |A|^2 = 16$

$\Rightarrow (1)\,(0) - \alpha\,(4 - 6) + (3)(4 - 6) = 16$

$\Rightarrow 2\alpha - 6 = 16 \Rightarrow \alpha = 11$

21. As the system of equations has no solution

$$\frac{k+1}{k} = \frac{8}{k+3} \neq \frac{4k}{3k-1}$$

But $\dfrac{k+1}{k} = \dfrac{8}{k+3} \Rightarrow k^2 + 4k + 3 = 8k$

$\Rightarrow (k - 1)\,(k - 3) = 0 \Rightarrow k = 1, 3$

For $k = 1$, $\dfrac{8}{k+3} = \dfrac{4k}{3k-1}$

and for $k = 3$, $\dfrac{8}{k+3} = \dfrac{8}{6} = \dfrac{4}{3}$ and $\dfrac{4k}{3k-1} = \dfrac{3}{2}$

Thus, there is exactly one such value of k.

22. Adding first two equations and subtracting from third, we get

$(a - 8)x_3 = b - 15$

If $a \neq 8$, we get value of x_3, and substituting in first two we get values of x_1 and x_2. When $a \neq 8$, we get the system has a unique solution.

Thus, $a = 8$ and hence $b = 15$.

When $a = 8$ and $b = 15$, we solve first two equations in terms of x_3 to obtain infinite number of solutions.

23. $3p + 3q + 2r = 3$ (i)

$4p + 2q = 0$ (ii)

$p + 3q + 2r = 1$ (iii)

From (i) and (iii) $2p = 2$ or $p = 1$

When $p = 1$, $q = -2$ [from (ii)]

Now, $2p + q - r$

$$= 2p + q - \frac{1}{2}[1 - p - 3q]$$

$$= 2(1) + (-2) - \frac{1}{2}[1 - 1 - 6] = -3$$

24. As the system of equation has a unique solution.

$$\Delta = \begin{vmatrix} 1 & a & 0 \\ 0 & 1 & a \\ a & 0 & 1 \end{vmatrix} \neq 0$$

Using $C_1 \to C_1 + C_2 + C_3$, we get

$$\Delta = (1 + a)\begin{vmatrix} 1 & a & 0 \\ 1 & 1 & a \\ 1 & 0 & 1 \end{vmatrix}$$

Using $R_2 \to R_2 - R_1$, $R_3 \to R_3 - R_1$, we get

$$\Delta = (1 + a)\begin{vmatrix} 1 & a & 0 \\ 0 & 1 - a & a \\ 0 & -a & 1 \end{vmatrix}$$

$= (1 + a)(1 - a + a^2) = 1 + a^3$

$\Delta \neq 0 \Rightarrow a \neq -1$ [$\because a \in \mathbf{R}$]

25. Let $A = \begin{pmatrix} a & b \\ c & a \end{pmatrix}$; $a, b, c \in \{0, 1, 2\}$.

$|A| = a^2 - bc$

When $a = 0$, $bc \neq 0 \Rightarrow b, c \in \{1, 2\}$

There are four such values of b, c, viz. $(b, c) = (1, 1), (1, 2), (2, 1)$ and $(2, 2)$

When $a = 1$, both b and c cannot be 1. In this case there are 8 such pairs of (b, c).

When $a = 2$, both b and c cannot be 2. In this case also, there are 8 such pairs of (b, c).

26. $$A^2 = \begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix}\begin{bmatrix} 1 & 2 \\ 4 & -3 \end{bmatrix} = \begin{bmatrix} 9 & -4 \\ -8 & 17 \end{bmatrix}$$

$$A^2 + 4A - 5I$$

$$= \begin{bmatrix} 9 & -4 \\ -8 & 17 \end{bmatrix} + \begin{bmatrix} 4 & 8 \\ 16 & -12 \end{bmatrix} + \begin{bmatrix} -5 & 0 \\ 0 & -5 \end{bmatrix}$$

$$= \begin{bmatrix} 8 & 4 \\ 8 & 0 \end{bmatrix} = 4\begin{bmatrix} 2 & 1 \\ 2 & 0 \end{bmatrix}$$

27. Let $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$

$A^2 = I \Rightarrow \det(A)^2 = 1$

$\Rightarrow \det(A) = \pm 1.$

Now, $A^2 = I \Rightarrow A^{-1} = A$

$$\Rightarrow \det(A)\begin{pmatrix} d & -b \\ -c & a \end{pmatrix} = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad (1)$$

If $\det(A) = 1$, then

$a = d$, $-b = b$, $-c = c$

$\Rightarrow a = d$, $b = 0$, $c = 0$.

$\therefore \det(A) = 1 \Rightarrow a^2 = 1 \Rightarrow a = \pm 1.$

Thus, in this case $A = I$ or $A = -I$.

But $A \neq I, -I$.

Therefore $\det(A) = -1$.

$\Rightarrow$ Statement-2 is true.

Now, from (1)

$$(-1)\begin{pmatrix} d & -b \\ -c & a \end{pmatrix} = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

$\Rightarrow a + d = 0 \Rightarrow \operatorname{tr}(A) = 0$

Thus, Statement-1 is true and Statement-2 is correct reason for it.

28. $$\begin{aligned} BB' &= (A^{-1}A')(A^{-1}A')' \\ &= (A^{-1}A')[(A')'(A^{-1})'] \\ &= A^{-1}(A'A)(A^{-1})' \\ &= A^{-1}(AA')(A')^{-1} \\ &= (A^{-1}A)[A'(A')^{-1}] \\ &= (I)(I) = I \end{aligned}$$

29. As $B^2 = 0$, $B^r = 0 \ \forall \ r \geq 2$.

Now, $(I + B)^{50} = I + {}^{50}C_1B + {}^{50}C_2B^2 + \cdots + {}^{50}C_{50}\,B^{50}$

$= I + 50B$ $[\because B^r = 0 \ \forall \ r \geq 2]$

$\Rightarrow (I + B)^{50} - 50B = I$

$\Rightarrow \det(I + B)^{50} - 50B = 1$

30. Applying $C_2 \leftrightarrow C_3$, we get

$$A\begin{bmatrix} 1 & 3 & 2 \\ 0 & 3 & 2 \\ 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Applying $C_1 \leftrightarrow C_2$, we get

$$A\begin{bmatrix}3&1&2\\3&0&2\\1&0&1\end{bmatrix}=\begin{bmatrix}1&0&0\\0&1&0\\0&0&1\end{bmatrix}$$

$$\Rightarrow \quad A^{-1}=\begin{bmatrix}3&1&2\\3&0&2\\1&0&1\end{bmatrix}$$

31. $AB=\begin{bmatrix}6\\8\end{bmatrix}$

$\Rightarrow \quad y + 2x + x = 6$

$3y - x + 2 = 8$

$\Rightarrow \quad 3x + y = 6$

$-x + 3y = 6$

$\Rightarrow \quad 3x + y = -x + 3y$

$\Rightarrow \quad y = 2x$

32. Let $C = AB - BA$, then

$C' = (AB - BA)' = (AB)' - (BA)'$

$= B'A' - A'B'$

$= (-B)A - A(-B)$

$= -BA + AB = C$

$\Rightarrow AB - BA$ is symmetric.

33. $AA^T = 9I$

$$\Rightarrow\begin{bmatrix}1&2&2\\2&1&-2\\a&2&b\end{bmatrix}\begin{bmatrix}1&2&a\\2&1&2\\2&-2&b\end{bmatrix}=9\begin{bmatrix}1&0&0\\0&1&0\\0&0&1\end{bmatrix}$$

$$\Rightarrow\begin{bmatrix}9&0&a+4+2b\\0&9&2a+2-2b\\a+4+2b&2a+2-2b&a^2+4+b^2\end{bmatrix}=\begin{bmatrix}9&0&0\\0&9&0\\0&0&9\end{bmatrix}$$

$\Rightarrow a + 2b = -4,\ a - b = -1,\ a^2 + b^2 = 5$

$\Rightarrow (a, b) = (-2, -1)$

34. $|5 \text{ adj } A| = 5$

$\Rightarrow 5^3\ |\text{adj } A| = 5$

$\Rightarrow |\text{adj } A| = 1/25$

$\Rightarrow |A|^2 = 1/25 \Rightarrow |A| = \pm\ 1/5$

35. $A^2=\begin{bmatrix}0&-1\\1&0\end{bmatrix}\begin{bmatrix}0&-1\\1&0\end{bmatrix}=-I$

$\Rightarrow A^3 = -A$ and $A^4 = I$

Now, $A^4 - I = O = A^2 + I$

and $A^3 - I = -A - I = -A + A^2 = A(A - I)$

and $A^3 + I = -A + I = A^4 - A = A(A^3 - I)$

But $A^2 + I = O$ and $A(A^2 - I) = -\ 2A$.

$\therefore\ A^2 + I \neq A(A^2 - I)$.

36. We know $A(\text{Adj } A) = |A|I_2$

$\therefore\ AA' = |A|I_2$

$$\Rightarrow \begin{bmatrix}5a&-b\\3&2\end{bmatrix}\begin{bmatrix}5a&3\\-b&2\end{bmatrix} = (10a + 3b)\begin{bmatrix}1&0\\0&1\end{bmatrix}$$

$$\Rightarrow \begin{bmatrix}25a^2+b^2&15a-2b\\15a-2b&13\end{bmatrix} = (10a + 3b)\begin{bmatrix}1&0\\0&1\end{bmatrix}$$

$\Rightarrow 25a^2 + b^2 = 10a + 3b,\ 15a - 2b = 0,\ 10a + 3b = 13$

Now, $b = (15/2)a\ 100 + \dfrac{45}{2}a = 13$

$\Rightarrow a = 2/5,\ b = 3$

$\therefore\ 5a + b = 2 + 3 = 5$

37. $P = \begin{pmatrix}\cos\alpha&\sin\alpha\\-\sin\alpha&\cos\alpha\end{pmatrix}$ where $\alpha = \pi/6$

$P' = \begin{pmatrix}\cos\alpha&-\sin\alpha\\\sin\alpha&\cos\alpha\end{pmatrix}$

We have $PP' = \begin{pmatrix}1&0\\0&1\end{pmatrix}$

$\Rightarrow P' = P^{-1}$

Thus, $Q = PAP^{-1} \Rightarrow P^{-1}QP = A$

$\Rightarrow A^2 = (P^{-1}QP)^2 = P^{-1}Q^2P$

$\Rightarrow A^3 = P^{-1}Q^3P$

Continuing like this we get,

$A^{2015} = P^{-1}Q^{2015}P = P'Q^{2015}P$

We have $A = I + B$ where $B = \begin{pmatrix}0&1\\0&0\end{pmatrix}$

Also, $B^2 = \begin{pmatrix}0&1\\0&0\end{pmatrix}\begin{pmatrix}0&1\\0&0\end{pmatrix} = \begin{pmatrix}0&0\\0&0\end{pmatrix}$

$\Rightarrow B^r = \begin{pmatrix}0&0\\0&0\end{pmatrix}\ \forall\ r \geq 2$

Thus, $A^{2015} = I + 2015B = \begin{pmatrix}1&2015\\0&1\end{pmatrix}$

38. Let $B = A^{2016} - 2A^{2015} - A^{2014}$

$= A^{2014}(A^2 - 2A - I)$

$= A^{2014}(A - (\sqrt{2} + 1)I)(A + (\sqrt{2} - 1)I)$

We have $|A| = \begin{vmatrix} -4 & -1 \\ 3 & 1 \end{vmatrix} = -1$

$$|A - (\sqrt{2} + 1)I| = \begin{vmatrix} -4-(\sqrt{2}+1) & -1 \\ 3 & 1-(\sqrt{2}+1) \end{vmatrix}$$

$= (-4 - (\sqrt{2} + 1)(1 - (\sqrt{2} + 1) + 3$

$= (\sqrt{2} + 1)^2 + 3(\sqrt{2} + 1) - 1 = 5 + 5\sqrt{2}$

$$|A + (\sqrt{2} - 1)I| = \begin{vmatrix} -4+(\sqrt{2}-1) & -1 \\ 3 & 1+(\sqrt{2}-1) \end{vmatrix}$$

$= (-4 + (\sqrt{2} - 1))(1 + (\sqrt{2} - 1)) + 3$

$= (\sqrt{2} - 1)^2 - 3(\sqrt{2} - 1) - 1$

$= 5 - 5\sqrt{2}$

Thus $\det(B) = (-1)^{2014}(5 + 5\sqrt{2})(5 - 5\sqrt{2})$
$= -25$

39. $A^2 - 5A = 7I = O$

$\Rightarrow 7I = A(5I - A) = (5I - A)A$

$I = AB = BA$

where $B = \frac{1}{7}(5I - A)$

$\therefore A^{-1} = B = \frac{1}{7}(5I - A)$

$\Rightarrow$ Statement-1 is true.

We have

$A^3 - 2A^2 - 3A + \mathrm{I}$

$= A(5A - 7I) - 2(5A - 7I) - 3A + I$

$= 5A^2 - 7A - 10A + 14I - 3A + I$

$= 5(5A - 7I) - 20A + 15I$

$= 25I - 35I - 20A + 15I$

$= 5(A - 4I)$

Thus, Statement-2 is also true.

Previous Years' B-Architecture Entrance Examination Questions

1. $\mathrm{adj}(AB) = (\mathrm{adj}\ B)(\mathrm{adj}\ A)$ [See Theory]

2. $A = I + B$

where $B = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$

Note that $B^2 = O$.

$A^2 = (I + B)^2 = I^2 + 2IB + B^2$

$= I + 2B$

$A^3 = AA^2 = (I + B)(I + 2B)$

$= I^2 + BI + 2(IB) + 2B^2$

$= I + 3B$ $[\because B^2 = O]$

Thus, $2A^2 - A^3 = 2(I + 2B) - (I + 3B)$

$= I + B = A.$

3. Statement-2 is true. [See Theory]

$\mathrm{tr}(AB - BA) = \mathrm{tr}(AB) - \mathrm{tr}(BA) = 0$

But $\mathrm{tr}(I) = 2$.

$\therefore AB - BA \neq I.$

Thus, both statements are true and Statement-2 is a correct explanation for Statement-1.

4. As $A - \alpha I$ is invertible for all $\alpha \in \mathbf{R}$.

$\det(A - \alpha I) \neq 0 \quad \forall \alpha \in \mathbf{R}.$

$\Rightarrow (a - \alpha)(d - \alpha) - bc \neq 0 \quad \forall \alpha \in \mathbf{R}.$

$\Rightarrow \alpha^2 - (a + d)\alpha + ad - bc \neq 0 \quad \forall \alpha \in \mathbf{R}.$

Therefore

$(a + d)^2 - 4(ad - bc) < 0$

$\Rightarrow (a - d)^2 + 4bc < 0$

Therefore, $bc < 0$.

Also, $a^2 + d^2 - 2ad + 4bc < 0$

$\Rightarrow 0 \leq a^2 + d^2 < 2ad - 4bc$

$\Rightarrow bc < \frac{1}{2}ad.$

Thus, $bc < \min\left(0, \frac{1}{2}ad\right)$

5. Statement-2 is false as

$\mathrm{adj}(AB) = (\mathrm{adj}\ B)(\mathrm{adj}\ A)$

$\neq (\mathrm{adj}\ A)(\mathrm{adj}\ B)$

But Statement-1 is true as

$A(\mathrm{adj}\ A) = |A|I_2.$ [See Theory]

6. $\det(A) = ad - bc$

Note that $\det(A)$ can take value -1, 0 or 1. We have

$\det(A) = 1 \Leftrightarrow ad = 1, bc = 0$

$\Leftrightarrow a = 1,\ d = 1$ or $(b = 0,\ c = 0,\ b = 0;\ c = 1;\ b = 1,\ c = 0)$

and $\det(A) = -1 \Leftrightarrow ad = 0$ or $bc = 1$

This is also possible in 3 cases.

$\therefore A^{-1}$ exists in 6 cases.

7. $$A^2 = \begin{bmatrix} a & b \\ c & d \end{bmatrix}\begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

$$= \begin{bmatrix} a^2+bc & b(a+d) \\ c(a+d) & bc+d^2 \end{bmatrix}$$

$$= \begin{bmatrix} a^2+bc & 2b \\ 2c & bc+d^2 \end{bmatrix}$$

$$\therefore A^2 - 2A = \begin{bmatrix} a^2-2a+bc & 0 \\ 0 & a^2-2d+bc \end{bmatrix}$$

Since $A' = A^2 - 2A$, we get

$$\begin{bmatrix} a & c \\ b & d \end{bmatrix} = \begin{bmatrix} a^2-2a+bc & 0 \\ 0 & a^2-2d+bc \end{bmatrix}$$

$\Rightarrow b = 0,\ c = 0,\ a = a^2 - 2a,\ d = d^2 - 2d$

$\Rightarrow a(a - 3) = 0$ and $d(d - 3) = 0$

$\Rightarrow a = 0$ or $a = 3$ and $d = 0$ or $d = 3$

But then $a + d$ cannot be 2.

$\therefore\ \ S = \phi$

8. $$S_2 = \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix} = I + B \text{ where}$$

$$I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \text{ and } B = \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix}$$

Note that $B^2 = O$, therefore, $B^r = O\ \forall\ r \geq 2$.

Thus, $(S_2)^n = (I + B)^n = I + nB$

$$= \begin{bmatrix} 1 & 2n \\ 0 & 1 \end{bmatrix}$$

Also, $S_k^{-1} = \begin{pmatrix} 1 & -k \\ 0 & 1 \end{pmatrix}$

$$\therefore (S_2)^n (S_k)^{-1} = \begin{pmatrix} 1 & 2n \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & -k \\ 0 & 1 \end{pmatrix}$$

$$= \begin{pmatrix} 1 & 2n-k \\ 0 & 1 \end{pmatrix} = S_{2n-k}$$

9. Let $A = I + C$ where $C = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}$

AS $C^2 = O$, we get $C^r = 0\ \forall\ r > 2$.

Now,

$$A^{10} = (I + C)^{10}$$

$$= I + 10C + {}^{10}C_2\,(C^2) + \ldots + {}^{10}C_{10}(C^{10})$$

$$= I + 10C + O = \begin{bmatrix} 1 & 10 \\ 0 & 1 \end{bmatrix}$$

$$\Rightarrow \operatorname{Adj}(A^{10}) = \begin{bmatrix} 1 & -10 \\ 0 & 1 \end{bmatrix}$$

As $\begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix} = 10A^{10} + \operatorname{adj}(A^{10})$, we get

$$\Rightarrow \begin{bmatrix} b_1 & b_2 \\ b_3 & b_4 \end{bmatrix} = \begin{bmatrix} 10 & 100 \\ 0 & 10 \end{bmatrix} + \begin{bmatrix} 1 & -10 \\ 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 11 & 90 \\ 0 & 11 \end{bmatrix}$$

$\Rightarrow\ \ b_1 = b_4 = 11,\ b_2 = 90,\ b_3 = 0,$

$\therefore\ b_1 + b_2 + b_3 + b_4 = 112$

10. $|\operatorname{adj} A| = |A|^2 = 36$

$$\Rightarrow \begin{vmatrix} 1 & -2 & 4 \\ 4 & 1 & 1 \\ -1 & k & 0 \end{vmatrix} = 36$$

$$\Rightarrow (-1)\begin{vmatrix} -2 & 4 \\ 1 & 1 \end{vmatrix} - k\begin{vmatrix} 1 & 4 \\ 4 & 1 \end{vmatrix} = 36$$

[Expanding along R_3]

$\Rightarrow (-1)(-2 - 4) - k(1 - 16) = 36$

$\Rightarrow 6 + 15k = 36 \Rightarrow k = 2$

CHAPTER SIX

Permutations and Combinations

FUNDAMENTAL PRINCIPLES OF COUNTING

The Sum Rule

Suppose that A and B are two disjoint events (mutually exclusive); that is, they never occur together. Further suppose that A occurs in m ways and B in n ways. Then A or B can occur in $m + n$ ways. This rule can also be applied to more than two mutually exclusive events.

The Product Rule

Suppose that an event X can be decomposed into two stages, A and B. Let stage A occur in m ways and suppose that these stages are unrelated, in the sense that stage B occurs in n ways regardless of the outcome of stage A. Then event X occurs in mn ways. This rule is applicable even if event X can be decomposed in more than two stages.

PERMUTATIONS AND COMBINATIONS

Suppose we have a set of n distinct objects $\{x_1, x_2, \cdots, x_n\}$ from which we have to take a sample of r $(1 \leq r \leq n)$ objects. In how many ways can this be done? However, the problem is not completely specified; in particular, the phrase 'take a sample' is somewhat ambiguous.

1. Is the order in which we take the sample important? For example, if $r = 2$, do we consider first picking x_1 and then x_2 to be different from picking x_2 and then x_1?
2. Do we allow repetition of objects? For example, do we allow a sample to consists of two x_1?

Since each question has two answers, the product rule says that our original problem is really made up of four separate problems.

1. How many such samples are there if the order is important and we allow repetitions?
2. How many such samples are there if the order is important and we do not allow repetitions?
3. How many such samples are there if the order is not important and we allow repetitions?
4. How many such samples are there if the order is not important and we do not allow repetitions?

We now introduce some terminology. If the order is important, then we say that our sample consists of *arrangements*. If the order is not important then we have *selections*. If repetition is allowed, then we are using *replacement*. An arrangement of r objects with replacement is called an *r-sequence* (or simply sequence). Vehicle numbers are examples of sequences.

An *r-permutation* (or simply *permutation*) is an arrangement without replacement. The different orderings of a deck of cards are examples of permutations. A selection of r objects with replacement is called an *r-multiset*. The letters used to form the word MATHEMATICS can be thought of as a multiset with two Ms, two As, two Ts, one H, one E, one I, one C and one S. An *r-combination* (or simply *combination*) is a selection of r objects without replacement.

In Table 6.1 we illustrate the four different problems and their solutions. We take two objects from $\{x_1, x_2, x_3\}$.

Table 6.1

Repetition		*No repetition*	
$x_1\,x_1$ $x_1\,x_2$ $x_1\,x_3$ $x_2\,x_1$ $x_2\,x_2$ $x_2\,x_3$ $x_3\,x_1$ $x_3\,x_2$ $x_3\,x_3$	r-sequence	$x_1\,x_2$ $x_1\,x_3$ $x_2\,x_1$ $x_2\,x_3$ $x_3\,x_1$ $x_3\,x_2$	r-permutation
$\{x_1, x_1\}$ $\{x_1, x_2\}$ $\{x_1, x_3\}$ $\{x_2, x_2\}$ $\{x_2, x_3\}$ $\{x_3, x_3\}$	r-multiset	$\{x_1, x_2\}$ $\{x_1, x_3\}$ $\{x_2, x_3\}$	r-combination

What happens when $r = 0$? We may view the r-combination as a subset of r elements, and thus a 0-combination may be viewed as the empty set. Since there is exactly one empty set, we may say that there is exactly one 0-combination. Mathematicians also say that there is exactly one 0-sequence, one 0-permutation, and one 0-multiset. By relaxing the definitions we may use the terms sequence and permutation interchangeably and call a multiset, a combination.

SOME IMPORTANT RESULTS

1. The number of sequences (that is, permutations) of n distinct objects taken r at a time, when repetition of objects is allowed, is n^r $(r > 0)$.

2. The number of permutations of n distinct objects taken r $(0 \le r \le n)$ at a time, when repetition is not allowed, is given by

$$^nP_r = \frac{n!}{(n-r)!}$$

Conventionally, $^nP_r = 0$ for $r > n$.

3. The number of permutations of n objects taken all together, when p_1 of the objects are alike and of one kind, p_2 of them are alike and of the second kind, $\cdots$, p_r of them are alike and of the rth kind, where $p_1 + p_2 + \cdots + p_r = n$ is given by

$$\frac{n!}{p_1!\, p_2! \cdots p_r!}$$

4. The number of combinations of n distinct objects taken r $(0 \le r \le n)$ at a time is given by

$$\binom{n}{r} = {}^nC_r = \frac{n!}{(n-r)!r!}$$

By definition $^nC_r = 0$ if $r > n$.

5. The number of ways of selecting zero or more objects out of p_1 identical objects of first kind, p_2 identical objects of second kind, …, p_r identical objects of rth kind is $(p_1 + 1)(p_2 + 1) \ldots (p_r + 1)$.

6. The number of combinations of n distinct objects taken r $(\le n)$ at a time, when k $(0 \le k \le r)$ particular objects always occur, is $^{n-k}C_{r-k}$.

7. The number of combinations of n distinct objects taken r at a time, when $k\,(1 \le k \le n)$ never occur, is $^{n-k}C_r$.

8. If $n > 1$, $^nP_0 < {}^nP_1 < {}^nP_2 < \ldots < {}^nP_{n-1} = {}^nP_r$

9. If $n = 2m + 1$, then

$$^nC_0 < {}^nC_1 < {}^nC_2 \ldots < {}^nC_m = {}^nC_{m+1}$$
$$^nC_{m+1} > {}^nC_{m+2} > {}^nC_{m+3} > \ldots > {}^nC_n$$

10. If $n = 2m$, then

$$^nC_0 < {}^nC_1 < {}^nC_2 \ldots < {}^nC_m$$
$$^nC_m > {}^nC_{m+1} > {}^nC_{m+2} \ldots > {}^nC_n$$

CIRCULAR PERMUTATION

The number of ways of arranging n distinct objects around a circle is $(n-1)!$.

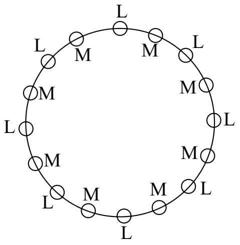
Remark

1. Note that even if one object is lying on the circle, then the circle has to be treated as a row, so far as arranging the objects around the circle is concerned.
2. Note that if no distinction is to be made between clockwise and counter-clockwise arrangements, then the number of arrangements is equal to $(n-1)!/2$.
3. The number of ways of arranging r identical objects and $(n-r)$ distinct objects along a circle is $\dfrac{(n-1)!}{r!}$

Illustration 1

In how many ways can 8 ladies and 5 men can be seated around a round table so that no two men are together.

Solution: 8 ladies can be arranged arround a round table in $(8-1)!$ ways. After the ladies have been arranged, there are 8 places for men. We can place 5 men at these places in $^8P_5$ ways. Thus, required number of ways is $(7!)\,(^8P_5)$.



SOME IMPORTANT IDENTITIES

(i) $^nC_0 = 1 = {}^nC_n$.

(ii) $^nC_r = {}^nC_{n-r}$ $\quad (0 \le r \le n)$.

(iii) $^nC_{r-1} + {}^nC_r = {}^{n+1}C_r$.

(iv) $^nC_r = {}^nC_s$ implies $r = s$ or $r + s = n$.

(v) $^nC_r = \dfrac{n-r+1}{r}\, {}^nC_{r-1}$ $\quad (1 \le r \le n)$.

(vi) If n is even, then the greatest value of ^nC_r is ^nC_m, where $m = n/2$. If n is odd, then the greatest value of ^nC_r is ^nC_m, where $m = (n-1)/2$ or $(n+1)/2$.

(vii) $^nC_0 + {}^nC_1 + {}^nC_2 + \cdots + {}^nC_n = 2^n$.

(viii) $^nC_0 + {}^nC_2 + \cdots = {}^nC_1 + {}^nC_3 + \cdots = 2^{n-1}$.

(ix) $^{2n+1}C_0 + {}^{2n+1}C_1 + \cdots + {}^{2n+1}C_n = 2^{2n}$
$^{2n+1}C_{n+1} + {}^{2n+1}C_{n+2} + \ldots + {}^{2n+1}C_{2n+1} = 2^{2n}$

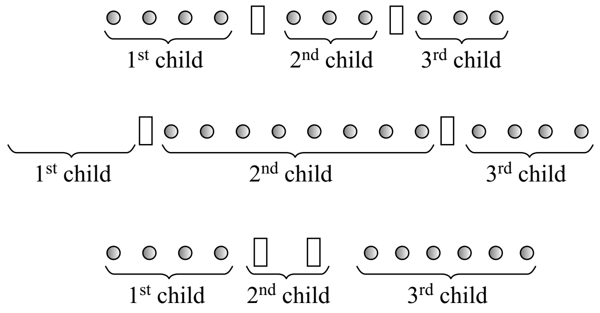
DIVISION OF IDENTICAL OBJECTS

The number of ways of distributing n identical objects among r persons giving zero or more to each is equal to the number of ways of arranging n identical object of one kind and $(r-1)$ identical objects of second kind (separators) in a row

$$= \frac{(n+r-1)!}{n!(r-1)!} = {}^{n+r-1}C_{r-1}$$

Illustration 2

To distribute 10 identical toys among 3 children, we may use two separators as follows:



etc.
The required number of ways

$$= \frac{(10+2)!}{10!2!} = {}^{12}C_2 = 66.$$

Alternative method

1. The number of distributing n identical objects among r persions giving zero or more to each

$= \text{coefficient of } x^n \text{ in } (1-x)^{-r}$

$= \text{coefficient of } x^n \text{ in } (1+x+x^2+\ldots)^r$

2. The number of ways of distributing n identical object among r persons giving at least one to each.

= the number of ways of distributing remaining $(n-r)$ identical objects (after giving one to each of r persons) among r persons giving zero or more to each

$= {}^{(n-r)+(r-1)}C_{r-1} = {}^{n-1}C_{r-1}$

Illustration 3

(i). To distribute 10 toys among 3 children giving at least one to each, we first give one toy to each of the child and distribute the remaining 7 toys among 3 children giving zero or more to each in ${}^{7+3-1}C_{3-1} = {}^9C_2 = 36$ ways.

(ii). However if we wish to give at least two to first, at least three to second and at least one to the third, then, we first give $(2+3+1)$ toys to the three children as desired and distribute the remaining 4 toys among three children giving zero or more to each. This can be done in ${}^{4+3-1}C_{3-1} = {}^6C_2 = 15$ ways.

(iii). If wish to distribute n identical object among r persons so that kth person $(1 \le k \le r)$ does not get more than a_k, then the desired number of ways

$= \text{Coeffcient of } x^n \text{ in } (1+x+\ldots+x^{a_1})(1+x+\ldots+x^{a_2}) \ldots (1+x+\ldots+x^{a_r})$

Illustration 4

Find the number of ways of distributing 10 identical toys among 3 children so as give a_i $(1 \le i \le 3)$ to the ith children, where $2 \le a_1 \le 4$, $3 \le a_2 \le 5$, $1 \le a_3 \le 7$.

The required number of ways

$= \text{coefficient of } x^{10} \text{ in } (x^2+x^3+x^4)(x^3+x^4+x^5)(x+\ldots+x^7)$

$= \text{coefficient of } x^{10} \text{ in } x^6(1+x+x^2)^2(1+\ldots+x^6)$

$$= \text{coefficient of } x^4 \text{ in } \left(\frac{1-x^3}{1-x}\right)^2 \left(\frac{1-x^7}{1-x}\right)$$

$= \text{coefficient of } x^4 \text{ in } (1-2x^3)(1-x)^{-3}$ [ignore any power that is more than 4]

$= \text{coeffcient of } x^4 \text{ in } (1-2x^3)(1+{}^3C_1 x+{}^4C_2 x^2+{}^5C_3 x^3+{}^6C_4 x^4+\ldots)$

$= {}^6C_4 - 2({}^3C_1) = 15 - 6 = 9$

Finding Number Integral Solutions of a Linear Equation

The number of non-negative integral solution of

$$x_1 + x_2 + \ldots + x_r = n,$$

where $n \in \mathbf{N} \cup \{0\}$, and $r \in \mathbf{N}$

= the number of ways of distributing n identical objects among r persons giving zero or more to each

$= {}^{n+r-1}C_{r-1}$.

MULTIPLICATION OF TWO INFINITE SERIES

The following informal method of multiplying two infinite power series is also useful:

$$(a_0 + a_1x + a_2x^2 + a_3x^3 + \ldots)(b_0 + b_1x + b_2x^2 + \ldots)$$
$$= c_0 + c_1x + c_2x^2 + c_3x^3 + \ldots$$

where $c_n = a_0b_n + a_1b_{n-1} + a_2b_{n-2} + \ldots a_nb_0$ for all $n \ge 0$.

DISTRIBUTION INTO GROUPS

1. The number of ways in which n distinct objects can be split into three groups containing respectively r, s and t objects (where r, s and t are distinct and $r+s+t=n$) is

$$({}^nC_r)({}^{n-r}C_s)({}^{n-r-s}C_t)$$

$$= \frac{n!}{r!(n-r)!}\,\frac{(n-r)!}{(n-r-s)!\,s!}\,\frac{(n-r-s)!}{(n-r-s-t)!\,t!}$$

$$= \frac{n!}{r!\,s!\,t!}$$

2. Suppose mn distinct objects are to be divided into m groups, each containing n objects and the order of the groups is not important. Then the number of ways of doing this is given by

$$\frac{(mn)!}{m!(n!)^m}$$

If, however, the order of groups is important, then the number of ways is given by

$$\frac{(mn)!}{(n!)^m}$$

SELECTION

1. The number of ways of selecting one or more objects out of n distinct objects is $2^n - 1$.
2. Suppose we have n distinct objects, and p like objects of one kind, q like objects of a second kind, r like objects of a third kind, etc. Then the number of ways of selecting one or more objects from these objects is
$2^n (p + 1)(q + 1)(r + 1) \cdots - 1$.

EXPONENT OF PRIME *p* IN *n*!

Let $E_p(m)$ denote the exponent of the prime p in the prime factorization of positive integer m. We have

$$E_p(n!) = E_p(1\cdot2\cdot3\cdot4 \cdots (n-1)\cdot n)$$

The last integer amongst $1, 2, 3, \cdots, (n-1), n$ which is divisible by p is $[n/p]p$, where $[x]$ denotes greatest integer $\le x$.

Therefore,

$$E_p(n!) = E_p\left(p\cdot2p\cdot3p\cdots\left[\frac{n}{p}\right]p\right)$$

because the remaining integers from the set $\{1, 2, 3, \cdots, (n-1), n\}$ are not divisible by p.

$$E_p(n!) = E_p\left(p\cdot2p\cdot3p\cdots\left[\frac{n}{p}\right]p\right)$$

$$= \left[\frac{n}{p}\right] + E_p\left(1\cdot2\cdot3\cdots\left[\frac{n}{p}\right]\right)$$

The last integer amongst $1, 2, \cdots, [n/p]$ which is divisible by p is

$$\left[\frac{[n/p]}{p}\right]p = \left[\frac{n}{p^2}\right]p$$

Since the remaining integers are not divisible by p, we get

$$E_p(n!) = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + E_p\left(1\cdot2\cdots\left[\frac{n}{p^2}\right]\right)$$

Continuing in this way, we get

$$E_p(n!) = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + \cdots + \left[\frac{n}{p^s}\right]$$

where $p^s \le n < p^{s+1}$.

Illustration 5

Find exponent of 3 in 32!

As 3 divides 3, 6, 9...., 30 amongst 1, 2, . . . 31, 32,

$E_3(32!) = E_3(3 \times 6 \times 9 \times \ldots \times 30)$

$= E_3(3^{10} \times 1 \times 2 \times \ldots \times 10)$

$= 10 + E_3(3 \times 6 \times 9)$

[Ignore 1, 2, 4, 5, 7, 8, 10 as 3does not divide these.]

$= 10 + E_3(3^3 \times 1 \times 2 \times 3)$

$= 10 + 3 + E_3(3)$

$= 10 + 3 + 1 = 14.$

Note, $10 = \left[\frac{31}{3}\right]$, $3 = \left[\frac{31}{3^2}\right]$ and $1 = \left[\frac{31}{3^3}\right]$

SOLVED EXAMPLES

Concept-based Straight Objective Type Questions

Example 1: If ${}^{n+5}p_{n+1} = \frac{1}{2}(11)(n-1)\left({}^{n+3}p_n\right)$ then n is equal to:

(a) 10, 11 (b) 9, 10
(c) 8, 7 (d) 6, 7

Ans: (d).

Solution: $\frac{1}{2}(11)(n-1) = \frac{{}^{n+5}P_{n+1}}{{}^{n+3}P_n}$

$$= \frac{(n+5)!}{4!} \times \frac{3!}{(n+3)!}$$

$\Rightarrow \quad \frac{1}{2}(11)(n-1) = \frac{1}{4}(n+5)(n+4)$

$\Rightarrow \quad 22n - 22 = n^2 + 9n + 20$

$\Rightarrow \quad n^2 - 13n + 42 = 0 \Rightarrow n = 6, 7$

Example 2: If ${}^{n+2}C_3 = {}^{n+3}P_2 - 20$, then n is equal to:

(a) 6 (b) 5
(c) 4 (d) 3

Ans (d).

Solution: $\frac{1}{6}(n+2)(n+1)n = (n+3)(n+2) - 20$

$\Rightarrow \quad n^3 + 3n^2 + 2n = 6(n^2 + 5n + 6) - 120$

$\Rightarrow \quad n^3 - 3n^2 - 28n + 84 = 0$

$\Rightarrow \quad (n - 3)(n^2 - 28) = 0$

As n is a positive integer, we get $n = 3$

Example 3: If ${}^{10}C_{r-1} > 2({}^{10}C_r)$ then r is equal to

(a) 6, 7, 8, 9 (b) 7, 8, 9
(c) 8, 9, 10 (d) 5, 6, 9, 10

Ans: (c).

Solution: Note that $0 \le r \le 10$. Now $\dfrac{{}^{10}C_{r-1}}{{}^{10}C_r} > 2$

$$\Rightarrow \quad \frac{10!}{(r-1)!\,(10-r+1)!}\cdot\frac{r!(10-r)!}{10!} > 2$$

$$\Rightarrow \quad \frac{r}{11-r} > 2 \Rightarrow r > 22 - 2r$$

$$\Rightarrow \quad 3r > 22 \Rightarrow r \ge 8 \Rightarrow r = 8, 9, 10.$$

Example 4: If $\frac{1}{a}({}^nP_{r+1}) = \frac{1}{b}({}^nP_r) = \frac{1}{c}({}^nP_{r-1})$, then $b^2 - (a + b)c$ is equal to.

(a) 0 (b) 1
(c) – 1 (d) – 2

Ans: (a).

Solution: $\dfrac{{}^nP_{r+1}}{{}^nP_r} = \dfrac{a}{b} \Rightarrow \dfrac{(n-r)!}{(n-r-1)!} = \dfrac{a}{b}$

$$\Rightarrow \quad n - r = \frac{a}{b}$$

Similarly $\quad n - r + 1 = \dfrac{b}{c}$

$$\therefore \quad \frac{b}{c} - \frac{a}{b} = 1$$

$$\Rightarrow \quad b^2 - ac = bc \Rightarrow b^2 - (a + b)c = 0.$$

Exemple 5: Let Q_n be the number of possible quadrilaterals formed by joining vertices of an n sided regular polygon. If $Q_{n+1} - Q_n = 20$, then value of n is:

(a) 8 (b) 7
(c) 6 (d) 5

Ans: (c).

Solution: Q_n = Number of ways of choosing four vertices out of n

$$= {}^nC_4$$

$$\therefore \quad 20 = Q_{n+1} - Q_n = {}^{n+1}C_4 - {}^nC_4$$

$$= {}^nC_4 + {}^nC_3 - {}^nC_4 = {}^nC_3$$

$$[\because {}^nC_{r-1} + {}^nC_r = {}^{n+1}C_r]$$

$$\Rightarrow \quad \frac{1}{6}n\,(n-1)(n-2) = 20 \qquad (1)$$

$$\Rightarrow \quad n^3 - 3n^2 + 2n - 120 = 0$$

$$\Rightarrow \quad n^3 - 6n^2 + 3n^2 - 18n + 20n - 120 = 0$$

$$\Rightarrow \quad (n - 6)(n^2 + 3n + 20) = 0$$

As $n \in \mathbf{N}$, $n = 6$.

TIP

You can directly reach the answer by substituting the given choices in (1).

Example 6: If there are 62 onto mapping from a set X containing n elements to the set $Y = \{-1, 1\}$, then n is equal to:

(a) 4 (b) 5
(c) 6 (d) 7

Ans: (c)

Solution: Let $X = \{x_1, x_2, \ldots, x_n\}$.

Each x_i can have two images *viz* – 1 and 1. Thus, there are 2^n mappings from X to Y. But there are exactly two mapping which are not onto. These are when all the elements are mapped to – 1 or when all the elements are mapped to 1. $\therefore$ there are $2^n - 2$ onto mapping from X to Y.

Set $\quad 2^n - 2 = 62 = \Rightarrow 2^n = 64 = 2^6$

$$\Rightarrow \quad n = 6$$

Example 7: The maximum possible number of points of intersection of 7 straight lines and 5 circles is:

(a) 111 (b) 109
(c) 107 (d) 105

Ans: (a)

Solution: Maximum possible number of points of intersection of 7 lines is ${}^7C_2 = 21$.

Maximum possible number of points of intersection of 5 circles in $2\,({}^5C_2) = 20$

[$\because$ two circles can intersect in two distinct points.]

Maximum possible number of points of intersection of 5 circles and 7 lines is $2(5)(7) = 70$

Thus, maximum possible number of points of intersection is

$$21 + 20 + 70 = 111.$$

Example 8: The number of injective functions from a set X containing m elements to a set Y containing n elements, for $m > n$ is:

(a) ${}^mP_n$ (b) $(m - n)!$
(c) ${}^mC_n$ (d) 0

Ans. (d)

Solution:

TIP

If X and Y are two finite sets and $f : X \to Y$ is an injective function from X to Y then $n \ge m$ where $m = n(X)$ and $n = n(Y)$. The number of injective functions from X to Y is

$$n(n-1)(n-2)\ldots(n-m+1) = {}^nP_m$$

As $m > n$, there does not exist any injective function from X to Y.

Example 9: If ${}^nP_r = 2520$ and ${}^nC_r = 21$ then n is equal to:

(a) 6 (b) 7
(c) 8 (d) 10

Ans: (b)

Solution: $(r!)({}^nC_r) = {}^nP_r \Rightarrow (r!)(21) = 2520$

$$\Rightarrow \quad r! = 120 \Rightarrow r = 5$$

$$\text{Now} \quad {}^nC_5 = 21 = \frac{1}{2!}(7 \times 6) = \frac{7!}{5!2!}$$

$$\Rightarrow \quad n = 7$$

Example 10: If ${}^{15}C_{r+1} : {}^{15}C_{3r} = 3 : 11$, then value of r is:

(a) 2 (b) 3
(c) 4 (d) 5

Ans: (b)

Solution: Note that $0 \le 3r \le 15$

$$\Rightarrow 0 \le r \le 5. \text{ Also, } \frac{15!}{(14-r)!(r+1)!} \times \frac{(3r)!(15-3r)!}{15!} = \frac{3}{11}$$

$$\Rightarrow \quad \frac{(3r)!(15-3r)!}{(14-r)!(r+1)!} = \frac{3}{11} \qquad (1)$$

For the denominator, to be divisible by 11, $11|(14-r)!$. Setting $14 - r = 11$.

$$\Rightarrow \quad r = 3$$

Putting $r = 3$, in LHS of (1) we get

$$\text{LHS of (1)} \; \frac{9!6!}{11!4!} = \frac{6 \times 5}{11 \times 10} = \frac{3}{11} = \text{RHS of (1)}$$

$$\therefore \quad r = 3$$

LEVEL 1

Straight Objective Type Questions

Example 11: If ${}^nC_4$, ${}^nC_5$ and ${}^nC_6$ are in A.P., then a value of n can be

(a) 6 (b) 7
(c) 8 (d) 9

Ans. (b)

Solution: As ${}^nC_4$, ${}^nC_5$ and ${}^nC_6$ are in A.P.,

$$2({}^nC_5) = {}^nC_4 + {}^nC_6$$

$$\Rightarrow \quad 2 = \frac{{}^nC_4}{{}^nC_5} + \frac{{}^nC_6}{{}^nC_5}$$

$$= \frac{n!}{4!(n-4)!}\,\frac{5!(n-5)!}{n!} + \frac{n!}{6!(n-6)!}\,\frac{5!(n-5)!}{n!}$$

$$\Rightarrow \quad 2 = \frac{5}{n-4} + \frac{n-5}{6} \quad \Rightarrow \quad n^2 - 21n + 98 = 0$$

$$\Rightarrow \quad n = 7, 14.$$

Example 12: The least positive integer n for which ${}^{n-1}C_5 + {}^{n-1}C_6 < {}^nC_7$ is

(a) 14 (b) 15
(c) 16 (d) 28

Ans. (a)

Solution: Since ${}^mC_{r-1} + {}^mC_r = {}^{m+1}C_r$ we can write the given inequality as

$${}^nC_6 < {}^nC_7$$

$$\Rightarrow \quad \frac{{}^nC_6}{{}^nC_7} < 1 \quad \Rightarrow \quad \frac{7}{n-6} < 1 \quad \Rightarrow \quad n > 13$$

$\therefore$ the least value of n is 14.

Example 13: If ${}^nC_{r-1} = 36$, ${}^nC_r = 84$ and ${}^nC_{r+1} = 126$, then the value of r is equal to

(a) 1 (b) 2
(c) 3 (d) 4

Ans. (c)

Solution: We have

$$\frac{{}^nC_{r-1}}{{}^nC_r} = \frac{36}{84} \Rightarrow \frac{n!}{(r-1)!(n-r+1)!}\,\frac{r!(n-r)!}{n!} = \frac{3}{7}$$

$$\Rightarrow \quad \frac{r}{n-r+1} = \frac{3}{7} \quad \Rightarrow \quad 10r = 3n + 3$$

$$\text{Similarly,} \quad \frac{{}^nC_r}{{}^nC_{r+1}} = \frac{84}{126} \quad \Rightarrow \quad \frac{r+1}{n-r} = \frac{2}{3}$$

$$\Rightarrow \quad 5r + 3 = 2n \quad \Rightarrow \quad 5r + 3 = 2n$$

Solving we obtain $r = 3$.

Example 14: In a group of 8 girls, two girls are sisters. The number of ways in which the girls can sit in a row so that two sisters are not sitting together is

(a) 4820 (b) 1410
(c) 2830 (d) 30240

Ans. (d)

◎ **Solution:** The required number of ways
= the number of ways in which 8 girls can sit in a row – the number of ways in which two sisters sit together
= 8! – (2) (7!) = 30240.

◉ **Example 15:** The number of words that can be formed by using the letters of the word MATHEMATICS that start as well as end with T is:

(a) 80720 (b) 90720
(c) 20860 (d) 37528

Ans. (b)

◎ **Solution:** The word MATHEMATICS contains 11 letters viz. M, M, A, A T, T, H, E, I, C, S. The number of words that begin with T and end with T is

$$\frac{9!}{2!\,2!} = 90720.$$

◉ **Example 16:** If $a_n = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$, then $\sum_{r=0}^{n} \frac{r}{{}^nC_r}$ equals:

(a) $\frac{n}{2}a_n$ (b) $\frac{n}{4}a_n$
(c) na_n (d) $(n–1)a_n$

Ans. (a)

◎ **Solution:** Let $b_n = \sum_{r=0}^{n} \frac{r}{{}^nC_r} = \sum_{r=0}^{n} \frac{n-r}{{}^nC_{n-r}} = \sum_{r=0}^{n} \frac{n-r}{{}^nC_r}$

$$\Rightarrow \quad 2b_n = \sum_{r=0}^{n} \frac{r+(n-r)}{{}^nC_r} = n\sum_{r=0}^{n} \frac{1}{{}^nC_r} = na_n$$

$$\Rightarrow \quad b_n = \frac{n}{2}a_n\,.$$

◉ **Example 17:** *m* men and *w* women are to be seated in a row so that no two women sit together. If *m* > *w*, then the number of ways in which they can be seated is:

(a) $\frac{m!\,(m+1)!}{(m-w+1)!}$ (b) ${}^mC_{m-w}\,(m-w)!$
(c) ${}^{m+w}C_m\,(m-w)!$ (d) none of these

Ans. (a)

◎ **Solution:** We first arrange the *m* men. This can be done in *m*! ways. After *m* men have taken their seats, the women must choose *w* seats out of (*m* + 1) seats marked with *X* below.

X M X M X M X …X M X
1st 2nd 3rd *m*th (*m* + 1)th

They can choose *w* seats in ${}^{m+1}C_w$ ways and arrange *w* women in *w*! ways.
Thus, the required number of arrangements is

$$m!\,({}^{m+1}C_w)\,(w!) = \frac{m!\,(m+1)!\,w!}{w!\,(m+1-w)!} = \frac{m!\,(m+1)!}{(m+1-w)!}$$

◉ **Example 18:** The number of subsets of the set $A = \{a_1, a_2, \ldots, a_n\}$ which contain even number of elements is

(a) 2^{n-1} (b) $2^n - 1$
(c) 2^{n-2} (d) 2^n

Ans. (a)

◎ **Solution:** For each of the first (*n* – 1) elements $a_1, a_2, \ldots, a_{n-1}$ we have two choices: either a_i ($1 \le i \le n–1$) lies in the subset or a_i doesn't lie in the subset. For the last element we have just one choice. If even number of elements have already been selected, we do not include a_n in the subset, otherwise (when odd number of elements have been selected), we include it in the subset.
Thus, the number of subsets of $A = \{a_1, a_2,\ldots, a_n\}$ which contain even number of elements is equal to $2^{n–1}$.

◉ **Example 19:** The number of positive integers < 1,00,000 which contain exactly one 2, one 5 and one 7 in its decimal representation is

(a) 2940 (b) 7350
(c) 2157 (d) 1582

Ans. (a)

◎ **Solution:** We may consider a number of up to 5-digits to be a number of the form

X X X X X

where *X* is a digit from 0 to 9. The digit 2 can occupy any of the five places, 3 can occupy any of the remaining 4 places and 7 any of the 3-remaining places. The remaining 2 places can be filled up by 7 digits. Thus, there are (5) (4) (3) (7) (7) = 2940 positive integers in the desired category.

◉ **Example 20:** The number of ways of factoring 91,000 into two factors, *m* and *n*, such that *m* > 1, *n* > 1 and *gcd* (*m*, *n*) = 1 is

(a) 7 (b) 15
(c) 32 (d) 37

Ans. (a)

◎ **Solution:** We have $91{,}000 = 2^3 \times 5^3 \times 7 \times 13$
Let $A = \{2^3, 5^3, 7, 13\}$ be the set associated with the prime factorization of 91,000. For *m*, *n* to be relatively prime, each element of *A* must appear either in the prime factorization of *m* or in the prime factorization of *n* but not in both. Moreover, the 2 prime factorizations must be composed exclusively from the elements of *A*. Therefore, the number of relatively prime pairs *m*, *n* is equal to the number of ways of partitioning *A* into 2 unordered non-empty subsets. We can partition *A* as follows:

$\{2^3\}\cup\{5^3, 7, 13\}$, $\{5^3\} \cup \{2^3, 7, 13\}$
$\{7\}\cup\{2^3, 5^3, 13\}$, $\{13\} \cup \{2^3, 5^3, 7\}$
and $\{2^3, 5^3\}\cup\{7, 13\}$, $\{2^3, 7\} \cup \{5^3, 13\}$,
$\{2^3, 13\}\cup \{5^3, 7\}$

Therefore, the required number of ways = 4 + 3 = 7.

Example 21: The sum $S = \dfrac{1}{9!}+\dfrac{1}{3!7!}+\dfrac{1}{5!5!}+\dfrac{1}{7!3!}+\dfrac{1}{9!}$ equals

(a) $\dfrac{2^9}{10!}$ (b) $\dfrac{2^{10}}{8!}$

(c) $\dfrac{2^{11}}{9!}$ (d) $\dfrac{2^{10}}{7!}$

Ans. (a)

Solution: We can write S as follows

$$S = \frac{1}{10!}\,[{}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 + {}^{10}C_7 + {}^{10}C_9]$$

$$= \frac{1}{10!}\,(2^9).$$

Example 22: Let $n = 2015$. The least positive integer k for which

$$k(n^2)\,(n^2 - 1^2)\,(n^2 - 2^2)\,(n^3 - 3^2)\,\ldots\,(n^2 - (n-1)^2) = r!$$

for some positive integer r is

(a) 2014 (b) 2013

(c) 1 (d) 2

Ans. (d)

Solution: We can rewrite the given expression as

$$k(n^2)\,(n-1)\,(n+1)\,(n-2)\,(n+2)\,(n-3)\,(n+3)\ldots\,(n+n-1)\;\;(n-n+1) = r!$$

$\Rightarrow\quad kn\,(1)\,(2)\ldots\,(n-1)\,n(n+1)\,(n+2)\ldots\,(2n-1) = r!$

$\Rightarrow\quad kn\,(2n-1)! = r!$

$\therefore$ To convert L.H.S. to a factorial, we shall require, $k = 2$ which will convert it into $(2n)!$

Example 23: If $0 < r < s \le n$ and ${}^nP_r = {}^nP_s$, then value of $r + s$ is

(a) $2n - 2$ (b) $2n - 1$

(c) 2 (d) 1

Ans. (b)

Solution: ${}^nP_r = {}^nP_s \;\Rightarrow\; \dfrac{n!}{(n-r)!} = \dfrac{n!}{(n-s)!}$

$\Rightarrow\quad (n-r)! = (n-s)!$

As $r < s$, $n - r > n - s$. But the only two different factorials which are equal are 0! and 1!. Thus $n - r = 1$ and $n - s = 0$

$\Rightarrow r = n-1$ and $s = n$.

$\Rightarrow\quad r + s = 2n - 1.$

Example 24: If $E = \dfrac{1}{4}.\dfrac{2}{6}.\dfrac{3}{8}.\dfrac{4}{10}\cdots\dfrac{30}{62}.\dfrac{31}{64} = 8^x$, then value of x is

(a) -7 (b) -9

(c) -10 (d) -12

Ans. (d)

Solution: We have

$$E = \frac{31!}{2^{31}(32!)} = \frac{1}{2^{31}(32)} = \frac{1}{2^{36}} = 2^{-36} = (2^3)^{-12} = 8^{-12}$$

Thus, $x = -12$.

Example 25: The value of

$$E = \frac{(1+17)\left(1+\frac{17}{2}\right)\left(1+\frac{17}{3}\right)\ldots\left(1+\frac{17}{19}\right)}{(1+19)\left(1+\frac{19}{2}\right)\left(1+\frac{19}{3}\right)\ldots\left(1+\frac{19}{17}\right)} \text{ is}$$

(a) 1 (b) ${}^{36}C_{17}$

(c) 2/19 (d) ${}^{36}C_{18}$

Ans. (a)

Solution: We have

$$(1+k)\left(1+\frac{k}{2}\right)\left(1+\frac{k}{3}\right)\ldots\left(1+\frac{k}{n}\right)$$

$$= \frac{(1+k)(2+k)(3+k)\ldots(n+k)}{(2)(3)\ldots(n)} = \frac{(n+k)!}{k!\,n!}$$

$$= {}^{n+k}C_k$$

Thus, both the numerator and the denominator of E equals ${}^{36}C_{17} = {}^{36}C_{19}$.

$\therefore\quad E = 1.$

Example 26: Kunal Gaba has n objects, each of weight w. He weighs them in pairs and finds the sum of the weights of all possible pairs is 120g. When his friend Rakshit weighs them in triplets, the sum of all possible weights is 240g. The value of n is

(a) 7 (b) 6

(c) 5 (d) 10

Ans. (b)

Solution: According to the given condition

$$({}^nC_2)\,(2w) = 120 \quad\Rightarrow\quad n(n-1)w = 120$$

and $\quad ({}^nC_3)\,(3w) = 240 \quad\Rightarrow\quad n(n-1)\,(n-2)w = 480$

Thus, $\quad \dfrac{n(n-1)(n-2)w}{n(n-1)w} = \dfrac{480}{120}$

$\Rightarrow\quad n - 2 = 4 \quad\Rightarrow\quad n = 6$

Example 27: If $[y]$ denote the greatest integer $\le y$, and $2\left[\dfrac{x}{8}\right]^2 + 3\left[\dfrac{x}{8}\right] = 20$, then x lies in the smallest interval $[a, b)$ where $b - a$ is equal to

(a) 6 (b) 5

(c) 4 (d) 8

Ans. (d)

Solution: $2\left[\dfrac{x}{8}\right]^2 + 3\left[\dfrac{x}{8}\right] - 20 = 0$

$$\Rightarrow \quad \left[\frac{x}{8}\right] = \frac{5}{2} \quad \text{or} \quad -4$$

As $\left[\frac{x}{8}\right]$ is an integer, we take

$$\left[\frac{x}{8}\right] = -4 \qquad \Rightarrow \qquad -4 \le x/8 < -3$$

$\Rightarrow -32 \le x < -24$. Thus, $a = -32$, and $b = -24$. Therefore, $b - a = 8$

Example 28: The sum $\sum_{i=0}^{m} \binom{10}{i}\binom{20}{m-i}$ (where $\binom{p}{q} = 0$ if $p < q$) is maximum where m is

(a) 5 (b) 10

(c) 15 (d) 20

Ans. (c)

Solution: We have $\sum_{i=0}^{m} \binom{10}{i}\binom{20}{m-i}$

= the number of ways of choosing m persons out of 10 men and 20 women

= the number of ways of choosing m persons out of 30 persons

= ${}^{30}C_m$

But ${}^{30}C_m$ is maximum for $m = 15$.

Example 29: Let T_n denote the number of triangles which can be formed by using the vertices of a regular polygon of n sides. If $T_{n+1} - T_n = 21$, then n equals

(a) 5 (b) 7

(c) 6 (d) 4

Ans. (b)

Solution: The number of triangles that can be formed by using the vertices of a regular polygon is ${}^nC_3$. That is, $T_n = {}^nC_3$

$$\begin{aligned}
\text{Now,} \quad T_{n+1} - T_n &= 21 \\
\Rightarrow \quad {}^{n+1}C_3 - {}^nC_3 &= 21 \\
\Rightarrow \quad {}^nC_2 + {}^nC_3 - {}^nC_3 &= 21 \qquad [\because\ {}^{n+1}C_r = {}^nC_{r-1} + {}^nC_r] \\
\Rightarrow \quad \frac{1}{2}\, n(n-1) &= 21 \quad \Rightarrow \quad n = -6 \text{ or } 7.
\end{aligned}$$

As n is a positive integer, $n = 7$.

Example 30: An eight digit number divisible by 9 is to be formed by using 8 digits out of the digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 without replacement. The number of ways in which this can be done is

(a) 9! (b) 2(7!)

(c) 4(7!) (d) (36) (7!)

Ans. (d)

Solution: We have $0 + 1 + 2 + 3 \ldots + 8 + 9 = 45$

To obtain an eight digit number exactly divisible by 9, we must not use either (0, 9) or (1, 8) or (2, 7) or (3, 6) or (4, 5). [Sum of the remaining eight digits is 36 which is exactly divisible by 9.]

When, we do not use (0, 9), then the number of required 8 digit numbers is 8!.

When one of (1, 8) or (2, 7) or (3, 6) or (4, 5) is not used, the remaining digits can be arranged in 8!– 7! ways.{0 cannot be at extreme left.}

Hence, there are 8! + 4(8! – 7!) = (36) (7!) numbers in the desired category.

Example 31: The number of rational numbers lying in the interval (2015, 2016) all whose digits after the decimal point are non-zero and are in decreasing order is

(a) $\sum_{i=1}^{9} {}^9P_i$ (b) $\sum_{i=1}^{10} {}^9P_i$

(c) $2^9 - 1$ (d) $2^{10} - 1$

Ans. (c)

Solution: A rational number of the desired category is of the form 2015. $x_1\, x_2 \ldots x_k$ where $1 \le k \le 9$ and $9 \ge x_1 > x_2 > \ldots > x_k \ge 1$. We can choose k digits out 9 in ${}^9C_k$ ways and arrange them in decreasing order in just one way. Thus, the desired number of rational numbers is ${}^9C_1 + {}^9C_2 + \ldots + {}^9C_9 = 2^9 - 1$.

Example 32: The number of functions f from the set $A = \{0, 1, 2\}$ in to the set $B = \{0, 1, 2, 3, 4, 5, 6, 7\}$ such that $f(i) \le f(j)$ for $i < j$ and $i, j \in A$ is

(a) ${}^8C_3$ (b) ${}^8C_3 + 2({}^8C_2)$

(c) ${}^{10}C_3$ (d) ${}^{10}C_4$

Ans. (c)

Solution: A function $f : A \to B$ such that $f(0) \le f(1) \le f(2)$ falls in one of the following four categories.

Case 1 $f(0) < f(1) < f(2)$

There are ${}^8C_3$ functions in this category.

Case 2 $f(0) = f(1) < f(2)$

There are ${}^8C_2$ functions in this category.

Case 3 $f(0) < f(1) = f(2)$

There are again ${}^8C_2$ functions in this category.

Case 4 $f(0) = f(1) = f(2)$

There are ${}^8C_1$ functions in this category.

Thus, the number of desired functions is

$${}^8C_3 + {}^8C_2 + {}^8C_2 + {}^8C_1 = {}^9C_3 + {}^9C_2 = {}^{10}C_3.$$

Example 33: The number of positive integral solution of the equation $x_1\, x_2\, x_3\, x_4\, x_5 = 1050$ is

(a) 1800 (b) 1600
(c) 1400 (d) none of these

Ans. (d)

◎ **Solution:** Using prime factorization of 1050, we can write the given equation as

$$x_1\, x_2\, x_3\, x_4\, x_5 = 2 \times 3 \times 5^2 \times 7$$

We can assign 2, 3 or 7 to any of 5 variables. We can assign entire 5^2 to just one variable in 5 ways or can assign $5^2 = 5 \times 5$ to two variables in ${}^5C_2$ ways. Thus, 5^2 can be assigned in

$$ {}^5C_1 + {}^5C_2 = 5 + 10 = 15 \text{ ways}$$

Thus, the required number of solutions is $5 \times 5 \times 5 \times 15 = 1875$.

◉ **Example 34:** The number of ways in which we can arrange the digits 1, 2, 3, …, 9 such that the product of five digits at any of the five consecutive positions is divisible by 7 is

(a) 7! (b) ${}^9P_7$
(c) 8! (d) 5(7!)

Ans. (c)

◎ **Solution:** Let an arrangement of 9 digit number be $x_1\, x_2\, x_3\, x_4\, x_5\, x_6\, x_7\, x_8\, x_9$. Note that we require product of each of $(x_1, x_2, x_3, x_4, x_5)$; $(x_2, x_3, x_4, x_5, x_6)$; …; $(x_5, x_6, x_7, x_8, x_9)$ is divisible by 7.

This is possible if the 5th digit is 7.

Therefore, we can arrange the 9 digits in desired number of ways in 8! ways.

◉ **Example 35:** Let X be a set containing n elements. The number of reflexive relations that can be defined on X is

(a) 2^{n^2} (b) $2^{n^2 - n}$
(c) $n(2^{n^2 - n})$ (d) $n(2^{n^2})$

Ans. (b)

◎ **Solution:** Let $X = \{x_1, x_2, \ldots x_n\}$. The set $X \times X$ contains n^2 elements. A reflexive relation R on X must contain (x_i, x_i) for $1 \le i \le n$, i.e. R must contain the n elements (x_1, x_1), (x_2, x_2) . . . (x_n, x_n) and any subset of the set containing remaining $n^2 - n$ elements. Therefore, the number of reflexive relations that can be defined on X is $2^{n^2 - n}$

◉ **Example 36:** Suppose X contains m elements and Y contain n elements. The number of functions from X to Y is

(a) nm (b) n^m
(c) ${}^nP_m$ (d) ${}^nC_m$

Ans. (b)

◎ **Solution:** Let $X = \{x_1, x_2, \ldots x_m\}$ and

$$Y = \{y_1, y_2, \ldots y_n\}$$

For each x_i $(1 \le i \le m)$ we have n possible images. Therefore, the number of functions from X to Y is n^m.

◉ **Example 37:** Three boys and three girls are to be seated around a circular table. Among them the boy X does not want any girl as a neighbour and girl Y does not want any boy as a neighbour. The number of possible arrangement is:

(a) 9 (b) 4
(c) 8 (d) 6

Ans. (b)

◎ **Solution:** Clearly X should sit between the two remaining boys and Y should sit between the remaining two girls. We have to arrange two groups $\boxed{B_1\ X\ B_2}$ and $\boxed{G_1\ Y\ G_2}$ along a circle. This can be done is (2 – 1)! ways. But group of boys (girls) can be arranged in 2! ways. Thus, the required number of ways is (2) (2) (1) = 4 ways.

◉ **Example 38:** If ${}^nC_r : {}^nC_{r+1} : {}^nC_{r+2} = 1 : 2 : 3$, then r is equal to

(a) 5 (b) 4
(c) 3 (d) 0

Ans. (b)

◎ **Solution:** $\dfrac{2}{1} = \dfrac{{}^nC_{r+1}}{{}^nC_r} = \dfrac{n-r}{r+1}$

$$\text{and} \qquad \frac{3}{2} = \frac{n-r-1}{r+2}$$

$$\Rightarrow \qquad \frac{3}{2} = \frac{2(r+1)-1}{r+2} \qquad [\because\ n - r = 2(r+1)]$$

$$\Rightarrow \qquad 3r + 6 = 4r + 2 \Rightarrow r = 4.$$

◉ **Example 39:** The number of ways selecting three numbers from 1 to 30, so as to exclude every selection of three consecutive number is:

(a) 4030 (b) 4031
(c) 4032 (d) 4035

Ans. (c)

◎ **Solution:** The numbers of ways of selecting 3 number out of 30 is ${}^{30}C_3$. But this include 28 ways of selecting 3 consecutive numbers. [viz (1, 2, 3), (2, 3, 4), 3, 4, 5), ..., (28, 29, 30)]

Thus, required number of ways is ${}^{30}C_3 - 28 = 4032$.

◉ **Example:40:** If all permutations of the letters of the word P E N C I L are arranged as in a dictionary, then 413th word is

(a) L I C N E P (b) L I C N P E
(c) L I C P N E (d) L I C P E N

Ans. (d)

◎ **Solution:** Letters in the word PENCIL are C, E, I, L, N, P.

There are 5! words each beginning with C, E and I. That is, there are 3(5!) = 360 words beginning with C, E, I

Words beginning with L have serial numbers 361 to 480. 4! = 24 words beginning with LC have serial numbers 361 to 384. Words beginning with LE are numbered from 385 to 408. Words beginning with LIC are numbered from 409 to 414. Now 414th word is L I C P N E and 413th word is L I C P E N.

Example: 41: Out of 10 consonants and 4 vowels, words with 6 consonants and 3 vowels are formed. The number of such words is

(a) $\frac{7}{11}(12!)$ (b) $\frac{9}{10}(12!)$

(c) $\frac{7}{10}(11!)$ (d) $\frac{4}{5}(12!)$

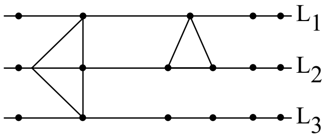
Ans. (a)

Solution: The number of ways of choosing 6 consonants out of 10 is ${}^{10}C_6$ and 3 vowels out of 4 in ${}^{4}C_3$. Thus number of such words is $({}^{10}C_4)\,({}^{4}C_3)\,({}^{9}P_9) = \frac{7}{11}(12!)$

Example: 42: Let L_1, L_2, L_3 be three distinct parrallel lines in the *XY*-plane, *p* distinct the points are taken on each of the three lines. The maximum number of triangles than can be formed by these $3p$ points is:

(a) $p^2(4p-3)$ (b) $p^3 + 3({}^{p}C_2)$
(c) $p^2(3p-4)$ (d) $(p+1)^3 - 1$

Ans. (a)



Solution: To obtain a triangle we may take one point from each of the three lines. This will give us p^3 triangles. Alternatively, we may choose two lines and take one point on one of them and two points on the other line. This will give us

$({}^{3}C_2)\,(2!)\,(p)\,({}^{p}C_2) = 3p^2\,(p-1)$ triangles

$\therefore$ required number of triangles is $p^3 + 3p^2\,(p-1) = p^2(4p-3)$

Alternative Solution

Choose three points not on the same lines. Number of ways $= {}^{3p}C_3 - 3({}^{p}C_3) = p^2(4p-3)$

Example : 43: The number of ways of selecting 4 letters out of the letters of the word MINIMAL is

(a) 16 (b) 17
(c) 18 (d) 20

Ans. (b)

Solution: Letters of the word , M I N I M A L are (*M*, *M*) (*I*, *I*), *A*, *N*, *L*

We can select 4 letters from letters of the word MINIMAL as follows:

Case 1 All letters are distinct.
This can be done in ${}^{5}C_4 = 5$ ways

Case 2 Exactly two letters are identical.
We can choose two identical letters in ${}^{2}C_1$ ways and two remaining distinct letters in ${}^{4}C_2 = 6$ ways
$\therefore$ In this case the selection can be made in (2) (6) = 12 ways.

Case 3 Two pairs of identical letters are selected.
This can be done in ${}^{2}C_2 = 1$ way
$\therefore$ two number of ways
$= 5 + 12 + 1 = 17$.

Example 44: Let $S = \left\{\begin{bmatrix} 18 & a \\ b & 25 \end{bmatrix} : a, b \in \mathbf{N}\right\}$

The number of singular matrices in *S* is

(a) 18 (b) 25
(c) 450 (d) infinite

Ans: (a)

Solution: det $\begin{bmatrix} 18 & a \\ b & 25 \end{bmatrix} = 2 \times 3^2 \times 5^2 - ab = 0$

$\Leftrightarrow \quad ab = 2 \times 3^2 \times 5^2$

$\Leftrightarrow \quad a \mid 2 \times 3^2 \times 5^2$

That is *a* is a divisor of $2 \times 3^2 \times 5^2$

Therefore, *a* is of the form $2^a\, 3^b\, 5^g$ where $\alpha \in \{0, 1\}$, $\beta, \gamma \in \{0, 1, 2\}$.

Thus number of elements in *S* is $2 \times 3 \times 3 = 18$.

Example 45: The number of positive integers *n* such that 2^n divides $n!$ is

(a) exactly 1 (b) exactly 2
(c) infinite (d) none of these

Ans. (d)

Solution: The exponent of 2 in $n!$ is given by

$$E = \left[\frac{n}{2}\right] + \left[\frac{n}{2^2}\right] + \left[\frac{n}{2^3}\right] + \dots$$

where $[x]$ denotes greatest integer $\le x$, As $[x] \le x \;\forall\; x$, $\left[\frac{n}{2^m}\right] = 0$ after finite number of terms. Thus we get

$$E < \frac{n}{2} + \frac{n}{2^2} + \frac{n}{2^3} + \dots = \frac{n/2}{1 - 1/2} = n$$

Thus, there is no positive integer for which 2^n divides $n!$

Example 46: The range of the function ${}^{7-x}\mathrm{P}_{x-3}$ is

(a) $\{1, 2, 3, 4\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{1, 2, 3\}$ (d) $\{1, 2, 3, 4, 5\}$

Ans. (c)

Solution: We must have $7 - x \ge 1$, $x - 3 \ge 0$ and $x - 3 \le 7 - x$

$\Rightarrow \quad x \le 6$, $x \ge 3$ and $x \le 5$

Thus, $\quad 3 \le x \le 5$.

$\therefore \quad$ Range of ${}^{7-x}\mathrm{P}_{x-3}$ is $\{{}^{4}P_0, {}^{3}P_1, {}^{2}P_2\} = \{1, 3, 2\}$

Example 47: The value of $^{50}C_4 + \sum_{r=1}^{6} {}^{56-r}C_3$ is

(a) $^{56}C_3$ (b) $^{56}C_4$
(c) $^{55}C_4$ (d) $^{55}C_3$

Ans. (b)

Solution: $^{50}C_4 + \sum_{r=1}^{6} {}^{56-r}C_3$

$$
\begin{aligned}
&= {}^{50}C_4 + ({}^{55}C_3 + {}^{54}C_3 + \ldots + {}^{50}C_3)\\
&= ({}^{50}C_4 + {}^{50}C_3) + ({}^{51}C_3 + \ldots + {}^{55}C_3)\\
&= ({}^{51}C_4 + {}^{51}C_3) + ({}^{52}C_3 + \ldots + {}^{55}C_3)\\
&= ({}^{52}C_4 + {}^{52}C_3) + ({}^{53}C_3 + \ldots + {}^{55}C_3)\\
&= \ldots\ldots\\
&= {}^{56}C_4
\end{aligned}
$$

Example 48: A class consists of 4 boys and g girls. Every Sunday five students, including at least three boys go for a picnic to Appu Ghar, a different group being sent every week. During, the picnic, the class teacher gives each girl in the group a doll. If the total number of dolls distributed was 85, then value of g is

(a) 15 (b) 12
(c) 8 (d) 5

Ans. (d)

Solution: Number of groups having 4 boys and 1 girl

$$= ({}^4C_4)\,({}^gC_1) = g$$

and number of groups having 3 boys and 2 girls

$$= ({}^4C_3)\,({}^gC_2) = 2g(g-1)$$

Thus, the number of dolls distributed

$$= g(1) + (2)\,[2g\,(g-1)] = 4g^2 - 3g$$

We are given $4g^2 - 3g = 85 \quad \Rightarrow \quad g = 5$.

Example 49: Sum of the factors of 9! which are odd and are of the form $3m + 2$, where m is a natural number is

(a) 40 (b) 45
(c) 51 (d) 54

Ans. (a)

Solution: We have $9! = 2^7 \times 3^4 \times 5 \times 7$

Odd factors of the form $3m + 2$ are neither multiples of 2 nor multiples of 3. So the factors may be 1, 5, 7, 35 of which just 5 and 35 are of the form $3m + 2$. Their sum is 40.

Example 50: Sum of all three digit numbers (no digit being zero) having the property that all digits are perfect squares, is

(a) 3108 (b) 6216
(c) 13986 (d) none of these

Ans. (c)

Solution: The non-zero perfect square digits are 1, 4 and 9.
1 can occur at units place in $3 \times 3 = 9$ ways.

$\therefore$ Sum due to 1 at units place is 1×9. Similarly, sum due to 1 at tens place is $1 \times 10 \times 9$ and sum due to 1 at hundreds place is $1 \times 100 \times 9$. We can deal with the digits 4 and 9 in a similar way.

Thus, sum of the desired number is

$$(1 + 4 + 9)\,(1 + 10 + 100)\,(9) = 13986$$

Example 51: The number of ordered pairs (m, n), $m, n \in \{1, 2, \ldots, 100\}$ such that $7^m + 7^n$ is divisible by 5 is

(a) 1250 (b) 2000
(c) 2500 (d) 5000

Ans. (c)

Solution: Note that 7^r $(r \in \boldsymbol{N})$ ends in 7, 9, 3 or 1 (corresponding to $r = 1, 2, 3$ and 4 respectively.)
Thus, $7^m + 7^n$ cannot end in 5 for any values of $m, n \in \boldsymbol{N}$. In other words, for $7^m + 7^n$ to be divisible by 5, it should end in 0.
For $7^m + 7^n$ to end in 0, the forms of m and n should be as follows:

	m	n
1	$4r$	$4s + 2$
2	$4r + 1$	$4s + 3$
3	$4r + 2$	$4s$
4	$4r + 3$	$4s + 1$

Thus, for a given value of m there are just 25 values of n for which $7^m + 7^n$ ends in 0. [For instance, if $m = 4r$, then $n = 2, 6, 10, \ldots, 98$]
$\therefore$ there are $100 \times 25 = 2500$ ordered pairs (m, n) for which $7^m + 7^n$ is divisible by 5.

Example 52: An n-digit number is a positive number with exactly n digits. Nine hundred distinct n-digit numbers are to be formed using only three digits 2, 5 and 7. The smallest value of n for which this is possible is

(a) 6 (b) 7
(c) 8 (d) 9

Ans. (b)

Solution: The number of n-digit distinct numbers that can be formed using digits 2, 5 and 7 is 3^n. We have to find n, so that $3^n \geq 900$

$\Rightarrow \quad 3^{n-2} \geq 100 \quad \Rightarrow \quad n - 2 \geq 5 \quad \Rightarrow \quad n \geq 7.$

Thus, the smallest value of n is 7.

Example 53: The number of ways of arranging p numbers out of 1, 2, 3, …, q so that maximum is q–2 and minimum is 2 (repetition of number is allowed) such that maximum and minimum both occur exactly once, $(p > 5, q > 3)$ is

(a) $^{p-3}C_{q-2}$ (b) $^pC_2\,(q-3)^{q-1}$
(c) $^pC_2 \times {}^qC_3$ (d) $p(p-1)\,(q-5)^{p-2}$

Ans. (d)

◎ **Solution:** First we take one of the numbers as 2 and one another as $q-2$. We can arrange these two numbers in $p(p-1)$ ways. We have to choose remaining $p-2$ numbers from the numbers 3, 4, …, $q-4$, $q-3$. This can be done in $(q-5)^{p-2}$ ways.

Thus, the total number of ways of arranging the numbers in desired way is

$$p(p-1)\,(q-5)^{p-2}.$$

● **Example 54:** The number of ways of selecting 4 cards of an ordinary pack of playing cards so that exactly 3 of them are of the same denomination is

(a) 2496 (b) ${}^{13}C_3 \times {}^{4}C_3 \times 48$
(c) ${}^{52}C_3 \times 48$ (d) none of these

Ans. (a)

◎ **Solution:** We can choose one denomination in ${}^{13}C_1$ ways, then 3 cards of this denomination can be chosen in ${}^{4}C_3$ ways and one remaining card can be chosen in ${}^{48}C_1$ ways. Thus, the total number of choices is $({}^{13}C_1)\,({}^{4}C_3)\,({}^{48}C_1) = 13 \times 4 \times 48 = 2496$.

● **Example 55:** The number of integers x, y, z, w such that $x + y + z + w = 20$ and $x, y, z, w \geq -1$, is

(a) ${}^{24}C_3$ (b) ${}^{25}C_3$
(c) ${}^{26}C_3$ (d) ${}^{27}C_3$

Ans. (d)

◎ **Solution:** Put $x = a-1$, $y = b-1$, $z = c-1$, $w = d-1$, then $a, b, c, d \geq 0$ and $(a-1) + (b-1) + (c-1) + (d-1) = 20$

$$\Rightarrow \qquad a + b + c + d = 24$$

The number of non-negative integral solutions of this equation is

$$^{24+4-1}C_{4-1} = {}^{27}C_3$$

● **Example 56:** If 20% of three subsets (i.e., subsets containing exactly three elements) of the set $A = \{a_1, a_2, \ldots, a_n\}$ contain a_1, then value of n is

(a) 15 (b) 16
(c) 17 (d) 18

Ans. (a)

◎ **Solution:** The number of subsets of A containing exactly three elements is ${}^{n}C_3$ whereas the number of three subsets of A that contain a_1, is ${}^{n-1}C_2$. We are given,

$$^{n-1}C_2 = \frac{20}{100}\left({}^{n}C_3\right)$$

$$\Rightarrow \frac{(n-1)(n-2)}{2} = \frac{1}{5}\,\frac{n(n-1)\,(n-2)}{(6)} \Rightarrow n = 15.$$

● **Example 57:** There are three piles of identical yellow, black and green balls and each pile contains at least 20 balls. The number of ways of selecting 20 balls if the number of black balls to be selected is twice the number of yellow balls, is

(a) 6 (b) 7
(c) 8 (d) 9

Ans. (b)

◎ **Solution:** Let the number of yellow balls be x, that of black be $2x$ and that of green be y. Then

$$x + 2x + y = 20 \text{ or } 3x + y = 20$$

$$\Rightarrow \qquad y = 20 - 3x.$$

As $0 \leq y \leq 20$, we get $0 \leq 20 - 3x \leq 20$

$$\Rightarrow \quad 0 \leq 3x \leq 20 \quad \text{or} \quad 0 \leq x \leq 6$$

$\therefore$ The number of ways of selecting the balls is 7.

● **Example 58:** The total number of permutations of n (>1) different things taken not more that r at a time, when a thing may be repeated any number of times, is

(a) $\dfrac{n}{n-1}(n^r - 1)$ (b) $\dfrac{n^{r-1}}{n-1}$

(c) $\dfrac{n^r + 1}{n+1}$ (d) $\dfrac{n^r + n}{n-1}$

Ans. (a)

◎ **Solution:** When k $(1 \leq k \leq r)$ things are arranged, the number of possible arrangements, when repetition is allowed is

$$\underbrace{n \times n \times \ldots\ldots \times n}_{k \text{ times}} = n^k$$

Thus, the total possible arrangements is

$$n + n^2 + n^3 + \ldots + n^r = \frac{n\,(n^r - 1)}{n-1}.$$

● **Example 59:** The exponent of 7 in the prime factorization of ${}^{100}C_{50}$ is

(a) 0 (b) 2
(c) 4 (d) none of these

Ans. (a)

◎ **Solution:** We have ${}^{100}C_{50} = \dfrac{100!}{50!50!}$.

The exponent of 7 in 50! is $\left[\dfrac{50}{7}\right] + \left[\dfrac{50}{7^2}\right] = 7 + 1 = 8$,

and the exponent of 7 in 100! is $\left[\dfrac{100}{7}\right] + \left[\dfrac{100}{7^2}\right]$

$= 14 + 2 = 16$

Thus, exponent of 7 in the prime factorization of ${}^{100}C_{50}$ is $16 - 2(8) = 0$.

● **Example 60:** In a certain test there are n questions. In this test 2^k students gave wrong answers to at least $(n-k)$ questions, where $k = 0, 1, 2, \ldots, n$. If the total number of wrong answers is 4095, then value of n is

(a) 11 (b) 12
(c) 13 (d) 15

Ans. (b)

Solution: The number of students answering at least r questions incorrectly is 2^{n-r}.

$\therefore$ the number of students answering exactly r $(1 \le r \le n-1)$ questions incorrectly is $2^{n-r} - 2^{n-(r+1)}$.

Also, the number of students answering all questions wrongly is $2^0 = 1$.

Thus, the total number of wrong answers is

$$1(2^{n-1} - 2^{n-2}) + 2(2^{n-2} - 2^{n-3}) + 3(2^{n-3} - 2^{n-4}) + \dots + (n-1)(2^1 - 2^0) + n(2^0)$$

$$= 2^{n-1} + 2^{n-2} + \dots + 2^0 = 2^n - 1.$$

Now, $2^n - 1 = 4095 \Rightarrow 2^n = 4096 = 2^{12} \Rightarrow n = 12$.

Example 61: The number of ways of permuting letters of the word ENDEANOEL so that none of the letters D, L, N occurs in the last five positions is

(a) 5! (b) 2(5!)
(c) 7(5!) (d) 21(5!)

Ans. (b)

Solution: Letters of the word ENDEANOEL are

$$3E\text{'s}, 2N\text{'s}, 1D, 1O, 1L, 1A$$

Letters D, L, N can be permuted at first 4 places in $\frac{4!}{2!}$ ways and the remaining letters can be permuted $\frac{5!}{3!}$ ways.

$\therefore$ required number of ways $\frac{4!}{2!} \times \frac{5!}{3!} = 2(5!)$

Example 62: Sum of the series $\sum_{r=1}^{n} (r^2 + 1)(r!)$ is

(a) $(n + 1)!$ (b) $(n + 2)! - 1$
(c) $n(n + 1)!$ (d) none of these

Ans. (c)

Solution: We can write

$$r^2 + 1 = (r + 2)(r + 1) - 3(r + 1) + 2$$

Thus, $$\sum_{r=1}^{n} (r^2 + 1)(r!) = \sum_{r=1}^{n} [(r + 2)(r + 1) - (r + 1) - 2\{(r + 1) - 1\}]\, r!$$

$$= \sum_{r=1}^{n} [(r + 2)! - (r + 1)!] - 2\sum_{r=1}^{n} \{(r + 1)! - r!\}$$

$$= (n + 2)! - 2! - 2\{(n + 1)! - 1\} = n(n + 1)!$$

Example 63: If letters of the word SACHIN are arranged in all possible ways and are written out as in a dictionary, then the word SACHIN appears at serial number

(a) 603 (b) 602
(c) 601 (d) 600

Ans. (c)

Solution: Letters appearing in the word SACHIN are

$$A, C, H, I, N, S$$

The words beginning with letters A, C, H, I and N appear before the word SACHIN.

There are 5(5!) = 600 words beginning with A, C, H, I and N.

Word SACHIN appears is the first word beginning with S. Therefore, SACHIN appears at serial number 601.

Example 64: The set $S = \{1, 2, 3, \dots 12\}$ is to be partitioned into three sets A, B, C of equal size. Thus $A \cup B \cup C = S$, $A \cap B = B \cap C = C \cap A = \phi$. The number of ways to partition S is

(a) $\frac{12!}{3!(4!)^3}$ (b) $\frac{12!}{3!(3!)^3}$

(c) $\frac{12!}{(4!)^3}$ (d) $\frac{12!}{(3!)^4}$

Ans. (a)

Solution: Each of the three sets A, B, C contains exactly 4 elements.

Thus, the number of ways of partitioning the set S is

$$\frac{1}{3!}\left({}^{12}C_4\right)\left({}^{8}C_4\right)\left({}^{4}C_4\right) = \frac{1}{3!}\,\frac{12!}{4!\,8!} \times \frac{8!}{4!\,4!}(1) = \frac{12!}{3!\,(4!)^3}$$

Example 65: Ten letters of an alphabet are given. Words with five letters are formed by these given letters. Then the number of words which have at least one letter repeated is

(a) 69760 (b) 30240
(c) 99748 (d) none of these

Ans. (a)

Solution: Number of five letter words that can be formed from 10 letters

$$= 10 \times 10 \times 10 \times 10 \times 10 = 10^5$$

Number of five letter words that have none of their letter repeated

$$= {}^{10}P_5 = 10 \times 9 \times 8 \times 7 \times 6 = 30240$$

$\therefore$ Number of words which have at least one letter repeated

$$= 10^5 - 30240 = 69760$$

Example 66: The number of ways in which six '+' and four '–' signs can be arranged in a line such that no two '–' signs occur together is

(a) 30 (b) 35
(c) 6!5! (d) 10!

Ans. (b)

◎ **Solution:** Six '+' signs can be arranged in just one way. There are seven places for '–' signs as shown in the following figure marked with X.

$$X + X + X + X + X + X + X$$

We can choose 4 places out of 7 in ${}^7C_4 = 35$ ways.

◉ **Example 67:** The remainder when $x = 1! + 2! + 3! + 4! + \ldots + 100!$ is divided by 240, is

(a) 153 (b) 33
(c) 73 (d) 187

Ans. (a)

◎ **Solution:** For $r \geq 6$; $r!$ is divisible by 240. Thus, when x is divided by 240, the remainder is $1! + 2! + \ldots + 5! = 153$.

◉ **Example 68:** If $x \in \boldsymbol{N}$ and ${}^{x-1}C_4 - {}^{x-1}C_3 < \frac{5}{4}\,({}^{x-2}P_2)$, then x can take

(a) 8 values (b) 7 values
(c) 6 values (d) none of these

Ans. (b)

◎ **Solution:** For $1 \leq x \leq 3$, each of ${}^{x-1}C_4$, ${}^{x-1}C_3$ and ${}^{x-2}P_2$ is zero. For $x = 4$, ${}^{x-1}C_4 = 0$, ${}^{x-1}C_3 = 1$ and ${}^{x-2}P_2 = 2$ and the inequality is valid trivally. For $x \geq 5$, we have

$$\frac{{}^{x-1}C_4}{{}^{x-2}P_2} - \frac{{}^{x-1}C_3}{{}^{x-2}P_2} < \frac{5}{4}$$

$$\Rightarrow \quad \frac{(x-1)(x-4)}{4!} - \frac{x-1}{3!} < \frac{5}{4}$$

$$\Rightarrow \quad x^2 - 9x - 22 < 0 \Rightarrow (x - 11)\,(x + 2) < 0$$

$$\Rightarrow \quad x - 11 < 0 \;[\because x + 2 > 0]$$

Thus, $5 \leq x < 11$. Hence, x can take 7 values viz. 4, 5, 6, 7, 8, 9 and 10.

◉ **Example 69:** The total number of ways in which 5 balls of different colours can be distributed among three persons so that each person gets at least one ball is:

(a) 75 (b) 150
(c) 210 (d) 243

Ans. (b)

◎ **Solution:** 5 balls can be distributed to 3 persons by giving (2, 2, 1) balls or by giving (3, 1, 1) balls. Each of the above distribution has three such ways. Thus, the required number of ways

$$= (3)\,({}^5C_2)\,({}^3C_2)\,({}^1C_1) + 3({}^5C_3)\,({}^2C_1)\,({}^1C_1)$$
$$= (3)\,(10)\,(3)\,(1) + (3)\,(10)\,(2)\,(1) = 150$$

◉ **Example 70:** Let $n \geq 2$ be an integer. Take n distinct points on a circle and join each pair of points by a line segment. Colour the line segment joining every pair of adjacent points by blue and rest by red. If the number of red and blue line segments are equal than value of n is

(a) 4 (b) 5
(c) 6 (d) 7

Ans. (b)

◎ **Solution:** Total number of line segments is ${}^nC_2$. The number of line segments joining adjacent points is n and number of lines joining non-adjacent points in ${}^nC_2 - n$. We are given

$${}^nC_2 - n = n \Rightarrow \frac{1}{2}\,n(n - 1) = 2n$$

$$\Rightarrow \qquad n = 5.$$

◉ **Example 71:** The number of seven digit integers, with sum of the digits equal to 10 and formed by using the digits 1, 2 and 3 only, is

(a) 55 (b) 66
(c) 77 (d) 88

Ans. (c)

◎ **Solution:** Let x_i $(1 \leq i \leq 7)$ be the digit at the ith place. As $1 \leq x_i \leq 3$, and $x_1 + x_2 + \ldots + x_7 = 10$, at most one x_i can be 3.

Two cases arise.

Case 1.

Exactly one of x_i's is 3. In this case exactly one of the remaining x_i's is 2.

In this case, the number of seven digit numbers is

$$\frac{7!}{5!} = 7 \times 6 = 42$$

Case 2.

None of x_i's is 3.

In this case exactly three of x_i's is 2 and the remaining four x_i's are 1.

In this case, the number of seven digit number is

$$\frac{7!}{3!4!} = 35$$

Hence, the required seven digit numbers is 42 + 35 = 77.

◉ **Example 72:** Let $S = \{1, 2, 3, 4\}$. The total number of unordered pairs of disjoint subsets of S is equal to

(a) 25 (b) 34
(c) 42 (d) 41

Ans. (d)

◎ **Solution:** Let A and B be two subsets of S. If $x \in S$, then x will not belong to $A \cap B$ if x belongs to at most one of A, B. This can happen in 3 ways.

Thus, there are $3^4 = 81$ subsets of S for which $A \cap B = \phi$.

Out of these there is just one way for which $A = B = \phi$.

As, we, are interested in unordered pairs of disjoint sets, the number of such subsets is

$$\frac{1}{2}\left(3^4 - 1\right) + 1 = 41.$$

Example 73: How many different words can be formed by jumbling the letters in the word MISSISSIPPI in which no two S are adjacent?

(a) $(8)\left({}^6C_4\right)\left({}^7C_4\right)$ (b) $(6)(7)\left({}^8C_4\right)$

(c) $(6)(8)\left({}^7C_4\right)$ (d) $(7)\left({}^6C_4\right)\left({}^8C_4\right)$

Ans. (d)

Solution: We can permute M, I, I, I, I, P, P in $\frac{7!}{4!2!}$ ways. Corresponding to each arrangement of these seven letters, we have 8 places where S can be arranged as shown below with X.

$$X \square X \square X \square X \square X \square X \square X \square$$

We can choose 4 places out of 8 in ${}^8C_4$ ways.
Thus, the required number of ways

$$= ({}^8C_4)\left(\frac{7!}{4!2!}\right) = (7)\left({}^8C_4\right)\left({}^6C_4\right)$$

Example 74: From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on a shelf so that the dictionary is always in the middle. Then the number of such arrangement is

(a) at least 750 but less than 1000
(b) at least 1000
(c) less than 500
(d) at least 500 but less than 750

Ans. (b)

Solution: We can choose 4 novels out of 6 in ${}^6C_4$ ways and 1 dictionary out of 3 in $3C_1$ ways. We can arrange 4 novels and 1 dictionary in the middle in 4! ways. Thus, required number of ways

$$= ({}^6C_4)\,({}^3C_1)\,(4!) = 1080 > 1000$$

Example 75: There are two urns. Urn A has 3 distinct red balls and urn B has 9 distinct blue balls. From each urn two balls are taken out and then transferred to the other. The number of ways in which this can be done is

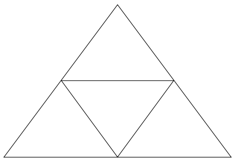
(a) 66 (b) 108
(c) 3 (d) 36

Ans. (b)

Solution: The number of ways of transferring the balls

$$= ({}^3C_2)\,({}^9C_2) = (3)\,(36) = 108$$

Example 76: The number of ways in which the diagram in Figure can be coloured so that each of the smaller triangle is painted with one of the three colours yellow, pink or green and no two adjacent regions are painted with the same colour, is



(a) 24 (b) 12
(c) 36 (d) 16

Ans. (a)

Solution: This can be done in the following ways:

(i) paint the central triangle with one of the three colours;
(ii) paint each of the remaining triangles with any one of the two remaining colours.

Thus, the required number of ways

$$= 3 \times 2 \times 2 \times 2 = 24.$$

Example 77: Four married couples are to be seated in a row having 8 chairs. The number of ways so that spouses are seated next to each other, is

(a) 72 (b) 186
(c) 384 (d) 516

Ans. (c)

Solution: Let us denote the four married couples of C_1, C_2, C_3 and C_4. We consider each couple as one unit. We can permute four units in 4! ways. Each couple can be seated in 2! ways. Thus, the required number of ways is

$$(4!)\,(2)\,(2)\,(2)\,(2) = 384.$$

Example 78: 25 lines are drawn in a plane such that no two of them are parallel and no three of them are concurrent. The number of points in which these lines intersect, is

(a) 300 (b) 315
(c) 325 (d) 450

Ans. (a)

Solution: The number of points in which the lines can intersect = the number of ways of choosing two lines out of 25

$${}^{25}C_2 = \frac{25 \times 24}{2} = 300.$$

Example 79: Letter of the word INDIANOIL are arranged in all possible ways. The number of permutations in which A, I, O occur only at odd places, is

(a) 720 (b) 360
(c) 240 (d) 120

Ans. (c)

Solution: A, I, I, I, O can occur at odd places in $\frac{5!}{3!}$ ways, and the remaining letters N, N, D, L can be arranged at the remaining places in $\frac{4!}{2!}$ ways.

Thus, the required number of ways $= \left(\frac{5!}{3!}\right)\left(\frac{4!}{2!}\right) = 240$ ways

Example 80: Let $a_n = \sum_{r=0}^{n} \frac{1}{\left({}^nC_r\right)^2}$ and $b_n = \sum_{r=0}^{n} \frac{(n-r)}{\left({}^nC_r\right)^2}$, then b_n equals

(a) a_n (b) na_n

(c) $\frac{n}{2}a_n$ (d) 0

Ans. (c)

◎ **Solution:** We have

$$b_n = \sum_{r=0}^{n} \frac{n-r}{\left({}^nC_r\right)^2} = \sum_{r=0}^{n} \frac{n-r}{\left({}^nC_{n-r}\right)^2} = \sum_{r=0}^{n} \frac{r}{\left({}^nC_r\right)^2}$$

Thus,

$$b_n + b_n = \sum_{r=0}^{n} \frac{n-r}{\left({}^nC_r\right)^2} + \sum_{r=0}^{n} \frac{r}{\left({}^nC_r\right)^2} = n \sum_{r=0}^{n} \frac{1}{\left({}^nC_r\right)^2} = n\,a_n$$

$$\Rightarrow \qquad b_n = \frac{n}{2} a_n .$$

◉ **Example 81:** A committee of at least three members is to be formed from a group of 6 boys and 6 girls such that it always has a boy and a girl.The number of ways to form such a committee is

(a) $2^{11} - 2^6 - 13$ (b) $2^{12} - 2^7 - 35$
(c) $2^{11} - 2^7 - 35$ (d) $2^{12} - 2^7 - 13$.

Ans. (b)

◎ **Solution:** Required number of ways

$$= ({}^6C_1 + {}^6C_2 + \cdots + {}^6C_6)\,({}^6C_1 + {}^6C_2 + \cdots {}^6C_6) - ({}^6C_1)\,({}^6C_1)$$
$$= (2^6-1)\,(2^6-1) - 36 = 2^{12} - 2^7 - 35$$

◉ **Example 82:** There are 10 points in a plane, out of these 6 are collinear. If N is the number of triangles formed by joining these points, then

(a) $N \le 100$ (b) $100 < N \le 140$
(c) $140 < N \le 190$ (d) $N > 190$.

Ans. (a)

◎ **Solution:** Number of triangles

$$= {}^{10}C_3 - {}^6C_3 = 120 - 20 = 100$$

◉ **Example 83:** Assuming the balls to be identical except for difference of colours the number of ways in which one or more ball can be selected from 10 white, 9 green and 7 black balls is:

(a) 629 (b) 630
(c) 879 (d) 880

Ans. (c)

◎ **Solution:** We can select 0 or more balls out of 10 white balls in 11 ways. [select 0 or 1 or 2 ⋯ or 10 white balls.] Thus, the number of ways of making a selection of 0 or more balls

$$= (1+10)\,(1+9)(1+7) = 880$$

Therefore, number of ways of selecting at least one ball = 880 – 1 = 879.

◉ **Example 84:** Let a_n = number of n-digit positive integers formed by the digits 0, 1 or both such that no consecutive digits in them is 0.

Let b_n = number of such n digit integers ending with digit 1, and c_n = the numner of such n digit integers ending with digit 0, then for $n \ge 3$,

(a) $a_n = b_{n-1} + c_{n-2}$ (b) $a_n = b_{n-1} + c_{n-1}$
(c) $a_n = b_{n-2} + c_{n-1}$ (d) $a_n = b_n + c_n$

Ans. (d)

◎ **Solution:** Note that all such numbers begin with 1.

If number ends in 1, then there $b_n = a_{n-1}$ such numbers. If number ends in 0, then $(n-1)$th digit cannot be 0 and thus, there are $c_n = a_{n-2}$ such numbers.

$$\therefore \qquad a_n = b_n + c_n = a_{n-1} + a_{n-2}$$

◉ **Example 85:** In Example 84, a_8 equals

(a) 21 (b) 34
(c) 38 (d) 41

Ans. (b)

◎ **Solution:** If # (S) = number of elements of S, then

$a_1 = 1,\ a_2 = \#\,\{10, 11\} = 2,$
$a_3 = \#\,\{101, 110, 111\} = 3$

Next, $a_n = b_n + c_n = a_{n-1} + a_{n-2}\ \forall\ n \ge 3,$
we get $a_4 = a_3 + a_2 = 5,$
$a_5 = a_4 + a_3 = 8,\ a_6 = 13,\ a_7 = 21$
and $a_8 = 34$

◉ **Example 86:** The number of natural numbers less than one million that can be formed by using the digits, 0, 2, and 3 is

(a) 728 (b) 726
(c) 730 (d) 732

Ans. (a)

◎ **Solution:** The number of k digit natural numbers formed by using the digit 0,2 and 3 is $2(3^{k-1})$.

∴ Number of natural numbers less than one million formed by 0,2 and 3 is

$$= 2 + (2)\,(3) + (2)\,(3^2) + 2(3^3) + 2(3^4) + 2(3^5)$$
$$= 728$$

Assertion-Reason Type Questions

◉ **Example 87:**

Statement-1:

The number of ways of distributing 10 identical balls in 4 distinct boxes such that no box is empty is ${}^9C_3$

Statement-2: The number of ways of choosing 3 places from 9 different place is ${}^9C_3$.

Ans. (b)

Solution: Let x_i = number of balls put in ith box, then $x_1 + x_2 + x_3 + x_4 = 10$ where $x_i \geq 1$.

Put $x_i = y_i + 1$, so that equation becomes

$y_1 + y_2 + y_3 + y_4 = 6$. where $y_i \geq 0$

Number of non-negative integral solution of the above equation = Number of ways of arranging 6 identical balls and 3 identical separators

$= \dfrac{(6+3)!}{6!3!} = {}^9C_3$ number of ways of choosing 3 places out of 9 different places.

Example 88: Statement-1: If n is a natural number then $\dfrac{(n^2)!}{(n!)^{n+1}}$ is a natural number.

Statement-2: The number of ways of dividing mn students into m groups each containing n students is $\dfrac{(mn)!}{m!(n!)^m}$

Ans. (a)

Solution: The number of ways of selecting students for the first group is ${}^{mn}C_n$; for the second group is ${}^{mn-n}C_n$ and so on.

$\therefore$ the number of ways of dividing (mn) students into m numbered groups is

$$({}^{mn}C_n)\,({}^{mn-n}C_n)\cdots({}^{n}C_n)$$

$$= \frac{(mn)!}{n!(mn-n)!}\,\frac{(mn-n)!}{n!(mn-2n)!}\cdots\frac{n!}{n!\,0!}$$

$$= \frac{(mn)!}{(n!)^m}$$

As groups are not to be numbered, the desired number of ways is $\dfrac{(mn)!}{m!(n!)^m}$

$\therefore$ Statement-2 is true.

For statement-1, put $m = n$.

Example 89: Let $n \in \boldsymbol{N}$, and

$$f(n) = \begin{vmatrix} n & n+1 & n+2 \\ {}^nP_n & {}^{n+1}P_{n+1} & {}^{n+2}P_{n+2} \\ {}^nC_n & {}^{n+1}C_{n+1} & {}^{n+2}C_{n+2} \end{vmatrix}$$

Statement-1: $f(n)$ is an integer for all $n \in \mathbf{N}$.

Statement-2: If elements of a determinant are integers, then determinant itself is an integer.

Ans. (a)

Solution: If each element of a determinant is an integer, then its each cofactor is an integer, and hence determinant itself is an integer.

Example 90: Statement-1: $\displaystyle\sum_{j=1}^{n}\sum_{k=j}^{n}\binom{n}{k}\binom{k}{j} = 3^n - 2^n$

Statement-2: $\displaystyle\sum_{k=1}^{n}\left({}^nC_k\right)^2 = {}^{2n}C_n$

Ans. (c)

Solution: $\displaystyle\binom{n}{k}\binom{k}{j} = \frac{n!}{k!(n-k)!}\,\frac{k!}{j!(k-j)!}$

$$= \frac{n!}{j!(n-j)!}\,\frac{(n-j)!}{(k-j)!\,(n-k)!}$$

$$= \binom{n}{j}\binom{n-j}{k-j}$$

Thus, $\displaystyle\sum_{j=1}^{n}\sum_{k=j}^{n}\binom{n}{k}\binom{k}{j} = \sum_{j=1}^{n}\binom{n}{j}\sum_{k=j}^{n}\binom{n-j}{k-j}$

But $\displaystyle\sum_{k=j}^{n}\binom{n-j}{k-j} = \sum_{l=0}^{n-j}\binom{n-j}{l} = 2^{n-j}$

$\therefore$ $\displaystyle\sum_{j=1}^{n}\sum_{k=j}^{n}\binom{n}{k}\binom{k}{j} = \sum_{j=1}^{n}\binom{n}{j}2^{n-j} = (2+1)^n - 2^n$

$$= 3^{\mathrm{n}} - 2^{\mathrm{n}}$$

Statement-2 is false as $\displaystyle\sum_{k=1}^{n}\left({}^nC_k\right)^2 = {}^{2n}C_n - 1$

Example 91: Statement-1: $T_n = \displaystyle\sum_{k=1}^{n} k\left({}^{2n}C_k\right) = 2^{2n-2}$

Statement-2: $\displaystyle\sum_{k=0}^{n} {}^{2n+1}C_k = 2^{2n}$

Ans. (d)

Solution: $\displaystyle 2\sum_{k=0}^{n} {}^{2n+1}C_k = \sum_{k=0}^{n} {}^{2n+1}C_k + \sum_{k=0}^{n} {}^{2n+1}C_k$

$$= \sum_{k=0}^{n} {}^{2n+1}C_k + \sum_{k=0}^{n} {}^{2n+1}C_{2n+1-k}$$

$$= \sum_{k=0}^{2n+1} {}^{2n+1}C_k = 2^{2n+1}$$

$\Rightarrow$ $\displaystyle\sum_{k=0}^{n} {}^{2n+1}C_k = 2^{2n}$

$\therefore$ Statement-2 is true.

Using $k({}^{2n}C_k) = 2n({}^{2n-1}C_{k-1})$, for $k \geq 1$, we get

$$T_n = 2n\sum_{k=1}^{n}\left({}^{2n-1}C_{k-1}\right) = 2n\sum_{j=0}^{n-1} {}^{2n-1}C_j$$

$$= 2n(2^{2n-2}) = n(2^{2n-1})$$

Example 92: Statement-1: The number of ways of distributing at most 12 toys to three children A_1, A_2 and A_3 so that A_1 gets at least one, A_2 at least three and A_3 at most five, is 145.

Statement-2: The number of non-negative integral solutions of $x_1 + x_2 + x_3 \le m$ is ${}^{m-1}P_2$.
Ans. (d)

Solution: Suppose A_i gets x_i toys, then

$$x_1 + x_2 + x_3 \le 12.$$

Let $\quad x_4 = 12 - (x_1 + x_2 + x_3)$, then

$$x_1 + x_2 + x_3 + x_4 = 12 \qquad (1)$$

The number of non-negative integral solutions of (1)

$= \text{coefficient of } t^{12} \text{ in } (t + t^2 + \cdots)(t^3 + t^4 + t^5 + \cdots)(1 + t + \cdots + t^5) \times (1 + t + t^2 + \cdots)$

$= \text{coefficient of } t^{12} \text{ in } t^4(1 - t^6)(1 - t)^{-4}$

$= \text{coefficient of } t^8 \text{ in } (1 - t^6)(1 + {}^4C_1 t + {}^5C_2 t^2 + \cdots)$

$= {}^{11}C_8 - {}^5C_2 = 165 - 10 = 155$

Statement-2 is false as the number of non-negative integral solutions of

$$x_1 + x_2 + x_3 \le m$$

equals the number of non-negative integral solution of

$$x_1 + x_2 + x_3 + x_4 = m,$$

which equals ${}^{m+3}C_m$.

LEVEL 2

Straight Objective Type Questions

Example 93: The letters of the word COCHIN are permuted and all the permutations are arranged in an alphabetical order as in an English dictionary. The number of words that appear before COCHIN is

(a) 360 (b) 192
(c) 96 (d) 48

Ans. (c)

Solution: Letters appearing in the word COCHIN are

$$C, C, H, I, N, O$$

Words appearing before COCHIN are of the form

$$C\,X\text{ - - - -}$$

where X is one of the letters C, H, I, N and the four remaining places can be filled by the remaining four letters.
Thus, the number of words before COCHIN is (4) (4!) = 96

Example 94: If r, s, t are prime numbers and p, q are natural numbers such that LCM of p, q is $r^2 s^4 t^2$, then the number of ordered pairs (p, q) is

(a) 252 (b) 254
(c) 225 (d) 224

Ans. (c)

Solution: Numbers p and q must be of the form

$$p = r^a s^b t^c, \quad q = r^\alpha s^\beta t^\gamma$$

where $\quad 0 \le a, \alpha \le 2$ and at least one of a, α is 2
$\quad 0 \le b, \beta \le 4$ and at least one of b, β is 4
$\quad 0 \le c, \gamma \le 2$ and at least one of c, γ is 2

Possible values of (a, α), and (c, γ) are

(0, 2), (1, 2), (2, 2), (2, 0), (2, 1).

Possible values of (b, β) are

(0, 4), (1, 4), (2, 4), (3, 4), (4, 4), (4, 0), (4, 1), (4, 2), (4, 3).

Thus, number of possible order pairs (p, q) is $5 \times 9 \times 5 = 225$.

Example 95: If $n > 1$ and n divides $(n - 1)! + 1$, then

(a) n must be prime
(b) n must be divisible by exactly two primes
(c) n must be a composite number
(d) none of these.

Ans. (a)

Solution: If n is not prime, then there exists $r \in \mathbf{N}$ such that $2 \le r \le n - 1$ and $r \mid n$.
As $r \mid n$ and $n \mid [(n - 1)! + 1]$, we get
$\quad r \mid [(n - 1)! + 1]$
As $2 \le r \le n - 1$, $r \mid (n - 1)!$, therefore $r \mid 1$. A contradiction.

Example 96: Which of the following statement is false?

(a) There exist 100 consecutive natural numbers none of which is prime
(b) There exist 1000 consecutive natural number none of which is prime.
(c) Given $n \in \mathbf{N}$, there exist n consecutive natural numbers none of which is prime.
(d) none of these.

Ans. (d).

Solution: Given any $n \in \mathbf{N}$, then

$\quad (n + 1)! + 2, (n + 1)! + 3, \ldots\ldots, (n + 1)! + (n + 1)$

are n consecutive natural numbers none of which is prime.

Example 97: The results of 21 football matches (win, lose or draw) are to be predicted. The number of forecasts that contain exactly 18 correct results is

(a) ${}^{21}C_3\,2^{18}$ (b) ${}^{21}C_{18}\,2^3$
(c) $3^{21} - 2^{18}$ (d) ${}^{21}C_3\,3^{21} - 2^{18}$

Ans. (b)

Solution: 18 correct results can be predicted in ${}^{21}C_{18}$ ways and 3 wrong results in 2^3 ways. Thus, required number of ways is ${}^{21}C_{18}\,2^3$.

Example 98: There are 15 points in a plane, no two of which are in a straight line except 4, all of which are in a straight line. The number of triangles that can be formed by using these 15 points is

(a) 404 (b) 415
(c) 451 (d) 490

Ans. (c)

Solution: The required number of triangle is

$$ {}^{15}C_3 - {}^4C_3 = 455 - 4 = 451 $$

Example 99: If $x, y \in (0, 30)$ such that

$$\left[\frac{x}{3}\right]+\left[\frac{3x}{2}\right]+\left[\frac{y}{2}\right]+\left[\frac{3y}{4}\right]=\frac{11}{6}x+\frac{5}{4}y$$

(where $[x]$ denotes greatest integer $\le x$), then number of ordered pairs (x, y) is

(a) 0 (b) 2
(c) 4 (d) none of these

Ans. (d)

Solution: Let $\{x\} = x - [x]$ denote the fractional part of x. Note that $0 \le \{x\} < 1$. We can write the given equation as

$$\frac{x}{3}-\left\{\frac{x}{3}\right\}+\frac{3x}{2}-\left\{\frac{3x}{2}\right\}+\frac{y}{2}-\left\{\frac{y}{2}\right\}+\frac{3y}{4}-\left\{\frac{3y}{4}\right\}=\frac{11}{6}x+\frac{5}{4}y$$

$$\Rightarrow \quad \left\{\frac{x}{3}\right\}+\left\{\frac{3x}{2}\right\}+\left\{\frac{y}{2}\right\}+\left\{\frac{3y}{4}\right\}=0$$

As each number on the L.H.S. lies in the interval $0 \le x < 1$, we must have

$$\left\{\frac{x}{3}\right\}=\left\{\frac{3x}{2}\right\}=\left\{\frac{y}{2}\right\}=\left\{\frac{3y}{4}\right\}=0$$

$$\Rightarrow \quad \frac{x}{3},\frac{3x}{2},\frac{y}{2} \text{ and } \frac{3y}{4} \text{ must be integers.}$$

$\therefore$ $x = 6, 12, 18, 24,$ $y = 4, 8, 12, 16, 20, 24, 28$

$\Rightarrow$ Number of ordered pairs (x, y) equals $4 \times 7 = 28$.

Example 100: The sum $\sum\limits_{0\le i\le j\le 10}\sum ({}^{10}C_j)({}^jC_i)$ is equal to

(a) $2^{10} - 1$ (b) 2^{10}
(c) $3^{10} - 1$ (d) 3^{10}

Ans. (c)

Solution: We have $\sum\limits_{0\le\ i<j\le 10}\sum {}^{10}C_j({}^jC_i)$

$$= {}^{10}C_1\,({}^1C_0 + {}^1C_1) + {}^{10}C_2\,({}^2C_0 + {}^2C_1 + {}^2C_2) + \ldots + {}^{10}C_{10}\,({}^{10}C_0 + {}^{10}C_1 + \ldots + {}^{10}C_{10})$$
$$= {}^{10}C_1(2) + {}^{10}C_2(2^2) + {}^{10}C_3(2^3) + \ldots + {}^{10}C_{10}(2^{10})$$
$$= (2 + 1)^{10} - 1 = 3^{10} - 1.$$

Example 101: There are p letters a, q letters b, r letters c. The number of ways of selecting k letters out of these if $p < k < q < r$ is

(a) $\frac{1}{2}\,(p + 1)^2 - k$

(b) $\frac{1}{2}\,(p + 1)\,(2k - p)$

(c) $\frac{1}{3}\,(p+1)\,(q+1)\,(r+1)-k$

(d) none of these

Ans. (b)

Solution: Let x *a′s*, y *b′s* and z *c′s* be selected. Then number of selections is equal to the number of non-negative integral solutions of

$$x + y + z = k \tag{1}$$

If we take $x = l$, $0 \le x \le p$ then $y + z = k - l$ and its number of solutions is $k - l + 1$.

Thus, the desired number of selections

$$\sum_{l=0}^{p}(k-l+1) = (k + 1)\,(p + 1) - \frac{1}{2}\,(p + 1)\,(p + 2)$$
$$= \frac{1}{2}\,(p + 1)\,(2k - p).$$

Example 102: The number of ways of choosing n objects out of $(3n + 1)$ objects of which n are identical and $(2n + 1)$ are distinct, is

(a) 2^{2n} (b) 2^{2n+1}
(c) $2^{2n} - 1$ (d) none of these

Ans. (a)

Solution: If we choose k $(0 \le k \le n)$ identical objects, then we must choose $(n - k)$ distinct objects. This can be done in ${}^{2n+1}C_{n-k}$ ways.Thus, the required number of ways

$$= \sum_{k=0}^{n} {}^{2n+1}C_{n-k} = {}^{2n+1}C_n + {}^{2n+1}C_{n-1} + \ldots + {}^{2n+1}C_0 = 2^{2n}.$$

Example 103: The greatest common divisor ${}^{31}C_3$, ${}^{31}C_5$, …, ${}^{31}C_{29}$ is

(a) 31 (b) 2
(c) 17 (d) none of these

Ans. (a)

Solution: We have, for $3 \le r \le 29$

$$r!\,(31 - r)!\,({}^{31}C_r) = 31!$$

As the prime 31 divides R.H.S. and 31 does not divide $r!$ and $(31 - r)!$ for $3 \le r \le 29$, we get $31 \mid ({}^{31}C_r)$.

Also, since ${}^{31}C_{29} = (31)(3)(5)$, ${}^{31}C_3 = (31)(29)(5)$ and ${}^{31}C_5 = (31)(29)(7)$

No prime other than 31 can divide all the numbers.

Thus greatest common divisors of the given numbers is 31.

Example 104: For $x \in \boldsymbol{R}$, let $[x]$ denote the greatest integer $\le x$, then value of $\left[-\frac{1}{3}\right]+\left[-\frac{1}{3}-\frac{1}{100}\right]+\left[-\frac{1}{3}-\frac{2}{100}\right]+\ldots+\left[-\frac{1}{3}-\frac{99}{100}\right]$ is

(a) -100 (b) -123
(c) -135 (d) -153

Ans. (c)

Solution: For $0 \le r \le 66, 0 \le \frac{r}{100} < \frac{2}{3} \Rightarrow -\frac{2}{3} < -\frac{r}{100} \le 0$

$$\Rightarrow \quad -\frac{1}{3}-\frac{2}{3} < -\frac{1}{3}-\frac{r}{100} \le -\frac{1}{3}$$

$$\therefore \quad \left[-\frac{1}{3}-\frac{r}{100}\right] = -1 \qquad \text{for } 0 \le r \le 66$$

Also, for $67 \le r \le 100, \frac{67}{100} \le \frac{r}{100} \le 1 \Rightarrow -1 \le -\frac{r}{100} \le -\frac{67}{100}$

$$\Rightarrow \quad -\frac{1}{3}-1 \le -\frac{1}{3}-\frac{r}{100} \le -\frac{1}{3}-\frac{67}{100}$$

$$\therefore \quad \left[-\frac{1}{3}-\frac{r}{100}\right] = -2 \text{ for } 67 \le r \le 100$$

Hence, $\sum_{r=0}^{100}\left[-\frac{1}{3}-\frac{r}{100}\right] = 67(-1) + 2(-34) = -135.$

Example 105: If $n \le 8$ and ${}^{n}C_{r+1} = 20$ and ${}^{n-1}C_{r} = 10$, then n is equal to

(a) 5 (b) 6
(c) 7 (d) 8

Ans. (b)

Solution $\frac{{}^{n}C_{r+1}}{{}^{n-1}C_{r}} = \frac{20}{10}$

$$\Rightarrow \quad \frac{n!}{(r+1)!\,(n-r-1)!}\;\frac{r!(n-r-1)!}{(n-1)!} = 2$$

$$\Rightarrow \quad \frac{n}{r+1} = 2$$

This shows that n is even and $r + 1 = n/2$ Now. ${}^{n}C_{n/2} = 20$ and $n \le 8$

$\Rightarrow \qquad n = 6.$

EXERCISE

Concept-based Straight Objective Type Questions

1. If $x \in \mathbf{N}$ and $\frac{(2x)!}{3!(2x-3)!} : \frac{x!}{2!(x-2)} = 44:3,$ then x is equal to
   (a) 6 (b) 7
   (c) 11 (d) 12
2. If $x \in \mathbf{N}$ and $\frac{(x+2)!}{(2x-1)!} \cdot \frac{(2x+1)!}{(x+3)!} = \frac{72}{7}$, then x is equal to
   (a) 3 (b) 4
   (c) 5 (d) 6
3. If ${}^{m+n}P_2 = 90$ and ${}^{m-n}P_2 = 30$, then (m, n) is equal to
   (a) (12, 8) (b) (8, 2)
   (c) (6, 4) (d) (7, 4)
4. The number of ways in which you can put five beads of five different colours to form a necklace is:
   (a) 12 (b) 24
   (c) 60 (d) 120
5. 15 lines are drawn in a plane in such a way that no two of them are parallel and no three are concurrent. The number of points of intersections of these lines is
   (a) 455 (b) 465
   (c) 475 (d) 485
6. Suppose $p \in \mathbf{N}$, $n = {}^{p}C_2$ and $m = {}^{n}C_2$. If $4m : n = 18 : 1$, then p is equal to
   (a) 11 (b) 9
   (c) 7 (d) 5
7. If ${}^{2n}C_4$, ${}^{2n}C_5$ and ${}^{2n}C_6$ are in A.P, then n is equal to
   (a) 14 (b) 12
   (c) 7 (d) 6
8. If ${}^{n}P_{r} = 1680$ and ${}^{n}C_{r} = 70$, then n is equal to
   (a) 5 (b) 7
   (c) 8 (d) 10
9. If ${}^{n+1}C_{r+1} : {}^{n}C_{r} : {}^{n-1}C_{r-1} = 11 : 6 : 3$, then value of n is
   (a) 12 (b) 10
   (c) 18 (d) 21
10. Suppose P is a set containing n distinct elements. Let $S = \{(x, y, z.) \mid x, y, z, \in, P$ and at least two of x, y, z are equal$\}$.

The number of elements in S is

(a) $n(3n - 2)$ (b) $n^2 (n - 2)$
(c) $n^3 - {}^{n}C_3$ (d) $n(5n - 4)$

LEVEL 1

Straight Objective Type Questions

11. A man invites 6 non-vegeterian and 5 vegeterian friends for a dinner party. He arrange 6 non-vegeterian friends on one round table and 5 vegeterian friends along another round table. The number of ways this can be done is:

(a) 11! (b) 9!
(c) 2880 (d) 8280

12. In an examination, there are 11 papers. A candidate has to pass in at least 6 papers to pass the examination. The number of ways in which the candidate can pass the examination is:

(a) 2^9 (b) 2^{10}
(c) 2^{11} (d) $2^{11} - {}^{11}C_5$

13. At an election, a voter may vote for any number of candidates not greater than the number to be chosen. There are 10 candidates and 5 members to be selected. The number of ways of in which a voter can vote is:

(a) 630 (b) 635
(c) 637 (d) 639

14. In a class of 10 students there are 3 girls students. The number of ways in which they can be arranged in a row, so that no two girls are consecutive is $k(8!)$, then k is equal to

(a) 12 (b) 24
(c) 36 (d) 42

15. The number of ways of putting 5 identical balls in 10 identical boxes, if not more than one can go in a box is

(a) ${}^{10}P_5$ (b) ${}^{10}C_5$
(c) 10^5 (d) 1

16. The number of four digit numbers that do not contain 4 different digits is:

(a) 4464 (b) 3680
(c) 4120 (d) 7208

17. The number of ways of dividing 10 girls into two groups of 5 each so that two shortest girls are in the different groups is:

(a) 70 (b) 252
(c) 140 (d) 282

18. The number of solutions of $\frac{1}{x} + \frac{1}{y} = \frac{1}{6}$ where $x, y \in \mathbf{N}$ is

(a) 9 (b) 18
(c) 21 (d) 28

19. Let m and n be two digit natural numbers. The number of pairs (m, n) such that n can be subtracted from m without borrowing is:

(a) 2475 (b) 2550
(c) 2675 (d) 2875

20. 5-digit numbers are formed using 2, 3, 5, 7, 9 without repeating the digits. If p is the number of such numbers that exceeds 20000 and q be the number of those that lie between 30000 and 90000 then $p : q$ is:

(a) 5 : 4 (b) 5 : 3
(c) 8 : 3 (d) 15 : 16

21. The number of diagonals of a polygon of 15 sides is

(a) 105 (b) 90
(c) 75 (d) 60

22. A five digit number divisible by 3 is to be formed using the digits 0, 1, 2, 3, 4 and 5 without repetition. The total number of ways, this can be done is

(a) 240 (b) 3125
(c) 600 (d) 216

23. The number of subsets of a set containing n distinct object is

(a) ${}^nC_1 + {}^nC_2 + {}^nC_3 + \dots + {}^nC_{n-1}$
(b) $2^n - 1$
(c) ${}^nC_0 + {}^nC_1 + \dots + {}^nC_n$
(d) $2^n + 1$

24. If a, b and r are positive integers, then value of

$${}^aC_r + {}^aC_{r-1}\,{}^bC_1 + {}^aC_{r-2}\,{}^bC_2 + \dots + {}^bC_r \text{ is}$$

(a) $\frac{a!b!}{r!}$ (b) $\frac{(a+b)!}{r!}$
(c) ${}^{a+b}C_r$ (d) ${}^{ab}C_r$

25. The number of 10 digit numbers that can be written by using the digits 0 and 1 is

(a) ${}^{10}C_2 + {}^9C_2$ (b) 2^{10}
(c) $2^{10}–2$ (d) 10!

26. If P_r stands for ${}^rP_r$, then sum of the series $1 + P_1 + 2P_2 + 3P_3 + \dots + nP_n$ is

(a) $(n + 1)!$ (b) $P_{n+1} - 1$
(c) $P_{n-1} + 1$ (d) none of these

27. If $a_n = \sum_{r=0}^{n} \frac{1}{{}^nC_r}$, then value of $\sum_{r=0}^{n} \frac{n-2r}{{}^nC_r}$ is

(a) $\frac{n}{2}a_n$ (b) $\frac{1}{4}a_n$
(c) na_n (d) 0

28. m men and w women are to be seated in a row so that all women sit together. The number of ways in which they can be seated is
(a) $(m+1)!\,w!$ (b) $m!\,w!$
(c) $m!\,(w-1)!$ (d) ${}^{m+w}C_w$

29. A five digit number divisible by 6 is to be formed by using the digits 0, 1, 2, 3, 4 and 8 without repetition. The total number of ways in which this can be done is
(a) 216 (b) 150
(c) 116 (d) 98

30. Rakshit is allowed to select $(n+1)$ or more books out of $(2n+1)$ distinct books. If the number of ways in which he may not select all of them is 255, then value of n is
(a) 3 (b) 4
(c) 5 (d) 11

31. The number of ways in which a committee of 3 women and 4 men be chosen from 8 women and 7 men if Mr. X refuses to serve on the committee if Mr. Y is a member of the committee is
(a) 420 (b) 840
(c) 1540 (d) 1400

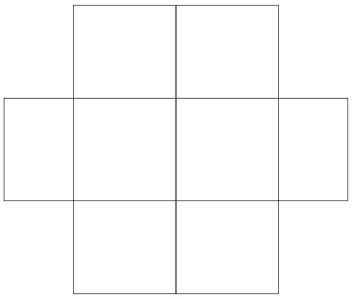
32. The product of first n odd natural numbers equals
(a) $({}^{2n}C_n)({}^nP_n)$ (b) $\left(\frac{1}{2}\right)^n({}^{2n}C_n)({}^nP_n)$
(c) $\left(\frac{1}{4}\right)^n({}^{2n}C_n)({}^{2n}P_n)$ (d) none of these

33. The number of ways in which two teams A and B of 11 players each can be made up from 22 players so that two particular players are on the opposite sides is
(a) 369512 (b) 184755
(c) 184756 (d) 369514

34. The number of ways in which 20 letters $x_1, x_2, \ldots x_{10}, y_1, y_2, \ldots, y_{10}$ be arranged in a line so that suffixes of the letters x and also those of y are respectively in ascending order of magnitude is
(a) 126 (b) 64
(c) 2^{20} (d) 184756

35. The product of n consecutive natural number is always divisible by
(a) ${}^nP_n$ (b) ${}^{2n}C_n$
(c) ${}^{2n}P_n$ (d) ${}^{n+1}P_n$

36. Six X have to be placed in the squares of Figure such that each row contain at least one X. The number of ways in which this can be done is
(a) 25 (b) 26
(c) 27 (d) 30



37. There are three pigeon holes marked M, P, C. The number of ways in which we can put 12 letters so that 6 of them are in M, 4 are in P and 2 are in C is
(a) 2520 (b) 13860
(c) 12530 (d) 25220

38. The greatest number of points of intersection of n circles and m straight lines is
(a) $2mn + {}^mC_2$
(b) $\frac{1}{2}\,m(m-1) + n(2m+n-1)$
(c) ${}^mC_2 + 2({}^nC_2)$
(d) none of these

39. The number of binary sequences of length n that contain even number of 1's is
(a) 2^{n-1} (b) $2^n - 1$
(c) $2^n - 2$ (d) none of these

40. The number of natural numbers with distinct digits is
(a) $9^{10}-1$ (b) $10^{10} - 9^{10}$
(c) $9^{10}\times 1$ (d) none of these

41. The number of five digit numbers that contain 7 exactly once is
(a) $(41)(9^3)$ (b) $(37)(9^3)$
(c) $(7)(9^4)$ (d) $(41)(9^4)$

42. The units digit of $17^{2009} + 11^{2009} - 7^{2009}$ is
(a) 1 (b) 8
(c) 2 (d) 9

43. If $\frac{1}{{}^4C_n} = \frac{1}{{}^5C_n} + \frac{1}{{}^6C_n}$, then value of n is
(a) 3 (b) 4
(c) 1 (d) 2

44. At an election there are five candidates and three members are to be elected, and a voter may vote for any number of candidates not greater than the number

to be elected. The number of ways in which the person can vote is

(a) 25 (b) 30
(c) 35 (d) $2^5 – 2^3$

45. If n is odd and ${}^nC_0 < {}^nC_1 < {}^nC_2 < \ldots < {}^nC_r$, then maximum possible value of r is

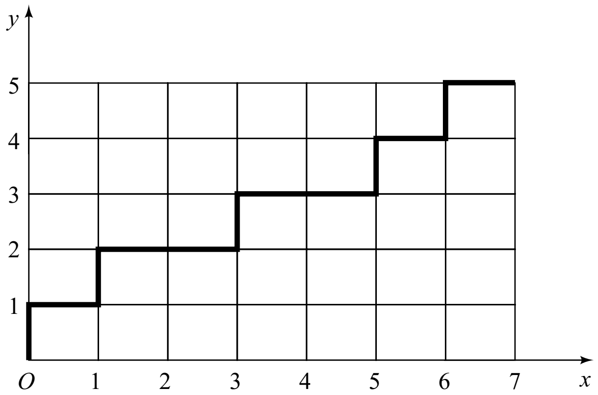
(a) $\frac{n-1}{2}$ (b) $\frac{n+1}{2}$
(c) n (d) none of these

46. The number of arrangements of the letters of the word BANANA in which two N's do not appear adjacently is

(a) 40 (b) 60
(c) 80 (d) 100

47. The number of (staircase) paths in the xy-plane from (0, 0) to (7, 5) where each such path is made up of individual steps going one unit upward (U) or one unit to the right (R). One such path is shown in figure

(a) ${}^{12}C_5$ (b) 12!
(c) 5! 7! (d) ${}^{12}P_5$



48. In Question 47, how many such paths are there if each path must pass through the point (3, 4)?

(a) 175 (b) 145
(c) 95 (d) 78

49. The number of ways we can put 5 different balls in 5 different boxes such that at most three boxes is empty, is equal to

(a) $5^5 – 5$ (b) $5^5 – 10$
(c) $2^5 – 2$ (d) none of these

50. The number of ordered pairs of integers (x, y) satisfying the equation $x^2 + 6x + y^2 = 4$ is

(a) 2 (b) 4
(c) 6 (d) 8

51. The number of the factors of 20! is

(a) 4140 (b) 41040
(c) 4204 (d) 81650

52. The number of five digit numbers that can be formed by using digits 1, 2, 3 only, such that three digits of the formed number are identical, is

(a) 30 (b) 60
(c) 120 (d) 90

53. Let $S_n = \sum_{r=1}^{n} r!$. If $T_n = S_n - 7\left[\frac{S_n}{7}\right]$, where $[x]$ denotes greatest integer $\le x$, then T_{100} is equal to

(a) 7 (b) 5
(c) 11 (d) none of these

54. The number of ordered pairs (m, n), m, $n \in \{1, 2, \ldots, 50\}$ such that $6^m + 9^n$ is a multiple of 5 is

(a) 1250 (b) 2500
(c) 500 (d) 625

55. Ten different letters of an alphabet are given. Words with five letters are formed from these given letters. The number of words which have at least one of their letter repeated is

(a) 69760 (b) 30240
(c) 99748 (d) none of these

56. The number of squares that we can find on a chess board is

(a) 64 (b) 160
(c) 224 (d) 204

57. In a football championship, 153 matches were played. Every team played one match with each other, the number of teams participating in the championship is

(a) 18 (b) 16
(c) 9 (d) none of these

58. The total number of ways of dividing mn distinct objects into n equal groups is

(a) $\frac{(mn)!}{(m!)^n (n!)}$ (b) $\frac{(mn)!}{(n!)^m (m!)}$
(c) $\frac{(mn)!}{m!\,n!}$ (d) none of these

59. The number of ways in which we can get at least 6 successive tails when a coin is tossed 10 times in a row, is

(a) ${}^{10}C_6$ (b) $2^7 - 2^6$
(c) 40 (d) 48

60. Let $R = \{a, b, c, d\}$ and $S = \{1, 2, 3\}$, then the number of functions f, from R to S, which are onto is

(a) 80 (b) 16
(c) 24 (d) 36

61. If ${}^{n+1}C_2 + 2({}^2C_2 + {}^3C_2 + {}^4C_2 + \ldots + {}^nC_2) = x$, then x equals

(a) $1 + 2 + 3 \ldots + n$ (b) $1^2 + 2^2 + \ldots + n^2$
(c) $\frac{1}{2}\, n(n + 1)(n + 3)$ (d) none of these

62. The number of ways in which three girls and nine boys can be seated in two cars, each having numbered seats, 3 in the front and 4 at the back, is

(a) ${}^{14}P_{12}$ (b) ${}^{14}P_{12} \times 14 \times 3$
(c) ${}^{11}P_9$ (d) none of these

63. The number of integral solutions of $x + y + z = 0$ with $x \geq -5$, $y \geq -5$, $z \geq -5$ is

(a) 134 (b) 136
(c) 138 (d) 140

64. A library has n different books and has p copies of each of the book. The number of ways of selecting one or more books from the library is

(a) n^p (b) p^n
(c) $(n + 1)^p - 1$ (d) $(p + 1)^n - 1$

65. The number of ways in which we can get a score of 11 by throwing three dice is

(a) 18 (b) 27
(c) 45 (d) 56

66. Three straight lines l_1, l_2 and l_3 are parallel and lie in the same plane. Five points are taken on each of l_1, l_2 and l_3. The maximum number of triangles which can be obtained with vertices at these points, is

(a) 425 (b) 405
(c) 415 (d) 505

67. The number of 9 digit numbers which have all distinct digits, is

(a) 10! (b) 9!
(c) 8(9!) (d) 10! – 9!

68. A four digit number of distinct digits is formed by using the digits 2, 3, 4, 5, 6, 7, 8. The number of such numbers which are divisible by 25, is

(a) 60 (b) 40
(c) 20 (d) 15

69. The range of the function $f(x) = {}^{15-x}P_{x-8}$ is

(a) $\{1, 6, 20, 24\}$ (b) $\{1, 6, 10, 15\}$
(c) $\{1, 4, 11, 15\}$ (d) $\{1, 8, 11, 19\}$

70. The number of ways of arranging 20 boys so that 3 particular boys are separated is

(a) 9(16!) (b) 15(16!)
(c) 15(17!)/2 (d) none of these

71. A library has n different books and 3 copies of each of the n books. The number of ways of selecting one or more books from the library is

(a) $4^n - 1$ (b) $5^n - 1$
(c) $2^n - 1$ (d) $n^3 - 1$.

72. Let $a_n = 10^n/n!$ for $n \geq 1$. Then a_n take the greatest value when n equals

(a) 20 (b) 18
(c) 6 (d) 9

Assertion-Reason Type Questions

73. **Statement-1:** The expression
$$\binom{40}{r}\binom{60}{0}+\binom{40}{r-1}\binom{60}{1}+\cdots$$ attains maximum value when $r = 50$.

Statement-2: $\binom{2n}{r}$ is maximum when $r = n$.

74. **Statement-1:** The number of non-negative integral solution of
$$x_1 + x_2 + \ldots + x_{20} = 100$$
is $\binom{120}{20}$.

Statement-2: The number of ways of distributing n identical objects among r persons giving zero or more objects to a person is $\binom{n+r-1}{r-1}$.

75. **Statement-1:** The sum of divisors of $n = 2^{10}\ 3^2\ 5^3\ 7^2\ 11^2$ is
$$\frac{1}{480}\ (2^{11} - 1)\ (3^3 - 1)\ (5^4 - 1)\ (7^3 - 1)\ (11^3 - 1)$$

Statement-2: The number of divisors of $m = p_1^{\alpha_1} p_2^{\alpha_2} \cdots p_r^{\alpha_r}$ where $p_1, p_2, \cdots p_r$ are distinct primes and $\alpha_1, \alpha_2, \cdots \alpha_r$ are natural numbers is $(\alpha_1 + 1)\ (\alpha_2 + 1) \cdots (\alpha_r + 1)$.

76. **Statement-1:** The number $\binom{1000}{500}$ is not divisible by 11.

Statement-2: If p is a prime, the exponent of p in $n!$ is
$$\left[\frac{n}{p}\right]+\left[\frac{n}{p^2}\right]+\left[\frac{n}{p^3}\right]+\cdots$$
where $[x]$ denotes the greatest integer $\leq x$.

77. **Statement-1:** A student is allowed to select at most n books from a collection of $(2n + 1)$ books. If the total number of ways in which he can select at least one book is 255, then $n = 3$.

Statement-2: $$\binom{2n+1}{0}+\binom{2n+1}{1}+\cdots+\binom{2n+1}{n}=4^n$$

LEVEL 2

Straight Objective Type Questions

78. $2m$ white counters and $2n$ red counters are arranged in a straight line with $(m + n)$ counters on each side of a central mark. The number of ways of arranging the counters, so that the arrangements are symmetrical with respect to the central mark, is

(a) $\dfrac{(m+n)!}{m!n!}$ (b) ${}^{2m+2n}C_{2m}$

(c) $\dfrac{1}{2}\dfrac{(m+n)!}{m!n!}$ (d) none of these

79. Let $x = (2n + 1)(2n + 3)(2n + 5) \ldots (4n - 3)(4n - 1)$ and $y = \left(\dfrac{1}{2}\right)^n \dfrac{(4n)!\,n!}{(2n)!\,(2n)!}$, then $x - y + 2^n$ is equal to

(a) 0 (b) $(2n)!/2^n$

(c) ${}^{2n}C_n$ (d) 2^n

80. There are 3 set of parallel lines containing respectively p lines, q lines and r lines respectively. The greatest number of parallelograms that can be formed by the system

(a) $pqr + (p - 1)(q - 1)(r - 1)$

(b) $\dfrac{1}{4}\{pqr + (p - 1)(q - 1)(r - 1)\}$

(c) $\dfrac{1}{4}pqr(p + 1)(q + 1)(r + 1)$

(d) none of these

81. The number of six digit numbers which have sum of their digits as an odd integer, is

(a) 45000 (b) 450000

(c) 97000 (d) 970000

82. In the identity $\dfrac{m!}{x(x+1)(x+2)\ldots(x+m)} = \sum_{i=0}^{m}\dfrac{A_i}{x+i}$, then value of A_k is

(a) ${}^nC_k$ (b) ${}^nC_{k+1}$

(c) $(-1)^k \cdot {}^nC_k$ (d) none of these

83. The number of integral solutions of $x^2 - y^2 = 352706$, is

(a) 276 (b) 0

(c) 720 (d) infinite

84. Let A be a set containing n elements. The number of ways of choosing two subsets P and Q of A such that $P \cap Q = \phi$ is

(a) 2^n (b) 3^n

(d) $4^n - 2^n$ (d) $4^n - 3^n$.

85. The last digit of $(1! + 2! + \ldots\ldots + 2009!)^{500}$ is

(a) 1 (b) 2

(c) 7 (d) 9

86. If $n = 2^{100}3^2$ and $\{d_1, d_2, \ldots d_k\}$ is the set of all divisors of n, then $\sum_{j=1}^{k}\dfrac{1}{d_j}$ equals

(a) 2 (b) N

(c) $2N$ (d) none of these

87. If ${}^nC_{r-1} = (k^2 - 8)({}^{n+1}C_r)$, then k belongs to

(a) $[-3, -2\sqrt{2})$

(b) $(-3, 3)$

(c) $[-3, -2\sqrt{2}) \cup (2\sqrt{2}, 3]$

(d) $[-2\sqrt{2}, 2\sqrt{2}]$

Previous Years' AIEEE/JEE Main Questions

1. The number of ways in which 6 men and 5 women can dine at a round table if no two women are to sit together is given by

(a) 30 (b) 5! ´ 4!

(c) $7! \times 5!$ (d) $6! \times 5!$ **[2003]**

2. A student is to answer 10 questions out of 13 questions in an examination such that he must choose at least 4 from the first five questions. The number of choices available to him is

(a) 196 (b) 280

(c) 346 (d) 140 **[2003]**

3. If ^nC_r denotes the number of combinations of n things taken r at a time, then the expression

$$^nC_{r+1} + {}^nC_{r-1} + 2 \times {}^nC_r$$

equals

(a) $^{n+2}C_{r+1}$ (b) $^{n+1}C_r$
(c) $^{n+1}C_{r+1}$ (d) $^{n+2}C_r$ **[2003]**

4. The range of the function $^{7-x}P_{x-3}$ is

(a) $\{1, 2, 3, 4\}$ (b) $\{1, 2, 3, 4, 5, 6\}$
(c) $\{1, 2, 3\}$ (d) $\{1, 2, 3, 4, 5\}$ **[2004]**

5. How many ways are there to arrange the letters in the word GARDEN with the vowels in alphabetical order?

(a) 360 (b) 240
(c) 120 (d) 480 **[2004]**

6. The number of ways distributing 8 identical balls in 3 distinct boxes so that none of the boxes is empty is

(a) 3^8 (b) 21
(c) 5 (d) $^8C_3$ **[2004]**

7. If $S_n = \sum_{r=0}^{n} \frac{1}{^nC_r}$ and $t_n = \sum_{r=0}^{n} \frac{r}{^nC_r}$, then $\frac{t_n}{S_n}$ is equal to

(a) $n - 1$ (b) $\frac{1}{2}n - 1$
(c) $\frac{1}{2}n$ (d) $\frac{2n-1}{2}$ **[2004]**

8. The value of $^{50}C_4 + \sum_{r=1}^{6} {}^{56-r}C_3$ is

(a) $^{56}C_3$ (b) $^{56}C_4$
(c) $^{55}C_4$ (d) $^{55}C_3$ **[2005]**

9. If the letters of the word SACHIN are arranged in all possible ways and these are written out as in a dictionary, then the word SACHIN appears at serial number

(a) 603 (b) 602
(c) 601 (d) 600 **[2005]**

10. At an election, a voter may vote for any number of candidates, not greater than the number to be elected. There are 10 candidates and 4 are to be elected. If a voter votes for at least one candidate, then the number of ways in which he can vote is

(a) 1110 (b) 5040
(c) 62010 (d) 385 **[2006]**

11. The set $S = \{1, 2, 3 \ldots 12\}$ is to be partitioned into three sets A, B, C of equal size such that, $A \cup B \cup C = S$, $A \cap B = B \cap C = C \cap A = \phi$. The number of ways to partition S is.

(a) $\frac{12!}{3!(4!)^3}$ (b) $\frac{12!}{3!(3!)^3}$
(c) $\frac{12!}{(4!)^3}$ (d) $\frac{12!}{(3!)^4}$ **[2007]**

12. In a shop there are five types of ice-creams available. A child buys six ice-creams

Statement-1: The number of different ways the child can buy the six ice-creams is $^{10}C_5$.

Statement-2: The number of different ways the child can buy the six ice-creams is equal to the number of different ways of arranging 6 A's and 4B's in a row. **[2008]**

13. From 6 different novels and 3 different dictionaries, 4 novels and 1 dictionary are to be selected and arranged in a row on a shelf so that the dictionary is always in the middle. Then the number of such arrangements is

(a) at least 750 but less than 1000
(b) at least 1000
(c) less than 500
(d) at least 500 but less than 750. **[2009]**

14. There are two urns. Urn A has 3 distinct red balls and urn B has 9 distinct blue balls. From each urn two balls are taken out at random and then transferred to the other. The number of ways in which this can be done is

(a) 66 (b) 108
(c) 3 (d) 36 **[2010]**

15. There are 10 points in a place, out of these 6 are collinear. If N is the number of triangles formed by joining these points, then

(a) $N \leq 100$ (b) $100 < N \leq 140$
(c) $140 < N \leq 190$ (d) $N > 190$ **[2011]**

16. **Statement-1**: The number of ways of distributing 10 identical balls in 4 distinct boxes such that no box is empty is $^9C_3$.

Statement-2: The number of choosing 3 places from 9 different places is $^9C_3$. **[2011]**

17. Assuming the balls to be identical except for difference in colours, the number of ways in which one or more balls can be selected from 10 white, 9 green and 7 black balls is:

(a) 629 (b) 630
(c) 879 (d) 880 **[2012]**

18. Let T_n be the number of all possible triangles formed by joining vertices of an n-sided regular polygon. If $T_{n+1} - T_n = 10$, then value of n is

(a) 5 (b) 10
(c) 8 (d) 7 **[2013]**

19. The number of ways in which an examiner can assign 30 marks to 8 question, giving no less then 2 marks to any question is:
(a) ${}^{30}C_7$ (b) ${}^{21}C_8$
(c) ${}^{21}C_7$ (d) ${}^{30}C_8$ **[2013, online]**

20. 5-digit numbers are formed using 2, 3, 5, 7, 9 without repeating the digits. If p is the number of such numbers that exceeds 20000 and q be the number of those that lie between 30000 and 90000, then $p : q$ is:
(a) 6 : 5 (b) 3 : 2
(c) 4 : 3 (d) 5 : 3 **[2013, online]**

21. A committee of 4 persons is to be formed from 2 ladies, 2 old men and 4 youngmen such that it includes at least 1 lady, at least one old man and at most 2 youngmen. Then the total number of ways in which this committee can be formed is
(a) 40 (b) 41
(c) 16 (d) 32 **[2013, online]**

22. On the sides AB, BC, CA of a triangle ABC, 3, 4, 5 distinct points (excluding vertices A, B, C) are respectively chosen. The number of triangles that can be constructed using these chosen points as vertices are:
(a) 210 (b) 205
(c) 215 (d) 220 **[2013, online]**

23. The sum of the digits in the unit's place of all the 4-digit numbers formed by using the numbers 3, 4, 5 and 6, without repetition, is:
(a) 432 (b) 108
(c) 36 (d) 18 **[2014, online]**

24. An eight digit number divisible by 9 is to be formed using digits from 0 to 9 without repeating the digits. The number of ways in which this can be done is:
(a) 72(7!) (b) 18(7!)
(c) 40(7!) (d) 36(7!) **[2014, online]**

25. 8-digit numbers are formed using the digits 1, 1, 2, 2, 2, 3, 4, 4. The number of such numbers in which the odd digits do not occupy odd places, is:
(a) 160 (b) 120
(c) 60 (d) 48 **[2014, online]**

26. Two women and some men participated in a chess tournament in which every participant played two games with each of the other participants. If the number of games that the men played betweeen themselves exceeds the number of games that the men played with the women by 66, then the number of men who participated in the tournament lies in the interval:
(a) [8, 9] (b) [10, 12)
(c) (11, 13] (d) (14, 1) **[2014, online]**

* None of the given options is correct

27. Let A and B be two sets containing four and two elements respectively. Then the number of subsets of the set $A \times B$, each having at least three elements is:
(a) 219 (b) 256
(c) 275 (d) 510 **[2015]**

28. The number of integers greater than 6,000 that can be formed, using the digits 3, 5, 6, 7 and 8, without repetition, is:
(a) 216 (b) 192
(c) 120 (d) 72 **[2015]**

29. The number of points, having both co-ordinates as integers, that lie in the interior of the triangle with vertices (0, 0), (0, 41) and (41, 0), is:
(a) 901 (b) 861
(c) 820 (d) 780 **[2015]**

30*. The number of ways of selecting 15 teams from 15 men and 15 women, such that team consists of a man and a woman, is:
(a) 1120 (b) 1240
(c) 1880 (d) 1960 **[2015 online]**

31. If in a regular polygon the number of diagonals is 54, then the number of sides of this polygon is:
(a) 10 (b) 12
(c) 9 (d) 16 **[2015 online]**

32. If all the words (with or without meaning) having five letters, formed using the letters of the word SMALL and arranged as in a dictionary, then the position of the word SMALL is:
(a) 46th (b) 59th
(c) 52nh (d) 58th **[2016]**

33. The value of $\sum_{r=1}^{15} r^2\left(\frac{{}^{15}C_r}{{}^{15}C_{r-1}}\right)$ is equal to:
(a) 1240 (b) 560
(c) 1085 (d) 680 **[2016 online]**

34. The sum $\sum_{r=1}^{15}(r^2+1)\times(r!)$ is equal to:
(a) $11\times(11!)$ (b) $10\times(11!)$
(c) (11)! (d) $101\times(10!)$
[2016, online]

35. If the four letter words (need not be meaningful) are to be formed using the letters from the word "MEDITERRANEAN" such that the first letter is A and the fourth letter is E, then the total number of all such words is:
(a) 110 (b) 59
(c) $\frac{11!}{(2!)^3}$ (d) 56 **[2016, online]**

36. If $\frac{^{n+2}C_6}{^{n-2}P_2} = 11$, then n satisfies the equation:

(a) $n^2 + n - 110 = 0$ (b) $n^2 + 2n - 80 = 0$
(c) $n^2 + 3n - 108 = 0$ (d) $4n^2 + 5n - 84 = 0$ **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. A set B contain 2007 elements. Let C be the set consisting of subsets of B which contain at most 1003 elements. The number of elements in C is:
(a) 2^{2005} (b) 2^{2006}
(c) 2^{1003} (d) 2^{2007} **[2006]**

2. A parallelogram is cut by two set of n parallel lines, parallel to the sides of the parallelogram. The number of parallelograms formed is:
(a) $(^{n+2}C_2)\,(^{n+2}C_2)$ (b) $(^nC_2)\,(^{n+1}C_2)$
(c) $(^nC_2)\,(^{n+2}C_2)$ (d) $(^nC_2)\,(^nC_2)$ **[2007]**

3. If there are 30 onto, mappings from a set containing n elements to the set $\{0, 1\}$, then n equals:
(a) 3 (b) 5
(c) 7 (d) 2 **[2007]**

4. Let A be a set containing ten elements. Then the number of subsets of A containing at least four elements is
(a) 845 (b) 848
(c) 850 (d) 854 **[2008]**

5. A group of $2n$ students consisting of n boys and n girls are to be arranged in a row such that adjacent members are of opposite sex. The number of ways in which this can be done is:
(a) $2(n!)$ (b) $(n!)^2$
(c) $2(n!)^2$ (d) $n!$ **[2009]**

6. The maximum possible number of points of intersection of 8 straight lines and 4 circles is
(a) 164 (b) 76
(c) 104 (d) 32 **[2010]**

7. A committee consisting of at least three members is to be formed from a group of 6 boys and 6 girls such that it always has a boy and a girl. The number of ways to form such committee is:
(a) $2^{12} - 2^7 - 13$ (b) $2^{11} - 2^6 - 13$
(c) $2^{12} - 2^7 - 35$ (d) $2^{11} - 2^7 - 35$ **[2011]**

8. The total number of injective mappings from a set with m elements to a set with n elements for, $m > n$, is:
(a) $\frac{m!}{n!(m-n)!}$ (b) $\frac{m!}{(m-n)!}$
(c) n^m (d) zero **[2012]**

9. The least positive integral value of x for which $^{10}C_{x-1} > 2(^{10}C_x)$ is:
(a) 5 (b) 8
(c) 9 (d) 6 **[2013]**

10. Suppose that six students, including Madhu and Puja, are having six beds arranged in a row. Further, suppose that Madhu does not want a bed adjacent to Puja. Then the number of ways, the beds can be allotted to students is:
(a) 264 (b) 480
(c) 600 (d) 384 **[2014]**

11. In a car with seating capacity of exactly five persons, two persons can occupy the front seat and three persons can occupy the back seat. If amongst the seven persons, who wish to travel by this car, only two of them know driving then number of ways in which the car can be fully occupied and driven by them, is:
(a) 360 (b) 60
(c) 240 (d) 720 **[2015]**

12. If $S = \sum_{i=1}^{n}\left(\frac{^nC_{i-1}}{^nC_i + {^nC_{i-1}}}\right)^3 = \frac{36}{13}$, then n is equal to:
(a) 11 (b) 12
(c) 13 (d) 10 **[2016]**

13. A code word of length 4 consists two distinct consonants in the English alphabet followed by two digits from 1 to 9, with repetition allowed in digits. If the number of code words so formed ending with an even digit is 432 k, then k is equal to:
(a) 5 (b) 49
(c) 35 (d) 7 **[2016]**

Answers

Hints and Solutions

Concept-based

1. $$\frac{(2x)!}{3!(2x-3)!}\cdot\frac{2!(x-2)!}{x!}=\frac{44}{3}$$

$$\Rightarrow \frac{(2x)(2x-1)(2x-2)}{3x(x-1)}=\frac{44}{3}$$

$\Rightarrow 2x - 1 = 11 \Rightarrow x = 6$

2. $$\frac{(2x+1)(2x)}{x+3}=\frac{72}{7}$$

$\Rightarrow 7(2x^2 + x) = 36(x + 3)$

$\Rightarrow 14x^2 - 29x - 108 = 0$

$\Rightarrow (14x + 27)(x - 4) = 0 \Rightarrow x = 4$

3. $(m + n)(m + n - 1) = 90$ and $(m - n)(m - n - 1) = 30$

$\Rightarrow m + n = 10,\ m - n = 6$

$\therefore\ m = 8,\ n = 2$

4. Number of ways of putting beads in a necklace is 4! But clockwise arrangement abcde and anticlockwise arrangement aedcb are not really different, for, the arrangement abcde gives rise to arrangement aedcb if the necklace is turned over.

$\therefore$ required number of ways $= \frac{1}{4}(4!) = 12$

5. For a point of intersection, we require two lines, therefor, the number of points of intersection is ${}^{15}C_3$.

6. $m = \frac{1}{2}n(n - 1) \Rightarrow \frac{4m}{n} = 2(n - 1) = p(p - 1) - 2$

$\therefore\ 18 = p(p - 1) - 2 \Rightarrow p = 5$

7. $2({}^{2n}C_5) = {}^{2n}C_4 + {}^{2n}C_6$

$$\Rightarrow\ 2=\frac{{}^{2n}C_4}{{}^{2n}C_5}+\frac{{}^{2n}C_6}{{}^{2n}C_5}=\frac{5}{2n-4}+\frac{2n-5}{6}$$

$\Rightarrow 12(2n - 4) = 30 + (2n - 4)(2n - 5)$

$\Rightarrow 2n^2 - 21n + 49 = 0 \Rightarrow n = 7$

8. ${}^nP_r = (r!)({}^nC_r) \Rightarrow 1680 = (r!)(70)$

$\Rightarrow r! = 24 \Rightarrow r = 4$

Also, $1680 = {}^nP_4 = n(n - 1)(n - 2)(n - 3)$

$\Rightarrow (n^2 - 3n)(n^2 - 3n + 2) = 1680$

$\Rightarrow (n^2 - 3n + 1)^2 = 41^2 \Rightarrow n^2 - 3n + 1 = 41$

$\Rightarrow n^2 - 3n - 40 = 0 \Rightarrow (n + 5)(n - 8) = 0$

$\Rightarrow n = 8.$

9. As $(r + 1)({}^{n+1}C_{r+1}) = (n + 1)({}^nC_r)$,

we get, $\frac{n+1}{r+1}=\frac{11}{6}$.

Also, $\frac{n}{r}=\frac{6}{3}\Rightarrow r=\frac{1}{2}n$

Thus, $\frac{n+1}{n/2+1}=\frac{11}{6}\Rightarrow n=10$

10. We can choose x, y, z in n^3 ways out of which ${}^nP_3$ have distinct elements.

Level 1

11. Arrange non-vegeterians in $(6 - 1)! = 5!$ ways and vegeterian in $(5 - 1)! = 4!$ways

    $\therefore$ required number of ways

    $= (5!)\ (4!) = (120)\ (24) = 2880$

12. Number of ways passing the examination is

    $S = {}^{11}C_6 + {}^{11}C_7 + {}^{11}C_8 + {}^{11}C_9 + {}^{11}C_{10} + {}^{11}C_{11} \quad (1)$

    Using ${}^{n}C_{r} = {}^{n}C_{n-r}$, we get

    $S = {}^{11}C_5 + {}^{11}C_4 + {}^{11}C_3 + {}^{11}C_2 + {}^{11}C_1 + {}^{11}C_0 \quad (2)$

    Adding (1) and (2) we get

    $2S = 2^{11} \Rightarrow S = 2^{10}$

13. The voter has to vote for at least one and at most 5 candidates. The number of ways is:

    ${}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4 + {}^{10}C_5 = 637$

14. Seven boys can be arranged in 7! ways. If $XB_1\ XB_2\ XB_3\ XB_4\ XB_5\ XB_6\ XB_7\ X$ is one such arrangement, then 3 girls can be arranged at any of the 3 places marked with a X. Thus, the number of arrangements is $({}^{8}P_3)\ (7!) = (6 \times 7)\ (8!) = (42)\ (8!)$. Thus, $k = 42$.

15. There is only one way in which five identical balls can be put in 10 boxes.

16. The number of 4 digit numbers is (9) (10) (10) (10), out of these (9) (9) (8) (7) have distinct digits.

17. Excluding two shortest girls, the remaining eight girls can be divided into two groups in $\frac{1}{2!}({}^{8}C_4)({}^{4}C_4) = 35$ ways. The two shortest girls can be put in two different groups in 2 ways. Therefore, the required number of ways is 70.

18. $\frac{1}{x} + \frac{1}{y} = \frac{1}{6} \Rightarrow 6\,(x + y) = xy$

    $\Rightarrow (x - 6)\ (y - 6) = 36$

    $\Rightarrow (x - 6)|36.$

    $\Rightarrow x - 6 = 1, 2, 3, 4, 6, 9, 12, 18, 36$

    $\Rightarrow (x, y) = (7, 42), (8, 24), (9, 18), (10, 15), (12, 12), (15, 10), (18, 9), (24, 8), (42, 7)$

19. Suppose $m = 10a + b$ and $n = 10c + d$ where $1 \le a, c \le 9$ and $0 \le b, d \le 9$. Note that $0 \le d \le b$. Thus d can take $(b + 1)$ values. Similarly , $1 \le c \le a$, therefore, c can take a values. Hence, the required number of pairs (m, n) is $(1 + 2 + \ldots + 10)\ (1 + 2 + .. + 9) = 2475$

20. Any number 5-digit formed by 2, 3, 5, 7, 9, exceeds 20000. Therefore, $p = 5! = 120$

    A number will lie between 30000 and 90000 if it begins with 3, 5 or 7

    $\therefore q = (3)\ (4!)$. Thus $p : q = 5 : 3$.

21. Number of diagonals = ${}^{15}C_2 - 15 = 90$.

22. As $0 + 1 + 2 + 3 + 4 + 5 = 15$, for a five digit number to be divisible by 3 either do not use 0 or 3.

    When 0 is not used, the number of such numbers is 5! and when 3 is not used, the number of such numbers is $5! - 4!$

    $\therefore$ Required number of ways $= 5! + (5! - 4!) = 216$

23. Use: The number of subsets containing exactly r elements is ${}^{n}C_{r}$.

24. The given expression = number of ways of selecting r persons out of a men and b women $= {}^{a+b}C_r$

25. For each place we have two choices: either use 0 or use 1.

26. $1 + P_1 + 2P_2 + 3P_3 + \ldots + nP_n$

    $= 1 + 1! + 2(2!) + 3(3!) + \ldots + n(n!)$

    $$= 1 + \sum_{r=1}^{n} [(r+1) - 1]r! = 1 + \sum_{r=1}^{n} \{(r+1)! - r!\}$$

    $= 1 + (n + 1)! - 1! = (n + 1)!$

27. $$\sum_{r=0}^{n} \frac{n-2r}{{}^{n}C_r} = \sum_{r=0}^{n} \frac{n-r}{{}^{n}C_r} - \sum_{r=0}^{n} \frac{r}{{}^{n}C_r}$$

    $$= \sum_{r=0}^{n} \frac{n-r}{{}^{n}C_{n-r}} - \sum_{r=0}^{n} \frac{r}{{}^{n}C_r} = 0$$

28. Treating w women as one block, we can permute m men and one block in $(m + 1)!$ ways and women in the block in $w!$ ways. Thus, the required number of ways is $(m + 1)!\ w!$

29. Since $0 + 1 + 2 + 3 + 4 + 8 = 18$, the 5 digit number will be divisible by 3 if either 0 or 3 is not used.

    When 0 is not used. For the unit place we have 3 choices (2, 4 or 8) and for the remaining place we have 4! Choices.

    When 3 is not used

    In this case, 0 is used at the unit's place, the number of choices is 4! If 0 is not used at the unit's place, then unit's place can be filled up in 3 ways and the remaining places in $(4! - 3!)$ ways.

    Thus, required number of numbers

    $= 3(4!) + 4! + 3(4! - 3!) = 150$

30. Use ${}^{2n+1}C_{n+1} + {}^{2n+1}C_{n+2} + \dots + {}^{2n+1}C_{2n} = 2^{2n} - 1$
31. Women can be chosen in ${}^{8}C_3$ ways and men in ${}^{7}C_4 - {}^{5}C_2$
32. $1.3.5 \dots (2n-1) = \dfrac{(2n)!}{2^n\,(n!)} = \left(\dfrac{1}{2}\right)^n \left({}^{2n}C_n\right)\left({}^{n}P_n\right)$
33. We can choose 10 players from (22 – 2) players in ${}^{20}C_{10}$ ways and one player from 2 players in ${}^{2}C_1$ ways.

   ∴ required number of ways

   $$= \frac{20!}{10!\,10!} \times 2 = 369512$$

34. Choose 10 places (out of 20) for $x_1, x_2, \dots, x_{10}$ in ${}^{20}C_{10}$ ways.
35. Let n consecutive natural numbers be $m+1, m+2, \dots, m+n$ where $m \ge 0$.

   $$P = (m+1)(m+2)\dots(m+n)$$
   $$= \left(\frac{m!\,(m+1)\cdots(m+n)}{m!\,n!}\right) n!$$
   $$= \left({}^{m+n}C_n\right)\left({}^{n}P_n\right)$$

   ∴ P is divisible by ${}^{n}P_n$

36. This can be done in four mutually exclusive ways as follows:

	Row R_1	*Row R_2*	*Row R_3*	*Number of ways*
I	1	3	2	$({}^2C_1)({}^4C_3)({}^2C_2) = 8$
II	1	4	1	$({}^2C_1)({}^4C_4)({}^2C_1) = 4$
III	2	2	2	$({}^2C_2)({}^4C_2)({}^2C_2) = 6$
IV	2	3	1	$({}^2C_2)({}^4C_3)({}^2C_1) = 8$
			Total	26

37. Number of ways is ${}^{12}C_6$ for M, ${}^{6}C_4$ for P and ${}^{2}C_2$ for C.

   Thus, the required number of ways

   $$= ({}^{12}C_6)({}^{6}C_4)({}^{2}C_2)$$

38. The number of points of intersections

   $$= ({}^{n}C_2)(2) + ({}^{m}C_2)(1) + ({}^{n}C_1)({}^{m}C_1)(2)$$
   $$= n(n-1) + \frac{1}{2}\,m(m-1) + 2mn$$

39. Imitate Example 18.
40. Required number of natural numbers

   $$= {}^{9}P_1 + 9 \times {}^{9}P_1 + 9 \times {}^{9}P_2 + \dots + 9 \times {}^{9}P_9$$

41. When 7 is right in the beginning, the number of numbers = 9^4 and when 7 is not in the beginning, the number of numbers is $({}^{4}C_1)(8)(9^3)$

   ∴ Required number of numbers

   $$= 9^4 + ({}^{4}C_1)(8)\,9^3 = (41)(9^3)$$

42. Use unit's digit of 17^{2009} is same as that of the unit's digit of 7^{2009}.
43. $\dfrac{{}^{5}C_n}{{}^{4}C_n} = 1 + \dfrac{{}^{5}C_n}{{}^{6}C_n}$

   $$\Rightarrow \quad \frac{5}{5-n} = 1 + \frac{6-n}{6}$$
   $$\Rightarrow n^2 - 17n + 30 = 0 \quad \Rightarrow \quad n = 2.$$

44. Number of ways = ${}^{5}C_1 + {}^{5}C_2 + {}^{5}C_3 = 25$
45. Use ${}^{2m+1}C_r$ is maximum when $r = m$ or $r = m + 1$.
46. Required number of ways

   = Total number of ways – Number of ways when two N's are together

   $$= \frac{6!}{3!\,2!} - \frac{5!}{3!} = 40$$

47. The number of paths

   = the number of ways of arranging 5 $U'\,S$ and 7 R's.

   $$= \frac{12!}{5!\,7!} = {}^{12}C_5$$

48. Required number of paths

   = (Number of paths upto (3, 4)) × (Number of paths from (3, 4) to (5, 7))

   $$= \frac{7!}{3!\,4!} \times \frac{5!}{4!} = 175$$

49. The number of ways of putting all the balls in exactly one box = 5

   As for each ball there are 5 choices for the box, the number of ways of putting balls in the boxes = 5^5

   Thus, the required number of ways of putting the balls in the boxes = $5^5 - 5$

50. $x^2 + 6x + y^2 = 4 \;\Rightarrow\; (x+3)^2 + y^2 = 13$

   $\Rightarrow\; (x+3, y) = (\pm 3, \pm 2)$ or $(\pm 2, \pm 3)$

   $\Rightarrow\; x = 0, y = \pm 2, x = -6, y = \pm 2,$

   $x = -1, y = \pm 3, y = -5, y = \pm 3$

51. Use $20! = 2^{18}\, 3^8\, 5^4\, 7^2\, (11)(13)(17)(19)$
52. When exactly three digits are identical and the remaining two are different, then the number of such numbers

   $$\left({}^{3}C_1\right)\left(\frac{5!}{3!}\right) = 60$$

   When three digits are identical and the remaining two are also identical, then the number of ways

   $$= \left({}^{3}C_2\right)(2)\left(\frac{5!}{3!\,2!}\right) = 60$$

   Thus, the number of such numbers = 120.

53. Use the fact that $r!$ is divisible by 7 whenever $r \geq 7$.

54. As the last digit of 6^m, $m \in \mathbf{N}$ is 6, $6^m + 9^n$ will be divisible by 5 if the unit's digit of 9^n is 4 or 9. This is possible when n is odd.

    $\therefore$ required number of ordered pairs = 50×25 = 1250.

55. The required number of words = $10^5 - {}^{10}P_5$

56. To get a square of size $r \times r$, we must choose $(r + 1)$ consecutive horizontal and $(r + 1)$ consecutive vertical lines. This can be done in $(9 - r)(9 - r) = (9 - r)^2$ ways.

57. ${}^nC_2 = 153 \Rightarrow n = 18$

58. As groups are indistinguishable, the number of ways

$$= \frac{1}{n!}({}^{mn}C_m)({}^{mn-m}C_m)\ldots({}^mC_m)$$

$$= \frac{1}{n!}\frac{(mn)!}{m!(mn-m)!}\frac{(mn-m)!}{m!(mn-2m)!}\cdots\frac{m!}{m!0!}$$

$$= \frac{1}{n!}\frac{(mn)!}{(m!)^n}$$

59. The sequence of six tails may begin at with the ith toss where $i = 1, 2, 3, 4, 5$. Thus, the number of ways is

$$2^4 + 1(2^3) + 2(1)(2^2) + 2^2(1)2 + 2^3(1) = 48$$

60. Total number of functions = 3^4.

    All the four elements can be mapped to exactly one element in 3 ways, and exactly two elements in $3(2^4 - 2)$.

    Thus, the number of onto functions = $3^4 - 3 - 3(2^4 - 2) = 36$.

61. We have

$$\begin{aligned}&{}^2C_2 + {}^3C_2 + {}^4C_2 + \ldots + {}^nC_2\\ &= ({}^3C_3 + {}^3C_2) + {}^4C_2 + \ldots + {}^nC_2\\ &= {}^4C_3 + {}^4C_2 + \ldots + {}^nC_2\\ &= {}^5C_3 + \ldots + {}^nC_2 = \ldots = {}^{n+1}C_3\end{aligned}$$

Thus, $$\begin{aligned}x &= {}^{n+1}C_2 + 2({}^{n+1}C_3)\\ &= {}^{n+1}C_2 + {}^{n+1}C_3 + {}^{n+1}C_3 = {}^{n+2}C_3 + {}^{n+1}C_3\\ &= \frac{1}{6}n(n+1)(2n+1)\end{aligned}$$

62. We have to arrange 12 persons at 14 seats.

63. Let $x_1 = x + 5$, $y_1 = y + 5$, $z_1 = z + 5$ and find the number of non-negative integral solutions of

$$x_1 + y_1 + z_1 = 15$$

64. For each book we have $p + 1$ choices.

65. Find the number of positive integral solutions of

$$x + y + z = 11$$

    where $1 \leq x, y, z \leq 6$.

66. The total number of points is 15. From these 15 points we can obtain ${}^{15}C_3$ triangles. However, if all the 3 points are chosen on the same straight line, we do not get a triangle. Therefore, the required number of triangles

$$= {}^{15}C_3 - 3({}^5C_3) = 425.$$

67. The required number of ways

    = The number of ways of permuting nine digits out of ten digits 0, 1, 2, …, 9

    – The number of ways of permuting nine digits out of nine digits 1, 2, …, 9

$$= {}^{10}P_9 - {}^9P_9 = \frac{10!}{1!} - 9! = 10! - 9!$$

68. The number will be divisible by 25 if it ends in 25 or 75. Therefore, the required number of numbers is

$$\left({}^5P_2\right)(2) = 40$$

69. We must have $15 - x \geq 1$ and $x - 8 \geq 0$ and $15 - x \geq x - 8 \Rightarrow 8 \leq x \leq 11$. Now,

$$f(8) = {}^7P_0 = 1,\quad f(9) = {}^6P_1 = 6,$$

$$f(10) = {}^5P_2 = 20,\quad f(11) = {}^4P_3 = 24,$$

    Thus, range of f is $\{1, 6, 20, 24\}$.

70. We can arrange remaining 17 boys in 17! ways. For 3 particular boys we have 18 positions. We can arrange 3 particulars boys at these places in ${}^{18}P_3$ ways. Thus, the required number of ways

$$= (17!)\left({}^{18}P_3\right) = 17!\,\frac{18!}{15!}$$

71. For each book we have four choices. We can choose 0, 1, 2 or 3 volumes of the book.

72. We have $\dfrac{a_n}{a_{n+1}} = \dfrac{10^n}{n!} \times \dfrac{(n+1)!}{10^{n+1}} = \dfrac{n+1}{10}$.

    Note that $\dfrac{a_1}{a_2} < 1$, $\dfrac{a_2}{a_3} < 1$, $\dfrac{a_3}{a_4} < 1$, $\dfrac{a_4}{a_5} < 1$,

$$\ldots\ \frac{a_8}{a_9} < 1, \frac{a_9}{a_{10}} = 1, \frac{a_{10}}{a_{11}} > 1, \frac{a_{11}}{a_{12}} > 1, \ldots$$

    Thus, $a_1 < a_2 < a_3 < \ldots < a_9 = a_{10} > a_{11} > a_{12}$

    $\therefore$ a_n is greatest if $n = 9$ or 10.

73. We have $\dfrac{\binom{2n}{r}}{\binom{2n}{r+1}} = \dfrac{(2n)!}{r!(2n-r)!}\,\dfrac{(r+1)!(2n-r-1)!}{(2n)!}$

$$= \frac{r+1}{2n-r}$$

Since for $0 \le r \le n-1$, $\dfrac{r+1}{2n-r} < 1$, we get

$$\binom{2n}{0} < \binom{2n}{1} < \cdots < \binom{2n}{n-1} < \binom{2n}{n}$$

Also, as $\binom{2n}{r} = \binom{2n}{2n-r}$

$$\binom{2n}{2n} < \binom{2n}{2n-1} \cdots < \binom{2n}{2n+1} < \binom{2n}{n}$$

Thus, $\binom{2n}{r}$ is maximum when $r = n$.

Next,

$$\binom{40}{r}\binom{60}{0} + \binom{40}{r-1}\binom{60}{1} + \cdots$$

= the number ways of selecting r persons out of 40 men and 60 women

$$= \binom{100}{r}$$

which is maximum when $r = 50$.

74. The number of ways of distributing n identical objects among r persons giving zero of more objects to a person is equivalent to arranging n identical objects of one kind and $(r-1)$ identical objects of second kind in a row, which is equal to $\dfrac{(n+r-1)!}{n!(r-1)!} = \binom{n+r-1}{r-1}$.

Next, the number of non-negative integral solutions of $x_1 + x_2 + \cdots + x_{20} = 100$ equals the number of ways of distributing 100 identical objects among 20 persons giving zero or more objects to a person, which equal $\binom{100+20-1}{20-1} = \binom{109}{19}$.

75. Sum of the divisors of n

$= (1 + 2 + \cdots - 2^{10})\,(1 + 3 + 3^2)\,(1 + 5 + 5^2 + 5^3)\,(1 + 7 + 7^2)\,(1 + 11 + 11^2)$

$$= (2^{11} - 1)\left(\frac{3^3-1}{3-1}\right)\left(\frac{5^4-1}{5-1}\right)\left(\frac{7^3-1}{7-1}\right)\left(\frac{11^3-1}{11-1}\right)$$

$$= \frac{1}{480}(2^{11} - 1)\,(3^3 - 1)\,(5^4 - 1)\,(7^3 - 1)\,(11^3 - 1)$$

A divisors of m is of the form $p_1^{\beta_1} p_2^{\beta_2} \cdots p_r^{\beta_r}$ where $0 \le \beta_i \le \alpha_i$ for $i = 1, 2, \ldots, r$.

That is, β_i can take $\alpha_i + 1$ values. Thus, the number of divisors of m is $(\alpha_1 + 1)\,(\alpha_2 + 1)\,\ldots\,(\alpha_r + 1)$

76. For the truth of statement-2, see theory of this chapter.

We have

$$\binom{1000}{500} = \frac{1000!}{500!500!}$$

Exponent of 11 in the prime factorization of 1000! is

$$\left[\frac{1000}{11}\right] + \left[\frac{1000}{11^2}\right] = 90 + 8 = 98$$

Exponent of 11 in the prime factorization of 500! is

$$\left[\frac{500}{11}\right] + \left[\frac{500}{11^2}\right] = 45 + 4 = 49.$$

Thus, exponent of 11 in the prime factorization of $\binom{1000}{500}$ is 0.

$\Rightarrow$ $\binom{1000}{500}$ is not divisible by 11.

77. Let

$$S = \binom{2n+1}{0} + \binom{2n+1}{1} + \cdots + \binom{2n+1}{n} \qquad (1)$$

Using $\binom{n}{r} = \binom{n}{n-r}$, we can write (1) as

$$S = \binom{2n+1}{2n+1} + \binom{2n+1}{2n} + \cdots + \binom{2n+1}{n+1} \qquad (2)$$

Adding (1) and (2), we get

$$2S = \binom{2n+1}{0} + \cdots + \binom{2n+1}{2n+1} = 2^{2n+1}$$

$\Rightarrow \quad S = 2^{2n} = 4^n$

The number of ways of choosing r books out of $2n + 1$ is $\binom{2n+1}{r}$. We are given

$$\Rightarrow \quad \binom{2n+1}{1} + \binom{2n+1}{2} + \cdots + \binom{2n+1}{n} = 255$$

$$\Rightarrow \quad 4^n - 1 = 255 \quad \Rightarrow \quad 4^n = 256 = 4^4 \quad \Rightarrow \quad n = 4.$$

Level 2

78. Arrange m white and n red counters on one side of the central mark. This can be done in $\dfrac{(m+n)!}{m!n!}$

79. $x = \dfrac{(2n+1)(2n+2)\cdots(4n-1)(4n)}{(2n+2)(2n+4)\cdots(4n)}$

$= \dfrac{1}{(2n)!}\dfrac{(4n)!n!}{2^n(2n)!} = y$

Thus, $x - y + 2^n = 2^n$

80. Number of parallelograms

$= ({}^pC_2)\,({}^qC_2) + ({}^qC_2)\,({}^rC_2) + ({}^rC_2)\,({}^pC_2)$

81. For the first place we have nine choices. For each of the next four places, we have 10 choices. At this stage we add the numbers already selected and choose the digit at unit's place in 5 ways.

82. A_k is obtained by putting $x = -k$ everywhere in the expression except in $x + k$. Therfore,

$A_k = \dfrac{m!}{(-k)\cdots(-k+k-1)(-k+k+1)\cdots(-k+m)}$

$= \dfrac{(-1)^k m!}{k!(m-k)!} = (-1)^k\left({}^mC_k\right)$

83. As 352706 is even, either both x and y are even or both x and y are odd.

If x, y are both even, $x^2 - y^2$ is divisble by 4, but 352706 is not divisible by 4.

If x, y are both odd, $x^2 - y^2$ is divisible by 4, but 352706 is not divisible by 4.

84. For each $x \in A$, we have four choices;

(i) $x \in P$, $x \in Q$

(ii) $x \in P$, $x \notin Q$

(iii) $x \notin P$, $x \in Q$

(iv) $x \notin P$, $x \notin Q$

Out of these four choices, last 3 choices imply $x \notin P \cap Q$.

Thus, P and Q can be chosen in 3^n ways, so that $P \cap Q = \phi$.

85. As $1! + 2! + 3! + 4! = 33$ and last digit of $n!$, for $n \geq 5$ is 0, last digit of $(1! + 2! + \cdots + 2009!)^{500}$ is same as that of last digit of 3^{500}

But $3^{500} = 9^{250} = (10 - 1)^{250}$, and last digit of $(10 - 1)^{250}$ is 1.

86. Note that $d\,\big|\,n \iff \dfrac{n}{d}\,\Big|\,n$

Now, $\displaystyle\sum_{j=1}^{k}\frac{1}{d_j} = \sum_{j=1}^{k}\frac{d_j}{n} = \frac{1}{n}\sum_{j=1}^{k} d_j$

But divisors of $n = 2^{100}\,3^2$ are

$1, 2, \cdots, 2^{100}, 3, (3)\,(2), \cdots, 3(2^{100}), 3^2\,(3^2)(2), \cdots (3^2)\,(2^{100})$

Thus, $\displaystyle\sum_{j=1}^{k} d_j = (1 + 2 + \cdots + 2^{100})\,(1 + 3 + 3^2)$

$= \left(\dfrac{2^{101}-1}{2-1}\right)(13) = 13(2^{101}-1)$

87. We have, $r - 1 \geq 0$, $r \leq n + 1$

$\Rightarrow 1 \leq r \leq n + 1 \Rightarrow \dfrac{1}{n+1} \leq \dfrac{r}{n+1} \leq 1$

Also, $k^2 - 8 = \dfrac{n!}{(r-1)!\,(n-r+1)!}\cdot\dfrac{r!(n+1-r)!}{(n+1)!}$

$= \dfrac{r}{n+1}$

Thus, $\dfrac{1}{n+1} \leq k^2 - 8 \leq 1$

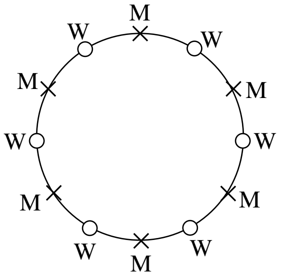
$\Rightarrow 8 < \dfrac{1}{n+1} + 8 \leq k^2 \leq 9$

$\Rightarrow 8 < k^2 \leq 9 \Rightarrow -3 \leq k < -2\sqrt{2}$ or $2\sqrt{2} < k \leq 3$

Hence, $k \in [-3, -2\sqrt{2})$

Previous Years' AIEEE/JEE Main Questions

1. We can arrange 6 men around the round table in 5! ways. There are 6 places for women to sit. Out of these we choose 5 and arrange women there. This can be done in $(5!)\,({}^6C_5)\,(5!) = (5!)\,(6!)$ ways.



2. Required number of ways

$= ({}^5C_4)\,({}^8C_6) + ({}^5C_5)\,({}^8C_5) = 196$

3. ${}^nC_{r+1} + {}^nC_{r-1} + 2({}^nC_r)$

$= ({}^nC_{r-1} + {}^nC_r) + ({}^nC_r + {}^nC_{r+1})$

$= {}^{n+1}C_r + {}^{n+1}C_{r+1} = {}^{n+2}C_{r+1}$

4. We must have

$7 - x \geq 1$, $x - 3 \geq 0$ and $7 - x \geq x - 3$

$\Rightarrow x \leq 6$, $x \geq 3$ and $x \leq 5$

Thus, $3 \leq x \leq 5$

$\therefore$ Range $= \{{}^4P_0, {}^3P_1, {}^2P_2\}$

$= \{1, 3, 2\}$

5. We can arrange the letters of the word GARDEN in 6! ways. Exactly half of these will be with vowels in alphabetical order.

So the required number of ways is (1/2) 6! = 360.

6. If x_1 is the number of balls in the ith box, then we must have

$$x_1 + x_2 + x_3 = 8 \qquad (1)$$

where $x_i \geq 1$.

The number of solutions of (1) is ${}^7C_2 = 21$.

7. We have $t_n = \sum_{r=0}^{n} \frac{r}{{}^nC_r} = \sum_{r=0}^{n} \frac{n-r}{{}^nC_{n-r}}$

$$= \sum_{r=0}^{n} \frac{n-r}{{}^nC_r} = n\, s_n - t_n$$

$$\Rightarrow 2t_n = n\, s_n \Rightarrow \frac{t_n}{s_n} = \frac{n}{2}.$$

8. ${}^{50}C_4 + \sum_{r=1}^{6} {}^{56-r}C_3$

$= {}^{50}C_4 + ({}^{50}C_3 + {}^{51}C_3 + \ldots + {}^{55}C_3)$

$= ({}^{50}C_4 + {}^{50}C_3) + {}^{51}C_3 + \ldots + {}^{55}C_3$

$= ({}^{51}C_4 + {}^{51}C_3) + {}^{52}C_3 + \ldots + {}^{55}C_3$

[using ${}^nC_r + {}^nC_{r-1} = {}^{n+1}C_r$]

$= {}^{52}C_4 + {}^{52}C_3 + \ldots + {}^{55}C_3$

$= \ldots = {}^{56}C_4$

9. Number of words which begin with A, C, H, I or N is 5(5!) = 600. These have ranks from 1 to 600. Then words beginning S are listed and SACHIN is the first word beginning with S, therefore, its rank is 601.

10. Required number of ways

$= {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + {}^{10}C_4$

$= 10 + 45 + 120 + 210 = 385$

11. Number of ways

$= ({}^{12}C_4)\,({}^8C_4)\,({}^4C_4)$

$$= \frac{12!}{(41)^3}$$

12. Let x_i = number of ice creams of ith type bought by the child.

Then, $x_1 + x_2 + x_3 + x_4 + x_5 = 6 \qquad (1)$

The number of non-negative integral solution of (1) ${}^{6+5-1}C_{5-1} = {}^{10}C_4 = N$ (say)

$\therefore$ Statement-1 is false.

The number of ways of arranging 6 A's and 4 B's in a row

$$= \frac{10!}{4!6!} = {}^{10}C_4 = N.$$

Thus, statement-2 is true.

13. We can choose 4 novels out of 6 in ${}^6C_4$ ways and 1 dictionary out of 3 in ${}^3C_1$ ways. We can arrange 4 novels and 1 dictionary in the middle in 4! Ways. Thus, required number of ways

$= ({}^6C_4)\,({}^3C_1)\,(4!) = 1080 > 1000$

14. Number of ways

$= ({}^3C_2)\,({}^9C_2) = (3)\,(36) = 108$

15. Number of triangles

$N = {}^{10}C_3 - {}^6C_3$

$$= \frac{1}{6}(10 \times 9 \times 8) - \frac{1}{6}(6 \times 5 \times 4)$$

$= 100$

16. Let x_i = number of balls put in the ith box, then

$x_1 + x_2 + x_3 + x_4 = 10 \qquad (1)$

where $x_i \geq 1$.

Let $x_i = y_i + 1$ where $y_i \geq 0$

Thus, (1) becomes

$y_1 + y_2 + y_3 + y_4 = 6 \qquad (2)$

Number of non-negative integral solutions of (2) = number of ways of arranging 6 identical balls and 3 identical separators in a row.

$$= \frac{(6+3)!}{6!3!} = {}^9C_3$$

= number of ways of choosing 3 places out of 9 different places.

17. We can choose 0 or more balls out of 10 white balls in 11 ways.

[Select 0 or 1 or 2, … or 10 balls.]

Thus, the number ways of selecting 0 or more balls is (1 + 10) (1 + 9) (1 + 7) = 880.

Therefore, the number of ways selecting one or more balls is 880 – 1 = 879.

18. As $T_n = {}^nC_3$,

$T_{n+1} - T_n = 10$

$\Rightarrow {}^{n+1}C_3 - {}^nC_3 = 10$

$\Rightarrow {}^nC_2 + {}^nC_3 - {}^nC_3 = 10$

$\Rightarrow \frac{1}{2}\, n(n-1) = 10 \Rightarrow n = 5$

19. Let x_i = marks assigned to ith question, then

$x_1 + x_2 + \ldots + x_8 = 30,$

$x_i \geq 2$ for $i = 1, 2, \ldots, 8.$

Put $x_i = y_i + 2$, then

$$y_1 + y_2 + \ldots + y_8 = 14 \qquad (1)$$

The number of solutions of (1) is

${}^{14+8-1}C_{8-1} = {}^{21}C_7$

20. Any number that is formed by 2, 3, 5, 7, 9 exceeds 20000.

$\therefore\ p = 5!$

A number that begins with 3, 5 or 7 lies between 3000 and 90000. Therefore,

$q = (3)\ (4!)$

Thus, $p : q = 5 : 3$

21. Different number of ways of forming committee are as under.

	Ladies	Old men	Young men
OPTION 1	1	1	2
OPTION 2	1	2	1
OPTION 3	2	1	1

Thus, the required number of ways

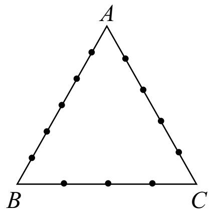
$= ({}^2C_1)\ ({}^2C_1)\ ({}^4C_2) + ({}^2C_1)\ ({}^2C_2)\ ({}^4C_1) + ({}^2C_2)\ ({}^2C_1)\ ({}^4C_1)$

$= 24 + 8 + 8 = 40.$

22. Take one vertex on each side.

This can be done in $({}^3C_1)\ ({}^4C_1)\ ({}^5C_1)$

= 60 ways.



Choose two vertices on one side and one from the remaining two sides. This can be done in

$({}^3C_2)\ ({}^9C_1) + ({}^4C_2)\ ({}^8C_1) + ({}^5C_2)\ ({}^7C_1)$

= 27 + 48 + 70 = 145.

Thus, number of required triangle is 60 + 145 = 205.

23. Each digit occurs at the unit's place exactly 3! = 6 times. This, sum of the digits at the units place

= 6[3 + 4 + 5 + 6] = 108

24. As 0 + 1 + 2 + … + 9 = 45, a number will be divisible by 9, if we do not use (0, 9), (1, 8), (2, 7), (3, 6), (4, 5).

Thus, the number of 8 digit number that are divisible by 9 is 8! + (8! – 7!) (4) = (36) (7!)

25. We can choose places for 1, 1, 3 in ${}^4C_3 = 4$ ways.

$\therefore$ We can arrange the digits

1, 1, 2, 2, 2, 3, 4, 4 is

$(4)\ \frac{3!}{2!}\frac{5!}{3!2!} = 120$

26. Number of games played by men among themselves $= 2({}^nC_2) = n(n-1)$

Number of games played by men with women = 2(2n) = 4n

$\therefore\ n(n-1) - 4n = 66 \Rightarrow n(n-5) = 66$

$\Rightarrow (n-11)\ (n+6) = 0 \Rightarrow n = 11 \in [10, 12)$

27. $n(A \times B) = n(A)\ n(B) = (4)\ (2) = 8$

$\therefore$ number of subset of $A \times B$ which contain at least three elements

$= {}^8C_3 + {}^8C_4 + {}^8C_5 + {}^8C_6 + {}^8C_7$

$= 2^8 - ({}^8C_0 + {}^8C_1 + {}^8C_2)$

= 256 – (1 + 8 + 28) = 219

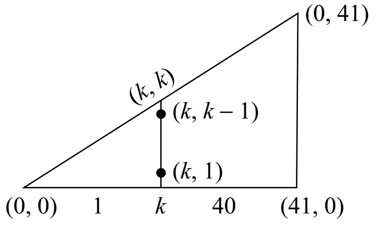
28. Any four digit number beginning with 6, 7 or 8 is greater than 6000. Also, any five digit number is greater than 6000. Thus, required number of numbers is

$({}^3P_1)\ ({}^4P_3) + {}^5P_5 = 192$

29. For $1 \le k \le 40$, the number of integral points on the line $x = k$ and lying in the interior of triangles is $k - 1$.

    Thus, required number of points = $\sum_{k=1}^{40}(k-1)$

    $\frac{1}{2}$ (39) (40) = 780



30. If we allow same man (woman) to be in two distinct teams (for instance if (M_1, W_1) and (M_1, W_2) are two distinct teams), then the answer is $^{225}C_{15}$.

    If we do not allow same man (woman) to be in two distinct teams, then first team can be chosen in (15) (15) ways, second team can be chosen in (14) (14) ways and so on.

    As all the teams 15 are to be chosen, the number of ways

    $= (15)^2\ (14)^2\ (13)^2 \ldots (2^2)\ (1^2)$

    $= (15!)^2$

    It seems that answer 1240 is arrived by the following way

    $15^2 + 14^2 + \ldots + 2^2 + 1^2$

    $= \frac{1}{6}\ (15)\ (16)\ (2 \times 15 + 1) = 120$

    This is an incorrect way as we have to select all the 15 teams.

31. Let number of sides of the regular polygon be n. The number of diagonals of the polygon

    $= {^nC_2} - n = \frac{1}{2}n(n-1) - n = \frac{1}{2}n(n-3)$

    Thus, $\frac{1}{2}n(n-3) = 54$

    $\Rightarrow n^2 - 3n - 108 = 0$

    $\Rightarrow (n-12)(n+9) = 0$

    As $n \ge 3$, $n = 12$.

32. Number of 5 letter words that can be formed by using letters of word SMALL is $\frac{5!}{2!} = 60$.

    Last word (60th word) in the list is SMLLA, 59th word is SMLAL, and 58th word is SMALL.

    Alternate solution

    Number of words beginning with

    (i) A is $\frac{4!}{2!} = 12$ (Ranked 1 to 12)
    (ii) L is $4! = 24$ (Ranked 13 to 36)
    (iii) M is $\frac{4!}{2!} = 12$ (Ranked 37 to 48)
    (iv) SA is $\frac{3!}{2!} = 3$ (Ranked 49 to 51)
    (v) SL is $3! = 6$ (Ranked 52 to 57)
    (vi) SM (ALL) is 1 (Ranked 58th)

33. $\frac{^{15}C_r}{^{15}C_{r-1}} = \frac{15!}{r!(15-r)!}\cdot\frac{(r-1)!(16-r)!}{15!}$

    $= \frac{15-r}{r}$

    $\therefore\ a_r = r^2\left(\frac{^{15}C_r}{^{15}C_{r-1}}\right) = r(15-r)$

    $\Rightarrow \sum_{r=1}^{15} a_r = \sum_{r=1}^{15} r(16-r)$

    $= 16\left\{\frac{1}{2}(15)(16)\right\} - \frac{1}{6}\ (15)(16)(31)$

    $= \frac{1}{2}(15)(16)\left[16 - \frac{31}{3}\right]$

    $= \frac{1}{2}(15)(16)\left(\frac{17}{3}\right) = 680$

34. As $r^2 + 1 = (r+2)(r+1) - 3(r+1) + 2$, we get

    $(r^2 + 1)r! = (r+2)! - 3(r+1)! + 2(r!)$

    $= [(r+2)! - (r+1)!] - 2[(r+1)! - r!]$

    $\Rightarrow \sum_{r=1}^{10}(r^2+1)r! = (12! - 2!) - 2(11! - 1!)$

    $= 11!(12 - 2) = (10)(11!)$

35. Letters in the word M E D I T E R R A N E A N are A, A, D, E, E, E, I, M, N, N, R, R, T. Two middle letters must be chosen from

    A, A, D, E, E, I, M, N, N, R, T. If the chosen letters are distinct, then these can be arranged in $^8P_2 = 56$ ways.

    If the chosen letters are indentical, then these can be chosen and arranged in $^3C_2 = 3$ ways.

    Thus, total number of such letters is 59.

36. $\dfrac{(n+2)!}{6!(n-4)!}\cdot\dfrac{(n-4)!}{(n-2)!} = 11$

$\Rightarrow \dfrac{(n+2)(n+1)(n)(n-1)}{(6)(5)(4)(3)(2)} = 11$

$\Rightarrow (n + 2)\ (n + 1)\ (n)\ (n - 1) = (11)\ (10)\ (9)\ (8)$

$\Rightarrow n + 2 = 11 \Rightarrow n = 9$

$\Rightarrow n^2 + 3n - 108 = 0$

Previous Years' B-Architecture Entrance Examination Questions

1. The number of required subsets is

$N = {}^{2007}C_0 + {}^{2007}C_1 + {}^{2007}C_2 + \dots + {}^{2007}C_{1003}$

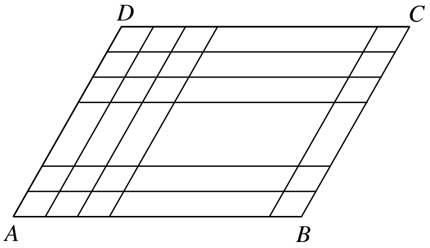
$N = {}^{2007}C_{2007} + {}^{2007}C_{2006} + \dots + {}^{2007}C_{1004}$

Adding above two equations we get

$2N = {}^{2007}C_0 + {}^{2007}C_1 + \dots + {}^{2007}C_{2007}$

$\Rightarrow N = 2^{2006}$

2. There are $(n + 2)$ line segments from A to B and $(n + 2)$ line segments from A to D.



To get a parallelogram, choose two line segments from A to B and two line segments from A to D.

$\therefore$ number of required ways

$= ({}^{n+2}C_2)\ ({}^{n+2}C_2)$

3. Suppose the set contains n elements.

Then number of onto mappings

$= 2^n - 1 - 1 = 2^n - 2$

Thus, $2^n - 2 = 30 \Rightarrow n = 5$.

4. Required number of subsets

$= {}^{10}C_4 + {}^{10}C_5 + \dots + {}^{10}C_{10}$

$= 2^{10} - ({}^{10}C_0 + {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3)$

$= 1024 - (1 + 10 + 45 + 120) = 848$

5. There are following ways for the photograph.

$M_1\ W_1\ M_2\ W_2\ \dots\ M_n\ W_n$

or

$W_1\ M_1\ W_2\ M_2\ \dots\ W_n\ M_n$

This can be done in $(2)\ (n!)\ (n!) = 2(n!)^2$ ways.

6. Number of points of intersections

$= ({}^8C_2) + 2({}^4C_2) + 2({}^8C_1)\ ({}^4C_1)$

$= 104$

7. Required number of ways

$= ({}^6C_1 + {}^6C_2 + \dots + {}^6C_6)\ ({}^6C_1 + {}^6C_2 + \dots + {}^6C_6) - ({}^6C_1)\ ({}^6C_1)$

$= (2^6 - 1)\ (2^6 - 1) - 36 = 2^{12} - 2^7 - 35$

8. If A and B are two finite sets, and $f : A \to B$ is an injective mapping, then $n(A) \le n(B)$.

As $m > n$, there does not exist any mapping from set with m elements to a set with n elements.

9. ${}^{10}C_{x-1} > 2({}^{10}C_x)$

$\Rightarrow \dfrac{10!}{(x-1)!(11-x)!} > 2\dfrac{10!}{x!(10-x)!}$

$\Rightarrow x > 2(11 - x) \Rightarrow 3x > 22$

$\Rightarrow x > 7 \Rightarrow x \ge 8.$

Thus, least positive integral value of x is 8.

10. Number of ways of arranging beds

$= {}^6P_6 = 6! = 720$

Number of ways in which Madhu and Puja have their beds together is $(2)\ ({}^5P_5) = 2(5!) = 240$.

Thus, required number of ways

$= 720 - 240 = 480.$

11. Two cases arise:

Case 1: Both the drivers are occupying the car. In this case we have to choose 3 persons out of 5 for the remaining seats and car can be driven by any of the two drivers. Thus, in this case car can be occupied and driven in $({}^5C_3)\ ({}^2C_1)\ (4!) = 480$ ways.

Case 2: Exactly one drive is occupying the car. In this case we have to choose 4 persons out of the remaining 5 people. In this case car can be occupied and driven in $({}^5C_4)\ ({}^2C_1)\ (4!) = 240$ ways.

Thus, the required number of ways

$= 480 + 240 = 720$

12. ${}^nC_{r-1} + {}^nC_r = {}^{n+1}C_n$

$\therefore \dfrac{{}^nC_{r-1}}{{}^nC_{r-1} + {}^nC_r} = \dfrac{n!}{(r-1)!(n-r+1)!}\cdot\dfrac{r!(n+1-r)!}{(n+1)!}$

$$= \frac{r}{n+1}$$

$$\Rightarrow S = \sum_{r=1}^{n}\left(\frac{r}{n+1}\right)^3 = \frac{1}{(n+1)^3}\cdot\frac{n^2(n+1)^2}{4}$$

$$= \frac{n^2}{4(n+1)} = \frac{36}{13}$$

$\Rightarrow 13n^2 = 144(n+1) \Rightarrow n = 12, -12/13$

Thus, $n = 12$

13. Number of code words ending with even digit

= (21) (20) (9) (4)

$\therefore$ $432k$ = (21) (20) (9) (4)

$\Rightarrow k = 35$.

CHAPTER SEVEN

Mathematical Induction and Binomial Theorem

PRINCIPLE OF MATHEMATICAL INDUCTION

Let $P(n)$ be a statement involving the natural number n. To prove that $P(n)$ is true for all natural numbers n, we proceed as follows:

1. Prove that $P(1)$ is true.
2. Assume that $P(k)$ is true.
3. Using steps 1 and 2, prove that $P(k + 1)$ is true.

Note

Sometimes step 2 is replaced by step 2′.

2′. Assume that $P(n)$ is true for all $n \in \mathbf{N}$, where $1 \le n \le k$.

The *First Principle of Mathematical Induction* comprises steps 1, 2 and 3. Steps 1, 2′ and 3 constitute another principle of mathematical induction, usually called the *Second Principle of Mathematical Induction*.

BINOMIAL THEOREM (FOR A POSITIVE INTEGRAL INDEX)

If n is a positive integer and x, y are two complex numbers, then

$$(x+y)^n = {}^nC_0x^n + {}^nC_1x^{n-1}y + {}^nC_2x^{n-2}y^2 + \dots + {}^nC_rx^{n-r}y^r + \dots + {}^nC_{n-1}xy^{n-1} + {}^nC_ny^n \qquad (1)$$

The coefficients ${}^nC_0$, ${}^nC_1$, $\cdots$, ${}^nC_n$ are called *binomial coefficients*.

PROPERTIES OF THE BINOMIAL EXPANSION

1. There are $(n + 1)$ terms in the expansion (1).
2. In any term of (1), the sum of the exponents of x and y is always n.
3. Binomial coefficients of terms equidistant from the beginning and the end are equal, since ${}^nC_r = {}^nC_{n-r}$ $(0 \le r \le n)$.
4. The term ${}^nC_rx^{n-r}y^r$ is the $(r + 1)$th term from the beginning of the expansion. It is usually denoted by T_{r+1} and is called the *general term* of the expansion.

MIDDLE TERM(S)

1. ***n* is even**

If n is *even*, then the expansion (1) has just one middle term, *viz.* $\left(\frac{n}{2}+1\right)$ th term. It is given by

$${}^nC_{n/2}\,x^{n/2}\,y^{n/2}.$$

2. ***n* is odd**

If n is *odd*, then the expansion (1) has two middle terms, *viz.* $\left(\frac{n+1}{2}\right)$ th term and $\left(\frac{n+1}{2}+1\right)$ th term. These are given by

$${}^nC_{(n-1)/2}\;x^{(n-1)/2}\;y^{(n+1)/2}$$

and $${}^nC_{(n+1)/2}\;x^{(n+1)/2}\;y^{(n-1)/2}$$

Illustration 1

Find the middle term of $\left(\frac{3}{2}x-\frac{2}{5}y\right)^{10}$

As $n = 10$ is even, middle term of $\left(\frac{3}{2}x-\frac{2}{5}y\right)^{10}$ is $\left(\frac{10}{2}+1\right)$th or 6th term. It is given by

$$T_6 = T_{5+1} = {}^{10}C_5\left(\frac{3}{2}x\right)^{10-5}\left(-\frac{2}{5}y\right)^5$$

$$= -252\left(\frac{3}{5}\right)^5 x^5y^5$$

Illustration 2

Find the middle terms of $\left(\frac{1}{2}x+\frac{2}{3}\sqrt{x}\right)^{11}$

As $n = 11$, is odd, the binomial expansion of $\left(\frac{1}{2}x+\frac{2}{3}\sqrt{x}\right)^{11}$ has two middle terms viz. $\left(\frac{11+1}{2}\right)$th and $\left(\frac{11+1}{2}+1\right)$ th terms, that is, 6th and 7th terms.

$$T_6 = T_{5+1} = {}^{11}C_5\left(\frac{1}{2}x\right)^{11-5}\left(\frac{2}{3}\sqrt{x}\right)^5$$

$$= \frac{11!}{5!6!}\cdot\frac{1}{2^6}\cdot\frac{2^5}{3^5}x^{6+5/2}$$

$$= \frac{77}{81}x^{17/2}$$

and $T_7 = T_{6+1} = {}^{11}C_6\left(\frac{1}{2}x\right)^{11-6}\left(\frac{2}{3}\sqrt{x}\right)^6$

$$= \frac{11!}{5!6!}\cdot\frac{1}{2^5}\cdot\frac{2^6}{3^6}x^{5+3} = \frac{308}{243}x^8$$

The Greatest Coefficient

If n is even, the greatest coefficient in the expansion of $(x + y)^n$ is ${}^nC_{n/2}$.

If n is *odd*, there are two greatest coefficients in the expansion of $(x + y)^n$. These are ${}^nC_{(n-1)/2}$ and ${}^nC_{(n+1)/2}$.

The Greatest Term

To find the greatest term in the expansion of $(x + y)^n$, $x, y > 0$, $n \in \boldsymbol{N}$ put

$$\alpha = \frac{(n+1)\,y}{x+y}$$

If α is not an integer, then the expansion of $(x + y)^n$ has just one greatest term and it is given by $k = [\alpha]$ where $[\alpha]$ denotes the greatest integer $\le \alpha$.

If α is an integer, then expansion of $(x + y)^n$ has two greatest terms *viz.* αth and $(\alpha + 1)$th terms.

TIP

If we are given that t_r is numerically the greatest term, we use

$|t_{r-1}| < |t_r|$

and $|t_{r+1}| < |t_r|$

to obtain two inequalities from which some other results can be obtained.

Illustration 3

Find numerically greatest term in the expansion of $(5 - 3x)^7$ when $x = 2/3$.

We have

$T_{r+1} = {}^7C_r\, 5^{7-r}\,(-3x)^r$

$$\Rightarrow \frac{T_{r+1}}{T_r} = \frac{7!\,(r-1)!\,(8-r)!}{r!\,(7-r)!\,7!}\,\frac{5^{7-r}}{5^{7-r+1}}\,\frac{(-3x)^r}{(-3x)^{r-1}}$$

$$= \frac{8-r}{r}\,\frac{1}{5}\,(-3x)$$

For $x = 2/3$,

$$\left|\frac{T_{r+1}}{T_r}\right| = \frac{(8-r)(2)}{5r}$$

Similarly $\frac{T_{r+2}}{T_{r+1}} = \frac{(7-r)(2)}{5(r+1)}$

For $(r + 1)$th term to be numerically greatest,

$|T_r| < |T_{r+1}|$ and $|T_{r+2}| < |T_{r+1}|$

$\Rightarrow 5r < 16 - 2r$ and $14 - 2r < 5r + 5$

$\Rightarrow 9 < 7r < 16 \Rightarrow r = 2.$

Thus, 3rd term is numerically greatest.

Some Other Useful Expansions

In the following expansions C_r stands for ${}^nC_r$

1. $(x + y)^n + (x - y)^n$
   $= 2\,[C_0\,x^n + C_2\,x^{n-2}\,y^2 + C_4\,x^{n-4}\,y^4 + \ldots]$
2. $(x + y)^n - (x - y)^n$
   $= 2\,[C_1\,x^{n-1}\,y + C_3\,x^{n-3}\,y^3 + C_5\,x^{n-5}\,y^5 + \ldots]$
3. $n\,(n-1)\,(n-2)\ldots(n-k+1)\,(x+y)^{n-k}$
   $= \sum_{r=k}^{n} r(r-1)(r-2)\ldots(r-k+1)C_r\; x^{r-k}y^{n-r}$
4. $(1 + x)^n + (1 - x)^n = 2\,[C_0 + C_2\,x^2 + C_4\,x^4 + \ldots]$
5. $(1 + x)^n - (1 - x)^n = 2\,[C_1\,x + C_3\,x^3 + \ldots]$
6. $C_1 + 2C_2\,x + 3C_3\,x^2 + \ldots + nC_n\,x^{n-1}$
   $= n(1 + x)^{n-1}$
7. $C_0\,x + C_1\frac{x^2}{2} + C_2\frac{x^3}{3} + \ldots + C_n\frac{x^{n+1}}{n+1}$
   $= \int_0^x (1+t)^n\,dt$

SOME PROPERTIES OF THE BINOMIAL COEFFICIENTS

1. $C_0 + C_1 + C_2 + \ldots + C_n = 2^n$
2. $C_0 + C_2 + C_4 + \ldots = C_1 + C_3 + C_5 + \ldots = 2^{n-1}$
3. $C_0 - C_1 + C_2 - \ldots + (-1)^n\,C_n = 0$
4. For $n > 1$,
   $C_1 - 2C_2 + 3C_3 - \ldots + (-1)^{n-1}\,nC_n = 0$
5. If $P_n = C_0\,C_1\,C_2 \ldots C_n$, then $\frac{P_{n+1}}{P_n} = \frac{(n+1)^n}{n!}$

REVERSING TECHNIQUE

If $a_0, a_1, a_2, \ldots, a_n$ are in A.P., then sum of the series

$$a_0\,C_0 + a_1\,C_1 + \ldots + a_n\,C_n$$

can be obtained by the reversing technique explained as follows.

Let

$$S = a_0\, C_0 + a_1\, C_1 + a_2\, C_2 + \ldots + a_{n-1}\, C_{n-1} + a_n\, C_n \quad (1)$$

Using $C_r = C_{n-r}$ and reversing the order in which terms are written above, we obtain

$$S = a_n\, C_0 + a_{n-1}\, C_1 + a_{n-2}\, C_2 + \ldots + a_1\, C_{n-1} + a_0\, C_n \quad (2)$$

Adding (1) and (2) we get

$2S = (a_0 + a_n)\, C_0 + (a_1 + a_{n-1})\, C_1 + (a_2 + a_{n-2})\, C_2 + \ldots + (a_{n-1} + a_1)\, C_{n-1} + (a_n + a_0)\, C_n$

As $a_0, a_1, a_2, \ldots a_n$ are in A.P., we have

$$a_0 + a_n = a_1 + a_{n-1} = a_2 + a_{n-2} = \ldots,$$

so that $2S = (a_0 + a_n)\,(C_0 + C_1 + C_2 + \ldots + C_n)$

$= (a_0 + a_n)2^n.$

$\Rightarrow \quad S = \dfrac{1}{2}\,(a_0 + a_n)2^n = (a_0 + a_n)2^{n-1}.$

e.g. (i) $C_0 + 2C_1 + 3C_2 + \ldots + (n + 1)C_n$

$= (1 + n + 1)2^{n-1} = (n + 2)2^{n-1}$

(ii) $C_1 + 2C_2 + \ldots + nC_n$

$= 0C_0 + 1C_1 + 2C_2 + \ldots + nC_n$

$= (0 + n)2^{n-1} = n(2^{n-1})$

MULTINOMIAL THEOREM

If we wish to expand $(x + y + z)^n$ (where n is a positive integer and x, y, z are complex numbers), we may take $y + z = a$, expand the binomial $(x + a)^n$, and then expand $(y + z)^r$ in each term of the expansion of $(x + a)^n$. In general, we have the following result:

$$(a_1 + a_2 + \ldots + a_m)^n = \sum \frac{n!}{n_1!\, n_2! \cdots n_m!}\, a_1^{n_1}\, a_2^{n_2} \cdots a_m^{n_m} \quad (1)$$

where the summation is taken over all non-negative integers $n_1, n_2, \ldots, n_m$ such that $n_1 + n_2 + \cdots + n_m = n$.

The number of distinct terms in the expansion (1) is ${}^{n+m-1}C_{m-1}$.

SOME USEFUL TIPS AND TRICKS

1. To find remainder when x^n is divided by y, try to express x or some power of x as $ky \pm 1$. For instance, to find the remainder when 7^{200} is divided by 50, we write $7^2 = 50 - 1$ and then use binomial theorem.
2. If $a, b, r \in \mathbf{Q}$ and $\sqrt{r}$ is an irrational number, then sometime it is useful to switch from $a + b\sqrt{r}$ to $a - b\sqrt{r}$.
3. If $p, q \in \mathbf{Q}$ and $\sqrt{p}$, $\sqrt{q}$ are irrational, then often it is preferable to simplify $(\sqrt{p} + \sqrt{q})^{2n}$ by first using $(\sqrt{p} + \sqrt{q})^2 = p + q + 2\sqrt{pq}$.
4. If three consecutive binomial coefficients ${}^nC_{r-1}$, ${}^nC_r$, ${}^nC_{r+1}$ are in A.P., then $r = \dfrac{1}{2}(n + \sqrt{n+2})$
5. Four consecutive binomial coefficients can never be in A.P.
6. Three consecutive binomial coefficients can never be in G.P. or H.P.

SOME PARTICULAR EXPANSIONS

For $|x| < 1$

1. $(1 + x)^{-1} = 1 - x + x^2 - x^3 + x^4 - \ldots$
2. $(1 - x)^{-1} = 1 + x + x^2 + x^3 + x^4 + \ldots$
3. $(1 + x)^{-2} = 1 - 2x + 3x^2 - 4x^3 + 5x^4 - \ldots$
4. $(1 - x)^{-2} = 1 + 2x + 3x^2 + 4x^3 + 5x^4 + \ldots$
5. $(1 + x)^{-3} = 1 - 3x + 6x^2 - 10x^3 + 15x^4 - \ldots$
6. $(1 - x)^{-3} = 1 + 3x + 6x^2 + 10x^3 + 15x^4 + \ldots$
7. $(1 - x)^{-n} = 1 + {}^nC_1\, x + {}^{n+1}C_2\, x^2 + {}^{n+2}C_3\, x^3 + \ldots$

where if n is a natural number.

Expansion when *x* is very small

If x is very small so that x^2 and higher powers of x can be neglected, then

$$(1 + x)^n = 1 + nx.$$

If x is very small so that x^3 and higher powers of x can be neglected, then

$$(1 + x)^n = 1 + nx + \frac{1}{2}\, n\,(n - 1)\, x^2$$

SOLVED EXAMPLES

Concept-based Straight Objective Type Questions

Example 1: Suppose $a \in \mathbf{R}$. If the coefficient of x^5 in the expansion of $\left(ax + \dfrac{1}{x^3}\right)^{17}$ is 680, then a is equal to

(a) ± 2 (b) ± 1

(c) ± 1/2 (d) ± 1/3

Ans. (b)

◎ **Solution:** $T_{r+1} = {}^{17}C_r\,(ax)^{17-r}\left(\frac{1}{x^3}\right)^r$

$$= {}^{17}C_r\,a^{17-r}\,x^{17-4r}$$

For the coefficient of x^5, we set

$17 - 4r = 5$ or $r = 3$.

∴ ${}^{17}C_3\,a^{14} = 680$

⇒ $a^{14} = \dfrac{680 \times 3!14!}{17!} = 1$

⇒ $a = \pm 1$.

◉ **Example 2:** The absolute term (that is, term independent of x) in the expansion of $\left(\frac{3}{2}x^2 - \frac{1}{3x}\right)^9$ is:

(a) $\frac{1}{9}$ (b) $\frac{2}{17}$

(c) $\frac{7}{18}$ (d) $\frac{11}{18}$

Ans. (c)

◎ **Solution:** $T_{r+1} = {}^{9}C_r\left(\frac{3}{2}x^2\right)^{9-r}\left(-\frac{1}{3x}\right)^r$

$$= {}^{9}C_r\left(\frac{3}{2}\right)^{9-r}\left(-\frac{1}{3}\right)^r x^{18-3r}$$

For term independent of x, we set $18 - 3r = 0$ or $r = 6$. Thus, term independent of x in the expansion of $\left(\frac{3}{2}x^2 - \frac{1}{3x}\right)^9$ is

$${}^{9}C_6\left(\frac{3}{2}\right)^{9-6}\left(-\frac{1}{3}\right)^6 = \frac{7}{18}$$

◉ **Example 3:** Let a_r denote the coefficient of y^{r-1} in the expansion of $(1 + 2y)^{10}$. If $\dfrac{a_{r+2}}{a_r} = 4$, then r is equal to

(a) 2 (b) 3

(c) 4 (d) 5

Ans. (c)

◎ **Solution:** $T_{r+1} = {}^{10}C_r\,(2y)^r = ({}^{10}C_r\,2^r)\,y^r$.

∴ $a_r = {}^{10}C_r\,2^r$

Now

$$4 = \frac{a_{r+2}}{a_r} = \frac{{}^{10}C_{r+2}}{{}^{10}C_r}\,\frac{2^{r+2}}{2^r}$$

⇒ ${}^{10}C_{r+2} = {}^{10}C_r \Rightarrow r + 2 = 10 - r \Rightarrow r = 4$

◉ **Example 4:** Suppose $k \in \mathbf{R}$. Let a be the coefficient of the middle term in the expansion of $\left(\frac{k}{x} + \frac{x}{k}\right)^{10}$, and b be the term independent of x in the expansion of $\left(\frac{k^2}{x} + \frac{x}{k}\right)^{10}$. If $\frac{a}{b} = 1$, then k is equal to

(a) 1 (b) 2

(c) –3 (d) any non-zero number

Ans. (a)

◎ **Solution:** Middle term of $\left(\frac{k}{x} + \frac{x}{k}\right)^{10}$ is $\left(\frac{10}{2} + 1\right)$th = 6th term. We have

$$T_6 = {}^{10}C_5\left(\frac{k}{x}\right)^{10-5}\left(\frac{x}{k}\right)^5 = {}^{10}C_5$$

∴ $a = {}^{10}C_5$

Also, $(r + 1)$th term of $\left(\frac{k^2}{x} + \frac{x}{k}\right)^{10}$ is

$$T_{r+1} = {}^{10}C_r\left(\frac{k^2}{x}\right)^{10-r}\left(\frac{x}{k}\right)^r$$

$$= {}^{10}C_r\,k^{20-3r}\,x^{2r-10}$$

For term independent of x, set $2r - 10 = 0$ or $r = 5$. Thus, term independent of x in the expansion of $\left(\frac{k^2}{x} + \frac{x}{k}\right)^{10}$ is

$${}^{10}C_5\,k^5 = b.$$

As $\dfrac{a}{b} = 1$, we get $k^5 = 1$ or $k = 1$

◉ **Example 5:** The remainder when $6^n - 5n$ is divided by 25, is

(a) 1 (b) 24

(c) 0 (d) n

Ans. (a)

◎ **Solution:** $6^n - 5n = (1 + 5)^n - 5n$

$= 1 + 5n + {}^nC_2(5^2) + {}^nC_3(5^3) + \ldots + {}^nC_n(5^n) - 5n$

$= 1 + 25m$

where $m = {}^nC_2 + {}^nC_3(5) + \ldots + {}^nC_n(5^{n-2})$

is a whole number.

Thus, remainder when $6^n - 5n$ is divided by 25 is 1.

◉ **Example 6:** If coefficients of r th and $(r + 1)$th term in the expansion of $(3 + 2x)^{74}$ are equal, then r is equal to:

(a) 28 (b) 29

(c) 30 (d) 31

Ans. (c)

◎ **Solution:** $T_{r+1} = {}^{74}C_r\,3^{74-r}\,(2x)^r$

⇒ coefficient of $(r + 1)$th term is ${}^{74}C_r\,3^{74-r}\,2^r$

We are given

$${}^{74}C_{r-1}\,3^{74-r+1}\,2^{r-1} = {}^{74}C_r\,3^{74-r}\,2^r$$

⇒ $\dfrac{3}{2} = \dfrac{74!}{r!\,(74-r)!}\cdot\dfrac{(r-1)!\,(75-r)!}{74!}$

$= \dfrac{75 - r}{r}$

⇒ $3r = 150 - 2r \Rightarrow r = 30$

Example 7: If the coefficients of three consecutive terms in the expansion of $(1 + x)^n$ are in the ratio 1 : 7 : 42, then value of n is

(a) 45 (b) 55
(c) 65 (d) 75

Ans. (b)

Solution: Let three consecutive terms be $(r + 1)$th, $(r + 2)$th and $(r + 3)$th. Then

$$\frac{{}^nC_r}{{}^nC_{r+1}} = \frac{1}{7} \Rightarrow \frac{r+1}{n-r} = \frac{1}{7} \Rightarrow n - 8r = 7 \qquad (1)$$

and $$\frac{{}^nC_{r+1}}{{}^nC_{r+2}} = \frac{7}{42} = \frac{1}{6} \Rightarrow \frac{r+2}{n-r-1} = \frac{1}{6}$$

$$\Rightarrow \quad n - 7r = 13 \qquad (2)$$

From (1) and (2), $n = 55$.

Example 8: The coefficient of x^9 in the expansion of $E = (1 + x)^9 + (1 + x)^{10} + \ldots + (1 + x)^{100}$ is

(a) ${}^{101}C_9$ (b) ${}^{101}C_{10}$
(c) ${}^{100}C_9$ (d) ${}^{100}C_{10}$

Ans. (b)

Solution: $$E = \frac{(1+x)^9\left[(1+x)^{92} - 1\right]}{1 + x - 1}$$

$$= \frac{(1+x)^{101} - (1+x)^9}{x}$$

Coefficient of x^9 in E

$= \text{coefficient of } x^{10} \text{ in } [(1 + x)^{101} - (1 + x)^9]$

$= {}^{101}C_{10}$

Example 9: If the 7th term in the binomial expansion of $\left(\frac{3}{84^{1/3}} + \sqrt{3}\ln x\right)^9$, $(x > 0)$ is equal to 729, then x is equal to

(a) e, $1/e$ (b) $2e$, $1/2e$
(c) e^2, e^{-2} (d) $1/e$

Ans. (a)

Solution: $$T_7 = {}^9C_6\left(\frac{3}{84^{1/3}}\right)^{9-6}\left(\sqrt{3}\ln x\right)^6$$

$$\Rightarrow \quad \frac{9 \times 8 \times 7}{3 \times 2} \cdot \frac{3^3}{84}\, 3^3(\ln x)^6 = 729$$

$$\Rightarrow \quad (\ln x)^6 = 1$$

$$\Rightarrow \quad \ln x = \pm 1 \Rightarrow x = e,\ 1/e$$

Example 9: Sum of the series

$$S = \sum_{j=0}^{8} \frac{1}{(j+1)(j+2)}\left({}^8C_j\right) \text{ is}$$

(a) $\frac{1003}{90}$ (b) $\frac{1013}{90}$
(c) $\frac{1023}{90}$ (d) $\frac{1033}{90}$

Ans. (b)

Solution: For $0 \le j \le 8$,

$$\frac{1}{(j+1)(j+2)}\left({}^8C_j\right)$$

$$= \frac{8!}{(j+1)(j+2)\, j!\,(8-j)!}$$

$$= \frac{1}{10 \times 9}\,\frac{10!}{(j+2)!\,(10-(j+2))!}$$

$$= \frac{1}{90}\left({}^{10}C_{j+2}\right)$$

Thus,

$$S = \frac{1}{90}\left(\sum_{j=0}^{10} {}^{10}C_{j+2}\right)$$

$$= \frac{1}{90}\left(\sum_{k=0}^{10} {}^{10}C_k - {}^{10}C_0 - {}^{10}C_1\right)$$

$$= \frac{1}{90}\ (2^{10} - 1 - 10) = \frac{1013}{90}$$

Example 10: If sum of the coefficients in the expansion of $(x + y)^n$ is 2048, then the greatest coefficient in the expansion is:

(a) ${}^{10}C_6$ (b) ${}^{11}C_6$
(c) ${}^{10}C_7$ (d) ${}^{12}C_6$

Ans. (b)

Solution: Sum of the coefficients in the expansion of $(x + y)^n$ is 2^n. Therefore,

$$2^n = 2048 = 2^{11} \Rightarrow n = 11.$$

As n is odd, the greatest value of ${}^nC_r$ is ${}^nC_k$ where

$k = \frac{1}{2}(n - 1)$ or $k = \frac{1}{2}(n + 1)$.

Here $n = 11$, therefore $k = 5$ or 6.

Thus, greatest coefficient is ${}^{11}C_6$.

LEVEL 1

Straight Objective Type Questions

Example 11: 5th term from the end in the expansion of $\left(\frac{x^2}{3}-\frac{3}{x^2}\right)^8$ is:

is:

(a) $25x^2$

(b) –70

(c) 70

(d) $-25x^2$

Ans. (c)

Solution:

TIP

As number of terms in the binomial expansion of $(x + a)^n$ is $(n + 1)$, the rth term from the end is $((n + 1) + (-1)(r - 1))$th $= (n + 2 - r)$th term from the beginning.

Here $n = 8$, $r = 5$, thus, 5th term from the end is $(8 + 2 - 5)$th = 5th term from the beginning, and it is given by

$$t_5 = {}^8C_4\left(\frac{x^2}{3}\right)^4\left(-\frac{3}{x^2}\right)^{8-4} = {}^8C_4 = 70$$

Example 12: If

$$P(x)=\frac{1}{\sqrt{3x+1}}\left[\left(\frac{1+\sqrt{3x+1}}{5}\right)^n-\left(\frac{1-\sqrt{3x+1}}{5}\right)^n\right]$$

is a 5th degree polynomial, then value of n is

(a) 9

(b) 11

(c) 23

(d) 21

Ans. (b)

Solution: $P(x) = \frac{1}{5^n\, a}[(1 + a)^n - (1 - a)^n]$

where $a = \sqrt{3x+1}$

Now,

$$P(x) = \frac{2}{5^n a}\left[{}^nC_1\, a + {}^nC_3\, a^3 + \ldots\right]$$

Note that n must be odd, so that $\sqrt{3x+1}$ does not appear in $P(x)$.

$$\therefore \quad P(x) = \frac{2}{5^n}\left[{}^nC_1 + {}^nC_3\, a^2 + \ldots + {}^nC_n\, a^{n-1}\right]$$

$$= \frac{2}{5^n}\left[{}^nC_1 + {}^nC_3\,(3x + 1) + {}^nC_5\,(3x + 1)^2 + \ldots + {}^nC_n\,(3x + 1)^{(n-1)/2}\right]$$

For this to be a polynomial of degree 5, $\frac{n-1}{2} = 5 \Rightarrow n = 11$.

Example 13: The two consecutive terms whose coefficients in the expansion of $(3 + 2x)^{94}$ are equal, are

(a) 37th, 38th

(b) 38th, 39th

(c) 47th, 48th

(d) 48th, 49th

Ans. (b)

Solution: Suppose coefficients of $(r + 1)$th and $(r + 2)$th terms in the expansion of $(3 + 2x)^{94}$ are equal. Then

$${}^{94}C_r\, 3^{94-r}\, 2^r = {}^{94}C_{r+1}\, 3^{94-(r+1)}\, 2^{r+1}$$

$$\Rightarrow \quad \frac{94!}{r!\,(94-r)!}\cdot\frac{(r+1)!\,(94-r-1)!}{94!} = \frac{2}{3}$$

$$\Rightarrow \quad \frac{r+1}{94-r} = \frac{2}{3} \Rightarrow 3r + 3 = 188 - 2r$$

$$\Rightarrow \quad 5r = 185 \Rightarrow r = 37$$

Example 14: Coefficient of the constant term in the expansion of

$$E = (x^{2/3} + 4x^{1/3} + 4)^5\left(\frac{1}{x^{1/3}-1}+\frac{1}{x^{2/3}+x^{1/3}+1}\right)^{-9}$$

is

(a) 74

(b) 98

(c) 148

(d) 168

Ans. (d)

Solution: $E=((x^{1/3}+2)^2)^5\left(\frac{x^{2/3}+x^{1/3}+1+x^{1/3}-1}{x-1}\right)^{-9}$

$$= (2 + x^{1/3})^{10}\left(\frac{x^{2/3}+2x^{1/3}}{x-1}\right)^{-9}$$

$$= (2 + x^{1/3})^{10}\,\frac{(x-1)^9}{(x^{1/3})^9\,(x^{1/3}+2)^9}$$

$$= (2 + x^{1/3})x^{-3}\,(x - 1)^9$$

Constant term in E

$= 2$[constant term in $x^{-3}\,(x - 1)^9$]

$= 2(-1)^9$ [coefficient of x^3 in $(1 - x)^9$]

$= 2(-1)\,{}^9C_3\,(-1) = 168$

Example 15: Coefficient of x^4 in the expansion of $\left(1+3x+\frac{2}{x^2}\right)^6$ is:

(a) 240

(b) 735

(c) 820

(d) 936

Ans. (b)

Solution: The general term in the expansion of $\left(1+3x+\frac{2}{x^2}\right)^6$ is

$$\frac{6!}{a!\,b!\,c!}\,1^a\,(3x)^b\left(\frac{2}{x^2}\right)^c$$

where $a, b, c \ge 0$ and $a + b + c = 6$

$$= \frac{6!\,3^b\,2^{6-a-b}}{a!\,b!\,(6-a-b)!}\,x^{b+2a+2b-12}$$

for coefficient of x^4, set $2a + 3b - 12 = 4$

Now $2a + 3b = 16$ and $a + b + c = 6 \Rightarrow (a, b, c) = (2, 4, 0)$

Thus, required coefficient is

$$\frac{6!\,(3^4)\,(2^0)}{2!\,4!} = 735$$

◉ **Example 16:** Coefficient of x^{17} in the polynomial $P(x)$ $= \prod_{r=0}^{17}\left(x + {}^{35}C_r\right)$ is

(a) 2^{34} (b) ${}^{36}C_{17}$

(c) $2^{35} - {}^{36}C_{17}$ (d) 0

Ans. (a)

◎ **Solution:** $P(x)$ is a polynomial of degree 18, and coefficient of x^{17} is

$$N = {}^{35}C_0 + {}^{35}C_1 + {}^{35}C_2 + \ldots + {}^{35}C_{17} \qquad (1)$$

Using ${}^nC_r = {}^nC_{n-r}$, we can write N as

$$N = {}^{35}C_{35} + {}^{35}C_{34} + \ldots + {}^{35}C_{18} \qquad (2)$$

Adding (1) and (2), we get

$$2N = {}^{35}C_0 + {}^{35}C_1 + \ldots + {}^{35}C_{35} = 2^{35}$$

$$\Rightarrow \qquad N = 2^{34}$$

◉ **Example 17:** The coefficient of x^{20} in the expansion of

$$\left(1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \ldots + \frac{1}{20!}x^{20}\right)^3$$

is:

(a) 0 (b) $\frac{3}{20!}$

(c) $\frac{3^{20}}{20!}$ (d) ${}^{60}C_{20}$

Ans. (c)

◎ **Solution:** Note that, coefficient of x^{20} in

$$\left(1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \ldots + \frac{1}{20!}x^{20}\right)^3$$

= coefficient of x^{20} in

$$\left(1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \ldots + \frac{1}{20!}x^{20} + \frac{1}{21!}x^{21} + \ldots\right)^3$$

= coefficient of x^{20} in $e^{3x} = \frac{3^{20}}{20!}$

◉ **Example 18:** The coefficient of x^7 in the expansion of

$$\left(1 + \frac{1}{1!}x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \frac{1}{4!}x^4 + \frac{1}{5!}x^5\right)^2$$

is:

(a) $\frac{2}{7!}\left({}^8C_3\right)$ (b) $\frac{2^{10}}{5!}$

(c) $\frac{4}{15}$ (d) $\frac{7}{20!}$

Ans. (a)

◎ **Solution:** Required coefficient is

$$\frac{1}{2!\,5!} + \frac{1}{3!\,4!} + \frac{1}{4!\,3!} + \frac{1}{5!\,2!}$$

$$= \frac{1}{7!}\left({}^7C_2 + {}^7C_3 + {}^7C_4 + {}^7C_5\right)$$

$$= \frac{2}{7!}\left({}^7C_2 + {}^7C_3\right) = \frac{2}{7!}\left({}^8C_3\right)$$

◉ **Example 19:** Sum of the series

$\sum_{k=1}^{\infty}\sum_{r=0}^{k}\frac{2^{2r}}{7^k}\left({}^kC_r\right)$ is:

(a) 1/7 (b) 4/7

(c) 2.5 (d) 5.2

Ans. (c)

◎ **Solution:** $\sum_{r=0}^{k}\frac{2^{2r}}{7^k}\left({}^kC_r\right) = \frac{1}{7^k}\sum_{r=0}^{k}\left({}^kC_r\,4^r\right)$

$$= \frac{1}{7^k}(1 + 4)^k = \left(\frac{5}{7}\right)^k$$

Thus, $\sum_{k=1}^{\infty}\sum_{r=0}^{k}\frac{2^{2r}}{7^k}\left({}^kC_r\right)$

$$= \sum_{k=1}^{\infty}\left(\frac{5}{7}\right)^k = \frac{5/7}{1 - 5/7} = 2.5$$

◉ **Example 20:** If the 6th term from the beginning is equal to the 6th term from the end in the expansion of $\left(2^{1/5} + \frac{1}{3^{1/5}}\right)^n$, then n is equal to:

(a) 7 (b) 9

(c) 10 (d) 12

Ans. (c)

◎ **Solution:** 6th term from the beginning

$$= {}^nC_5\,(2^{1/5})^{n-5}\left(\frac{1}{3^{1/5}}\right)^5 = {}^nC_5\left(\frac{2^{n/5}}{6}\right)$$

Also, 6th term from the end

$= (n + 2 - 6) = (n - 4)$ th from the beginning

$$= {}^nC_{n-5}\,(2^{1/5})^{n-(n-5)}\left(\frac{1}{3^{1/5}}\right)^{n-5} = {}^nC_5\left(\frac{6}{3^{n/5}}\right)$$

We are given

$${}^nC_5\left(\frac{2^{n/5}}{6}\right) = {}^nC_5\left(\frac{6}{3^{n/5}}\right) \Rightarrow 6^{n/5} = 6^2 \Rightarrow n = 10$$

◉ **Example 21:** If the coefficients of x^7 and x^8 in $\left(2+\frac{x}{3}\right)^n$ are equal, then value of n is

(a) 56 (b) 55
(c) 47 (d) 19

Ans. (b)

◎ **Solution:** T_{r+1}, the $(r+1)$th term in the expansion of $\left(2+\frac{x}{3}\right)^n$ is given by

$$T_{r+1} = {}^nC_r\,2^{n-r}\left(\frac{x}{3}\right)^r = {}^nC_r\left(\frac{2^{n-r}}{3^r}\right)x^r$$

According to the given condition

$${}^nC_7\left(\frac{2^{n-7}}{3^7}\right) = {}^nC_8\left(\frac{2^{n-8}}{3^8}\right) \quad\Rightarrow\quad \frac{{}^nC_7}{{}^nC_8} = \frac{2^{n-8}}{3^8}\cdot\frac{3^7}{2^{n-7}}$$

$$\Rightarrow\quad \frac{n!}{7!\,(n-7)!}\,\frac{8!\,(n-8)!}{n!} = \frac{1}{6} \quad\Rightarrow\quad \frac{8}{n-7} = \frac{1}{6}$$

$$\Rightarrow\quad 48 = n-7 \quad\Rightarrow\quad n = 55$$

◉ **Example 22:** In the expansion of $\left(x^3-\frac{1}{x^2}\right)^{15}$, the constant term equals

(a) ${}^{15}C_9$ (b) 0
(c) $-({}^{15}C_9)$ (d) ${}^{15}C_{11}$

Ans. (c)

◎ **Solution:** T_{r+1}, the $(r+1)$th term in the expansion of $\left(x^3-\frac{1}{x^2}\right)^{15}$ is

$$T_{r+1} = {}^{15}C_r\,(x^3)^{15-r}\left(-\frac{1}{x^2}\right)^r = {}^{15}C_r\,(-1)^r\,x^{45-5r}$$

To obtain constant term, we set $45 - 5r = 0 \Rightarrow r = 9$

$\therefore$ Coefficient of constant term is ${}^{15}C_9\,(-1)^9 = -\,{}^{15}C_9$.

◉ **Example 23:** If a is real and the 4th term in the expansion of $\left(ax+\frac{1}{x}\right)^n$ is 5/2, for each $x \in \mathbf{R} - \{0\}$, then values of n and a are respectively

(a) 5, 1/2 (b) 6, – 1/2
(c) 3, 1/3 (d) 6, 1/2

Ans. (d)

◎ **Solution:** We have

$$T_4 = T_{3+1} = {}^nC_3\,(ax)^{n-3}\left(\frac{1}{x}\right)^3$$

$$= {}^nC_3\,a^{n-3}x^{n-6} = 5/2$$

As this is true for each $x \in \mathbf{R} - \{0\}$, we get

$$n - 6 = 0 \text{ and } {}^nC_3\,a^{n-3} = 5/2$$

$$\Rightarrow \quad n = 6 \text{ and } {}^6C_3\,a^3 = 5/2$$

$$\therefore \quad a^3 = \frac{5}{2}\times\frac{3!\,3!}{6!} = \frac{5}{2}\times\frac{1}{20} = \frac{1}{8}$$

$$\Rightarrow \quad a = 1/2.$$

Thus, $n = 6,\ a = 1/2$.

◉ **Example 24:** If the 6th term in the expansion of $\left(\frac{1}{x^{8/3}}+x^2\log_{10}x\right)^8$ is 5600, then value of x is

(a) 2 (b) $\sqrt{5}$
(c) $\sqrt{10}$ (d) 10

Ans. (d)

◎ **Solution:** Note that for $\log_{10}x$ to be defined, $x > 0$.

We have $T_6 = T_{5+1} = {}^8C_5\left(\frac{1}{x^{8/3}}\right)^{8-5}(x^2\log_{10}x)^5$

$$\Rightarrow \quad 5600 = \frac{8!}{5!\,3!}\left(\frac{1}{x^8}\right)x^{10}\,(\log_{10}x)^5$$

$$\Rightarrow \quad 5600 = 56\,x^2\,(\log_{10}x)^5$$

$$\Rightarrow \quad 100 = x^2\,(\log_{10}x)^5$$

$$\Rightarrow \quad 100/x^2 = (\log_{10}x)^5$$

The curves $y = 100/x^2$,
$y = (\log_{10}x)^5$
intersect in just one point.
See Fig. 7.1. This points is (10, 1).
Therefore, $x = 10$.

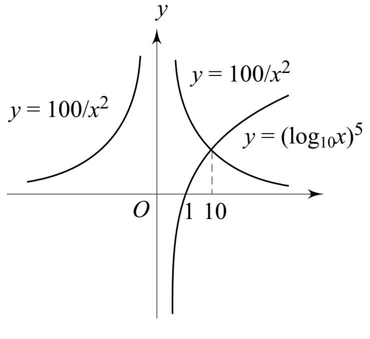


Fig. 7.1

◉ **Example 25:** If the $(r+1)$th term in the expansion of $\left(\frac{a^{1/3}}{b^{1/6}}+\frac{b^{1/2}}{a^{1/6}}\right)^{21}$ has equal exponents of both a and b, then value of r is

(a) 8 (b) 9
(c) 10 (d) 11

Ans. (b)

Solution: We have

$$T_{r+1} = {}^{21}C_r \left(\frac{a^{1/3}}{b^{1/6}}\right)^{21-r} \left(\frac{b^{1/2}}{a^{1/6}}\right)^{r}$$

$$= {}^{21}C_r \frac{a^{7-r/3}}{b^{7/2-r/6}} \cdot \frac{b^{r/2}}{a^{r/6}} = {}^{21}C_r\, a^{7-r/2}\, b^{2r/3-7/2}$$

Since exponents of a and b in the $(r+1)$th term are equal,

$$7-\frac{r}{2} = \frac{2r}{3}-\frac{7}{2} \Rightarrow \frac{21}{2} = \frac{7}{6}r \Rightarrow r = 9.$$

Example 26: If A and B are coefficients of x^n in the expansions of $(1+x)^{2n}$ and $(1+x)^{2n-1}$ respectively, then

(a) $A = B$ (b) $A = 2B$
(c) $2A = B$ (d) none of these

Ans. (b)

Solution: We know that coefficient of x^r in the expansion of $(1+x)^m$ is ${}^mC_r$.

Thus, $A = {}^{2n}C_n$ and $B = {}^{2n-1}C_n$.

We have $$\frac{A}{B} = \frac{{}^{2n}C_n}{{}^{2n-1}C_n} = \frac{(2n)!}{n!\,n!}\,\frac{(n!)\,(n-1)!}{(2n-1)!} = \frac{2n}{n} = 2$$

$\Rightarrow$ $A = 2B$

Example 27: If x^{2k} occurs in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$, then

(a) $n-2k$ is a multiple of 2
(b) $n-2k$ is a multiple of 3
(c) $k = 0$
(d) none of these

Ans. (b)

Solution: T_{r+1} the $(r+1)$th term in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$ is given by

$$T_{r+1} = {}^{n-3}C_r\,(x)^{n-3-r}\left(\frac{1}{x^2}\right)^r = {}^{n-3}C_r\, x^{n-3-3r}$$

As x^{2k} occurs in the expansion of $\left(x+\frac{1}{x^2}\right)^{n-3}$, we must have $n-3-3r = 2k$ for some non-negative integer r.

$\Rightarrow$ $3(1+r) = n-2k$ $\Rightarrow$ $n-2k$ is a multiple of 3.

Example 28: Coefficient of the term independent of x in the expansion of $\left(\frac{x+1}{x^{2/3}-x^{1/3}+1}-\frac{x-1}{x-x^{1/2}}\right)^{10}$ is

(a) 210 (b) 105
(c) 70 (d) 35

Ans. (a)

Solution: We have

$$x+1 = (x^{1/3})^3+1 = (x^{1/3}+1)\,(x^{2/3}-x^{1/3}+1),$$

$$x-1 = \left(\sqrt{x}-1\right)\left(\sqrt{x}+1\right)$$

and $$x-x^{1/2} = \sqrt{x}(\sqrt{x}-1),$$

Thus, $$\frac{x+1}{x^{2/3}-x^{1/3}+1}-\frac{x-1}{x-x^{1/2}}$$
$$= x^{1/3}+1-(1+x^{-1/2}) = x^{1/3}-x^{-1/2}$$

Now, the $(r+1)$th term in the expansion of $(x^{1/3}-x^{-1/2})^{10}$ is

$$T_{r+1} = {}^{10}C_r\,(x^{1/3})^{10-r}\,(x^{-1/2})^r\,(-1)^r$$
$$= {}^{10}C_r\, x^{10/3-5r/6}\,(-1)^r$$

For this term to be independent of x,

$$\frac{10}{3}-\frac{5r}{6} = 0 \quad\Rightarrow\quad r = \frac{10}{3}\times\frac{6}{5} = 4$$

Thus, coefficient of the term independent of x in the given expression is

$${}^{10}C_4 = \frac{10!}{4!6!} = 210.$$

Example 29: If $(1+x)^n = C_0+C_1x+C_2x^2+\ldots+C_nx^n$, then value of $C_0+2C_1+3C_2+\ldots+(n+1)C_n$ is

(a) 2^{n-1} (b) $n(2^{n-1})$
(c) $n(2^{n-1})+2^n$ (d) $(n+1)2^n$

Ans. (c)

Solution: Let $E = C_0+2C_1+3C_2+\ldots+nC_{n-1}+(n+1)C_n$ (1)

Using $C_r = C_{n-r}$, we can rewrite (1) as

$$E = (n+1)\,C_0+nC_1+(n-1)C_2+\ldots+2C_{n-1}+C_n \qquad (2)$$

Adding (1) and (2), we get

$$2E = (n+2)C_0+(n+2)C_1+(n+2)C_2+\ldots+(n+2)C_n$$
$$= (n+2)\,\{C_0+C_1+\ldots+C_n\} = (n+2)2^n$$

$\Rightarrow$ $E = (n+2)2^{n-1}$

Alternative Solution

We have

$$C_0\,x+C_1\,x^2+C_2\,x^3+\ldots+C_n\,x^{n+1} = x\,(1+x)^n$$

Differentiating both the sides, we get

$$C_0+2C_1\,x+3C_2\,x^2+\ldots+(n+1)C_n\,x^n = (1+x)^n+nx(1+x)^{n-1} \qquad (1)$$

Putting $x = 1$, we get

$$C_0+2C_1+3C_2+\ldots+(n+1)C_n = 2^n+n(1)\,2^{n-1} = (n+2)2^{n-1}$$

Example 30: If $n > 1$, and $(1+x)^n = C_0+C_1\,x+C_2\,x^2+\ldots+C_n\,x^n$ then value of $C_0-2C_1+3C_2-4C_3+\ldots+(-1)^n(n+1)C_n$ is

(a) -1 (b) 0
(c) 1 (d) 2

Ans. (b)

Solution: Putting $x = -1$ in the equation (1) of alternative solution to Example 29, we get

$$C_0 - 2C_1 + 3C_2 - 4C_3 + \ldots + (-1)^n (n+1)C_n = 0 + 0 = 0$$

Example 31: If $n \in \mathbf{N}$, $n > 1$, then value of
$E = a - {}^nC_1 (a-1) + {}^nC_2 (a-2) + \ldots + (-1)^n (a-n)({}^nC_n)$ is

(a) a (b) 0
(c) a^2 (d) 2^n

Ans. (b)

Solution: We can write E as

$$a\,[{}^nC_0 - {}^nC_1 + {}^nC_2 - \ldots + (-1)^n ({}^nC_n)] + [{}^nC_1 - (2)({}^nC_2) + (3)({}^nC_3) - \ldots - (-1)^n (n)({}^nC_n)]$$
$$= 0 + F \text{ where}$$
$$F = {}^nC_1 - (2)({}^nC_2) + (3)({}^nC_3) - \ldots - (-1)^n (n)({}^nC_n)$$

We have $(1+x)^n = {}^nC_0 + {}^nC_1\,x + {}^nC_2\,x^2 + {}^nC_3\,x^3 + \ldots + {}^nC_n\,x^n$

Differentiating, we get

$$n(1+x)^{n-1} = {}^nC_1 + 2({}^nC_2)x + 3({}^nC_3)x^2 + \ldots + n({}^nC_n)x^{n-1}$$

Putting $x = -1$, we get

$$0 = {}^nC_1 - 2({}^nC_2) + 3({}^nC_3) - \ldots - (-1)^{n-1}(n)({}^nC_n)$$

$\Rightarrow$ $0 = F.$

Thus, $E = 0 + 0 = 0.$

Example 32: Suppose ABC is a triangle and n is a natural number, then sum of the series

$$S = \sum_{r=0}^{n} {}^nC_r\, a^{n-r} b^r \cos\,[nA - (n-r)B]$$

is:

(a) $(a+b)^n$ (b) $(a-b)^n$
(c) c^n (d) c^{2n}

Ans. (c)

Solution: $S = \displaystyle\sum_{r=0}^{n} {}^nC_r\; a^{n-r} b^r\, \mathrm{Re}[e^{i(nB-(n-r)A)}]$

$$= \mathrm{Re} \sum_{r=0}^{n} {}^nC_r\, (ae^{-iB})^{n-r} (be^{\,iA})^r$$
$$= \mathrm{Re}\,(ae^{-iB} + be^{iA})^n$$
$$= \mathrm{Re}\,[a(\cos B - i\sin B) + b\,(\cos A + i\sin A)]^n$$
$$= \mathrm{Re}\,[(a\cos B + b\cos A) - i\,(a\sin B - b\sin A)]^n$$

But $a\cos B + b\cos A = c$ [projection formula]

and $a\sin B = b\sin A$ [Law of sines]

$\therefore$ $S = \mathrm{Re}(c^n) = c^n.$

Example 33: The positive integer just greater than $S = (1 + 0.0001)^{10000}$ is

(a) 2 (b) 3
(c) 4 (d) 5

Ans. (b)

Solution: Let $n = 10000$, then

$$S = \left(1 + \frac{1}{n}\right)^n$$
$$= 1 + {}^nC_1\left(\frac{1}{n}\right) + {}^nC_2\left(\frac{1}{n}\right)^2 + \cdots + {}^nC_n\left(\frac{1}{n}\right)^n$$
$$= 1 + 1 + \frac{1}{2!}\frac{n(n-1)}{n^2} + \frac{1}{3!}\frac{n(n-1)(n-2)}{n^3} + \cdots + \frac{1}{n!}\frac{n(n-1)\cdots(n-n+1)}{n^n}$$
$$= 1 + 1 + \frac{1}{2!}\left(1 - \frac{1}{n}\right) + \frac{1}{3!}\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right) + \cdots + \frac{1}{n!}\left(1 - \frac{1}{n}\right)\cdots\left(1 - \frac{n-1}{n}\right)$$
$$< 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!}$$

But $\displaystyle\frac{1}{r!} = \frac{1}{1.2\ldots r} \le \frac{1}{2^{r-1}} \quad \forall\, r \ge 2.$

Thus, $\displaystyle S \le 1 + 1 + \frac{1}{2} + \frac{1}{2^2} + \cdots + \frac{1}{2^{n-1}}$

$$= 1 + \frac{1 - (1/2)^n}{1 - 1/2} = 3 - \left(\frac{1}{2}\right)^{n-1} < 3.$$

Example 34: The coefficient of the middle term in the binomial expansion of $(1 + \alpha x)^4$ and of $(1 - \alpha x)^6$ is the same if α equals

(a) $-\dfrac{3}{10}$ (b) $\dfrac{10}{3}$

(c) $-\dfrac{5}{3}$ (d) $\dfrac{3}{5}$

Ans. (a)

Solution: Middle term in the expansion of $(1 + \alpha x)^4$ is ${}^4C_2(\alpha x)^2 = 6\alpha^2 x^2$ and the middle term in the expansion of $(1 - \alpha x)^6$ is ${}^6C_3(-\alpha x)^3 = -20\,\alpha^3 x^3$.

We are given $6\alpha^2 = -20\,\alpha^3 \Rightarrow \alpha = 0$ or $\alpha = -\dfrac{3}{10}$

Example 35: For natural numbers m and n

$$(1-y)^m (1+y)^n = 1 + a_1 y + a_2 y^2 + \ldots$$

and $a_1 = a_2 = 10$, then (m, n) equals

(a) (35, 45) (b) (20, 45)
(c) (35, 20) (d) (45, 35)

Ans. (a)

◎ **Solution:** $(1-y)^m(1+y)^n = (1 - my + {}^mC_2 y^2 - \ldots)(1 + ny$ $+ {}^nC_2 y^2 + \ldots)$

$$= 1 + (n - m)y + ({}^nC_2 + {}^mC_2 - mn)y^2 + \ldots$$

We are given

$$n - m = a_1 = 10$$

and $\quad {}^nC_2 + {}^mC_2 - mn = a_2 = 10.$

$\Rightarrow \quad n = m + 10$ and

$$\frac{1}{2}n(n-1) + \frac{1}{2}m(m-1) - mn = 10$$

$\Rightarrow \quad (m + 10)(m + 9) + m(m - 1) - 2m(m + 10) = 20$

$\Rightarrow \quad m^2 + 19m + 90 + m^2 - m - 2m^2 - 20m = 20$

$\Rightarrow \quad -2m = -70 \quad \Rightarrow \quad m = 35.$

$\therefore \quad n = 45$

◉ **Example 36:** The sum of the series $S = {}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - {}^{20}C_3 + \ldots + {}^{20}C_{10}$ is

(a) $-({}^{20}C_{10})$ (b) $\frac{1}{2}({}^{20}C_{10})$

(c) 0 (d) ${}^{20}C_{10}$

Ans. (b)

◎ **Solution:** Using ${}^nC_r = {}^nC_{n-r}$, we can write

$2S = {}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - {}^{20}C_3 + \ldots {}^{20}C_{10} + {}^{20}C_{20} - {}^{20}C_{19} + {}^{20}C_{18} - \ldots + {}^{20}C_{10}$

$\Rightarrow \quad S = 0 + \frac{1}{2}({}^{20}C_{10}) = \frac{1}{2}({}^{20}C_{10})$

◉ **Example 37:** The expansion of

$\left(x + \sqrt{x^3 - 1}\right)^5 + \left(x - \sqrt{x^3 - 1}\right)^5$ is a polynomial of degree

(a) 5 (b) 6

(c) 7 (d) 8

Ans. (c)

◎ **Solution:** Using $(a + b)^5 + (a - b)^5$

$$= 2[a^5 + {}^5C_2\, a^3b^2 + {}^5C_4\, ab^4],$$

we get $\left(x + \sqrt{x^3 - 1}\right)^5 + \left(x - \sqrt{x^3 - 1}\right)^5$

$$= 2[x^5 + 10x^3(x^3 - 1) + 5x(x^3 - 1)^2]$$

which is a polynomial of degree 7.

◉ **Example 38:** The coefficient of x^r in the expansion of

$S = (x + 3)^{n-1} + (x + 3)^{n-2}(x + 2) + (x + 3)^{n-3}(x + 2)^2 + \ldots + (x + 2)^{n-1}$

is

(a) $3^{n-r} - 2^{n-r}$ (b) ${}^nC_r(3^r - 2^r)$

(c) ${}^nC_r(3^{n-r} - 2^{n-r})$ (d) none of these

Ans. (c)

◎ **Solution:** We can write

$$S = \frac{(x+3)^{n-1}\left[1 - \left(\dfrac{x+2}{x+3}\right)^n\right]}{1 - \dfrac{x+2}{x+3}} = (3 + x)^n - (2 + x)^n$$

$\therefore$ Coefficient of $x^r = {}^nC_r(3^{n-r} - 2^{n-r})$

◉ **Example 39:** Number of zeros at then end of $99^{1001} + 1$ is

(a) 2 (b) 4

(c) 1002 (d) 1004

Ans. (a)

◎ **Solution:** Let $n = 1001$. We can write

$$99^{1001} + 1 = (100 - 1)^n + 1$$
$$= {}^nC_0 100^n - {}^nC_1\, 100^{n-1} + {}^nC_2\, 100^{n-2} - \ldots$$
$$= 100\, m + {}^nC_{n-1}(100) - 1 + 1$$

where $\quad m = {}^nC_0 100^{n-1} - {}^nC_1\, 100^{n-2} + {}^nC_2\, 100^{n-3} - \ldots - {}^nC_{n-2}\, 100 + {}^nC_{n-1}$

As ${}^nC_{n-1} = 1001$, the units digit of m is different from 0. Thus, the number of zeros at the end of $99^{1001} + 1$ is two.

◉ **Example 40:** The coefficient of x^k in the expansion of $E = 1 + (1 + x) + (1 + x)^2 + \ldots + (1 + x)^n$ is

(a) ${}^nC_k$ (b) ${}^{n+1}C_k$

(c) ${}^{n+1}C_{k+1}$ (d) none of these

Ans. (c)

◎ **Solution:** We have

$$E = 1 + (1 + x) + (1 + x)^2 + \ldots + (1 + x)^n$$

$$= \frac{1 - (1+x)^{n+1}}{1 - (1+x)} = \frac{1}{x}\left[(1+x)^{n+1} - 1\right]$$

Thus, coefficient of x^k in E

$$= \text{Coefficient of } x^{k+1} \text{ in } [(1 + x)^{n+1} - 1]$$
$$= {}^{n+1}C_{k+1}$$

◉ **Example 41:** The number of irrational terms in the expansion of $(5^{1/6} + 2^{1/8})^{100}$ is

(a) 96 (b) 97

(c) 98 (d) 99

Ans. (b)

◎ **Solution:** T_{r+1}, the $(r + 1)$th in the expansion of $(5^{1/6} + 2^{1/8})^{100}$ is given by

$$T_{r+1} = {}^{100}C_r\,(5^{1/6})^{100-r}\,(2^{1/8})^r$$

As 5 and 2 are relatively prime, T_{r+1} will be rational if $\frac{100 - r}{6}$ and $\frac{r}{8}$ are both integers. i.e. if $100 - r$ is a multiple of 6 and r is a multiple of 8. As $0 \le r \le 100$, multiples of 8 upto 100 and corresponding value of $100 - r$ are

$$r = 0, 8, 16, 24, \ldots, 88, 96$$
$$100 - r = 100, 92, 84, 76, \ldots, 12, 4$$

Out of these values for $100 - r$, multiples of 6 are 84, 60, 36, 12

$\therefore$ there are just four rational terms in the expansion of $\left(5^{1/6}+2^{1/8}\right)^{100}$.

$\Rightarrow$ number of irrational terms is $101 - 4 = 97$

Example 42: The sum of the rational terms of $\left(2^{1/5}+\sqrt{3}\right)^{20}$ is

(a) 71 (b) 85
(c) 97 (d) none of these

Ans. (d)

Solution: T_{r+1}, the $(r + 1)$th term in the expansion of $\left(2^{1/5}+\sqrt{3}\right)^{20}$ is

$$T_{r+1} = {}^{20}C_r\,(2^{1/5})^{20-r}\,(3^{1/2})^r = {}^{20}C_r\,2^{4-r/5}\,(3)^{r/2}$$

As 2 and 3 are relatively prime $2^{4-r/5}$ and $3^{r/2}$ will be rational if both $4 - r/5$ and $r/2$ are integers, i.e. if $r/5$ and $r/2$ are integers. This is possible if

$$r = 0, 10, 20.$$

Thus, the sum of rational terms is

$${}^{20}C_0(2^4)(3^0) + {}^{20}C_{10}(2^2)(3^5) + {}^{20}C_{20}(2^0)(3^{10})$$

As this is more than 71, 85 or 97, answer is (d).

Example 43: If in the expansion of $\left(x^3-\dfrac{1}{x^2}\right)^n$, $n \in \mathbf{N}$, sum of the coefficient of x^5 and x^{10} is 0, then value of n is

(a) 5 (b) 10
(c) 15 (d) 20

Ans. (c)

Solution: T_{r+1}, the $(r + 1)$th term in the expansion of $\left(x^3-\dfrac{1}{x^2}\right)^n$ is

$$T_{r+1} = {}^nC_r(x^3)^{n-r}\left(-\frac{1}{x^2}\right)^r = {}^nC_r(-1)^r\,x^{3n-5r}$$

For the coefficient of x^5, we set $3n - 5r = 5 \Rightarrow r = \dfrac{3n-5}{5} = p$(say) and

for the coefficient of x^{10}, we set $3n - 5r = 10 \Rightarrow r = \dfrac{3n-10}{5} = q$ (say)

Note that $p - q = 1$. We are given

$${}^nC_p(-1)^p + {}^nC_q(-1)^q = 0$$

$$\Rightarrow \quad {}^nC_p(-1)^p + {}^nC_{p-1}(-1)^{p-1} = 0$$

$$\Rightarrow \quad {}^nC_p = {}^nC_{p-1} \Rightarrow n - p = p - 1$$

$$\Rightarrow \quad n = 2p-1 \quad \Rightarrow \quad p = \frac{n+1}{2}$$

$$\text{Thus,} \quad \frac{n+1}{2} = \frac{3n-5}{5} \quad \Rightarrow \quad 5n + 5 = 6n - 10$$

$$\Rightarrow \quad 15 = n$$

Example 44: In the expansion of $(1 + px)^n$, $n \in \mathbf{N}$, the coefficient of x and x^2 are 8 and 24 respectively, then

(a) $n = 3, p = 2$ (b) $n = 4, p = 2$
(c) $n = 4, p = 3$ (d) $n = 5, p = 3$

Ans. (b)

Solution: We have

$$(1 + px)^n = 1 + {}^nC_1(px) + {}^nC_2(px)^2 + \ldots$$
$$= 1 + npx + \frac{1}{2}\,n(n-1)p^2x^2 + \ldots$$

According to the hypothesis,

$$np = 8 \text{ and } \frac{1}{2}\,n(n-1)p^2 = 24$$

Putting $p = 8/n$ in the second expression, we get

$$\frac{1}{2}\,n(n-1)\left(\frac{8}{n}\right)^2 = 24 \Rightarrow \frac{n-1}{n} = \frac{24\times 2}{8\times 8} = \frac{3}{4}$$

$\Rightarrow$ $4n - 4 = 3n$ $\Rightarrow$ $n = 4$

Putting this value in $np = 8$, we get $p = 2$.

Example 45: The greatest value of the term independent of x, as α varies over $\boldsymbol{R}$, in the expansion of $\left(x\cos\alpha+\dfrac{\sin\alpha}{x}\right)^{20}$ is

(a) ${}^{20}C_{10}$ (b) ${}^{20}C_{15}$
(c) ${}^{20}C_{19}$ (d) ${}^{20}C_{10}\left(\dfrac{1}{2}\right)^{10}$

Ans. (d)

Solution: T_{r+1}, the $(r+1)$th term in the expansion of $\left(x\cos\alpha+\dfrac{\sin\alpha}{x}\right)^{20}$ is ${}^{20}C_r\,(x\cos\alpha)^{20-r}\left(\dfrac{\sin\alpha}{x}\right)^r$

$$= {}^{20}C_r\,x^{20-2r}\,(\cos\alpha)^{20-r}\,(\sin\alpha)^r$$

For this term to be independent of x, we set $20 - 2r = 0$

$\Rightarrow$ $r = 10$.

Let β = Term independent of x, then

$$\beta = {}^{20}C_{10}\,(\cos\alpha)^{10}\,(\sin\alpha)^{10}$$
$$= {}^{20}C_{10}\,[\cos\alpha\sin\alpha]^{10}$$

Thus, the greatest possible value of β is ${}^{20}C_{10}\left(\dfrac{1}{2}\right)^{10}$.

Example 46: Sum of the last 20 coefficients in the expansion of $(1 + x)^{39}$, when expanded in ascending powers of x, is

(a) 2^{19} (b) 2^{18}
(c) ${}^{40}C_{20}-2^{19}$ (d) 2^{38}

Ans. (d)

Solution: There are 40 terms in the expansion of $(1 + x)^{39}$. Sum of the last 20 coefficients is

$$S = {}^{39}C_{20} + {}^{39}C_{21} + \ldots + {}^{39}C_{38} + {}^{39}C_{39}$$

$$\Rightarrow \qquad S = {}^{39}C_{19} + {}^{39}C_{18} + \ldots + {}^{39}C_1 + {}^{39}C_0$$
$$[\text{using } {}^nC_r = {}^nC_{n-r}]$$

Adding the above two expressions, we get

$$2S = {}^{39}C_0 + {}^{39}C_1 + \ldots + {}^{39}C_{39} = 2^{39}$$
$$\Rightarrow \qquad S = 2^{38}$$

◉ **Example 47:** If $(1 + x)^{15} = C_0 + C_1x + C_2x^2 + \ldots + C_{15}x^{15}$ then value of the expression $S = C_2 + 2C_3 + 3C_4 + \ldots + 14C_{15}$ is

(a) $13(2^{14}) + 1$ (b) $13(2^{15})$
(c) $13(2^{14})$ (d) none of these

Ans. (a)

◎ **Solution:** We add $-1C_0 + 0C_1$ to both the sides of S and let

$$S_1 = S - 1C_0 + 0C_1 = S - 1.$$

Note that

$$S_1 = -1C_0 + 0C_1 + 1C_2 + 2C_3 + \ldots + 13C_{14} + 14C_{15} \qquad (1)$$

Using $C_r = C_{n-r}$, we rewrite the above expression as

$$S_1 = 14C_0 + 13C_1 + 12C_2 + \ldots + 0C_{14} + (-1)C_{15} \qquad (2)$$

Adding (1) and (2), we get

$$2S_1 = 13\,[C_0 + C_1 + C_2 + \ldots + C_{15}] = 13(2^{15})$$
$$\Rightarrow \quad S_1 = 13(2^{14}) \qquad \Rightarrow \qquad S = 13(2^{14}) + 1$$

◉ **Example 48:** Let $R = (2+\sqrt{3})^{2n}$ and $f = R - [R]$ where [ ] denotes the greatest integer function, then $R(1 - f)$ is equal to

(a) 1 (b) 2^{2n}
(c) $2^{2n} - 1$ (d) ${}^{2n}C_n$

Ans. (a)

◎ **Solution:** As $0 < 2 - \sqrt{3} < 1$ we get $0 < F = (2 - \sqrt{3})^{2n} < 1$

We have

$$R + F = (2 + \sqrt{3})^{2n} + (2 - \sqrt{3})^{2n}$$
$$= 2\,[{}^{2n}C_0\,2^{2n} + {}^{2n}C_2\,2^{2n-2}\left(\sqrt{3}\right)^2 +$$
$${}^{2n}C_4\,(2^{2n-4})(\sqrt{3})^4 \ldots + {}^{2n}C_{2n}\left(\sqrt{3}\right)^{2n}]$$

$\Rightarrow$ $R + F$ is an even integer.

$\Rightarrow$ $[R] + f + F$ is an even integer.

$\Rightarrow$ $f + F$ is an integer.

But $0 \le f < 1$ and $0 < F < 1 \quad \Rightarrow \quad 0 < f + F < 2$

But the only integer between 0 and 2 is 1. Thus,

$$f + F = 1 \qquad \Rightarrow \qquad 1 - f = F$$

Now, $\quad R(1 - f) = RF = \left(2+\sqrt{3}\right)^{2n}\left(2-\sqrt{3}\right)^{2n}$

$$= (4 - 3)^{2n} = 1^{2n} = 1$$

◉ **Example 49:** If [ ] denotes the greatest integer function, then $[(\sqrt{2} + 1)^6]$ is equal

(a) 199 (b) 198
(c) 197 (d) 196

Ans. (c)

◎ **Solution:** Let $(\sqrt{2} + 1)^6 = R + f$ where R is an integer and $0 \le f < 1$.

Note that

$$R = [(\sqrt{2} + 1)^6]$$

Also $0 < \sqrt{2} - 1 < 1 \Rightarrow 0 < F = (\sqrt{2} - 1)^6 < 1$.

We have, $R + f + F = \left(\sqrt{2}+1\right)^6 + \left(\sqrt{2}-1\right)^6$

$$= 2\,[{}^6C_0\,(\sqrt{2})^6 + {}^6C_2\,(\sqrt{2})^4 + {}^6C_4\,(\sqrt{2})^2 + {}^6C_6]$$
$$= 2\,[2^3 + 15(2^2) + 15(2) + 1] = 198$$
$$\Rightarrow \qquad f + F = 198 - R \text{ is an integer.}$$

As $0 \le f < 1$ and $0 < F < 1$, $0 < f + F < 2$.

But the only integer between 0 and 2 is 1. Therefore

$$f + F = 1$$

Thus, $\qquad 1 = 198 - R \qquad \Rightarrow \qquad R = 197$

◉ **Example 50:** Sum of the coefficients of the terms of degree m in the expansion of $(1 + x)^n\,(1 + y)^n\,(1 + z)^n$ is

(a) $({}^nC_m)^3$ (b) $3({}^nC_m)$
(c) ${}^nC_{3m}$ (d) ${}^{3n}C_m$

Ans. (d)

◎ **Solution:** We have

$$(1 + x)^n\,(1 + y)^n\,(1 + z)^n$$
$$= \left(\sum_{r=0}^{n} {}^nC_r x^r\right)\left(\sum_{s=0}^{n} {}^nC_s y^s\right)\left(\sum_{t=0}^{n} {}^nC_t z^t\right)$$
$$= \sum_{0 \le r,s,t \le n} ({}^nC_r)({}^nC_s)({}^nC_t)\,x^r y^s z^t$$

For sum of the coefficients of degree m, we must have $r + s + t = m$ where r, s, t are integers with $r, s, t \ge 0$.

Sum of such coefficients

$$= \sum_{\substack{r,s,t \ge 0 \\ r+s+t=m}} \left({}^nC_r\right)\left({}^nC_s\right)\left({}^nC_t\right)$$

=the number of ways of choosing a total number of m balls out of n distinct black, n distinct white and n distinct green balls

$= {}^{3n}C_m$

◉ **Example 51:** The remainder when 2^{2000} is divided by 17 is

(a) 1 (b) 2
(c) 8 (d) 12

Ans. (a)

Solution: We have $2^4 = 16 = 17 - 1$

$$\therefore \quad 2^{2000} = (2^4)^{500} = (17-1)^{500}$$
$$= {}^{500}C_0\, 17^{500} - {}^{500}C_1\, 17^{499} + {}^{500}C_2\, 17^{498} - {}^{500}C_3 17^{497} + \ldots - {}^{500}C_{499}\,(17) + (-1)^{500}$$
$$= 17m + 1$$

where m is some positive integer.

Thus, the required remainder is 1.

Example 52: If $(1 + x + x^2)^{48} = a_0 + a_1\, x + a_2\, x^2 + \ldots + a_{96}\, x^{96}$, then value of $a_0 - a_2 + a_4 - a_6 + \ldots + a_{96}$ is

(a) –1	(b) 0
(c) 1	(d) 48

Ans. (c)

Solution: Putting $x = i$, we get

$$(1 + i + i^2)^{48} = a_0 + a_1\, i + a_2\, i^2 + \ldots + a^{98}\, i^{96}$$
$$\Rightarrow \quad i^{48} = (a_0 - a_2 + a_4 - \ldots) + i(a_1 - a_3 + \ldots)$$

Equating the real parts we get

$$a_0 - a_2 + a_4 - a_6 + \ldots + a_{96} = 1$$

Example 53: Sum of the series $S = 3^{-1}\,({}^{10}C_0) - {}^{10}C_1 + (3)\,({}^{10}C_2) - 3^2({}^{10}C_3) + \ldots + 3^9\,({}^{10}C_{10})$ is

(a) 2^9	(b) $2^{10} - 1$
(c) $\frac{1}{3}\,(2^{11} - 2)$	(d) $\frac{1}{3}\,(2^{10})$

Ans. (d)

Solution: We have

$$S = 3^{-1}\,[{}^{10}C_0 - {}^{10}C_1\,(3) + {}^{10}C_2\,(3^2) - {}^{10}C_3\,(3^3) + \ldots + {}^{10}C_{10}(3^{10})]$$
$$= \frac{1}{3}\,(1-3)^{10} = \frac{1}{3}\,(2^{10})$$

Example 54: The coefficient of x^{53} in

$$\sum_{m=0}^{100} {}^{100}C_m (x-5)^{100-m} (4)^m \text{ is}$$

(a) ${}^{100}C_{47}$	(b) ${}^{100}C_{53}$
(c) $-\,{}^{100}C_{53}$	(d) 2^{53}

Ans. (c)

Solution: We have

$$\sum_{m=0}^{100} {}^{100}C_m (x-5)^{100-m} (4)^m = (x - 5 + 4)^{100} = (x-1)^{100}$$

$\therefore$ Coefficient of x^{53} is ${}^{100}C_{53}\,(-1)^{47} = -\,{}^{100}C_{53}$.

Example 55: Let

$$E = 1^{2017} + 2^{2017} + 3^{2017} + \ldots + 2016^{2017},$$

then E is divisible by

(a) 2016	(b) 2017
(c) 4033	(d) 2016^2

Ans. (b)

Solution: For $1 \le x \le 1013$,

$$x^{2017} + (2017 - x)^{2017}$$
$$= x^{2017} + {}^{2017}C_0\,(2017)^{2017} + {}^{2017}C_1\,(2017)^{2016}\,(-x) + {}^{2017}C_2\,(2017)^{2015}\,(-x)^2 + \ldots + {}^{2017}C_{2016}\,(2017)\,(-x)^{2016} + (-x)^{2017}$$
$$= (2017)m$$

where $m = {}^{2017}C_0\,(2017)^{2016} + {}^{2017}C_1\,(2017)^{2015}\,(-x) + \ldots + {}^{2017}C_{2016}\,(-x)^{2016}$,

is a positive integer.

Now, write E as sum of 1013 groups as follows:

$$E = (1^{2017} + 2016^{2017}) + (2^{2017} + 2015^{2017}) + \ldots + (1013^{2017} + 1014^{2017})$$

and note that each group is divisible by 2017.

Example 56: Let $(1 + x + x^2)^{100} = \sum_{r=0}^{200} a_r x^r \qquad (1)$

and $a = \sum_{r=0}^{200} a_r$, then value of $\sum_{r=1}^{200} \frac{ra_r}{25a}$ is

(a) 5	(b) 4
(c) 3	(d) 2

Ans. (b)

Solution: $a = \sum_{r=0}^{200} a_r = \sum_{r=0}^{200} a_r (1)^r = 3^{100}$

Differentiating (1), we get

$$100\,(1 + x + x^2)^{99}\,(1 + 2x) = \sum_{r=1}^{200} ra_r\; x^{r-1}$$

Put $x = 1$, to obtain

$$100(3)^{99}\,(3) = \sum_{r=1}^{200} ra_r$$
$$\Rightarrow \quad \sum_{r=1}^{200} \frac{ra_r}{25a} = \frac{100a}{25a} = 4$$

Example 57: If a_i $(i = 0, 1, 2, \ldots 16)$ are real constants such that for every real value of x

$(1 + x + x^2)^8 = a_0 + a_1x + a_2x^2 + \ldots + a_{16}x^{16}$, then a_5 is equal to

(a) 502	(b) 504
(c) 506	(d) 508

Ans. (b)

Solution: $(1 + x + x^2)^8 = \sum\limits_{\substack{p,q,r \ge 0 \\ P+q+r=8}} \frac{8!}{p!q!r!} 1^p\, x^p\, (x^2)^r$

For a_5, we require, $q + 2r = 5$,

$\Rightarrow$ $q = 5, r = 0, p = 3$ or $q = 3, r = 1, p = 4$,

or $q = 1, r = 2, p = 5$.

Thus, coefficient of x^5 is

$$\frac{8!}{5!\,3!} + \frac{8!}{3!\,1!\,4!} + \frac{8!}{1!\,2!\,5!} = 504$$

Example 58: Sum of the last 12 coefficients of in the binomial expansion of $(1 + x)^{23}$ is:

(a) 2^{22} (b) 2^{23}
(c) $2^{23} - {}^{23}C_{11}$ (d) $2^{23} - 2^{11}$

Ans. (a)

Solution: Sum of last 12 coefficients is

$$S = {}^{23}C_{12} + {}^{23}C_{13} + \ldots + {}^{23}C_{23} \quad (1)$$

Using ${}^nC_r = {}^nC_{n-r}$, we get

$$S = {}^{23}C_{11} + {}^{23}C_{10} + \ldots + {}^{23}C_0 \quad (2)$$

Adding (1) and (2), we get

$$2S = {}^{23}C_0 + {}^{23}C_1 + \ldots {}^{23}C_{23} = 2^{23}$$

$$\Rightarrow \quad S = 2^{22}$$

Example 59: If coefficient of x^3 and x^4 in the expansion of $(1 + ax + bx^2)(1 - 2x)^{18}$ in powers of x are both zeros, then (a, b) is equal to

(a) $\left(14, \frac{251}{3}\right)$ (b) $\left(14, \frac{272}{3}\right)$
(c) $\left(16, \frac{272}{3}\right)$ (d) $\left(16, \frac{251}{3}\right)$

Ans. (c)

Solution: $S = (1 + ax + bx^2)(1 - 2x)^{18}$

$$= (1 + ax + bx^2)\,[1 + {}^{18}C_1(-2x) + {}^{18}C_2(-2x)^2 + {}^{18}C_3(-2x)^3 + {}^{18}C_4(-2x)^4 + \ldots]$$

Coefficient of x^3 in the expansion of S is ${}^{18}C_3(-2)^3 + a({}^{18}C_2(-2)^2) + {}^{18}C_1(-2)b = 0$

Divide by ${}^{18}C_1(-2)$ to obtain

$$\frac{544}{3} - 17a + b = 0 \quad (1)$$

Similarly, coefficient of x^4 is

$${}^{18}C_4(-2)^4 + a({}^{18}C_3(-2)^3) + {}^{18}C_2(-2)^2\,b = 0$$

Divide by ${}^{18}C_2(-2)^2$ to obtain

$$80 - \frac{32}{3}a + b = 0 \quad (2)$$

Subtract (2) from (1) to obtain

$$\frac{304}{3} - \frac{19}{3}a = 0 \Rightarrow a = 16$$

From (1), $b = 17 \times 16 - \frac{544}{3} = \frac{272}{3}$

Example 60: Let a, b, c, d be any four consecutive coefficients in the binomial expansion of $(1 + x)^n$, then

$$\frac{a}{a+b} + \frac{c}{c+d} - 2\left(\frac{b}{b+c}\right) \text{ is equal to}$$

(a) n (b) 1
(c) 0 (d) $2n$

Ans. (c)

Solution: Suppose $a = {}^nC_r$, $b = {}^nC_{r+1}$, $C = {}^nC_{r+2}$, and $d = {}^nC_{r+3}$. Now

$$\frac{a}{a+b} = \frac{{}^nC_r}{{}^nC_r + {}^nC_{r+1}} = \frac{{}^nC_r}{{}^{n+1}C_{r+1}} = \frac{r+1}{n+1}$$

Similarly, $\dfrac{b}{b+c} = \dfrac{(r+1)+1}{n+1}$ and $\dfrac{c}{c+d} = \dfrac{(r+2)+1}{n+1}$

Thus, $$\frac{a}{a+b} + \frac{c}{c+d} - 2\left(\frac{b}{b+c}\right) = 0$$

Example 61: Suppose $a_0 = 2017, a_1\,a_2, \ldots, a_{n-1}, 2023 = a_n$ are in A.P. Let

$$S = \frac{1}{2^{n+1}}\sum_{r=0}^{n}\left({}^nC_r\right)a_r - 1000$$

Then S is equal to

(a) 10 (b) 40
(c) 1013 (d) 2021

Ans. (a)

Solution: Put ${}^nC_r = C_r$ and let

$$T = a_0\,C_0 + a_1\,C_1 + a_2\,C_2 + \ldots + a_n\,C_n \quad (1)$$

Using $C_r = C_{n-r}$, we get

$$T = a_n\,C_0 + a_{n-1}\,C_1 + \ldots + a_0\,C_n \quad (2)$$

Adding (1) and (2), we get

$$2T = (a_0 + a_n)C_0 + (a_1 + a_{n-1})C_1 + (a_2 + a_{n-2})C_2 + \ldots + (a_n + a_0)C_n$$

But $a_0 + a_n = a_1 + a_{n-1} = a_2 + a_{n-2}$
$= \ldots = a_n + a_0 = 2017 + 2023$

$\therefore$ $2T = 4040\,(C_0 + C_1 + \ldots + C_n)$

$\Rightarrow$ $T = (2020)2^n = (1010)2^{n+1}$

Thus,

$$S = \frac{1}{2^{n+1}}(T) - 1000 = 10$$

Example 62: The interval in which x (> 0) must lie so that the greatest term in the expansion of $(1 + x)^{2n}$ has the greatest coefficient is

(a) $\left(\frac{n-1}{n}, \frac{n}{n-1}\right)$ (b) $\left(\frac{n}{n+1}, \frac{n+1}{n}\right)$

(c) $\left(\frac{n}{n+2}, \frac{n+2}{n}\right)$ (d) none of these

Ans. (b)

◎ **Solution:** The greatest coefficient in the expansion of $(1 + x)^{2n}$ is ${}^{2n}C_n$. We are given ${}^{2n}C_n\, x^n$ is the greatest term.

$$\therefore \qquad {}^{2n}C_{n-1}\, x^{n-1} < {}^{2n}C_n\, x^n \text{ and } {}^{2n}C_{n+1}\, x^{n+1} < {}^{2n}C_n\, x^n$$

$$\Rightarrow \qquad \frac{{}^{2n}C_{n-1}}{{}^{2n}C_n} < x < \frac{{}^{2n}C_n}{{}^{2n}C_{n+1}}$$

$$\Rightarrow \qquad \frac{n}{n+1} < x < \frac{n+1}{n}.$$

◉ **Example 63:** If the coefficients of the rth, $(r + 1)$th and $(r + 2)$th terms in the binomial expansion of $(1 + y)^m$ are in A.P., then m and r satisfy the equation

(a) $m^2 - m(4r + 1) + 4r^2 - 2 = 0$
(b) $m^2 - m(4r - 1) + 4r^2 + 2 = 0$
(c) $m^2 - m(4r - 1) + 4r^2 - 2 = 0$
(d) $m^2 - m(4r + 1) + 4r^2 + 2 = 0$.

Ans. (a)

◎ **Solution:** Coefficient of the rth term is ${}^mC_{r-1}$. According to the given condition ${}^mC_{r-1} + {}^mC_{r+1} = 2({}^mC_r)$

$$\Rightarrow \qquad \frac{{}^mC_{r-1}}{{}^mC_r} + \frac{{}^mC_{r+1}}{{}^mC_r} = 2 \Rightarrow \frac{r}{m+1-r} + \frac{m-r}{r+1} = 2$$

$$\Rightarrow \qquad r^2 + r + (m - r)(m + 1 - r) = 2(m + 1 - r)(r + 1)$$

$$\Rightarrow \qquad r^2 + r + m^2 + (1 - 2r)\, m - r(1 - r) = 2m\,(r + 1) + 2(1 - r^2)$$

$$\Rightarrow \qquad m^2 - m(4r + 1) + 4r^2 - 2 = 0.$$

◉ **Example 64:** Let $x > -1$, then statement

$$P(n) : (1 + x)^n > 1 + nx$$

is true for

(a) all $n \in \mathbf{N}$
(b) all $n > 1$
(c) all $n > 1$ provided $x \neq 0$
(d) none of these.

Ans. (c)

Solution: For $n = 2$,

$P(2)$: $(1 + x)^2 = 1 + 2x + x^2 > 1 + 2x$ as $x \neq 0$.

Assume that

$$P(k): (1 + x)^k > 1 + kx \qquad (1)$$

for some $k \in \mathbf{N}$, $k > 1$.

As $x > -1$, multiplying both the sides of (1) by $1 + x$, we get

$$\begin{aligned}(1 + x)^{k+1} &> (1 + kx)(1 + x)\\ &= 1 + (k + 1)x + kx^2\\ &> 1 + (k + 1)x \qquad [\because \; kx^2 > 0]\end{aligned}$$

Thus, $P(k + 1)$ is true.

By the principle of mathematical induction $P(n)$ is true for all $n > 1$ provided $x \neq 0$.

◉ **Example 65:** For each $n \in \mathbf{N}$, $2^{3n} - 1$ is divisible by

(a) 8 (b) 16
(c) 32 (d) none of these

Ans. (d)

◎ **Solution:** We have

$$\begin{aligned}2^{3n} - 1 &= (2^3)^n - 1 = (1 + 7)^n - 1\\ &= 1 + {}^nC_1\,(7) + {}^nC_2\,(7^2) + \ldots + {}^nC_n\,(7^n) - 1\\ &= 7m\end{aligned}$$

where $m = {}^nC_1 + {}^nC_2\,(7) + \ldots + {}^nC_n\,(7^{n-1})$ is a positive integer.

Thus, 7 divides $2^{3n} - 1$ for all $n \in \mathbf{N}$.

◉ **Example 66:** For each $n \in \mathbf{N}$, $x^{2n-1} + y^{2n-1}$ is divisible by

(a) $x + y$ (b) $(x + y)^2$
(c) $x^3 + y^3$ (d) none of these

Ans. (a)

◎ **Solution:** $x^{2n-1} + y^{2n-1}$

$$= (x + y)(x^{2n-2} - x^{2n-3}y + x^{2n-4}y^2 - x^{2n-5}y^3 + \ldots + y^{2n-2})$$

Thus $x^{2n-1} + y^{2n-1}$ is divisible by $x + y$ for all $n \in \mathbf{N}$.

◉ **Example 67:** For all $n \in \mathbf{N}$, $n(n + 1)(2n + 1)$ is divisible by

(a) 6 (b) 8
(c) 15 (d) 9

Ans. (a)

◎ **Solution:** We have $n(n + 1)(2n + 1) = 6\{1^2 + 2^2 + \ldots + n^2\}$,

$\therefore$ $n(n + 1)(2n + 1)$ is divisible by 6 for all $n \in \mathbf{N}$.

◉ **Example 68:** If $a_n = \sqrt{7 + \sqrt{7 + \sqrt{7 + \cdots}}}$ having n radical signs then by methods of mathematical induction which of the following is true

(a) $a_n > 7 \;\forall\; n \geq 1$ (b) $a_n > 3 \;\forall\; n \geq 1$
(c) $a_n < 4 \;\forall\; n \geq 1$ (d) $a_n < 3 \;\forall\; n \geq 1$

Ans. (c)

◎ **Solution:** We have $a_1 = \sqrt{7} < 4$. Assume $a_k < 4$ for some natural number k.

We have

$$a_{k+1} = \sqrt{7 + a_k} < \sqrt{7 + 4} < 4$$

$\therefore a_n < 4 \;\forall\; n \geq 1$.

◉ **Example 69:** If $a_n = 2^{2^n} + 1$, then for $n > 1$, last digit of a_n is

(a) 5 (b) 7
(c) 3 (d) 4

Ans. (b)

◎ **Solution:** For $n = 2$, $a_n = 2^4 + 1 = 16 + 1 = 17$. Assume that $a_k = 2^{2^k} + 1 = 10m + 7$ where $k > 1$ and m is some positive integer.

Now, $a_{k+1} = 2^{2^{k+1}} + 1 = (2^{2^k})^2 + 1$
$= (10m + 6)^2 + 1 = 10\,(10m^2 + 12m + 3) + 7$

Thus, last digit of a_n is 7 $\forall$ $n > 1$.

◉ **Example 70:** Let $S(K)$: $1 + 3 + 5 + \ldots + (2K - 1) = 3 + K^2$. Then which of the following is true?

(a) $S(K) \nRightarrow S(K + 1)$
(b) $S(K) \Rightarrow S(K + 1)$
(c) $S(1)$ is correct
(d) principle of mathematical induction can be used to prove the formula.

Ans. (b)

◎ **Solution:** $S(1)$: $1 = 3 + 1^2$ which is not true. Suppose S(K) is true, then

$$1 + 3 + 5 + \ldots + (2K - 1) = 3 + K^2$$

Adding $(2K + 1)$ to both the sides, we get

$$1 + 3 + 5 + \ldots + (2K - 1) + (2K + 1) = 3 + K^2 + 2K + 1$$
$$= 3 + (K + 1)^2$$

which is $S(K + 1)$.

Thus, $S(K) \Rightarrow S(K + 1)$.

◉ **Example 71:** Let $(1 + x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$ and $\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \cdots + n\frac{C_n}{C_{n-1}} = \frac{1}{k} n(n+1)$, then value of k is

(a) 2 (b) 3
(c) 6 (d) 12

Ans. (a)

◎ **Solution:** $r\frac{C_r}{C_{r-1}} = r\frac{n!}{r!\,(n-r)!}\frac{(r-1)!\,(n-r+1)!}{n!}$
$= n - r + 1$

$$\Rightarrow \quad \sum_{r=1}^{n} r\frac{C_r}{C_{r-1}} = \sum_{r=1}^{n}(n - r + 1) = \frac{1}{2}n(n+1)$$

$\therefore$ $k = 2$.

◉ **Example 72:** The last term in the binomial expansion of $\left(\sqrt{2} - \frac{1}{\sqrt{2}}\right)^n$ is $\left(\frac{1}{(3)9^{\frac{1}{3}}}\right)^{\log_3 8}$, then the 5th term from the beginning is

(a) ${}^{10}C_6$ (b) $2({}^{10}C_4)$
(c) $\frac{1}{2}({}^{10}C_4)$ (d) $-\,{}^{10}C_6$

Ans. (b)

◎ **Solution:** ${}^{n}C_n\left(-\frac{1}{\sqrt{2}}\right)^n = (3^{-1-2/3})^{\log_3 8} = 3^{-5\log_3 2} = \frac{1}{2^5}$

$\Rightarrow$ $n = 10$.

$\therefore$ 5th term from the beginning

$$= {}^{10}C_4\,(\sqrt{2})^{10-4}\left(-\frac{1}{\sqrt{2}}\right)^4 = 2({}^{10}C_4)$$

◉ **Example 73:** Degree of the polynomial $\left(x^2 - \sqrt{1 - x^3}\right)^4 + \left(x^2 + \sqrt{1 - x^3}\right)^4$, is

(a) 7 (b) 8
(c) 9 (d) 12

Ans. (b)

◎ **Solution:** We have

$$(x - y)^4 + (x + y)^4 = 2\,[{}^4C_0\,x^4 + {}^4C_2\,x^2y^2 + {}^4C_4\,y^4]$$

Thus,

$$\left(x^2 - \sqrt{1 - x^3}\right)^4 + \left(x^2 + \sqrt{1 - x^3}\right)^4$$
$$= 2[{}^4C_0(x^2)^4 + {}^4C_2(x^2)^2\,(1 - x^3) + {}^4C_4(1 - x^3)^2]$$

which is a polynomial of degree 8.

◉ **Example 74:** Coefficient of $\frac{1}{x}$ in the expansion of $(1 + x)^n\,(1 + 1/x)^n$ is

(a) ${}^{2n}C_{n-1}$ (b) ${}^{2n}C_n$
(c) 1 (d) 0

Ans. (a)

◎ **Solution:** We have

$$(1 + x)^n\left(1 + \frac{1}{x}\right)^n = \frac{(1 + x)^{2n}}{x^n}$$

$\therefore$ Coefficient of x^{-1} in $(1 + x)^n\left(1 + \frac{1}{x}\right)^n$

$= \text{Coefficient of } x^{n-1} \text{ in } (1 + x)^{2n}$
$= {}^{2n}C_{n-1}$

◉ **Example 75:** Coefficient of x^4 in $(1 + x + x^2 + x^3)^{11}$ is

(a) 99 (b) 330
(c) 990 (d) 1050

Ans. (c)

◎ **Solution:** We have

$$1 + x + x^2 + x^3 = 1 + x + x^2(1 + x) = (1 + x)(1 + x^2)$$

$\Rightarrow$ $(1 + x + x^2 + x^3)^{11} = (1 + x)^{11}(1 + x^2)^{11}$
$= (1 + {}^{11}C_1\,x + {}^{11}C_2\,x^2 + {}^{11}C_3\,x^3 + {}^{11}C_4x^4 + \cdots)\,(1 + {}^{11}C_1\,x^2 + {}^{11}C_2\,x^4 + \cdots)$

Thus, coefficient of x^4 in $(1 + x + x^2 + x^3)^{11}$

$= (1)\,({}^{11}C_2) + ({}^{11}C_2)\,({}^{11}C_1) + ({}^{11}C_4)\,(1)$
$= 55 + (55)(11) + 330 = 990$

◉ **Example 76:** The sixth term in the expansion of $(x^{1/3} + y^{1/2})^n$, if the binomial coefficient of the third term form the end is 45, is

(a) $252\,x^{5/3}\,y^{5/2}$ (b) 45
(c) $45\,x^{5/3}\,y^{5/2}$ (d) none of these

Ans. (a)

◎ **Solution:** Binomial coefficients of the third term from the end in the expansion of $(x^{1/3} + y^{1/2})^n$, is

$${}^nC_2 = 45 \Rightarrow n\,(n-1) - 90 = 0 \Rightarrow n = 10.$$

$\therefore$ Sixth term in the expansion of $(x^{1/3} + y^{1/2})^n$ is

$${}^nC_5\,(x^{1/3})^{n-5}\,(y^{1/2})^5 = 252\ x^{5/3}\,y^{5/2}$$

Example 77: If $a > 0$ and coefficient of x^2, x^3, x^4 in the expansion of $(1 + x/a)^6$ are in A.P., then a equals

(a) $\left(4+\sqrt{7}\right)/3$ (b) $\left(4+\sqrt{3}\right)/3$

(c) $2-\sqrt{3}$ (d) $2+\sqrt{3}$

Ans. (a)

Solution: Coefficient of x^r in the expansion of $(1 + x/a)^6$

$$= {}^6C_r\,(1/a)^r$$

According to given condition ${}^6C_2(1/a)^2$, ${}^6C_3(1/a)^3$, ${}^6C_4(1/a)^4$ are in A.P.

$$\therefore\quad 2\left({}^6C_3\right)\left(\frac{1}{a}\right)^3 = {}^6C_2\left(\frac{1}{a}\right)^2 + {}^6C_4\left(\frac{1}{a}\right)^4$$

$$\Rightarrow\quad 2\,(20)\,a = 15(a^2+1)$$

$$\Rightarrow\quad 3a^2 - 8a + 3 = 0$$

$$\Rightarrow\quad a = \left(4+\sqrt{7}\right)/3 \text{ as } a > 0.$$

Example 78: Sum of two middle terms in the expansion of $(1 + x)^{2n-1}$ is

(a) ${}^{2n-1}C_{n-1}$ (b) ${}^{2n-1}C_n$

(c) ${}^{2n}C_n$ (d) ${}^{2n}C_{n+1}$

Ans. (c)

Solution: Two middle terms in the expansion of $(1 + x)^{2n-1}$ are $\left(\dfrac{2n-1+1}{2}\right)$th and $\left(\dfrac{2n-1+1}{2}+1\right)$th terms, that is, nth and $(n+1)$th terms.

Coefficients of the middle terms in the expansion of $(1 + x)^{2n-1}$ are ${}^{2n-1}C_{n-1}$ and ${}^{2n-1}C_n$ and their sum $= {}^{2n-1}C_{n-1} + {}^{2n-1}C_n = {}^{2n}C_n$

Example 79: If a is a real number and if the middle term of $\left(\dfrac{a}{3}+3\right)^8$ is 1120, then value of a is

(a) ± 2 (b) ± 1

(c) $\pm\sqrt{3}$ (d) $\pm\sqrt{2}$

Ans. (a)

Solution: Middle term of $\left(\dfrac{a}{3}+3\right)^8$ is the $\left(\dfrac{8}{2}+1\right)$th or 5th term. We have

$$T_5 = T_{4+1} = {}^8C_4\left(\frac{a}{3}\right)^4 (3)^4 = 70a^4$$

We are given $\quad T_5 = 1120 \Rightarrow 70a^4 = 1120$

$$\Rightarrow\quad a^4 = 16 = 2^4 \Rightarrow a = \pm 2$$

Example 80: Suppose F is the fractional part of $M = \left(\sqrt{13}+\sqrt{11}\right)^6$, then value of $M\,(1-F)$ is

(a) 128 (b) 64

(c) 32 (d) 16

Ans. (b)

Solution: Let $N = \left(\sqrt{13}-\sqrt{11}\right)^6$,

As $\left(\sqrt{13}-\sqrt{11}\right) = \dfrac{2}{\sqrt{13}+\sqrt{11}}$, we get $0 < N < 1$

Also, $M + N = \left(\sqrt{13}+\sqrt{11}\right)^6 + \left(\sqrt{13}-\sqrt{11}\right)^6$,

$$= 2\Big[{}^6C_0\left(\sqrt{13}\right)^6 + {}^6C_2\left(\sqrt{13}\right)^4\left(\sqrt{11}\right)^2 + {}^6C_4\left(\sqrt{13}\right)^2\left(\sqrt{11}\right)^4 + {}^6C_6\left(\sqrt{11}\right)^6\Big]$$

$\Rightarrow M + N$ is an integer, say, J

Let $M = K + F$, where K is the greatest integer contained in M. We have

$$J = M + N = K + N + F$$

As $0 < N < 1$, $0 < F < 1$ we get, $0 < N + F < 2$

Also, $N + F$ is an integer

$\Rightarrow\quad N + F = 1 \Rightarrow 1 - F = N$

Thus, $\quad M\,(1-F) = \left(\sqrt{13}+\sqrt{11}\right)^6\left(\sqrt{13}-\sqrt{11}\right)^6 = 2^6 = 64$

Example 81: The remainder when $8^{2n} - 62^{2n+1}$ is divided by 9 is

(a) 7 (b) 8

(c) 0 (d) 2

Ans. (b)

Solution: $8^{2n} - 62^{2n+1}$

$$= (9-1)^{2n} - (63-1)^{2n+1}$$

$$= ({}^{2n}C_0\,9^{2n} - {}^{2n}C_1\,9^{2n-1} + {}^{2n}C_2\,9^{2n-2} - \cdots - {}^{2n}C_{2n-1}\,(9) + {}^{2n}C_{2n}) - ({}^{2n+1}C_0(63^{2n+1}) - {}^{2n+1}C_1(63^{2n}) + {}^{2n+1}C_2\,(63^{2n-1}) - \cdots - + {}^{2n+1}C_1(63) - {}^{2n+1}C_0)$$

$$= 9m + 1 + 1 = 9m + 2 \text{ for some integer } m$$

Thus, when $8^{2n} - 62^{2n+1}$ is divided by 9, the remainder is 2.

Example 82: The coefficient of x^7 in the expansion of $(1 - x - x^2 + x^3)^6$ is

(a) 132 (b) 144

(c) – 132 (d) – 144

Ans. (d)

Solution: $(1 - x - x^2 + x^3)^6 = (1 - x)^6\,(1 - x^2)^6$

coefficient of x^7 in $(1 - x)^6\,(1 - x^2)^6$

$$= \text{coefficient of } x^7 \text{ in } [1 - {}^6C_1\,x + {}^6C_2\,x^2 - \cdots + {}^6C_6\,x^6] \times [1 - {}^6C_1\,x^2 + {}^6C_2\,x^4 - \cdots + {}^6C_6\,x^{12}]$$

$$= (-{}^6C_1)\,(-{}^6C_3) + (-{}^6C_3)\,({}^6C_2) + (-{}^6C_5)\,(-{}^6C_1)$$

$$= -144.$$

Example 83: If $n \in \mathbf{N}$, then $\left(\sqrt{3}+1\right)^{2n} - \left(\sqrt{3-1}\right)^{2n}$ is

(a) an odd positive integer

(b) an even positive integer

(a) a rational number but not a natural number
(d) an irrational number

Ans. (d)

◎ **Solution:** $\left(\sqrt{3}+1\right)^{2n}-\left(\sqrt{3}-1\right)^{2n}$

$$=2\left[{}^{2n}C_1\left(\sqrt{3}\right)^{2n-1}+{}^{2n}C_3\left(\sqrt{3}\right)^{2n-3}+\cdots+{}^{2n}C_{2n-1}\left(\sqrt{3}\right)\right]$$

$$=2\sqrt{3}\left[{}^{2n}C_1\left(3^{n-1}\right)+{}^{2n}C_3\,3^{n-2}+\cdots+{}^{2n}C_{2n-1}\right]$$

which is an irrational number.

◉ **Example 84:** The coefficient of x^n in the expansion of

$$\left(1+\frac{1}{1!}x+\frac{1}{2!}x^2\,..+\frac{1}{n!}x^n\right)^2$$

(a) $\dfrac{2^n}{n!}$ (b) $\dfrac{2^n}{n}$
(c) $n!$ (d) $\dfrac{1}{n!}$

Ans. (a)

◎ **Solution:** Coefficient of x^n in

$$\left(1+\frac{1}{1!}x+\frac{1}{2!}x^2+\ldots+\frac{1}{n!}x^n\right)^2$$

= coefficient of x^n is

$$\left(1+\frac{1}{1!}x+\frac{1}{2!}x^2+\ldots+\frac{1}{n!}x^n+\frac{1}{(n+1)!}x^{n+1}\ldots\right)^2$$

= coefficient of x^n in $e^{2x}=\left(1+2x+\dfrac{2^2\,x^2}{2!}+\dfrac{2^3x^3}{3!}\ldots\right)$

$$=\frac{2^n}{n!}$$

Alternate Solution

Coefficient of x^n in

$$\left(1+\frac{1}{1!}x+\frac{1}{2!}x^2+.\cdots+\frac{1}{n!}x^n\right)\left(1+\frac{1}{1!}x+\frac{1}{2!}x^2+\cdots+\frac{1}{n!}x^n\right)$$

$$=\frac{1}{n!}+\frac{1}{1!(n-1)!}+\frac{1}{2!(n-2)!}+.\cdots+\frac{1}{(n-1)!1!}+\frac{1}{n!}$$

$$=\frac{1}{n!}\left[{}^nC_0+{}^nC_1+{}^nC_2+\cdots{}^nC_{n-1}+{}^nC_n\right]=\frac{2^n}{n!}$$

◉ **Example 85:** The coefficient of x^n in the expansion of $(1+x)(1-x)^n$ is

(a) $(-1)^n\,n$ (b) $(-1)^n(1-n)$
(c) $(-1)^{n-1}(n-1)$ (d) $(n-1)$

Ans. (b)

◎ **Solution:** $(1+x)(1-x)^n=[2-(1-x)](1-x)^n$

$$=2(1-x)^n-(1-x)^{n+1}$$

$\therefore$ coefficient of x^n in $(1+x)(1-x)^n$

$$=2(-1)^n-{}^{n+1}C_n(-1)^n$$

$$=(-1)^n(2-n-1)=(-1)^n(1-n)$$

◉ **Example 86:** Sum of the coefficients of x^3 and x^6 in the expansion of $\left(x^2-\dfrac{1}{x}\right)^9$ is

Ans. (a)

◎ **Solution:** $T_{r+1}={}^9C_r\,(x^2)^{9-r}\left(-\dfrac{1}{x}\right)^r=(-1)^r\,({}^9C_r)x^{18-3r}$

For coefficient of x^3, x^6, we set $18-3r=3,6$

$\Rightarrow$ $r=5,4.$

$\therefore$ sum of coefficients of x^3 and x^6

$$=(-1)^5\,({}^9C_4)+(-1)^4\,({}^9C_5)=0$$

◉ **Example 87:** For $n\geq 2$, let

$$a_n=\sum_{r=0}^{n}\frac{1}{C_r^2}\text{, then value}$$

of $$b_n=\sum_{r=1}^{n}\frac{1}{r^2\,C_r^2}\text{ equals}$$

(a) $\dfrac{1}{n^2}\,a_n$ (b) $\dfrac{1}{n^2}\,a_{n-1}$
(c) a_n (d) a_n^2

Ans. (b)

◎ **Solution:** For $r\geq 1$, $r\,C_r=r\,({}^nC_r)=n\,({}^{n-1}C_{r-1})$

Thus, $b_n=\displaystyle\sum_{r=1}^{n}\frac{1}{n^2\left({}^{n-1}C_r\right)^2}=\frac{1}{n^2}\,a_{n-1}$

◉ **Example 88:** If in the expansion of $\left(x^3-\dfrac{1}{x^2}\right)^n$ the sum of the coefficients of x^5 and x^{10} is 0, then the coefficient of x^{20} is:

(a) ${}^{20}C_6$ (b) $-{}^{20}C_6$
(c) ${}^{15}C_5$ (d) $-{}^{15}C_5$

Ans. (d)

◎ **Solution:** $(r+1)$th term in the expansion of

$$\left(x^3-\frac{1}{x^2}\right)^n\text{ is}$$

$$T_{r+1}={}^nC_r(x^3)^{n-r}\left(-\frac{1}{x^2}\right)^r$$

$$= {}^nC_r\, x^{3n-5r}\,(-1)^r$$

For coefficient of x^{10}, set $3n - 5r = 5$

$$\Rightarrow \qquad r = \frac{3}{5}n - 1 = r_1 \text{ (say)}$$

For coefficient of x^{10}, set $3n - 5r = 10$

$$\Rightarrow \qquad r = \frac{3}{5}n - 2 = r_2\text{(say)}$$

Note that $r_1 = r_2 + 1$.

We are given

$$ {}^nC_{r_1}(-1)^{r_1} + {}^nC_{r_2}(-1)^{r_2} = 0$$

$$\Rightarrow \qquad {}^nC_{r_2} = {}^nC_{r_2+1}\ [\because\ r_1 = r_2 + 1]$$

$$\Rightarrow\ r_2 + r_2 + 1 = n \Rightarrow r_2 = \frac{1}{2}(n-1)$$

$$\Rightarrow \quad \frac{3}{5}n - 2 = \frac{1}{2}n - \frac{1}{2} \Rightarrow \frac{1}{10}n = \frac{3}{2} \Rightarrow n = 15$$

For coefficient of x^{20}, set $3n - 5r = 20$

$$\Rightarrow \qquad 5r = 45 - 20 = 25 \text{ or } r = 5.$$

Thus, coefficient of x^{20} is $-\,{}^{15}C_5$

Example 89: If $(1 + x)(1 + x + x^2)(1 + x + x^2 + x^3)\ldots(1 + x + x^2 + \ldots + x^n)$

$= a_0 + a_1x + a_2x^2 + \ldots + a_m x^m$,

then value of a_1 is

(a) $m + 1$ (b) $n + 1$

(c) n (d) m

Ans. (c)

Solution: a_1 = coefficient of x in

$(1 + x)(1 + x + x^2)(1 + x + x^2 + x^3)\ldots(1 + x + \ldots + x^n)$

$= $ coefficient of x in $\underbrace{(1 + x)(1 + x)\ldots(1 + x)}_{n \text{ times}}$

$= $ coefficient of x in $(1 + x)^n$

$= {}^nC_1 = n$

Example 90: If $x^n = a_0 + a_1(1 + x) + a_2(1 + x)^2 + \ldots + a_n(1 + x)^n$

$= b_0 + b_1(1 - x) + b_2(1 - x)^2 + \ldots + b_n(1 - x)^n$

then for $n = 201$, (a_{101}, b_{101}) is equal to:

(a) $(-{}^{201}C_{101}, -{}^{201}C_{101})$ (b) $({}^{201}C_{101}, -{}^{201}C_{101})$

(c) $(-{}^{201}C_{101}, {}^{201}C_{101})$ (d) $({}^{201}C_{101}, {}^{201}C_{101})$

Ans. (b)

Solution: $x^n = [(1 + x) - 1]^n = [1 - (1 - x)]^n$

$$= \sum_{k=0}^{n} {}^nC_k\,(1 + x)^{n-k}(-1)^k$$

$$= \sum_{k=0}^{n} {}^nC_k\,(-1)^k(1 - x)^k$$

$\therefore \qquad a_k$ = coefficient of $(1 + x)^k$ in

$$\sum_{k=0}^{n} {}^nC_k\ (1 + x)^{n-k}(-1)^k = (-1)^{n-k}\,{}^nC_{n-k} = (-1)^{n-k}\,{}^nC_k$$

and $\qquad b_k = {}^nC_k(-1)^k$

For $\qquad n = 201$, $k = 101$, we get

$$(a_{101}, b_{101}) = ({}^{201}C_{101}, -\,{}^{201}C_{101})$$

Assertion-Reason Type Questions

Example 91:

Statement-1: For each natural number n, $(n + 1)^7 - n^7 - 1$ is divisible by 7

Statement-2: For each natural number n, $n^7 - n$ is divisible by 7.

Ans. (a)

Solution: For Statement-2, write $n = 7r + k$, $k = -3, -2, -1, 0, 1, 2, 3$

Now, $\qquad n^7 - n = (7r + k)^7 - (7r + k)$

Using binomial theorem, we get

$\qquad n^7 - n - (k^7 - k)$ is divisible by 7.

$\Leftrightarrow \qquad n^7 - n$ is divisible by 7 if and only if $k^7 - k$ is divisible by 7

For $\qquad k = \pm 3, \pm 2, \pm 1$, $k^7 - k$ is divisible by 7 if and only if $k^6 - 1$ is divisible by 7.

But $\qquad k^6 - 1 = 728, 63, 0$ for $k = \pm 3, \pm 2, \pm 1$.

$\therefore \qquad k^6 - 1$ is divisible by 7 for $k = \pm 3, \pm 2, \pm 1$.

Thus, $n^7 - n$ is divisible by 7 for each $n \in \mathbf{N}$.

$\Rightarrow \qquad (n + 1)^7 - (n + 1) - (n^7 - n)$ is divisible by 7

$\Rightarrow \qquad (n + 1)^7 - n^7 - 1$ is divisible by 7.

Therefore, both the statements are true and statement - 2 is a correct reason for Statement-1.

Example 92: Let $S_1 = \sum_{j=1}^{10} j(j-1)\left({}^{10}C_j\right)$

$$S_2 = \sum_{j=1}^{10} j\left({}^{10}C_j\right) \text{and } S_3 = \sum_{j=1}^{10}\left(j^2\right)\left({}^{10}C_j\right)$$

Statement-1 $\quad S_3 = 55 \times 2^9$

Statement-2 $\quad S_1 = 90 \times 2^8$ and $S_2 = 10 \times 2^8$

Ans. (c)

Solution: We have

$$(1+x)^{10} = \sum_{j=0}^{10} \left({}^{10}C_j\right) x^{j}$$

Differentiating both the sides with respect to x, we get

$$10(1+x)^9 = \sum_{j=1}^{10} j\left({}^{10}C_j\right) x^{j-1} \qquad (1)$$

Again differentiating both the sides with respect to x, we get

$$(10)\,(9)\,(1+x)^8 = \sum_{j=1}^{10} j(j-1)\left({}^{10}C_j\right) x^{j-2} \qquad (2)$$

Putting $x = 1$ in (1) and (2), we get

$$S_2 = \sum_{j=1}^{10} j\left({}^{10}C_j\right) = 10\,(2^9)$$

and $$S_1 = \sum_{j=1}^{10} j(j-1)\left({}^{10}C_j\right) = (10)\,(9)\,(2^8) = (90)\,(2^8)$$

Adding the above two equation, we get

$$S_3 = \sum_{j=1}^{10} [j + j\,(j-1)]({}^{10}C_j)$$
$$= (10)\,(2^8)\,(2+9)$$
$$\Rightarrow \quad S_3 = (55)\,(2^9)$$

Thus, Statement-1 is true but Statement-2 is false.

Example 93: Let $(1+x)^n = C_0 + C_1x + C_2x^2 + \cdots + C_nx^n$.

Statement-1: $5C_0^{\,2} + 7C_1^{\,2} + 9C_2^{\,2} + \cdots + (5+2n)C_n^{\,2} = (5+n)\dfrac{(2n)!}{n!\,n!}$

Statement-2: $C_0^{\,2} + C_1^{\,2} + \cdots + C_n^{\,2} = {}^{2n}C_n$

Ans. (a)

Solution $C_0^{\,2} + C_1^{\,2} + \ldots + C_n^{\,2}$

$= C_0C_n + C_1C_{n-1} + \cdots + C_nC_0$

= number of ways of choosing n persons out of n men and n women

$= {}^{2n}C_n$

$\therefore$ Statement-2 is true

Let

$$S = 5C_0^{\,2} + 7C_1^{\,2} + 9C_2^{\,2} + \cdots + (5+2n)C_n^{\,2} \qquad (1)$$

Using $C_r = C_{n-r}$, we can rewrite (1) as

$$S = (5+2n)\,C_0^{\,2} + (3+2n)\,C_1^{\,2} + \ldots + 5C_n^{\,2} \qquad (2)$$

Adding (1) and (2), we get

$$2S = (10+2n)\,(C_0^{\,2} + C_1^{\,2} + \ldots + C_n^{\,2})$$

$$\Rightarrow \quad S = (5+n)\,({}^{2n}C_n) = (5+n)\frac{(2n)}{n!\,n!}$$

Example 94: Let

$$(1+t)^n = C_0 + C_1t + C_2t^2 + \cdots + C_nt^n \qquad (1)$$

Statement-1: $\dfrac{C_0}{(1)(2)} + \dfrac{C_1}{(2)(3)} + \dfrac{C_2}{(3)(4)} + \cdots + \dfrac{C_n}{(n+1)(n+2)}$

$$= \frac{1}{n+1}\left[\frac{2^{n+2}}{n+2} - 1\right]$$

Statement-2: $\dfrac{C_0}{2} - \dfrac{C_1}{3} + \dfrac{C_2}{4} - \cdots + (-1)^n\dfrac{C_n}{n+2} = 0$

Ans. (b)

Solution: From (1)

$$\int_0^x (1+t)^n\,dt = \int_0^x [C_0 + C_1t + C_2t^2 + \cdots + C_nt^n]\,dt$$

$$\Rightarrow \quad \frac{1}{n+1}\,[(1+x)^{n+1} - 1]$$
$$= \frac{C_0}{1}x + \frac{C_2}{2}x^2 + \cdots + \frac{C_n}{n+1}x^{n+1} \qquad (2)$$

Multiplying (1) by t and integrating, we get

$$\int_0^x t(1+t)^n\,dt = \int_0^x [C_0t + C_1t^2 + \ldots + C_nt^{n+1}]\,dt$$

$$\Rightarrow \quad \frac{x(1+x)^{n+1}}{n+1} - \frac{(1+x)^{n+2}}{(n+1)(n+2)}$$
$$= \frac{C_0}{2}x^2 + \frac{C_1}{3}x^3 + \frac{C_2}{4}x^4 + \ldots + \frac{C_n}{n+2}x^{n+2}. \qquad (3)$$

Putting $x = -1$ in (3), we obtain that the second statement is true.

Putting $x = 1$ in (2) and (3) and subtracting, we obtain that Statement-1 is also true.

Example 95: Let $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$.

Statement-1: For $m \geq 2$, $C_0 - C_1 + C_2 - \cdots + (-1)^{m-1}\,C_{m-1} = (-1)^{m-1}\,({}^{n-1}C_{m-1})$

Statement-2: ${}^nC_r = {}^{n-1}C_{r-1} + {}^{n-1}C_r$ for $1 \leq r \leq n-1$

Ans. (a)

Solution: $C_0 = {}^{n-1}C_0$

$$-C_1 = -{}^{n-1}C_0 - {}^{n-1}C_1$$
$$C_2 = {}^{n-1}C_1 + {}^{n-1}C_2$$
$$-C_3 = -{}^{n-1}C_2 - {}^{n-1}C_3$$
$$\cdots\cdots\cdots\cdots\cdots\cdots$$
$$(-1)^{m-1}(C_{m-1}) = (-1)^{m-1}({}^{n-1}C_{m-2} + {}^{n-1}C_{m-1})$$

Adding the above equations, we get

$$C_0 - C_1 + C_2 - C_3 + \cdots + (-1)^{m-1}C_{m-1}$$
$$= (-1)^{m-1}\,({}^{n-1}C_{m-1})$$

Example 96: Let $(1+x)^n = C_0 + C_1x + C_2x^2 + \ldots + C_nx^n$.

Statement-1: $S = C_0 + (C_0 + C_1) + (C_0 + C_1 + C_2) + \cdots + (C_0 + C_1 + \cdots + C_{n-1}) = n(2^{n-1})$

Statement-2: $\displaystyle\sum_{j=1}^{n}\sum_{i<j} (C_i + C_j) = (n+1)2^n.$

Ans. (c)

◎ **Solution:** We can write

$$S = nC_0 + (n-1)C_1 + (n-2)C_2 + \cdots + 1C_{n-1} + 0C_n \quad (1)$$

Using $C_r = C_{n-r}$, we can rewrite (1) as

$$S = 0C_0 + 1C_1 + 2C_2 + \cdots + (n-1)C_{n-1} + nC_n \quad (2)$$

Adding (1) and (2) we obtain

$$2S = n[C_0 + C_1 + C_2 + \cdots + C_n] = n(2^n)$$

$$\Rightarrow \qquad S = n(2^{n-1})$$

In the expression $\sum_{j=1}^{n} \sum_{i<j} (C_i + C_j)$ each C_i $(0 \le i \le n)$ occurs exactly n times. Thus

$$\sum_{j=1}^{n} \sum_{i<j} (C_i + C_j) = n \sum_{k=0}^{n} C_k = n\left(2^n\right)$$

⊛ **Example 97:** Let $(1 + x)^{3n} = C_0 + C_1x + C_2x^2 + \ldots + C_{3n}x^{3n}$, and $\omega \ne 1$ be a cube root of unity

Statement-1: $C_0 + C_1\omega + C_2\omega^2 + C_3 + C_4\omega + C_5\omega^2 + \cdots = (-1)^n$

Statement-2: Cube roots unity form a triangle of area $\sqrt{3}$ square units.

Ans. (c)

◎ **Solution:** $C_0 + C_1\omega + C_2\omega^2 + C_3 + C_4\omega + C_5\omega^2 + \ldots$

$$= \sum_{k=0}^{3n} C_k\,\omega^k = (1 + \omega)^{3n}$$

$$= (-\omega^2)^{3n} = (-1)^{3n}\,\omega^{6n}$$

$$= (-1)^n\,(1) = (-1)^n.$$

Statement-2 is false as area of triangle formed by cube roots of unity is $3\sqrt{3}/4$ square units.

⊛ **Example 98: Statement-1:** Coefficient of x^n in

$$\sum_{j=0}^{n} (-1)^j\,(2x + 3)^{n-j}\,(5 - 2x)^j$$

is $(n + 1)2^n$

Statement-2: $\sum_{j=0}^{n} a^{n-j}b^j = \dfrac{a^{n+1} - b^{n+1}}{a - b}$, $a \ne b$,

and coefficient of x^m in $(\alpha x + \beta)^{m+1}$ is $(m + 1)\alpha^m\beta$

Ans. (a)

◎ **Solution:** $\sum_{j=0}^{n} a^{n-j}b^j = a^n + a^{n-1}b + a^{n-2}b^2 + \ldots + ab^{n-1} + b^n$

$$= \frac{a^n\left[1 - (b/a)^{n+1}\right]}{1 - b/a} \qquad \text{[sum of a G.P.]}$$

$$= \frac{a^{n+1} - b^{n+1}}{a - b}$$

Also, coefficient of x^m in $(\alpha x + \beta)^{m+1}$ is $(m + 1)\alpha^m\beta$

$\therefore$ Statement-2 is true.

Next, $\sum_{j=0}^{n} (-1)^j\,(2x + 3)^{n-j}\,(5 - 2x)^j$

$$= \sum_{j=0}^{n} (2x + 3)^{n-j}\,(2x - 5)^j$$

$$= \frac{(2x + 3)^{n+1} - (2x - 5)^{n+1}}{(2x + 3) - (2x - 5)}$$

$$= \frac{1}{8}\,[(2x + 3)^{n+1} - (2x - 5)^{n+1}]$$

Coefficient of x^n is

$$\frac{1}{8}[{}^{n+1}C_n\,2^n\,(3) - {}^{n+1}C_n\,2^n\,(-5)]$$

$$= (n + 1)\,2^n$$

$\therefore$ Statement-1 is true and Statement-2 is correct explanation for it.

LEVEL 2

Straight Objective Type Questions

⊛ **Example 99:** The number of rational terms in the expansion of $\left(1 + \sqrt{2} + \sqrt[3]{5}\right)^6$ is

(a) 7 (b) 11

(c) 12 (d) 12

Ans. (a)

◎ **Solution:** A term in the expansion of $\left(1 + \sqrt{2} + \sqrt[3]{5}\right)^6$ is of the form

$$\frac{6!}{r!\,s!\,(6 - r - s)!}(1)^{6-r-s}\left(\sqrt{2}\right)^r\left(\sqrt[3]{5}\right)^s$$

$$= \frac{6!}{r!\,s!\,(6 - r - s)!}\left(2^{r/2}\right)(5^{s/3})$$

This term will be rational if $2^{r/2}$ and $5^{s/3}$ are both rational numbers. This is possible if and only if r is a multiple of 2 and s is a multiple of 3. Possible values of r are 0, 2, 4 and 6 whereas the possible values of s are 0, 3 and 6. Also note that $0 \le r + s \le 6$.

For $r = 0$, s can take value 0, 3 or 6.

For $r = 2$, s can take value 0 or 3.

For $r = 4$, s can take value 0.
For $r = 6$, s can take value 0.
Thus, the number of rational terms is $3 + 2 + 1 + 1 = 7$

Example 100: The sum of $(n + 1)$ terms of the series $\frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \frac{C_3}{5} + \dots$ is

(a) $\frac{1}{n+1}$ (b) $\frac{1}{n+2}$

(c) $\frac{1}{n(n+1)}$ (d) $\frac{1}{(n+1)(n+2)}$

Ans. (d)

Solution: We have

$$(1 - x)^n = C_0 - C_1 x + C_2 x^2 - C_3 x^3 + \dots + (-1)^n C_n x^n$$

$$\Rightarrow \quad x(1 - x)^n = C_0 x - C_1 x^2 + C_2 x^3 - C_3 x^4 + \dots + (-1)^n C_n x^{n+1}$$

$$\Rightarrow \int_0^1 x(1 - x)^n \, dx = \int_0^1 [C_0 x - C_1 x^2 + C_2 x^3 - C_3 x^4 + \dots + (-1)^n C_n x^{n+1}] dx \qquad (1)$$

L.H.S. of (1)

$$= \int_0^1 x(1-x)^n \, dx = \int_0^1 (1-x)(1-(1-x))^n \, dx$$

$$\left[\text{using } \int_0^a f(x)dx = \int_0^a f(a-x)dx\right]$$

$$= \int_0^1 (1-x)x^n dx = \left(\frac{x^{n+1}}{n+1} - \frac{x^{n+2}}{n+2}\right)\Bigg]_0^1$$

$$= \frac{1}{(n+1)(n+2)}$$

R.H.S. of (1)

$$= \left(C_0 \frac{x^2}{2} - C_1 \frac{x^3}{3} + C_2 \frac{x^4}{4} - \dots + \frac{(-1)^n C_n}{n+1} x^{n+1}\right)\Bigg]_0^1$$

$$= \frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \dots + \frac{(-1)^n C_n}{n+1}$$

Thus,

$$\frac{C_0}{2} - \frac{C_1}{3} + \frac{C_2}{4} - \dots + (-1)^n \frac{C_n}{n+1} = \frac{1}{(n+1)(n+2)}$$

Example 101: Two values of x for which the sixth term of the expansion of $E = \left(3^{\log_3 \sqrt{9^{|x-2|}}} + 7^{(1/5)\log_7[(4).3^{|x-2|}-9]}\right)^7$ is 567, is

(a) 3, 4 (b) 3, 1

(c) 2, 7 (d) none of these

Ans. (b)

Solution: Put $y = 3^{\log_3 \sqrt{9^{|x-2|}}} \Rightarrow \log_3 y = \log_3 \sqrt{9^{|x-2|}}$

$$\Rightarrow \qquad y = \sqrt{9^{|x-2|}} = 3^{|x-2|}$$

Next, put $z = \left(7^{(1/5)\log_7[(4).3^{|x-2|}-9]}\right)$

$$\Rightarrow \qquad \log_7 z = \frac{1}{5} \log_7 [(4)3^{|x-2|} - 9] = \log_7 [(4)\, 3^{|x-2|} - 9]^{1/5}$$

$$\Rightarrow \qquad z = [(4)3^{|x-2|} - 9]^{1/5}$$

Now, $E = (y + z)^7$ and the 6th term in its expansion is given by

$$T_6 = {}^7C_5\, y^{7-5} z^5 = 21\left(3^{|x-2|}\right)^2 \left\{(4)\, 3^{|x-2|} - 9\right\}$$

$$\Rightarrow \qquad 567 = 21\{3^{2|x-2|}\}\, \{(4)\, 3^{|x-2|} - 9\}$$

$$\Rightarrow \qquad 27 = \{(4)\, 3^{3|x-2|} - (9)\, (3^{2|x-2|})\}$$

$$\Rightarrow \qquad 27 = (4)\, 3^{3|x-2|} - (9)\, 3^{2|x-2|}$$

$\Rightarrow \quad 4u^3 - 9u^2 - 27 = 0$ where $u = 3^{|x-2|}$

Note that $u = 3$ satisfies this equation*.

$$\therefore \qquad 3^{|x-2|} = 3 \qquad \Rightarrow \qquad |x - 2| = 1 \Rightarrow x - 2 = \pm 1$$

$$x = 2 \pm 1 = 3 \text{ or } 1.$$

Example 102: Let a_n denote the term independent of x in the expansion of $\left[x + \frac{\sin(1/n)}{x^2}\right]^{3n}$, then $\lim_{x\to\infty} \frac{(a_n)n!}{{}^{3n}P_n}$ equals

(a) 0 (b) 1

(c) e (d) $e/\sqrt{3}$

Ans. (a)

Solution: $T_{r+1} = {}^{3n}C_r x^{3n-r} \left[\sin\left(\frac{1}{n}\right)\right]^r x^{-2r}$

For this term to be independent of x, set

$3n - r - 2r = 0 \quad \Rightarrow \quad r = n$

$$\therefore \qquad a_n = {}^{3n}C_n \sin^n\left(\frac{1}{n}\right)$$

Now, $\frac{n!a_n}{{}^{3n}P_n} = \sin^n\left(\frac{1}{n}\right) \to 0$ as $n \to \infty$

Example 103: The largest term in the expansion of $(3 + 2x)^{50}$, where $x = \frac{1}{5}$, is

(a) ${}^{50}C_6 3^{44}\left(\frac{2}{5}\right)^6$ (b) ${}^{50}C_7 3^{43}\left(\frac{2}{5}\right)^7$

(c) ${}^{50}C_{43} 3^7\left(\frac{2}{5}\right)^{43}$ (d) ${}^{50}C_{44} 3^6\left(\frac{2}{5}\right)^{44}$

Ans. (a)

---

* From available answer, possible values of u are $3^{|3-2|} = 3$ for the choices (a) and (b) and $3^{|2-2|} = 3^0 = 1$ for the choice (c).

Solution: Let $k = \dfrac{(50+1)(2x)}{3+2x} = \dfrac{(51)(2/5)}{17/5} = 6$.

As k is an integer, there are two greatest term *viz.* 6th and 7th terms

We have

$$T_7 = {}^{50}C_6 3^{44} \left(\frac{2}{5}\right)^6.$$

Remark

In fact $T_6 = T_7$.

Example 104: If n is odd, then sum of the series $C_0^{\,2} - C_1^{\,2} + C_2^{\,2} - C_2^{\,3} + \ldots + (-1)^n C_n^{\,2}$ is

(a) 0 (b) 1

(c) ${}^{2n}C_n$ (d) $-({}^{2n}C_n)$

Ans. (a)

Solution: Let $n = 2m - 1$. Using $C_r = C_{n-r}$, we get sum of the series in 0.

Example 105: If n is even, then sum of the series $C_0^{\,2} - C_1^{\,2} + C_2^{\,2} - C_3^{\,2} + \ldots + (-1)^n C_n^{\,2}$ is

(a) ${}^nC_{\frac{n}{2}} (-1)^{n/2}$ (b) ${}^nC_{\frac{n}{2}}$

(c) ${}^nC_{n-1}$ (d) $(-1)^{n/2}\ {}^nC_2$

Ans. (a)

Solution: Let $n = 2m$. We have

$$\sum_{r=0}^{2m} (-1)^r C_r^2 = \text{Coefficient of the constant term in}$$

$$(1+x)^{2m}\left(1 - \frac{1}{x}\right)^{2m}$$

$$\begin{aligned} &= \text{Coefficient of } x^{2m} \text{ in } (1+x)^{2m}(x-1)^{2m} \\ &= \text{Coefficient of } x^{2m} \text{ in } (1-x^2)^{2m} \\ &= {}^{2m}C_m(-1)^m = {}^nC_{\frac{n}{2}}(-1)^{n/2} \end{aligned}$$

Example 106: If $(1+x)^n = C_0 + C_1 x + C_2 x^2 + \ldots + C_n x^n$, then value of $C_0^{\,2} + 2C_1^{\,2} + 3C_2^{\,2} + \ldots + (n+1)C_n^2$ is

(a) $(2n+1)({}^{2n}C_n)$ (b) $(2n-1)({}^{2n}C_n)$

(c) $\left(\frac{n}{2}+1\right)({}^{2n}C_n)$ (d) $\left(1+\frac{n}{2}\right)({}^{2n-1}C_n)$

Ans. (c)

Solution: Let

$$S = C_0^{\,2} + 2C_1^{\,2} + 3C_2^{\,2} + \ldots + (n+1)C_n^{\,2} \qquad (1)$$

Using $C_r = C_{n-r}$, we rewrite (1) as

$$S = (n+1)C_0^{\,2} + nC_1^{\,2} + \ldots + C_n^{\,2} \qquad (2)$$

Adding (1) and (2), we get

$$2S = (n+2)\,[C_0^{\,2} + C_1^{\,2} + \ldots + C_n^{\,2}] = (n+2)\,({}^{2n}C_n)$$

$$\Rightarrow \quad S = \left(\frac{n}{2}+1\right)({}^{2n}C_n)$$

Example 107: If C_r stands for ${}^nC_r$, the sum of the series

$$\frac{2\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}{n!}\,[C_0^{\,2} - 2C_1^{\,2} + 3C_2^{\,2} - \ldots + (-1)^n(n+1)C_n^{\,2}]$$

where n is an even positive integer, is equal to

(a) $(-1)^{n/2}(n+2)$ (b) $(-1)^n(n+1)$

(c) $(-1)^{n/2}(n+1)$ (d) none of these

Ans. (a)

Solution: Let $n = 2m$, and

$$S = C_0^{\,2} - 2C_1^{\,2} + 3C_2^{\,2} - \ldots + (-1)^{2m}(2m+1)C_{2m}^2 \qquad (1)$$

Using $C_r = C_{n-r}$, we rewrite (1) as

$$S = (2m+1)C_0^{\,2} - (2m)C_1^{\,2} + (2m-1)C_2^{\,2} - \ldots + C_{2m}^2 \qquad (2)$$

we get

$$\begin{aligned} 2S &= (2m+2)\,[C_0^{\,2} - C_1^{\,2} + C_2^{\,2} - \ldots + C_{2m}^2] \\ &= (2m+2)\,({}^{2m}C_m)\,(-1)^m \end{aligned}$$

$$\begin{aligned} \Rightarrow \quad S &= (m+1)\,({}^{2m}C_m)\,(-1)^m \\ &= (-1)^{n/2}\left(\frac{n}{2}+1\right)\frac{n!}{\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!} \end{aligned}$$

$$\Rightarrow \quad \frac{2\left(\frac{n}{2}\right)!\left(\frac{n}{2}\right)!}{n!}\,S = (-1)^{n/2}(n+2)$$

Example 108: Sum of the coefficients of integral powers of x in the expansion of $\left(1 - 2\sqrt{x}\right)^{50}$ is

(a) $\frac{1}{2}(3^{50}+1)$ (b) $\frac{1}{2}(3^{50})$

(c) $\frac{1}{2}(2^{50}-2)$ (d) $\frac{1}{2}(2^{50}+2)$

Ans. (a)

Solution: The coefficients of integral powers of x are

$${}^{50}C_0,\ {}^{50}C_2\, 2^2,\ {}^{50}C_4\, 2^4, \ldots, {}^{50}C_{50}\, 2^{50}$$

Let

$$\begin{aligned} S &= {}^{50}C_0 + {}^{50}C_2\, 2^2 + {}^{50}C_4\, 2^4 + \ldots + {}^{50}C_{50}\, 2^{50} \\ &= \frac{1}{2}\left[(1+2)^{50} + (1-2)^{50}\right] = \frac{1}{2}\left[3^{50}+1\right] \end{aligned}$$

Example 109: Given that the 4th term in the expansion of $\left(2 + \frac{3x}{8}\right)^{10}$ has the maximum numerical value, then x lies in the interval

(a) $\left(-\frac{64}{21}, -2\right) \cup \left(2, \frac{64}{21}\right)$

(b) $\left(-\frac{60}{23},-2\right)\cup\left(2,\frac{64}{21}\right)$

(c) $\left(-\frac{64}{21},-2\right)$

(d) none of these

Ans. (a)

◎ **Solution:** Since T_4 is numerically the greatest term,

$$|T_3| < |T_4| \text{ and } |T_5| < |T_4|$$

$$\Rightarrow \quad \left|\frac{T_3}{T_4}\right| < 1 \text{ and } \left|\frac{T_5}{T_4}\right| < 1.$$

But $$\frac{T_3}{T_4} = \frac{{}^{10}C_2(2^8)(3x/8)^2}{{}^{10}C_3\left(2^7\right)(3x/8)^3} = \frac{2}{x}$$

and $$\frac{T_5}{T_4} = \frac{{}^{10}C_4\left(2^6\right)(3x/8)^4}{{}^{10}C_3\left(2^7\right)(3x/8)^3} = \frac{21x}{64}$$

Now, $$\left|\frac{T_3}{T_4}\right| < 1 \quad \Rightarrow \quad \left|\frac{2}{x}\right| < 1 \quad \Rightarrow \quad x < -2 \text{ or } x > 2.$$

Next, $$\left|\frac{T_5}{T_4}\right| < 1 \quad \Rightarrow \quad \left|\frac{21x}{64}\right| < 1 \quad \Rightarrow \quad -\frac{64}{21} < x < \frac{64}{21}$$

Thus $x \in (-\infty,-2)\cup(2,\infty)$ and $x \in \left(-\frac{64}{21},\frac{64}{21}\right)$

Hence, $x \in \left(-\frac{64}{21},-2\right)\cup\left(2,\frac{64}{21}\right)$.

◉ **Example 110:** Assuming x to be so small that x^3 and higher powers of x can be neglected, then value of

$$E = \left(1-\frac{3}{2}x\right)^5 (2+3x)^6 \text{, is}$$

(a) $64 + 96x + 720\,x^2$ (b) $65 - 97x + 721x^2$

(c) $64 - 96x + 720x^2$ (d) $64 + 96x - 720x^2$

Ans. (d)

◎ **Solution:** We have

$$\left(1-\frac{3}{2}x\right)^5 (2+3x)^6 = 2^6\left(1-\frac{3}{2}x\right)^5\left(1+\frac{3}{2}x\right)^6$$

$$= 2^6\left(1+\frac{3}{2}x\right)\left[\left(1-\frac{3}{2}x\right)\left(1+\frac{3}{2}x\right)\right]^5$$

$$= 2^6\left(1+\frac{3}{2}x\right)\left(1-\frac{9}{4}x^2\right)^5$$

$$= 2^6\left(1+\frac{3}{2}x\right)\left(1-\frac{45}{4}x^2\right)$$

$$= 2^6\left(1+\frac{3}{2}x-\frac{45}{4}x^2\right) = 64 + 96x - 720x^2$$

◉ **Example 111:** If $(1 + x + x^2)^8 = a_0 + a_1x + a_2x^2 + \cdots + a_{16}x^{16}$, then a_5 equals

(a) 504 (b) 506

(c) 508 (d) 502

◎ **Solution:** We have

$$(1 + x + x^2)^8 = \sum_{\substack{p,q\ge 0\\ p+q\le 8}} \frac{8!}{p!q!(8-p-q)!}x^p(x^2)^q$$

For coefficient of x^5, we set $p + 2q = 5$

This is possible if $p = 5$, $q = 0$, $p = 3$, $q = 1$, $p = 1$, $q = 2$

Thus, coefficient of x^5 is

$$\frac{8!}{5!3!} + \frac{8!}{3!4!} + \frac{8!}{2!5!} = 504$$

◉ **Example 112:** Coefficient of x^{11} in the expansion of $(1 + x^2)^4(1 + x^3)^7(1 + x^4)^{12}$ is

(a) 1051 (b) 1106

(c) 1113 (d) 1120

Ans. (c)

◎ **Solution:** We have

$$\begin{aligned}(1 + x^2)^4(1 + x^3)^7(1 + x^4)^{12} &= (1 + x^2)^4(1 + 7x^3 + 31x^6\\ &\quad + 35x^9 + \ldots)(1 + 12x^4 + 66x^8 + \ldots)\end{aligned}$$

As expansion of $(1 + x^2)^4$ contains only even power, while multiplying last two expansions, we shall only consider odd powers.

$$\begin{aligned}\therefore (1 + x^2)^4(1 + x^3)^7(1 + x^4)^{12} &= (1 + 4x^2 + 6x^4 + 4x^6 + x^8)(7x^3 + 84x^7\\ &\quad + 35x^9 + 462x^{11} + \ldots)\end{aligned}$$

Thus, coefficient of x^{11} is

$$(1)(462) + 4(35) + (6)(84) + (1)(7) = 1113$$

◉ **Example 113:** If the coefficients of three consecutive terms of $(1 + x)^{n+5}$ are in the ratio 5:10:14, then n is equal to

(a) 5 (b) 6

(c) 7 (d) 8

◎ **Solution:** Let three consecutive coefficients of $(1 + x)^{n+5}$ be ${}^{n+5}C_r$, ${}^{n+5}C_{r+1}$, ${}^{n+5}C_{r+2}$

We are given

$$\frac{{}^{n+5}C_r}{{}^{n+5}C_{r+1}} = \frac{5}{10} \text{ and } \frac{{}^{n+5}C_{r+1}}{{}^{n+5}C_{r+2}} = \frac{10}{14}$$

$$\Rightarrow \quad \frac{r+1}{n+5-r} = \frac{1}{2} \text{ and } \frac{r+2}{n+5-r-1} = \frac{5}{7}$$

$$\Rightarrow \quad 3r = n + 3 \text{ and } 12r = 5n + 6$$

$$\therefore \quad 4(n + 3) = 5n + 6 \Rightarrow n = 6$$

◉ **Example 114:** Sum of the series

$$\sum_{k=0}^{n} {}^nC_k(-1)^k\frac{1}{a_k}$$

where $a_k = \sum_{i=0}^{k} {}^kC_i\, b_i$

where $b_i = \sum_{j=0}^{i} {}^iC_j \left(\frac{-2}{3}\right)^j$

is

(a) $\frac{1}{2^n}$ (b) $\frac{1}{3^n}$

(c) $\frac{1}{4^n}$ (d) $\left(\frac{3}{4}\right)^n$

Ans. (c)

Solution:

$$b_i = \sum_{j=0}^{i} {}^iC_j \left(\frac{-2}{3}\right)^j = \left(1-\frac{2}{3}\right)^i = \left(\frac{1}{3}\right)^i$$

$$\therefore \quad a_k = \sum_{i=0}^{k} {}^kC_i \left(\frac{1}{3}\right)^i = \left(1+\frac{1}{3}\right)^k = \left(\frac{4}{3}\right)^k$$

Thus,
$$\sum_{k=0}^{n} {}^nC_k (-1)^k \left(\frac{3}{4}\right)^k = \left(1-\frac{3}{4}\right)^n = \frac{1}{4^n}$$

Example 115: Suppose m and n are positive integers and let

$$S = \sum_{k=0}^{n} (-1)^k \frac{1}{k+m+1} ({}^nC_k)$$

and
$$T = \sum_{k=0}^{m} (-1)^k \frac{1}{k+n+1} ({}^mC_k),$$

then $S - T$ is equal to

(a) 0 (b) $n^m - m^n$

(c) $(n + 1)^m - (m + 1)^n$ (d) $(1 - n)^m - (1 - m)^n$

Ans. (a)

Solution:

$$\begin{aligned} S &= \sum_{k=0}^{n} (-1)^k ({}^nC_k)\left(\int_0^1 x^{k+m} dx\right) \\ &= \int_0^1 \left(\sum_{k=0}^{n} (-1)^k ({}^nC_k) x^{k+m}\right) dx \\ &= \int_0^1 (1-x)^n x^m dx \\ &= \int_0^1 (1-(1-x))^n (1-x)^m dx \\ &= \int_0^1 x^n (1-x)^m dx \\ &= \int_0^1 x^n \left(\sum_{k=0}^{m} (-1)^k ({}^mC_k) x^k\right) dx \\ &= \sum_{k=0}^{m} (-1)^k ({}^mC_k) \int_0^1 x^{n+k} dx \\ &= \sum_{k=0}^{m} (-1)^k ({}^mC_k) \frac{1}{n+k+1} = T \end{aligned}$$

Thus, $S - T = 0$

Example 116: Coefficient of x^m in the expansion of

$$S = (1 + x)^{2m} + x(1 + x)^{2m-1} + x^2(1 + x)^{2m-2} + \ldots + x^{2m}$$

is

(a) ${}^{2m}C_m + {}^{2m-1}C_{m-1}$ (b) ${}^{2m+1}C_m$

(c) 0 (d) $2m^2 + 2m + 1$

Solution: Note S is a G.P. with first term $(1 + x)^{2m}$ and common ratio $\frac{x}{1+x}$ and number of terms $2m + 1$.

Thus,

$$S = \frac{(1+x)^{2m}\left[1-\left(\frac{x}{1+x}\right)^{2m+1}\right]}{1-x/(1+x)} = (1 + x)^{2m+1} - x^{2m+1}$$

$\therefore$ Coefficient of x^m in S is ${}^{2m+1}C_m$.

Example 117: Sum of the first 20 terms of the series

$$\frac{1}{(2)(4)} + \frac{(1)(3)}{(2)(4)(6)} + \frac{(1)(3)(5)}{(2)(4)(6)(8)} + \cdots$$

is

(a) $\frac{1}{2} - \frac{1}{2^{40}}({}^{40}C_{20})$ (b) $\frac{1}{2} - \frac{1}{2^{41}}({}^{42}C_{21})$

(c) $\frac{1}{2} - \frac{1}{2^{42}}({}^{42}C_{21})$ (d) $\frac{1}{2} - \frac{1}{2^{43}}({}^{40}C_{20})$

Ans. (c)

Solution: Let a_k denote the kth term of the series, then

$$\begin{aligned} a_k &= \frac{(1)(3)(5)\cdots(2k-1)}{(2)(4)(6)\cdots(2k)(2k+2)} \\ &= \frac{(1)(3)(5)\cdots(2k-1)(2k+2-2k-1)}{(2)(4)(6)\cdots(2k)(2k+2)} \\ &= b_k - b_{k+1} \end{aligned}$$

where

$$\begin{aligned} b_k &= \frac{(1)(3)(5)\cdots(2k-1)}{(2)(4)(6)\cdots(2k)} \\ &= \frac{(1)(2)(3)(4)\cdots(2k-1)(2k)}{[(2)(4)(6)\cdots(2k)]^2} \\ &= \frac{1}{2^{2k}}({}^{2k}C_k) \end{aligned}$$

Thus,

$$\sum_{k=1}^{20} a_k = \sum_{k=1}^{20} (b_k - b_{k+1}) = b_1 - b_{21}$$

$$= \frac{1}{2} - \frac{1}{2^{42}}\ ({}^{42}C_{21})$$

Example 118: The term independent of x in the expansion of

$$\left(1 - \frac{1}{2x} + 3x^7\right)\left(x^2 + \frac{1}{3x}\right)^{10}$$

is

(a) $10/3^8$
(b) $-2/3$
(c) $10/3^9$
(d) $11/6$

Ans. (a)

Solution: $(r+1)$th term in the expansion of $\left(x^2 + \frac{1}{3x}\right)^{10}$ is

$$t_{r+1} = {}^{10}\mathrm{C}_r\,(x^2)^{10-r}\left(\frac{1}{3x}\right)^r$$

$$= {}^{10}C_r\left(\frac{1}{3}\right)^r x^{20-3r}$$

We require terms containing x^0, x and x^{-7} in the expansion of $\left(x^2 + \frac{1}{3x}\right)^{10}$.

For x^0, set $20 - 3r = 0$. No value of r.
For x^1, set $20 - 3r = 1$. No value of r.
For x^{-7}, set $20 - 3r = -7 \Rightarrow r = 9$.
Thus, required coefficient is

$$3\left[{}^{10}C_9\left(\frac{1}{3}\right)^9\right] = \frac{10}{3^8}$$

Example 119: Let $P(x)$ be a polynomial with real coefficients such that $\int_0^1 x^m\ P(1-x)dx = 0\ \forall\ m \in \mathbf{N} \cup \{0\}$, then

(a) $P(x) = x^n\,(1-x)^n$ for some $n \in \mathbf{N}$
(b) $P(x) = (1-x)^{2n}$ for some $n \in \mathbf{N}$
(c) $P(x) = 1 - x^m\,(1-x)^n$ for some $m, n \in \mathbf{N}$
(d) $P(x) = 0$

Ans. (d)

Solution: $0 = \int_0^1 x^m P(1-x)dx = \int_0^1 (1-x)^m\ P(x)$

Let $\quad P(x) = \sum_{k=0}^{n} a_k x^k$ where $a_k \in \mathbf{R}$

$$= \sum_{k=0}^{n} a_k\ [1 - (1-x)]^k$$

$$= \sum_{k=0}^{n} a_k\left(\sum_{j=0}^{k} (-1)^k({}^kC_j)(1-x)^j\right)$$

$$= \sum_{k=0}^{n} b_k(1-x)^k$$

where $\quad b_k = \sum_{j=k}^{n} (-1)^k({}^jC_k)a_j$

Now $\int_0^1 (P(x))^2 dx = \int_0^1 P(x)\left(\sum_{k=0}^{n} b_k(1-x)^k\right)dx$

$$= \sum_{k=0}^{n} b_k\int_0^1 (1-x)^k P(x)dx = 0$$

As $P(x)$ is a polynomial,

$$P(x) \equiv 0\ \forall\ x \in [0, 1]$$
$$\Rightarrow \quad P(x) \equiv 0$$

Example 120: Suppose $[x]$ denote the greatest integer $\le x$, and $n \in \mathbf{N}$, then

$$\lim_{n\to\infty}\frac{[{}^nC_o x^2] + [{}^nC_1 x^2] + \cdots + [{}^nC_n x^2]}{2^n - 2}$$

is equal to

(a) $\frac{1}{2}\ x^2$
(b) x^2
(c) $2x^2$
(d) $4x^2$

Ans. (b)

Solution: We know $x - 1 < [x] \le x\ \forall\ x \in \mathbf{R}$, therefore ${}^nC_k x^2 - 1 < [{}^nC_k x^2] \le {}^nC_k x^2$

$$\Rightarrow \quad \sum_{k=0}^{n}({}^nC_k x^2 - 1) < \sum_{k=0}^{n}[{}^nC_k x^2] \le \sum_{k=0}^{n}{}^nC_k x^2$$

$$\Rightarrow \quad \frac{x^2(2^n) - (n+1)}{2^n - 2} < \frac{1}{2^n - 2}\sum_{k=0}^{n}[{}^nC_k x^2]$$

$$\le \frac{x^2(2^n)}{2^n - 2}$$

Taking limit as $n \to \infty$, and using sandwich theorem, we get

$$\lim_{n\to\infty}\frac{1}{2^n - 2}\sum_{k=0}^{n}\left[{}^nC_k x^2\right] = x^2$$

EXERCISE

Concept-based Straight Objective Type Questions

1. Suppose $k \in \mathbf{R}$. If the coefficient of x in the expansion of $\left(x^2 + \frac{k}{x}\right)^5$ is 270, then k is equal to:
   (a) 3 (b) – 3
   (c) 9 (d) – 9

2. Suppose $p \in \mathbf{R}$. If the fourth term in the expansion of $\left(px + \frac{1}{x}\right)^n$ is $\frac{5}{2}$, then (n, p) is equal to:
   (a) (5, 1/2) (b) (6, 1/2)
   (c) (8, 1/2) (d) (10, 1/2)

3. If the coefficient of $(3r + 4)$th term and $(2r - 2)$th term in the expansion of $(1 + x)^{20}$ are equal then r is equal to:
   (a) 4 (b) 5
   (c) 7 (d) 8

4. If sum of the coefficient in the binomial expansion of $(1 + 2x)^n$ is 6561, then coefficient of the fourth term is:
   (a) 442 (b) 446
   (c) 448 (d) 472

5. Coefficient of x^{10} in the expansion of $(1 + x^2)^{10}\left(x^2 + 2 + \frac{1}{x^2}\right)^5$ is
   (a) ${}^{10}C_5$ (b) ${}^{15}C_5$
   (c) 0 (d) 2

6. If $(1 + ax)^n = 1 + 10x + 40x^2 + \ldots$, then value of $\frac{a+n}{a-n}$ is
   (a) 5/7 (b) 7/3
   (c) –5/7 (d) – 7/3

7. The ratio of the coefficient of x^{10} in $(1 + x^2)^{10}$ and the term independent of x in $\left(x + \frac{2}{x}\right)^{10}$ is
   (a) 32 : 1 (b) 1 : 32
   (c) 1 : 64 (d) 64 : 1

8. If coefficient of 9th, 10th and 11th terms of $(1 + x)^n$ are in A.P., then value of n can be
   (a) 15 (b) 32
   (c) 23 (d) 17

9. $(p + 2)$th term from the end in the binomial expansion of $\left(x^2 - \frac{2}{x^2}\right)^{2n+1}$ is
   (a) ${}^{2n+1}C_{2n-p}\,(-2)^{2n-p}\,x^{2p+1-2n}$
   (b) ${}^{2n+1}C_{2n-p}\,(-2)^{2n-p}\,x^{2n-2p}$
   (c) ${}^{2n+1}C_{2n-p}\,(-2)^{2n-p}\,x^{2n-2p+1}$
   (d) ${}^{2n+1}C_{2n-p}\,(-2)^{2n-p}\,x^{2p-1+2n}$

10. Let $C_r = {}^{15}C_r$, $0 \le r \le 15$. Sum of the series $S = \sum_{r=1}^{15} r\left(\frac{C_r}{C_{r-1}}\right)$ is
   (a) 40 (b) 60
   (c) 100 (d) 120

LEVEL 1

Straight Objective Type Questions

11. If the middle term of $\left(x^2 + \frac{1}{x}\right)^n$ is $924\,x^6$, then value of n is
   (a) 8 (b) 10
   (c) 12 (d) 20

12. The greatest term in the expansion of $\sqrt{5}\left(1 + \frac{1}{\sqrt{5}}\right)^{20}$ is:
   (a) ${}^{20}C_5\left(\frac{1}{25}\right)$ (b) ${}^{20}C_5\left(\frac{1}{5}\right)$
   (c) ${}^{20}C_5$ (d) ${}^{20}C_5\,(5)$

13. Let $S(\theta)$ denote the sum of coefficients in the expansion of $(\sqrt{2} - x\sin\theta + x^2\cos\theta)^{2n}$. Maximum value of $S(\theta)$ is
   (a) 4^n (b) 8^n
   (c) 2^n (d) 1

14. Suppose
   $(x + a)^n = T_0 + T_1 + T_2 + \ldots + T_n$
   Then $(T_0 - T_2 + T_4 - \ldots)^2 + (T_1 - T_3 + T_5 - \ldots)^2$ is equal to
   (a) $(x^2 + a^2)^n$ (b) $(x^2 - a^2)^n$
   (c) $(x + a)^{2n}$ (d) $(x - a)^{2n}$

15. For $0 \le r < 2n$, $({}^{2n+r}C_n)\,({}^{2n-r}C_n)$ cannot exceed
    (a) ${}^{4n}C_n$ (b) ${}^{4n}C_{2n}$
    (c) ${}^{6n}C_{3n}$ (d) none of these.
16. If sum of the coefficients in the expansion $(2x^2 - 3cx + c^2)^{17}$ is zero, then c is equal to
    (a) 2, 3 (b) 1, 2
    (c) 1, 3 (d) 2, – 1
17. Coefficient of constant term in the expansion of $(x^3 + 5(3)^{-\log\sqrt{3}\;\sqrt{x^3}})^4$ is
    (a) 125 (b) $\log_{\sqrt{3}} 5$
    (c) $\log_3 5$ (d) 150
18. If the number of terms in the expansion of $(1 + 5x + 10x^2 + 10x^3 + 5x^4 + x^5)^{20}$ is m, then unit's place of 2^m is
    (a) 2 (b) 8
    (c) 6 (d) 4
19. Let P_n denote the product of all the coefficients in the expansion of $(1 + x)^n$. If $(20)!\,P_{n+1} = 21^{20}\,P_n$, then n is equal to
    (a) 21 (b) 20
    (c) 19 (d) 18
20. Coefficient of the term independent of x in the expansion of $(1 + x)^{2n}\left(\frac{x}{1-x}\right)^{-2n}$ is:
    (a) ${}^{2n}C_n$ (b) $(-1)^n\,{}^{2n}C_n$
    (c) ${}^{n^2-n}C_n$ (d) 0
21. Coefficient of x^4 in the expansion of $\left(\frac{x}{2} - \frac{3}{x^2}\right)^{10}$ is
    (a) $\frac{504}{256}$ (b) $\frac{405}{256}$
    (c) $\frac{459}{512}$ (d) $-\frac{135}{256}$
22. If α and β are the coefficients of x^r and x^{n-r} respectively in the expansion of $(1 + x)^n$, then
    (a) $\alpha = \beta$
    (b) $\alpha + \beta = n$
    (c) $\alpha = k\beta$ for some constant k
    (d) $\alpha + \beta = 2^n$
23. If the coefficients of $(2r + 4)$th and $(r - 2)$th terms in the expansion of $(1 + x)^{18}$ are equal, then value of r is
    (a) 5 (b) 6
    (c) 7 (d) 9
24. The total number of terms in the expansion of $(x + a)^{200} + (x - a)^{200}$ after simplification is
    (a) 101 (b) 102
    (c) 201 (d) 202
25. The coefficient of x^5 in the expansion of $(1 + x^2)^5\,(1 + x)^4$ is
    (a) 30 (b) 40
    (c) 50 (d) 60
26. If $n > 2$, $r > 1$ and the coefficients of $(3r)$th and $(r + 2)$th terms in the expansion of $(1 + x)^{2n}$ are equal, then
    (a) $n = 2r$ (b) $n = 3r$
    (c) $n = 2r + 1$ (d) $n = 2r + 2$
27. If $(1 + px)^n = 1 + 24x + 2642x^2 + \ldots$ then
    (a) $p = 2, n = 6$ (b) $p = 2, n = 12$
    (c) $p = 3, n = 6$ (d) none of these
28. Sum of the series $\sum_{r=0}^{10} (-1)^r \left({}^{10}C_r\right)\left[\frac{1}{2^r} + \frac{3^r}{2^{2r}}\right]$ is
    (a) $\frac{2^{10}+1}{2^{20}}$ (b) $\frac{2^{10}-1}{2^{20}}$
    (c) $\frac{2^{20}-1}{2^{20}}$ (d) none of these
29. If m and n are positive integers, then value of ${}^mC_0\,{}^nC_k + {}^mC_1\,{}^nC_{k-1} + \ldots + {}^mC_k\,{}^nC_0$
    (a) ${}^{m+n}C_k$ (b) ${}^{m+n}C_{m+k}$
    (c) ${}^{m+n}C_{n+k}$ (d) none of these
30. The expression $\left(x + \sqrt{x^3 - 1}\right)^6 + \left(x - \sqrt{x^3 - 1}\right)^6$ is a polynomial of degree
    (a) 6 (b) 7
    (c) 9 (d) 10
31. The number of distinct terms in the expansion of $(1 + 3x + 3x^2 + x^3)^7$ is
    (a) 18 (b) 19
    (c) 28 (d) 22
32. If $x > 0$, then the number of positive terms in the expansion of $(1 + ix)^{4n}$ is
    (a) $n + 1$ (b) $n - 1$
    (c) n (d) $2n$
33. The number of terms whose values depend on x in the expansion of $\left(x^2 - 2 + \frac{1}{x^2}\right)^n$ is
    (a) $2n$ (b) $2n + 1$
    (c) $2n - 1$ (d) 0
34. If the third term in the expansion of $\left(\frac{1}{x} + x^{\log_{10} x}\right)^5$, $x > 1$, is 1000, then value of x is
    (a) $\sqrt{10}$ (b) 10
    (c) 100 (d) $10\sqrt{10}$

35. Let $R = \left(\sqrt{2}+1\right)^{2n+1}$, $n \in \mathbf{N}$, and $f = R - [R]$, where [ ] denote the greatest integer function, Rf is equal to
(a) 1
(b) 2^{2n+1}
(c) $2^{2n} - 1$
(d) none of these

36. The coefficient of x^{60} in $(1 + x)^{51} (1 - x + x^2)^{50}$ is
(a) ${}^{50}C_{20}$
(b) $-({}^{50}C_{20})$
(c) ${}^{51}C_{20}$
(d) $-({}^{51}C_{20})$

37. If $a = 99^{50} + 100^{50}$ and $b = 101^{50}$, then
(a) $a < b$
(b) $a = b$
(c) $a > b$
(d) $a - b = 100^{49}$

38. If $(1 + x - 2x^2)^6 = \sum_{r=0}^{12} A_r x^r$, then value of $A_2 + A_4 + A_6 + \ldots + A_{12}$, is
(a) 30
(b) 31
(c) 32
(d) none of these

39. The sum of the coefficients in the expansion of $(1 + x - 3x^2)^{4321}$ is
(a) 0
(b) 1
(c) –1
(d) 2^{4320}

40. The greatest integer contained in $\left(\sqrt{3}+1\right)^6$ is
(a) 208
(b) 416
(c) 415
(d) 207

41. The number of terms in the expansion of $(x^2 + 6x + 9)^{30}$ is
(a) 31
(b) 61
(c) 91
(d) none of these

42. The expansion of $(x + y + z)^n$ is given by
(a) $\sum \frac{n!}{p!q!r!} x^p y^q z^r$ where $p, q, r \geq 0$, $p + q + r = n$
(b) $\sum \frac{n!}{p!q!r!} x^p y^q z^r$, where $p + q + r = n$
(c) $\sum \frac{(n+1)!}{p!q!r!} x^p y^q z^r$, where $p + q + r = n$
(d) none of these

43. The number of terms in the expansion of the multinomial $(x + y + z)^n$ is
(a) $\frac{1}{2}(n + 1)(n + 2)$
(b) $\frac{1}{2} n(n + 1)$
(c) $\frac{1}{2}(n + 1)(n + 3)$
(d) none of these

44. The number of terms in the expansion of $(x_1 + x_2 + \ldots + x_r)^n$ is
(a) ${}^{n+1}C_r$
(b) ${}^{n+r-1}C_{r-1}$
(c) ${}^{n+r+1}C_{r+1}$
(d) ${}^{n+r-1}C_r$

45. If the coefficient of x^7 in the expansion of $\left(ax^2 + \frac{1}{bx}\right)^{11}$ and the coefficient of x^{-7} is the expansion of $\left(ax - \frac{1}{bx^2}\right)^{11}$ are equal, then
(a) $ab = 1$
(b) $ab = 11$
(c) $ab = 5$
(d) $ab = 6$

46. If $x + y = 1$, then value of $\sum_{r=0}^{n} (r)({}^nC_r)\, x^{n-r} y^r$ is
(a) 1
(b) 0
(c) nx
(d) ny

47. If sum of the coefficients in the expansion of $\left(x + \frac{1}{x}\right)^n$ is 128, then coefficient of x in the expansion of $\left(x + \frac{1}{x}\right)^n$ is
(a) 51
(b) 48
(c) 35
(d) 28

48. If, in the binomial expansion of $(a - b)^n$, $n \geq 5$ the sum of 5th and 6th term is zero, then value of $\frac{a}{b}$ is
(a) $\frac{n-5}{6}$
(b) $\frac{6}{n-4}$
(c) $\frac{n-4}{5}$
(d) $\frac{5}{n-4}$

49. The value of $2C_0 + \frac{2^2}{2}C_1 + \frac{2^3}{3}C_2 + \ldots + \frac{2^{11}}{11}C_{10}$, is
(a) $\frac{1}{11}(2^{11} - 1)$
(b) $\frac{1}{11}(3^{11} - 1)$
(c) $\frac{1}{11}(11^3 - 1)$
(d) $\frac{1}{11}(11^2 - 1)$

50. If $C_r = {}^nC_r$, then value of $2\left(\frac{C_1}{C_0} + 2\frac{C_2}{C_1} + 3\frac{C_3}{C_2} + \cdots n\frac{C_n}{C_{n-1}}\right)$ is
(a) $n(n - 1)$
(b) $n(n + 1)$
(c) $n^2 - 1$
(d) $n^2 + 1$

51. If $C_r = {}^nC_r$, then the value of $\left(1 + \frac{C_1}{C_0}\right)\left(1 + \frac{C_2}{C_1}\right) \cdots \left(1 + \frac{C_n}{C_{n-1}}\right)$
(a) $\frac{(n+1)!}{2^n}$
(b) $\frac{(n+1)^n}{n!}$
(c) $\frac{2^{n-1}}{n!}$
(d) $\frac{2^n - 1}{n!}$

52. If $C_r = {}^nC_r$, then $C_0 - \frac{1}{3}C_1 + \frac{1}{5}C_2 \cdots$ upto $(n + 1)$ terms equal
    (a) $\int_0^1 x(1-x)^n\,dx$ (b) $\int_0^1 (1-x^2)^n\,dx$
    (c) 0 (d) $1 + \int_0^1 x(1+x)^n dx$

53. Let $(1 + x^2)^2 (1 + x)^n = \sum_{r=1}^{n+4} a_r x^r$. If a_1, a_2, a_3 are in *A.P.*, then n is equal to
    (a) 6 (b) 5
    (c) 7 (d) 2, 3, 4

54. The value of $\sum_{k=0}^{n}\left({}^{4n+1}C_k + {}^{4n+1}C_{2n-k}\right)$ is
    (a) $2^{4n} + {}^{4n+1}C_{2n}$ (b) 2^{4n+1}
    (c) 2^{4n} (d) $2^{4n+1} + {}^{4n+1}C_n$

55. Coeffiecient of t^{24} in the expansion of $(1 + t^2)^{12} (1 + t^{12}) (1 + t^{24})$ is
    (a) ${}^{12}C_6 + 2$ (b) ${}^{12}C_6 + 1$
    (c) ${}^{12}C_6$ (d) ${}^{12}C_6 + 3$

56. If the value of the third term in the expansion of $\left(x + x^{\log_{10} x}\right)^5$ is 10^6, then x may have value(s)
    (a) 1, 10 (b) $10, 10^{-5/2}$
    (c) $10, 10^{-3/2}$ (d) $10^2, 10^{-3/2}$

57. The greatest term in the expansion of $(1 + x)^{10}$ when $x = 2/3$ is
    (a) $210(3/2)^6$ (b) $210(2/3)^4$
    (c) $210(3/2)^4$ (d) none of these

58. The greatest term in the expansion of $(3 + 5x)^{15}$, when $x = 1/5$, is
    (a) ${}^{15}C_3\,(3^{13})$ (b) ${}^{15}C_4\,(3^{12})$
    (c) ${}^{15}C_4\,(3^{10})$ (d) none of these

59. If sum of the coefficients of x^7 and x^4 in the expansion of $\left(\frac{x^2}{a} - \frac{b}{x}\right)^{11}$ is zero, then
    (a) $ab = 1$ (b) $a = b$
    (c) $ab = -1$ (d) $a + b = 0$

60. The value of $\dfrac{19^3 + 6^3 + (3)(19)(6)(25)}{3^6 + 6(243)(2) + (15)(81)(4) + (20)(27)(8) + (15)(9)(16) + (6)(3)(32) + 2^6}$ is
    (a) 19 (b) 6
    (c) 25 (d) 1

61. In the expansion of $(x + a)^n$, if the sum of odd terms be A and the sum of even terms be B, then value of $(x^2 - a^2)^n$ is
    (a) AB (b) $2AB$
    (c) $4AB$ (d) $A^2 - B^2$

62. Coefficient of the term independent of x in the expansion of $\left(x + \frac{1}{x}\right)^4 \left(x - \frac{1}{x}\right)^{12}$ is
    (a) 192 (b) 194
    (c) 196 (d) 198

63. For all $n \in \mathbf{N}$, $(3)\,(5^{2n+1}) + 2^{3n+1}$ is divisible by
    (a) 19 (b) 17
    (c) 23 (d) 25

64. 1.2.3 + 2.3.4 + 3.4.5 + … upto n terms is equal to
    (a) $\frac{1}{4}$ $(n + 1)(n + 2)(n + 3)$
    (b) $\frac{1}{4}$ $(n + 2)(n - 2)(n - 3)(n + 3)$
    (c) $\frac{1}{4}$ $n(n + 1)(n + 2)(n + 3)$
    (d) none of these

65. If a, b, c, $\in \mathbf{N}$, $a^n + b^n$ is divisible by c when n is odd but not when n is even, then value of c is
    (a) $a + b$ (b) $a - b$
    (c) $a^3 + b^3$ (d) $a^3 + b^3$

Assertion-Reason Type Questions

66. Let $(1 + x)^n = C_0 + C_1x + C_2x^2 + \cdots + C_nx^n$

    Statement-1: $\sum_{r=0}^{n} C_r \sin(rx) \cos(n - r)x = 2^n \sin(nx)$

    Statement-2: $\sum_{r=0}^{n} C_r = 2^n$

67. **Statement-1:** The coefficient of the term of independent of x in the expansion of $\left(x + \frac{9}{x} + 6\right)^n$ is $\frac{3^n (2n)!}{n!n!}$.

Statement-2: The coefficient of x^r in the expansion of $(1 + x)^n$ is $\binom{n}{r}$.

68. **Statement-1:** For any positive integers m, n (with $n \geq m$),

$$\binom{n}{m}+\binom{n-1}{m}+\binom{n-2}{m}+\cdots+\binom{m}{m}=\binom{n+1}{m} \qquad (1)$$

Statement-2: Coefficient of x^r in the expansion of $(1 + x)^n$ is $\binom{n}{r}$.

69. **Statement-1:** If n is an odd prime, then greatest integer contained in $\left(2+\sqrt{5}\right)^n - 2^{n+1}$ is divisible by 20 n.

Statement-2: If p is a prime and $1 \leq r \leq p - 1$, then $\binom{p}{r}$ is divisible by p.

70. **Statement-1:** Greatest term in the expansion of $\left(\sqrt{3}+\sqrt{2}\right)^{50}$ is

$\binom{50}{22}\, 3^{14}\, 2^{11}$.

Statement-2: Greatest term in the expansion of $(1 + x)^n$, $x > 0$ is the rth term if $\dfrac{(n+1)x}{x+1}$ is not an integer and $r = \left[\dfrac{(n+1)x}{x+1}\right]$, where $[y]$ denotes the greatest integer $\leq y$.

LEVEL 2

Straight Objective Type Questions

71. Let S denote the set of real numbers x such that

$$\left(x+\sqrt{x^2-1}\right)^3+\left(x-\sqrt{x^2-1}\right)^3 = 2\cos\,(3\cos^{-1} x)$$

Then S contains

(a) one element　　(b) two elements

(c) infinte elements　　(d) no element

72. Value of

$({}^{40}C_0)\ ({}^{40}C_{15}) - ({}^{40}C_1)({}^{40}C_{16}) + ({}^{40}C_2)({}^{40}C_{12}) \cdots - ({}^{40}C_{25})\ ({}^{40}C_{40})$

equals

(a) 0　　(b) ${}^{40}C_{25}$

(c) ${}^{40}C_{20}$　　(d) -1

73. The hundred's digit of 3^{100} is

(a) 0　　(b) 1

(c) 2　　(d) 7

74. If $a,b,\ p \in \mathbf{N}$ and p is prime, then $(a + b)^p - a^p - b^p$ is divisible by

(a) p　　(b) p^2

(c) $\frac{1}{2}p(p - 1)$　　(d) $\frac{1}{2}p(p + 1)$

75. $C_0^2+\frac{1}{2}C_1^2+\frac{1}{3}C_2^2+\cdots+\frac{1}{n+1}C_n^2$ equals

(a) $\frac{1}{n}\left({}^{2n}C_n\right)$　　(b) $\frac{1}{n+1}\left({}^{2n+1}C_n\right)$

(c) $\frac{1}{n}\left({}^{2n}C_{n+1}\right)$　　(d) 2^n

76. Sum of the series $\displaystyle\sum_{k=0}^{n}\frac{(2n)!}{(k!)^2\,(n-k!)^2}$ equals

(a) $n^n + {}^{2n}C_n$　　(b) $({}^{2n}C_n)^2$

(c) ${}^{2n}C_n$　　(d) n^n

77. Sum of the series

$$S = n^2\left(\frac{C_0}{C_1}\right) + (n-1)^2\left(\frac{C_1}{C_2}\right) + \cdots + 1^2\left(\frac{C_{n-1}}{C_n}\right)$$

equals

(a) $\frac{1}{6}\ n(n+1)\ (2n + 1)$　　(b) $\frac{1}{3}\ n\ (n + 1)(n + 2)$

(c) $\frac{1}{6}\ n\ (n + 1)\ (n + 2)$　　(d) $\frac{1}{6}\ n^2(n + 1)\ (n + 2)$

78. If $\displaystyle\sum_{r=0}^{2n} a_r\,(x-2)^r = \sum_{r=0}^{2n} b_r\,(x-3)^r$ and

$a_k = \dfrac{1}{{}^{n+k}C_n}$ for $0 \leq k \leq n$ then b_n equals

(a) $n - 1$　　(b) n

(c) $2n - 1$　　(d) $n + 1$

79. Coefficient of x^{50} in the expansion of $(1 + x)^{41}\ (1 - x + x^2)^{40}$ is

(a) 0　　(b) 1

(c) ${}^{40}C_{19}$　　(d) ${}^{40}C_{29}$

80. If $n \in \mathbf{N}$, then $\displaystyle\sum_{i<j}\left({}^{n}C_i\right)\left({}^{n+1}C_j\right)$ equals

(a) 2^{2n}　　(b) 2^{2n-1}

(c) $2^{n+1}C_n$　　(d) $2n + 1$

Previous Years' AIEEE/JEE Main Questions*

1. If sum of the coefficients in the expansion of $(x + y)^n$ is 4096, then the greatest coefficient in the expansion is
(a) 792 (b) 924
(c) 1594 (d) 2990 **[2002]**

2. Let a_r denote the coefficient of x^r in the expansion of $(1 + x)^{p+q}$, then
(a) $a_p = a_q$ (b) $a_p = -a_q$
(c) $a_p a_q = 1$ (d) none of these **[2002]**

3. The positive integer just greater that $(1 + 0.0001)^{10000}$ is
(a) 2 (b) 3
(c) 4 (d) 5 **[2002]**

4. If $r, n \in \mathbf{N}$ $r > 1$, $n > 2$ and the coefficient of $(r + 2)$th term and (3r)th term in the expansion of $(1 + x)^{2n}$ are equal, then n equals
(a) $3r$ (b) $3r + 1$
(c) $2r$ (d) $2r + 1$ **[2002]**

5. The number of integral terms in the expansion of $(3^{1/2} + 5^{1/8})^{256}$ is
(a) 33 (b) 34
(c) 35 (d) 32 **[2003]**

6. *If x is positive, the first negative term in the expansion of $(1 + x)^{27/5}$ is
(a) 5th term (b) 8th term
(c) 6th term (d) 7th term **[2003]**

7. Let $S(K)$: $1 + 3 + 5 + \ldots + (2K - 1) = 3 + K^2$. Then which of the following is true?
(a) $S(K) \nRightarrow S(K + 1)$
(b) $S(K) \Rightarrow S(K + 1)$
(c) $S(1)$ is correct
(d) Principle of mathematical induction can be used to prove the formula. **[2004]**

8. The coefficients of the middle terms in the binomial expansions in powers of x of $(1 + \alpha x)^4$ and of $(1 - \alpha x)^6$ is the same if α equals
(a) $-\frac{3}{10}$ (b) $\frac{10}{3}$
(c) $-\frac{5}{3}$ (d) $\frac{3}{5}$ **[2004]**

9. The coefficient of x^n in the expansion of $(1 + x)(1 - x)^n$ is
(a) $(-1)^{n-1}(n - 1)^2$ (b) $(-1)^n(1 - n)$
(c) $n - 1$ (d) $(-1)^{n-1}n$ **[2004]**

10. If the coefficients of rth, $(r + 1)$th and $(r + 2)$th terms in the binomial expansion of $(1 + y)^m$ are in A.P., then m and r satisfy the equation
(a) $m^2 - m(4r + 1) + 4r^2 - 2 = 0$
(b) $m^2 - m(4r - 1) + 4r^2 + 2 = 0$
(c) $m^2 - m(4r - 1) + 4r^2 - 2 = 0$
(d) $m^2 - m(4r + 1) + 4r^2 + 2 = 0$ **[2005]**

11. If the coefficient of x^7 in $\left[ax^2 + \frac{1}{bx}\right]^{11}$, equals the coefficients of x^{-7} in $\left[ax - \frac{1}{bx^2}\right]^{11}$, then a and b satisfy the relation
(a) $\frac{a}{b} = 1$ (b) $ab = 1$
(c) $a - b = 1$ (d) $a + b = 1$ **[2005]**

12. *If x is small that x^3 are higher powers of x may be neglected, then

$$\frac{(1+x)^{3/2} - \left(1 + \frac{1}{2}x\right)^3}{(1-x)^{1/2}}$$

may be approximated as
(a) $-\frac{3}{8}x^2$ (b) $\frac{1}{2}x - \frac{3}{8}x^2$
(c) $1 - \frac{3}{8}x^2$ (d) $3x + \frac{3}{8}x^2$ **[2005]**

13. For natural numbers m and n, if $(1 - y)^m (1 + y)^n = 1 + a_1y + a_2y^2 + \ldots$ and $a_1 = a_2 = 10$, then (m, n) equals
(a) (35, 45) (b) (20, 45)
(c) (35, 20) (d) (45, 35) **[2006]**

14. The sum of the series

$${}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - {}^{20}C_3 + \ldots + {}^{20}C_{10} \text{ is}$$

(a) $-\left({}^{20}C_{10}\right)$ (b) $\frac{1}{2}\left({}^{20}C_{10}\right)$
(c) 0 (d) ${}^{20}C_{10}$ **[2007]**

---

* Questions marked with * may be skipped for the present JEE Main syllabus.

15. In the binomial expansion of $(a - b)^n$, $n \geq 0$, the sum of 5th and 6th terms is zero, then $\frac{a}{b}$ equals

(a) $\frac{5}{n-4}$ (b) $\frac{6}{n-5}$

(c) $\frac{n-5}{6}$ (d) $\frac{n-4}{5}$ **[2007]**

16. **Statement-1:** $\sum_{r=0}^{n} (r+1)\,({}^nC_r) = (n+2)2^{n-1}$

Statement-2: $\sum_{r=0}^{n} (r+1)\,({}^nC_r)\,x^r$

$= (1+x)^n + nx\,(1+x)^{n-1}$ **[2008]**

17. The remainder left out when $8^{2n} - 62^{2n+1}$ is divided by 9 is

(a) 7 (b) 8

(c) 0 (d) 2 **[2009]**

18. Let $S_1 = \sum_{j=1}^{10} j(j-1)({}^{10}C_j)$, $S_2 = \sum_{j=1}^{10} j\,({}^{10}C_j)$ and

$S_3 = \sum_{j=1}^{10} (j^2)({}^{10}C_j)$

Statement-1: $S_3 = 55 \times 2^9$

Statement-2: $S_1 = 90 \times 2^8$ and $S_2 = 10 \times 2^8$ **[2010]**

19. The coefficient of x^7 in the expansion of $(1 - x - x^2 + x^3)^6$ is

(a) 132 (b) 144

(c) – 132 (d) – 144 **[2011]**

20. **Statement-1:** For each natural number n, $(n+1)^7 - n^7 - 1$ is divisible by 7.

Statement-2: For each natural number n, $n^7 - n$ is divisible by 7. **[2011]**

21. If n is a positive integer, then $\left(\sqrt{3}+1\right)^{2n} - \left(\sqrt{3}-1\right)^{2n}$ is

(a) an odd positive integer

(b) an even positive integer

(c) a rational number other than a positive integer

(d) an irrational number **[2012]**

22. The term independent of x in the expansion of

$\left(\frac{x+1}{x^{2/3} - x^{1/3} + 1} - \frac{x-1}{x - x^{1/2}}\right)^{10}$ is

(a) 120 (b) 210

(c) 310 (d) 4 **[2013]**

23. If the 7th term in the binomial expansion of $\left(\frac{3}{84^{1/3}} + \sqrt{3}\ln x\right)^9$, $x > 0$ is equal to 729, then x can be:

(a) e^2 (b) e

(c) $\frac{1}{2}e$ (d) $2e$ **[2013, online]**

24. If for positive integers $r > 1$, $n > 2$, the coefficients of the $(3r)$th and $(r+2)$th powers of x in the expansion of $(1+x)^{2n}$ are equal, then n is equal to:

(a) $2r$ (b) $2r - 1$

(c) $3r$ (d) $r + 1$ **[2013, online]**

25. The ratio of the coefficient of x^{15} to the term independent of x in the expansion of $\left(x^2 + \frac{2}{x}\right)^{15}$ is:

(a) 7 : 16 (b) 7 : 64

(c) 1 : 4 (d) 1 : 32 **[2013, online]**

26. The sum of the rational terms in the binomial expansion of $(2^{1/2} + 3^{1/5})^{10}$ is:

(a) 25 (b) 32

(c) 9 (d) 41 **[2013, online]**

27. If the coefficients of x^3 and x^4 in the expansion of $(1 + ax + bx^2)(1 - 2x)^{18}$ in powers of x are both zero, then (a, b) is equal to:

(a) $\left(14, \frac{251}{3}\right)$ (b) $\left(14, \frac{272}{3}\right)$

(c) $\left(16, \frac{272}{3}\right)$ (d) $\left(16, \frac{251}{3}\right)$ **[2014]**

28. The number of terms in the expansion of $(1+x)^{101}(1 + x^2 - x)^{100}$ in powers of x is

(a) 302 (b) 301

(c) 202 (d) 101 **[2014, online]**

29. The coefficients of x^{50} in the binomial expansion of $(1+x)^{1000} + x(1+x)^{999} + x^2(1+x)^{998} + \ldots + x^{1000}$ is:

(a) $\frac{(1000)!}{(50)!(950)!}$ (b) $\frac{(1000)!}{(49)!(951)!}$

(c) $\frac{(1001)!}{(51)!(950)!}$ (d) $\frac{(1001)!}{(50)!(951)!}$

[2014, online]

30. If $\left(2 + \frac{x}{3}\right)^{55}$ is expanded in the ascending powers of x and the coefficients of powers of x in two consecutive terms of the expansion are equal, then these terms are:

(a) 7th and 8th (b) 8th and 9th

(c) 28th and 29th (d) 27th and 28th

[2014, online]

31. If $1 + x^4 + x^5 = \sum_{i=0}^{5} a_i (1+x)^i$, for all x in $\mathbf{R}$, then a_2 is:

(a) – 4 (b) 6

(c) – 8 (d) 10 **[2014, online]**

32. The coefficient of x^{1012} in the expansion of $(1 + x^n + x^{253})^{10}$, (where $n \leq 22$ is a positive integer), is
(a) 1 (b) ${}^{10}C_4$
(c) $4n$ (d) ${}^{253}C_4$ **[2014, online]**

33. The sum of coefficients of integral powers of x in the binomial expansion of $(1-2\sqrt{x})^{50}$ is:
(a) $\frac{1}{2}(3^{50}+1)$ (b) $\frac{1}{2}(3^{50})$
(c) $\frac{1}{2}(3^{50}-1)$ (d) $\frac{1}{2}(2^{50}+1)$ **[2015]**

34. If the coefficients of the three successive terms in the binomial expansion of $(1 + x)^n$ are in the ratio 1 : 7 : 42, then the first of these terms in the expansion is:
(a) 6th (b) 7th
(c) 8th (d) 9th **[2015 online]**

35. The term independent of x in the binomial expansion of $\left(1-\frac{1}{x}+3x^5\right)\left(2x^2-\frac{1}{x}\right)^8$ is:
(a) 400 (b) 496
(c) – 400 (d) – 496 **[2015 online]**

36. If the number of terms in the expansion of $\left(1-\frac{2}{x}+\frac{4}{x^2}\right)^n$, $x \neq 0$, is 28, then the sum of the coefficients of all the terms in this expansion is:
(a) 64 (b) 2187
(c) 243 (d) 729 **[2016]**

37. For $x \in \mathbf{R}$, $x \neq -1$, if
$(1+x)^{2016} + x(1+x)^{2015} + x^2(1+x)^{2014} + \ldots + x^{2016} = \sum_{i=0}^{2016} a_i x^i$, then a_{17} is equal to:
(a) $\frac{2017!}{17!2000!}$ (b) $\frac{2016!}{17!1999!}$
(c) $\frac{2016!}{16!}$ (d) $\frac{2017!}{2000!}$ **[2016 online]**

38. If the coefficients of x^{-2} and x^{-4} in the expansion of $\left(x^{\frac{1}{3}}+\frac{1}{2x^{\frac{1}{3}}}\right)^{18}$, $(x > 0)$, are m and n respectively, then $\frac{m}{n}$ is equal to:
(a) 27 (b) 182
(c) $\frac{5}{4}$ (d) $\frac{4}{5}$ **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. If in the expansion of $\left(x^3-\frac{1}{x^2}\right)^n$, the sum of the coefficients of x^5 and x^{10} is 0, then the coefficient of the third term is:
(a) 455 (b) 105
(c) 605 (d) 120 **[2006]**

2. If $(1 + x)(1 + x + x^2)(1 + x + x^2 + x^3) \ldots (1 + x + x^2 + \ldots + x^n) = a_0 + a_1 x + a_2 x^2 + \ldots + a_m x^m$, then the value of a_1 is
(a) $m + 1$ (b) $(n + 1)$
(c) n (d) m **[2006]**

3. If the ratio of the 7th term from the beginning to the 7th term from the end in the expansion of $(2^{1/3} + 3^{-1/3})^n$ is 1/6, then the value of n is
(a) 9 (b) 12
(c) 6 (d) 3 **[2007]**

4. The remainder when 7^{128} is divided by 10 is
(a) 1 (b) 3
(c) 7 (d) 9 **[2008]**

5. The value of the sum
$$\sum_{j=0}^{8} \frac{1}{(j+1)(j+2)}\binom{8}{j}$$
is
(a) $\frac{1003}{90}$ (b) $\frac{1013}{90}$
(c) $\frac{1023}{90}$ (d) $\frac{1033}{90}$ **[2008]**

6. **Statement-1:** The coefficients of x^n in
$\sum_{j=0}^{n} (-1)^j (2x+5)^{n-j}(5-2x)^j$ is $(n+1)\,2^n$

Statement-2:
$$\sum_{j=0}^{8} a^{n-j} b^j = \frac{a^{n+1}-b^{n+1}}{a-b}, \; a \neq b$$

and coefficient of $(\alpha x + \beta)^m$ is α^m **[2009]**

7. If $x^n = a_0 + a_1\,(1 + x) + a_2\,(1 + x)^2 + \ldots + a_n\,(1 + x)^n$
$= b_0 + b_1\,(1 - x) + b_2\,(1 - x)^2 + \ldots + b_n\,(1 - x)^n$
then for $n = 101$, (a_{50}, b_{50}) equals:
(a) $(-\,{}^{101}C_{50}, {}^{101}C_{50})$ (b) $({}^{101}C_{50}, -\,{}^{101}C_{50})$
(c) $(-\,{}^{101}C_{50}, -\,{}^{101}C_{50})$ (d) $({}^{101}C_{50}, {}^{101}C_{50})$ **[2009]**

8. If the third term in the expansion of $\left[\frac{1}{x} + x^{\log_{10} x}\right]^5$, $x > 1$, is 1000, then x equals
(a) 10 (b) 1
(c) $\frac{1}{\sqrt{10}}$ (d) 100 **[2010]**

9. If the sum of the coefficients in the expansion of $(x + y)^n$ is 2048, then the greatest coefficient in the expansion is:
(a) ${}^{10}C_6$ (b) ${}^{11}C_6$
(c) ${}^{11}C_7$ (d) ${}^{12}C_6$ **[2011]**

10. If $a_i (i = 0, 1, 2, \ldots, 16)$ be real constants such that for every real value of x, $(1 + x + x^2)^8 = a_0 + a_1x + a_2x^2 + \ldots + a_{16}x^{16}$, then a_5 is equal to:
(a) 502 (b) 504
(c) 506 (d) 508 **[2012]**

11. The coefficient of t^{24} in $(1 + t^2)^{12}\,(1 + t^{12})\,(1 + t^{24})$ is:
(a) ${}^{12}C_6 + 13$ (b) ${}^{12}C_6 + 2$
(c) ${}^{12}C_6 + 1$ (d) ${}^{12}C_6$ **[2013]**

12. Sum of the last 30 coefficients of powers of x in the binomial expansion of $(1 + x)^{59}$ is:
(a) 2^{29} (b) 2^{28}
(c) $2^{59} - 2^{29}$ (d) 2^{58} **[2014]**

13. If in the binomial expansion of $(1 - x)^m\,(1 + x)^n$, the coefficients of x and x^2 are respectively 3 and –4, then the ratio $m : n$ is equal to:
(a) 10 : 7 (b) 8 : 11
(c) 10 : 13 (d) 7 : 10 **[2015]**

14. For a positive integer n, if the mean of the binomial coefficients in the expansion of $(a + b)^{2n - 3}$ is 16, then n is equal to:
(a) 5 (b) 7
(c) 9 (d) 4 **[2016]**

Hints and Solutions

Concept-based

1. $T_{r+1} = {}^5C_r\,(x^2)^{5-r}\left(\frac{k}{x}\right)^r = {}^5C_r\,k^r\,x^{10-3r}$

set $10 - 3r = 1$ or $r = 3$. Therefore,

$^5C_3\, k^3 = 270 \Rightarrow k^3 = 27 \Rightarrow k = 3.$

2. $T_4 = {}^nC_3(px)^{n-3}\left(\dfrac{1}{x}\right)^3 = {}^nC_3\, p^{n-3}\, x^{n-6} = \dfrac{5}{2}$

$\Leftrightarrow n - 6 = 0$ and $^6C_3\, p^3 = \dfrac{5}{2} \Leftrightarrow n = 6,\ p = 1/2$

3. $^{20}C_{3r+3} = {}^{20}C_{2r-3} \Rightarrow (3r + 3) + (2r - 3) = 20 \Rightarrow r = 4$

4. Sum of the coefficients

$= (1 + 2)^n = 3^n = 3^8 \Rightarrow n = 8.$

$T_4 = {}^8C_3(2x)^3 = {}^8C_3\, 2^3\, x^3$

Thus, coefficient of fourth term is 448.

5. $(1 + x^2)^{10}\left(x^2 + 2 + \dfrac{1}{x^2}\right)^5$

$= (1 + x^2)^{10}\left(x + \dfrac{1}{x}\right)^5 = \dfrac{1}{x^5}\,(1 + x^2)^{15}$

$\therefore$ coefficient of x^{10} in $(1 + x^2)\left(x^2 + 2 + \dfrac{1}{x^2}\right)^5$

$=$ coefficient of x^{15} in $(1 + x^2)^{15} = 0.$

6. $10 = na,\ 40 = \dfrac{n(n-1)}{2}a^2$

$\dfrac{80}{100} = \dfrac{n(n-1)a^2}{n^2a^2} \Rightarrow \dfrac{4}{5} = \dfrac{n-1}{n} \Rightarrow n = 5$

and $a = 2$

7. $T_{r+1} = (r + 1)$th term in $(1 + x^2)^{10} = {}^{10}C_r\,(x^2)^r$

$\therefore$ coefficient of x^{10} in $(1 + x^2)^{10}$ is $^{10}C_5$.

Also, $t_{r+1} = (r + 1)$th term in $\left(x + \dfrac{2}{x}\right)^{10}$

$= {}^{10}C_r\,(x)^{10-r}\left(\dfrac{2}{x}\right)^r$

$= {}^{10}C_r\, 2^r\, x^{10-2r}$

For this term to be independent of x, set $10 - 2r = 0$ or $r = 5$.

$\therefore$ term independent of x is $^{10}C_5\,(2^5)$

Required ratio is $^{10}C_5 : {}^{10}C_5(2^5) = 1 : 32$

8. $2(^nC_9) = {}^nC_8 + {}^nC_{10}$

$\Rightarrow 2 = \dfrac{9}{n-8} + \dfrac{n-9}{10}$

$\Rightarrow 20(n - 8) = 90 + (n - 8)(n - 9)$

$\Rightarrow n^2 - 37n + 322 = 0$

$\Rightarrow (n - 14)(n - 23) = 0$

Thus, n can be 23

9. $(p + 2)$th term from the end

$= [2n + 2 - (p + 1)]$th $= (2n - p + 1)$th

from the beginning

and $T_{2n-p+1} = {}^{2n+1}C_{2n-p}\,(x^2)^{2n+1-(2n-p)}\left(-\dfrac{2}{x^2}\right)^{2n-p}$

$= {}^{2n+1}C_{2n-p}\,(-2)^{2n-p}\,x^{2p+1-2n}$

10. $\dfrac{C_r}{C_{r-1}} = \dfrac{15!}{r!(15-r)!} \times \dfrac{(r-1)!\,(16-r)!}{15!}$

$= \dfrac{16-r}{r}$

$\Rightarrow S = \displaystyle\sum_{r=1}^{15} r\left(\dfrac{C_r}{C_{r-1}}\right) = \sum_{r=1}^{15}(16-r)$

$= \dfrac{1}{2}\,(15)\,(16) = 120$

Level 1

11. As there is just one middle term, n must be even and middle term is $\left(\dfrac{n}{2} + 1\right)$ th term, and it is given by

$T_{n/2+1} = {}^nC_{n/2}\,(x^2)^{n-n/2}\left(\dfrac{1}{x}\right)^{n/2}$

$= {}^nC_{n/2}\, x^{n/2}$

Now, $^nC_{n/2}\, x^{n/2} = 924x^6$

$\Rightarrow n/2 = 6 \Rightarrow n = 12$

[Also, note that $^{12}C_6 = 924$]

12. We have

$T_{r+1} = {}^{20}C_r\,\dfrac{\sqrt{5}}{(\sqrt{5})^r} = {}^{20}C_r\,\dfrac{1}{(\sqrt{5})^{r-1}}$

Suppose $(r + 1)$th term is the greatest term. Then

$\dfrac{T_{r+1}}{T_r} > 1$ and $\dfrac{T_{r+1}}{T_{r+2}} > 1$

$\Rightarrow \dfrac{20-r}{r+1}\dfrac{1}{\sqrt{5}} > 1$ and $\dfrac{r+2}{19-r}\sqrt{5} > 1$

$\Rightarrow 20 - r > \sqrt{5}\,r + \sqrt{5}$ and $r\sqrt{5} + 2\sqrt{5} > 19 - r$

$\Rightarrow 19 - 2\sqrt{5} < \left(\sqrt{5} + 1\right)r < 20 - \sqrt{5}$

$\Rightarrow \dfrac{1}{4}(19 - 2\sqrt{5})(\sqrt{5} - 1) < r < \dfrac{1}{4}(20 - \sqrt{5})(\sqrt{5} - 1)$

$\Rightarrow \dfrac{1}{4}\,(21\sqrt{5} - 29) < r < \dfrac{1}{4}\,(21\sqrt{5} - 25)$

$\Rightarrow 4.48 < r < 5.49 \Rightarrow r = 5$,

$\therefore$ greatest term $= {}^{20}C_5 \left(\frac{1}{\sqrt{5}}\right)^4 = {}^{20}C_5 \left(\frac{1}{25}\right)$

13. $S(\theta) = (\sqrt{2} - \sin\theta + \cos\theta)^{2n}$

Maximum possible value of

$\sqrt{2} - \sin\theta + \cos\theta = \sqrt{2} - \sqrt{2}\left(\cos\frac{\pi}{4}\sin\theta - \sin\frac{\pi}{4}\cos\theta\right)$

$= \sqrt{2} - \sqrt{2}\sin(\theta - \pi/4)$

is $\sqrt{2} + \sqrt{2} = 2\sqrt{2}$

$\therefore$ Maximum possible value of $S(\theta)$ is $(2^{3/2})^{2n} = 8^n$

14. Note that $T_r = {}^nC_r\, x^{n-r} a^r$.

$(x + ai)^n = {}^nC_0\, x^n + {}^nC_r\, x^{n-1}(ia)$
$\quad + {}^nC_2\, x^{n-2}(ia)^2 + {}^nC_3\, x^{n-3}(ia)^3$
$\quad + \ldots + {}^nC_n\,(ia)^n$

$= (T_0 - T_2 + T_4 - \ldots)$
$+ i(T_1 - T_3 + T_5 - \ldots)$

$\Rightarrow (x^2 + a^2)^n = |(x + ai)^n|^2$
$= (T_0 - T_2 + T_4 - \ldots)^2 + (T_1 - T_3 + T_5 - \ldots)^2$

15. For $0 \le r < 2n$,

$(1 + x)^{4n} = (1 + x)^{2n+r}(1 + x)^{2n-r}$
$= (A_0 + A_1x + A_2x^2 + \ldots + A_{2n+r}\,x^{2n+r})$
$(B_0 + B_1\,x + B_2\,x^2 + \ldots + B_{2n-r}\,x^{2n-r})$

where $A_k = {}^{2n+r}C_k$ $(0 \le k \le 2n + r)$

and $B_k = {}^{2n-r}C_k$ $(0 \le k \le 2n - r)$

Coefficient of x^{2n} on the RHS

$A_{2n}\,B_0 + A_{2n-1}\,B_1 + \ldots + A_n\,B_n$
$\quad + A_{n+1}\,B_{n-1} + \ldots + A_r\,B_{2n-r}$

= coefficient of x^{2n} on LHS

$= {}^{4n}C_{2n}$.

Thus, $A_n\,B_n < {}^{4n}C_{2n}$

$\Rightarrow \left({}^{2n+r}C_n\right)\left({}^{2n-r}C_n\right) < {}^{4n}C_{2n}$

16. Sum of the coefficients $= (2 - 3c + c^2)^{17}$

We are given $(2 - 3c + c^2)^{17} = 0$

$\Rightarrow c^2 - 3c + 2 = 0 \Rightarrow c = 1, 2$

17. Let $y = 3^{-\log_{\sqrt{3}}(x^{3/2})}$

$\Rightarrow \log_3 y = -\frac{\log_3(x^{3/2})}{\log_3\sqrt{3}} = -2\log_3(x^{3/2})$

$\Rightarrow y = x^{-3}$

$(r + 1)$th term in the expansion of

$(x^3 + 5x^{-3})^4$ is

$T_{r+1} = {}^4C_r\,(x^3)^{4-r}(5x^{-3})^r$
$= {}^4C_r\,5^r\,x^{12-3r-3r}$

For $(r + 1)$th term to be independent of x, set $12 - 6r = 0$ or $r = 2$

$\therefore$ required constant term

$= {}^4C_2\,5^2 = (6)(25) = 150$

18. $(1 + 5x + 10x^2 + 10x^3 + 5x^4 + x^5)^{20}$

$= ((1 + x)^5)^{20} = (1 + x)^{100}$

m = number of terms = 101.

We have

$2^m = 2^{101} = (2^5)^{20}(2)$

$= (30 + 2)^{20}(2) = (10m_1 + 2^{20})(2)$

Let k = Unit's digit of 2^m is

= units digit of 2^{21}

Now, $2^{21} = (2^5)^4(2) = (30 + 2)^4(2)$

$\therefore$ k = unit's digit of $2^5 = 2$.

19. Suppose

$(1 + x)^{n+1} = \sum_{k=0}^{n+1} B_k\,x^k$, where $B_k = {}^{n+1}C_k$

and $(1 + x)^n = \sum_{k=0}^{n} C_k\,x^k$, where $C_k = {}^nC_k$.

We have

$\frac{P_{n+1}}{P_n} = B_0\left(\frac{B_1}{A_0}\right)\left(\frac{B_2}{A_1}\right)\cdots\left(\frac{B_{n+1}}{A_n}\right)$

Now, $\frac{B_{r+1}}{A_r} = \frac{(n+1)!}{(r+1)!\,(n-r)!}\cdot\frac{r!\,(n-r)!}{n!}$

$= \frac{n+1}{r+1} \qquad (0 \le r \le n)$

Thus, $\frac{P_{n+1}}{P_n} = \frac{(n+1)^n}{r!}$

$\Rightarrow \frac{21^{20}}{20!} = \frac{(n+1)^n}{r!} \Rightarrow n = 20$

20. Coefficient of the term independent of x in the expansion of $(1 + x)^{2n}\left(\frac{x}{1-x}\right)^{-2n}$

or $\dfrac{(1+x)^{2n}\,(1-x)^{2n}}{x^{2n}}$

= coefficient of x^{2n} in $(1 - x^2)^{2n}$

= coefficient of t^n in $(1 - t)^{2n}$

$= {}^{2n}C_n(-1)^n$

21. $T_{r+1} = {}^{10}C_r\left(\dfrac{x}{2}\right)^{10-r}\left(-\dfrac{3}{x^2}\right)^r = {}^{10}C_r\,\dfrac{(-3)^r}{2^{10-r}}\,x^{10-3r}$

For the coefficient of x^4 set $10 - 3r = 4$

$\Rightarrow \quad r = 2.$

22. $\alpha = {}^nC_r$ and $\beta = {}^nC_{n-r}$

$\therefore \quad \alpha = \beta$

23. ${}^{18}C_{2r+3} = {}^{18}C_{r-3}$

$\Rightarrow \; 2r + 3 = r - 3$ or $18 = (2r + 3) + (r - 3)$

$\Rightarrow \qquad r = -6$ or $r = 6$

24. $(x + a)^{200} + (x - a)^{200}$

$= 2[{}^{200}C_0\,x^{200} + {}^{200}C_2\,x^{198}\,a^2 + \ldots + {}^{200}C_{200}\,a^{200}]$

These are 101 terms.

25. $(1 + x^2)^5\,(1 + x)^4$

$= (1 + 5x^2 + 10x^4 + \ldots)\,(1 + 4x + 6x^2 + 4x^3 + \ldots)$

$\therefore$ Coefficient of x^5 is (5)(4) + (4)(10) = 60

26. ${}^{2n}C_{3r-1} = {}^{2n}C_{r+1} \;\Rightarrow\; 3r - 1 + r + 1 = 2n$

$\Rightarrow \quad n = 2r.$

27. $(1 + px)^n = 1 + npx + \dfrac{1}{2}n(n-1)p^2x^2 + \ldots$

$\therefore \quad np = 24,\; \dfrac{1}{2}n(n-1)p^2 = 264$

Solve to obtain $n = 12$, $p = 2$.

28. $\displaystyle\sum_{r=0}^{10}(-1)^r\left({}^{10}C_r\right)\left[\frac{1}{2^r}+\frac{3^r}{2^{2r}}\right]$

$= \left(1-\dfrac{1}{2}\right)^{10} + \left(1-\dfrac{3}{4}\right)^{10} = \dfrac{2^{10}+1}{2^{20}}$

29. Given expression

= number of ways of choosing k persons out m men and n women

$= {}^{m+n}C_k$

30. Use $(x + a)^6 + (x - a)^6$

$= \; 2[x^6 + {}^6C_2\,x^4a^2 + {}^6C_4\,x^2\,a^4 + {}^6C_6\,a^6]$

Putting $a = \sqrt{x^3-1}$, we find it to be a polynomial of 9.

31. $(1 + 3x + 3x^2 + x^3)^7 = ((1 + x)^3)^7 = (1 + x)^{21}$

32. Positive terms are

${}^{4n}C_0,\; {}^{4n}C_4x^4,\; {}^{4n}C_8x^8,\; \ldots,\; {}^{4n}C_{4n}\,x^{4n}$

$\therefore$ number of positive terms = $(n + 1)$.

33. $\left(x^2 - 2 + \dfrac{1}{x^2}\right)^n = \left(x - \dfrac{1}{x}\right)^{2n}$

Number of terms in the expansion is $(2n + 1)$ out of which just one is independent of x.

34. $T_3 = {}^5C_2\left(\dfrac{1}{x}\right)^{5-2}\left(x^{\log_{10}x}\right)^2 = 1000$

$\Rightarrow \; 10x^{2\log_{10}x-3} = 1000$

$\Rightarrow \; (2t - 3)t = 2$ where $t = \log_{10}x$

$\Rightarrow \; 2t^2 - 3t - 2 = 0$

$\Rightarrow \; (2t + 1)\,(t - 2) = 0$

$\Rightarrow \; x = \dfrac{1}{\sqrt{10}}$ or $x = 100.$

35. Let $F = \left(\sqrt{2}-1\right)^{2n+1}$. Note that $0 < F < 1$.

Also, $R - F = 2m$, where

$m = 2[{}^{2n+1}C_1(\sqrt{2})^{2n} + {}^{2n+1}C_3\,(\sqrt{2})^{2n-2} + \ldots + {}^{2n+1}C_{2n+1}]$ is an integer

$\Rightarrow \; [R] + f - F = 2m \;\Rightarrow\; f - F = 2m - [R]$ is an integer.

But $-1 < f - F < 1$. Thus, $f - F = 0$

$\therefore \; Rf = RF = 1$

36. The coefficient of x^{60} in $(1 + x)^{51}\,(1 - x + x^2)^{50}$

= the coefficient of x^{60} in $(1 + x)\,(1 - x^3)^{50}$

$= {}^{50}C_{20}$

37. $101^{50} - 99^{50} = (100 + 1)^{50} - (100 - 1)^{50}$

$= 2[{}^{50}C_1(100)^{49} + {}^{50}C_3(100)^{47} + \ldots + {}^{50}C_{49}(100)]$

$= 100^{50}$ + a positive term.

$\Rightarrow \; b = a$ + (a positive term) $\;\Rightarrow\; a < b$.

38. Clearly $A_0 = 1$.

Putting $x = 1$ and $x = -1$, we get

$0 = A_0 + A_1 + A_2 + \ldots + A_{12}$

and $(-2)^6 = A_0 - A_1 + A_2 + \ldots + A_{12}$

Adding we get

$64 = 2[A_0 + A_2 + \ldots + A_{12}]$

$\Rightarrow A_2 + A_4 + \ldots + A_{12} = 31$

39. Put $x = 1$.

40. Let $\quad R = \left(\sqrt{3}+1\right)^6$ and $R - [R] = f$.

Put $\quad F = \left(\sqrt{3}-1\right)^6$, then $0 < F < 1$ and

$$R + F = \left(\sqrt{3}+1\right)^6 + \left(\sqrt{3}-1\right)^6$$
$$= 2[3^3 + {}^6C_2\,(3^2) + {}^6C_4(3) + 1]$$
$$= 2[27 + 135 + 45 + 1] = 416$$

$\Rightarrow \quad f + F = 416 - [R]$ is an integer.

Now, show that $f + F = 1$.

41. Use $(x^2 + 6x + 9)^{30} = (x + 3)^{60}$

42. See Theory.

43. Number of terms in $(x + y + z)^n$

$= $ number of non-negative integral solution of $p + q + r = n$

$$= {}^{n+2}C_2 = \frac{1}{2}\,(n+2)\,(n+1)$$

44. Similar to Question 43.

45. T_{r+1}, the $(r + 1)$th term in the expansion $\left(ax^2 + \dfrac{1}{bx}\right)^{11}$ is

$$T_{r+1} = {}^{11}C_r(ax^2)^{11-r}\left(\frac{1}{bx}\right)^r = {}^{11}C_r\,\frac{a^{11-r}}{b^r}\,x^{22-3r}$$

For the coefficient of x^7, set $22 - 3r = 7 \quad \Rightarrow \quad r = 5$.

$\therefore$ Coefficient of x^7 in $\left(ax^2 + \dfrac{1}{bx}\right)^{11}$ is ${}^{11}C_5\,\dfrac{a^6}{b^5}$.

Next, t_{r+1}, the $(r + 1)$th term in the expansion of $\left(ax - \dfrac{1}{bx^2}\right)^{11}$ is

$$t_{r+1} = {}^{11}C_r\,(ax)^{11-r}\left(-\frac{1}{bx^2}\right)^r$$
$$= {}^{11}C_r\,\frac{a^{11-r}}{b^r}\,(-1)^r\,x^{11-3r}$$

For the coefficient of x^{-7}, set $11 - 3r = -7 \Rightarrow r = 6$.

$\therefore$ Coefficient of x^{-7} in the expansion of $= {}^{11}C_6\,\dfrac{a^5}{b^6}$

We are given $\quad {}^{11}C_5\,\dfrac{a^6}{b^5} = {}^{11}C_6\,\dfrac{a^5}{b^6} \quad \Rightarrow \quad ab = 1.$

46. We have $(a + t)^n = \displaystyle\sum_{r=0}^{n} {}^nC_r a^{n-r} t^r$

Differentiating both the sides with respect to t, we get

$$n(a + t)^{n-1} = \sum_{r=0}^{n} r\left({}^nC_r\right)a^{n-r}t^{r-1}$$

Multiplying both the sides by t and putting $a = x$ and $t = y$, we get

$$n(x + y)^{n-1}\,y = \sum_{r=0}^{n} r\left({}^nC_r\right)x^{n-r}\,y^r$$

$$\Rightarrow \sum_{r=0}^{n} r\left({}^nC_r\right)x^{n-r}\,y^r = ny \qquad [\because \quad x + y = 1]$$

47. Sum of the coefficients in the expansion of $\left(x + \dfrac{1}{x}\right)^n$ is equal to 2^n.

$\therefore \qquad 2^n = 128 = 2^7 \quad \Rightarrow \quad n = 7$

Now, T_{r+1}, the $(r + 1)$th term in the expansion of $\left(x + \dfrac{1}{x}\right)^7$ is

$$T_{r+1} = {}^7C_r\,x^{7-r}\left(\frac{1}{x}\right)^r = {}^7C_r\,x^{7-2r}$$

For the coefficient of x, we set $7 - 2r = 1 \Rightarrow r = 3$.

Thus, coefficient of x in the expansion of $\left(x + \dfrac{1}{x}\right)^7$ is ${}^7C_3 = 35$.

48. $\quad {}^nC_4\,a^{n-4}\,(-b)^4 + {}^nC_5\,a^{n-5}\,(-b)^5 = 0$

$$\Rightarrow {}^nC_4\,a^{n-4}\,b^4 = {}^nC_5\,a^{n-5}\,b^5$$

$$\Rightarrow \frac{a^{n-4}b^4}{a^{n-5}b^5} = \frac{{}^nC_5}{{}^nC_4} \quad \Rightarrow \quad \frac{a}{b} = \frac{n-4}{5}$$

49. Given expression is equal to

$$\int_0^2 \left(C_0 + C_1x + C_2x^2 + \cdots C_{10}x^{10}\right)dx$$
$$= \int_0^2 (1 + x)^{10}\;dx = \frac{1}{11}\left(3^{11} - 1\right)$$

50. $$\frac{C_r}{C_{r-1}} = \frac{n!}{r!(n-r)!}\cdot\frac{(r-1)!\,(n-r+1)!}{n!}$$
$$= \frac{n - r + 1}{r}$$
$$\Rightarrow r\,\frac{C_r}{C_{r-1}} = n - r + 1$$
$$\Rightarrow 2\sum_{r=1}^{n} r\,\frac{C_r}{C_{r-1}} = 2\sum_{r=1}^{n}(n - r + 1) = n(n+1)$$

51. From the previous question, we have

$$\left(1 + \frac{C_r}{C_{r-1}}\right) = \frac{n+1}{r}$$
$$\therefore \quad \left(1 + \frac{C_1}{C_0}\right)\left(1 + \frac{C_2}{C_1}\right)\cdots\left(1 + \frac{C_n}{C_{n-1}}\right) = \frac{(n+1)^n}{n!}$$

52. $C_0 - \dfrac{1}{3}C_1 + \dfrac{1}{5}C_2 - \cdots$

$$= \int_0^1\left[C_0 - C_1x^2 + C_2x^4 - \cdots\right]dx = \int_0^1\left(1 - x^2\right)^n dx$$

53. $(1 + 2x^2 + x^4)\ (1 + {}^nC_1x + {}^nC_2x^2 + {}^nC_3x^3 + \ldots)$

$= a_0 + a_1x + a_2x^2 + a_3x^3 + \ldots$

$\Rightarrow a_1 = {}^nC_1,\ a_2 = {}^nC_2 + 2,\ a_3 = {}^nC_3 + 2({}^nC_1)$

Now, a_1, a_2, a_3 are in A.P. implies

$2({}^nC_2 + 2) = {}^nC_1 + {}^nC_3 + 2({}^nC_1)$

$\Rightarrow n(n - 1) + 4 = 3n + \dfrac{1}{6}n(n - 1)\ (n - 2)$

$\Rightarrow 6(n^2 - n) + 24 = 18n + n^3 - 3n^2 + 2n$

$\Rightarrow n^3 - 9n^2 + 26n - 24 = 0$

$\Rightarrow (n - 2)\ (n - 3)\ (n - 4) = 0 \quad \Rightarrow \quad n = 2, 3, 4$

54. $\displaystyle\sum_{k=0}^{n} \left({}^{4n+1}C_k + {}^{4n+1}C_{2n-k}\right)$

$= \displaystyle\sum_{k=0}^{2n} ({}^{4n+1}C_k) + {}^{4n+1}C_{2n}$

$= 2^{4n} + {}^{4n+1}C_{2n}$ [See Theory]

55. Coefficient of t^{24} in $(1 + t^2)^{12}\ (1 + t^{12})\ (1 + t^{24})$

= Coefficient of t^{24} in $(1 + {}^{12}C_1\, t^2 + {}^{12}C_2\, t^4 + \ldots)$
$(1 + t^{12} + t^{24})$

$= {}^{12}C_{12} + {}^{12}C_6 + 1 = {}^{12}C_6 + 2$

56. $T_3 = {}^5C_2x^{5-2}\left(x^{\log_{10} x}\right)^2 = 10^6 \Rightarrow x^{2\log_{10} x + 3} = 10^5$

$\Rightarrow t(2t + 3) = 5$ where $t = \log_{10}x \Rightarrow t = -5/2,\ 1$

57. $\alpha = \dfrac{(10+1)(2/3)}{1+2/3} = \dfrac{22}{5} \quad \Rightarrow \quad [\alpha] = 4$

Thus, the greatest term is 5th term and it is given by

${}^{10}C_4\left(\dfrac{2}{3}\right)^4 = 210\left(\dfrac{2}{3}\right)^4$

58. $\alpha = \dfrac{(15+1)(5)(1/5)}{3+5(1/5)} = 4$

Thus, 4th and 5th terms are the greatest, and $T_5 = {}^{15}C_4(3)^{11}$

59. $T_{r+1} = {}^{11}C_r\left(\dfrac{x^2}{a}\right)^{11-r}\left(-\dfrac{b}{x}\right)^r$

$= {}^{11}C_r(-1)^r\ a^{r-11}b^rx^{22-3r}$

For coefficient of x^4 and x^7, we put $22 - 3r = 4$ and $22 - 3r = 7$

$\Rightarrow \quad r = 6$ and $r = 5$

We are given

${}^{11}C_6(-1)^6\ a^{-5}\ b^6 + {}^{11}C_5\ (-1)^5\ a^{-6}\ b^5 = 0$

$\Rightarrow \quad \dfrac{b^6}{a^5} = \dfrac{b^5}{a^6} \quad \Rightarrow \quad ab = 1$

60. Numerator $= 19^3 + 6^3 + 3(19)\ (6)\ (19 + 6)$
$= (19 + 6)^3 = 25^3$

and denominator $= (3 + 2)^6 = 5^6$

Thus, given expression = 1.

61. We have $(x + a)^n = A + B$ and $(x - a)^n = A - B$.

$\therefore\ (x^2 - a^2)^n = (x + a)^n\ (x - a)^n = (A + B)\ (A - B)$
$= A^2 - B^2$.

62. $\left(x + \dfrac{1}{x}\right)^4\left(x - \dfrac{1}{x}\right)^{12} = \left(x + \dfrac{1}{x}\right)^4\left(x - \dfrac{1}{x}\right)^4\left(x - \dfrac{1}{x}\right)^8$

$= \left(x^2 - \dfrac{1}{x^2}\right)^4\left(x - \dfrac{1}{x}\right)^8$

$= \left({}^4C_0x^8 - {}^4C_1x^4 + {}^4C_2 - {}^4C_3\dfrac{1}{x^4} + {}^4C_4\dfrac{1}{x^8}\right)$

$\times\left({}^8C_0x^8 - {}^8C_1x^6 + {}^8C_2x^4 - \cdots + {}^8C_8\dfrac{1}{x^8}\right)$

$\therefore$ Coefficient of the term independent of x

$= ({}^4C_0)\ ({}^8C_8) - ({}^4C_1)\ ({}^8C_6) + ({}^4C_2)\ ({}^8C_4) - ({}^4C_3)\ ({}^8C_2)$
$+ ({}^4C_4)\ ({}^8C_0) = 198$

63. For $n = 1$, $3(5^{2n+1}) + 2^{3n+1} = 3(5^3) + 2^4 = (17)\ (23)$

Assume $3(5^{2k+1}) + 2^{3k+1} = 17m$ for some m.

Using this show that $3(5^{2k+3}) + 2^{3k+4}$ is divisible by 17.

64. $t_r = r(r + 1)\ (r + 2) = (r + 1)\ \{(r + 1)^2 - 1\}$

$= (r + 1)^3 - (r + 1)$

$\Rightarrow \displaystyle\sum_{r=1}^{n} t_r = \sum_{r=1}^{n+1} r^3 - \sum_{r=1}^{n+1} r$

$= \dfrac{1}{4}(n+1)^2\ (n+2)^2 - \dfrac{1}{2}(n+2)\ (n+1)$

$= \dfrac{1}{4}(n+1)(n+2)\left(n^2 + 3n + 2 - 2\right)$

$= \dfrac{1}{4}n\ (n+1)(n+2)(n+3)$.

Remark

- ❖ We can also prove this by using the principle of mathematical induction.

65. Use $a^{2m+1} + b^{2m+1}$
$= (a + b)\ (a^{2m} - a^{2m-1}\, b + a^{2m-2}\, b^2 - \ldots$
$- ab^{2m-1} + b^{2m}]$

66. Let $S = \sum_{r=0}^{n} C_r \sin(rx)\cos[(n-r)x]$ $\quad (1)$

Using $C_r = C_{n-r}$, we can write

$$S = \sum_{r=0}^{n} C_{n-r}\sin(rx)\cos[(n-r)x]$$

$$= \sum_{r=0}^{n} C_r \sin[(n-r)x]\cos(rx) \quad (2)$$

Adding (1) and (2), we get

$$2S = \sum_{r=0}^{n} C_r\{\sin(rx)\cos[(n-r)x] + \sin[(n-r)x]\cos(rx)\}$$

$$= \sum_{r=0}^{n} C_r \sin(nx) = \sin(nx)\sum_{r=0}^{n} C_r$$

$$= 2^n \sin(nx)$$

$$\Rightarrow \quad S = 2^{n-1}\sin(nx)$$

67. $\left(x + \dfrac{9}{x} + 6\right)^n = \left(\dfrac{x^2+6x+9}{x}\right)^n = \dfrac{(3+x)^{2n}}{x^n}$

$$= \frac{3^{2n}}{x^n}\left(1+\frac{x}{3}\right)^{2n}$$

$\therefore$ Coefficient of the term independent of $x\left(x+\dfrac{9}{x}+6\right)^n$

$$= 3^{2n}\left[\text{Coefficient of } x^n \text{ in the expansion of} \left(1+\frac{x}{3}\right)^{2n}\right]$$

$$= 3^{2n}\binom{2n}{n}\left(\frac{1}{3}\right)^n = \frac{3^n(2n)!}{n!n!}$$

[using Statement-2]

68. LHS of (1)

$= \text{coefficient of } x^m \text{ in } \{(1+x)^m + (1+x)^{m+1} + \cdots + (1+x)^n\}$ [using Statement-2]

$= \text{coefficient of } x^m$ in

$$(1+x)^m\,\frac{\{(1+x)^{n-m+1}-1\}}{1+x-1}$$

$= \text{coefficient of } x^{m+1} \text{ in } [(1+x)^{n+1} - (1+x)^m]$

$$= \binom{n+1}{m+1}$$

69. We have

$$\binom{p}{r} = \frac{p!}{r!(p-r)!} \quad \Rightarrow \quad r!(p-r)!\binom{p}{r} = p!$$

As $p|p!$, we get $p|r!\,(p-r)!\binom{p}{r}$

But for $1 \le r \le p-1$, neither $r!$ nor $(p-r)!$ is divisible by p.

$$\therefore \quad p\left|\binom{p}{r}\right.$$

We have $\sqrt{5} - 2 = \dfrac{1}{\sqrt{5}+2}$

$\Rightarrow 0 < \sqrt{5} - 2 < 1 \quad \Rightarrow \quad 0 < f = \left(\sqrt{5}-2\right)^n < 1.$

Let $\left(2+\sqrt{5}\right)^n = N + F$ where $0 < F < 1$. Now,

$$N + F - f - 2^{n+1} = \left(\sqrt{5}+2\right)^n - \left(\sqrt{5}-2\right)^n$$

$$= 2\left[\binom{n}{1}5^{(n-1)/2}(2) + \binom{n}{3}5^{(n-3)/2}\left(2^3\right) + \cdots + \binom{n}{n-2}(5)2^{n-1}\right] \quad (1)$$

[$\because$ n is odd]

Since n is an odd prime, each of $\binom{n}{1}, \binom{n}{3}, \ldots \binom{n}{n-2}$ is divisible by n.

Thus RHS of (1) is divisible by $20\,n$

Also, $F - f$ is an integer. Since $0 < F < 1$ and $0 < f < 1$, we get $-1 < F - f < 1$. As $F - f$ is an integer, we get $F - f = 0$ or $F = f$.

$\therefore$ integral part of $\left(2+\sqrt{5}\right)^n - 2^{n+1}$ is $N - 2^{n+1}$, which is divisible by $20\,n$.

70. That Statement-2 is false can be seen from theory.

We can write $\left(\sqrt{3}+\sqrt{2}\right)^{50} = 2^{25}\left(1+\sqrt{\dfrac{3}{2}}\right)^{50}$.

Let $k = \dfrac{(50+1)\sqrt{3/2}}{1+\sqrt{3/2}}$

$$= \frac{51\sqrt{3}\left(\sqrt{3}-\sqrt{2}\right)}{\left(\sqrt{3}+\sqrt{2}\right)\left(\sqrt{3}-\sqrt{2}\right)} = 51\left(3-\sqrt{6}\right)$$

$\simeq 51\ (0.5505) \simeq 28.07$

$\Rightarrow [k] = 28.$

Thus, the greatest term in the expansion of $\left(\sqrt{3}+\sqrt{2}\right)^{50}$ is the 29th term and it equals

$$2^{25}\binom{50}{28}\left(\sqrt{\frac{3}{2}}\right)^{28} = \binom{50}{22}3^{14}2^{11}$$

Level 2

71. Note that $\sqrt{x^2 - 1}$ is defined if $x^2 \geq 1$ i.e. if $x \leq -1$ or $x \geq 1$ But $\cos^{-1} x$ is defined for $|x| \leq 1$.

    Thus, only possible values of x are 1 and -1. But these do not satisfy the given equation.

72. $({}^{40}C_0)\ ({}^{40}C_{15}) - ({}^{40}C_1)\ ({}^{40}C_{16}) + ({}^{40}C_2)\ ({}^{40}C_{17})$
    $+ \cdots - ({}^{40}C_{25})\ ({}^{40}C_{40})$
    $= ({}^{40}C_0)\ ({}^{40}C_{25}) - ({}^{40}C_1)\ ({}^{40}C_{24}) + ({}^{40}C_2)\ ({}^{40}C_{23})$
    $+ \cdots - ({}^{40}C_{25})\ ({}^{40}C_0)$
    = Coefficient of x^{25} in $[{}^{40}C_0 - {}^{40}C_1\, x + {}^{40}C_2\, x^2 - \cdots$
    $+ {}^{40}C_{40}\, x^{40}] \times [{}^{40}C_0 + {}^{40}C_1\, x + \cdots + {}^{40}C_{40}\, x^{40}]$
    = Coefficient of x^{25} in $(1 - x)^{40}\ (1 + x)^{40}$
    = Coefficient of x^{25} in $(1 - x^2)^{40} = 0$

73. $3^{100} = 9^{50} = (10 - 1)^{50}$
    $= {}^{50}C_0\, 10^{50} - {}^{50}C_1\, 10^{49} + \cdots\ {}^{50}C_{47}\, 10^3$
    $+ {}^{50}C_{48}\, 10^2 - {}^{50}C_{49}\, (10) + {}^{50}C_{50}$
    $= 1000m + 122000 + 1 = 1000\ (m + 122) + 1$
    where m is a natural number
    Thus, hundred's digit of 3^{100} is 0.

74. $(a + b)^p - a^p - b^p$
    $= {}^pC_1\, a^{p-1}\, b + {}^pC_2\, a^{p-2}\, b^2 + \cdots + {}^pC_{p-1}\, ab^{p-1}$
    For $1 \leq r \leq p - 1$,
    $({}^pC_r)\ (r!)\ (p - r)! = p!$
    As p is prime, $p \mid p!$ but
    $p \nmid (r!)$ and $p \nmid (p - r)!$
    $\therefore\ p \mid {}^pC_r$
    Thus, p divides $(a + b)^p - a^p - b^p$.

75. We have
    $(n + 1)\ ({}^nC_r) = (r + 1)\ ({}^{n+1}C_{r+1})$
    $$\Rightarrow \frac{1}{r+1}\ ({}^nC_r) = \frac{1}{n+1}\ ({}^{n+1}C_{r+1})$$
    $$\text{Thus, } C_0^2 + \frac{1}{2}C_1^2 + \frac{1}{3}C_1^2 + \cdots + \frac{1}{n+1}C_n^2$$
    $$= C_0\left(\frac{1}{1}C_0\right) + C_1\left(\frac{1}{2}C_1\right) + C_2\left(\frac{1}{3}C_2\right)$$
    $$+ \cdots + C_n\left(\frac{1}{n+1}C_n\right)$$
    $$= \frac{1}{n+1}\ [({}^nC_n)\ ({}^{n+1}C_1) + ({}^nC_{n-1})\ ({}^{n+1}C_2)$$
    $$+ ({}^nC_{n-2})\ ({}^{n+1}C_3) + \cdots + ({}^nC_0)\ ({}^{n+1}C_{n+1})]$$
    $$= \frac{1}{n+1}\ ({}^{2n+1}C_{n+1}) = \frac{1}{n+1}\ ({}^{2n+1}C_n)$$

76. $$\sum_{k=0}^{n} \frac{(2n)!}{(k!)^2\ ((n-k)!)^2} = \frac{(2n)!}{n!\,n!}\sum_{k=0}^{n}\left(\frac{n!}{k!\,(n-k)!}\right)^2$$
    $$= ({}^{2n}C_n)\ \sum_{k=0}^{n}\left({}^nC_k\right)^2$$
    $$= ({}^{2n}C_n)\ ({}^{2n}C_n) = ({}^{2n}C_n)^2$$

77. As $\dfrac{C_k}{C_{k+1}} = \dfrac{k+1}{n-k}$,
    $$S = n^2\left(\frac{1}{n}\right) + (n-1)^2\left(\frac{2}{n-1}\right) + \cdots + 1^2\left(\frac{n+0}{1}\right)$$
    $$= \sum_{k=0}^{n}(n-k)(k+1) = n\sum_{k=0}^{n}(k+1) - \sum_{k=1}^{n}k^2 - \sum_{k=1}^{n}k$$
    $$= n\left(\frac{1}{2}\right)(n + 1)\ (n + 2) - \left(\frac{1}{6}\right)n\ (n + 1)\ (2n + 1)$$
    $$- \left(\frac{1}{2}\right)\ n\ (n + 1)$$
    $$= \frac{1}{6}\,n\ (n + 1)\ (n + 2)$$

78. Put $x - 3 = t$, so that
    $$\sum_{r=0}^{2n} b_r\, t^r = \sum_{r=0}^{2n} a_r\,(1+t)^r$$
    $\Rightarrow b_n$ = coefficient of t^n of the R.H.S.
    $= a_n\ ({}^nC_n) + (a_{n+1})\ ({}^{n+1}C_n) + \cdots + (a_{2n})\ ({}^{2n}C_n)$
    $$= \sum_{k=0}^{n} a_k\ ({}^{n+k}C_k) = n + 1$$

79. $(1 + x)^{41}\ (1 - x + x^2)^{40}$
    $= (1 + x)\ [(1 + x)\ (1 - x + x^2)]^{40}$
    $= (1 + x)\ (1 - x^3)^{40}$
    Coefficient of x^{50} in $(1 + x)^{41}\ (1 - x + x^2)^{40}$
    = Coefficient of x^{50} in $(1 - x^3)^{40}$
    + Coefficient of x^{49} in $(1 - x^3) = 0 + 0 = 0$

80. $$\sum_{i<j} ({}^nC_i)\ \ ({}^{n+1}C_j)$$
    $$= \sum_{i=0}^{n} ({}^nC_i)\ \ [{}^{n+1}C_{i+1} + {}^{n+1}C_{i+2} + \cdots + {}^{n+1}C_{n+1}]$$

$$= \sum_{i=0}^{n} ({}^nC_i)\,[({}^nC_i + {}^nC_{i+1}) + ({}^nC_{i+1} + {}^nC_{i+2}) + \cdots + ({}^nC_{n-1} + {}^nC_n) + {}^nC_n]$$

$$= \sum_{i=0}^{n} \left({}^nC_i\right)^2 + 2\sum_{i<j} \left({}^nC_i\right)\left({}^nC_j\right)$$

$$= ({}^nC_0 + {}^nC_1 + \cdots + {}^nC_n)^2 = (2^n)^2 = 2^{2n}$$

Previous Years' AIEEE/JEE Main Questions

1. Sum of the coefficients of $(x + y)^n$ is 2^n.

   $\therefore\ 2^n = 4096 = 2^{12} \Rightarrow n = 12$

   Greatest coefficient $= {}^{12}C_6 = 924$

2. $a_r = {}^{p+q}C_r$

   $\Rightarrow a_p = {}^{p+q}C_p = {}^{p+q}C_q = a_q$

3. Let $n = 0.0001$ and

   $$S = \left(1 + \frac{1}{n}\right)^n$$

   $$= 1 + {}^nC_1\left(\frac{1}{n}\right) + {}^nC_2\left(\frac{1}{n}\right)^2 + \ldots + {}^nC_n\left(\frac{1}{n}\right)^n$$

   $$= 1 + 1 + \frac{1}{2!}\frac{n(n-1)}{n^2} + \frac{1}{3!}\frac{n(n-1)(n-2)}{n^3} + \ldots + \frac{1}{n!}\frac{n(n-1)\cdots(n-n+1)}{n^2}$$

   $$= 1 + 1 + \frac{1}{2!}\left(1 - \frac{1}{n}\right) + \frac{1}{3!}\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right) + \ldots + \frac{1}{n!}\left(1 - \frac{1}{n}\right)\cdots\left(1 - \frac{n-1}{n}\right)$$

   $$< 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!}$$

   But $\frac{1}{r!} = \frac{1}{1.2\ldots r} \le \frac{1}{2^{r-1}}\ \forall\ r \ge 2.$

   Thus, $S \le 1 + 1 + \frac{1}{2} + \frac{1}{2^2} + \ldots + \frac{1}{2^{n-1}}$

   $$= 1 + \frac{1 - (1/2)^n}{1 - 1/2} = 3 - \left(\frac{1}{2}\right)^{n-1} < 3.$$

4. ${}^{2n}C_{r+1} = {}^{2n}C_{3r-1}$

   $\Rightarrow r + 1 = 3r - 1$ or $(r + 1) + (3r - 1) = 2n$

   $\Rightarrow r = 1$ or $n = 2r$

   As $r > 1$, $n = 2r$.

5. $(r + 1)$th term of $(3^{1/2} + 5^{1/8})^{256}$ is

   $t_{r+1} = {}^{256}C_r\,(3^{1/2})^{256-r}\,(5^{1/8})^r$

   $= {}^{256}C_r\,3^{128 - r/2}\,5^{r/8}$

   This will be an integer if both $r/2$ and $r/8$ are integers, and $0 \le r \le 256$

   $\Rightarrow r = 0, 8, 16, \ldots, 256$

   Thus, there are 33 integral terms.

6. Not relevant to present JEE (Main) syllabus.

7. Note that $S(1)$ is not true

   Assume $S(K)$ is true, then

   $1 + 2 + \ldots + (2K - 1) = 3 + K^2$

   $\Rightarrow 1 + 2 + \ldots + (2K - 1) + (2K + 1)$

   $= 3 + K^2 + (2K + 1)$

   $= 3 + (K + 1)^2$

   Thus, $S(K) \Rightarrow S(K + 1)$

8. Third term of $(1 + \alpha x)^4$ is the middle term and the 4th term of $(1 - \alpha x)^6$ is the middle term. We are given

   ${}^4C_2\,\alpha^2 = {}^6C_3\,(-\alpha)^3 \Rightarrow 6\alpha^2 = -20\alpha^3$

   $\Rightarrow \alpha = -3/10$

9. Coefficient of x^n in $(1 + x)(1 - x)^n$

   $= (1 + x)(-1)^n(x - 1)^n$

   $= (-1)^n(1 + x)\{{}^nC_0\,x^n - {}^nC_1\,x^{n-1} + \ldots\}$

   $= (-1)^n({}^nC_0 - {}^nC_1) = (-1)^n(1 - n)$

10. Coefficient of $(r + 1)$th term in $(1 + y)^m$ is ${}^mC_r$. We are given ${}^mC_{r-1}$, ${}^mC_r$ ${}^mC_{r+1}$ are in A.P.

    $\Rightarrow 2({}^mC_r) = {}^mC_{r-1} + {}^mC_{r+1}$

    $$\Rightarrow 2 = \frac{{}^mC_{r-1}}{{}^mC_r} + \frac{{}^mC_{r+1}}{{}^mC_r}$$

    $$= \frac{m!}{(r-1)!(m-r+1)!}\cdot\frac{r!(m-r)!}{m!} + \frac{m!}{(r+1)!(m-r-1)!}\cdot\frac{r!(m-r)!}{m!}$$

    $$\Rightarrow 2 = \frac{r}{m-r+1} + \frac{m-r}{r+1}$$

    $\Rightarrow 2(m - r + 1)(r + 1) = r(r + 1) + (m - r)(m - r + 1)$

    $\Rightarrow 2(mr - r^2 + r + m - r + 1)$

    $= r^2 + r + m^2 - 2mr + r^2 + m - r$

    $\Rightarrow m^2 - m(4r + 1) + 4r^2 - 2 = 0$

11. $(r + 1)$th term in the expansion of

$\left(ax^2 + \frac{1}{bx}\right)^{11}$ is

$T_{r+1} = {}^{11}C_r\,(ax^2)^{11-r}\left(\frac{1}{bx}\right)^r$

$= {}^{11}C_r\,a^{11-r}\left(\frac{1}{b}\right)^r x^{22-3r}$

For coefficient of x^7, we set

$22 - 3r = 7$ or $r = 5$

$\therefore$ Coefficient of x^7 is ${}^{11}C_5\,\frac{a^6}{b^5}$

Next, $(r + 1)$th term in the expansion of $\left[ax = \frac{1}{bx^2}\right]^{11}$ is

$t_{r+1} = {}^{11}C_r\,(ax)^{11-r}\left(-\frac{1}{bx^2}\right)^r$

$= {}^{11}C_r\,a^{11-r}\left(-\frac{1}{b}\right)^r x^{11-3r}$

For coefficient of x^{-7}, we set $11 - 3r = -7$ or $r = 6$. Thus, coefficient of

x^{-7} is ${}^{11}C_6\,\frac{a^5}{b^6}$. We are given

${}^{11}C_5\,\frac{a^6}{b^5} = {}^{11}C_6\,\frac{a^5}{b^6}$

$\Rightarrow \frac{a^6}{b^5} = \frac{a^5}{b^6}$ $\qquad [\because {}^nC_r = {}^nC_{n-r}]$

$\Rightarrow (ab)^6 = (ab)^5$ or $ab = 1$

12. Not relevant to present JEE (Main) syllabus.

13. $(1 - y)^m (1 + y)^n = 1 + a_1y + a_2y^2 + \ldots$

We have

$(1 - y)^m (1 + y)^n$

$= \left(1 - my + \frac{m(m-1)}{2!}y^2 + \cdots\right)$

$\times \left(1 + ny + \frac{n(n-1)}{2!}y^2 + \cdots\right)$

$= 1 + (n - m)y + \frac{1}{2}(m^2 - m - 2mn + n^2 - n)y^2 + \ldots$

Thus, $10 = a_1 = n - m$

and $10 = a_2 = \frac{1}{2}[(n - m)^2 - (n + m)]$

$\Rightarrow n - m = 10$

and $n + m = 80$

$\Rightarrow n = 45,\ m = 35$

14. ${}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - \ldots + {}^{20}C_{10} - {}^{20}C_{11} + \ldots + {}^{20}C_{20} = 0$

Using ${}^nC_r = {}^nC_{n-r}$, we get

$2({}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - \ldots + {}^{20}C_{10}) - {}^{20}C_{10} = 0$

$\Rightarrow {}^{20}C_0 - {}^{20}C_1 + {}^{20}C_2 - \ldots + {}^{20}C_{10} = \frac{1}{2}({}^{20}C_{10})$

15. $T_5 + T_6 = 0$

$\Rightarrow {}^nC_4\,a^{n-4}(-b)^4 + {}^nC_5\,a^{n-5}(-b)^5 = 0$

$\Rightarrow \frac{a^{n-4}b^4}{a^{n-5}b^5} = \frac{{}^nC_5}{{}^nC_4}$

$\Rightarrow \frac{a}{b} = \frac{n!}{5!(n-5)!}\,\frac{4!(n-4)!}{n!} = \frac{n-4}{5}$

16. $\sum_{r=0}^{n}(r+1)\,({}^nC_r)\,x^r$

$= \sum_{r=0}^{n}({}^nC_r)\frac{d}{dx}\{x^{r+1}\}$

$= \frac{d}{dx}\left\{\sum_{r=0}^{n}{}^nC_r x^{r+1}\right\}$

$= \frac{d}{dx}\left\{x\left(\sum_{r=0}^{n}{}^nC_r x^r\right)\right\}$

$= \frac{d}{dx}\{x(1 + x)^n\}$

$= (1 + x)^n + nx(1 + x)^{n-1}$

Thus, Statement-2 is true.

Putting $x = 1$, we get

$\sum_{r=0}^{n}(r+1)\,({}^nC_r) = 2^n + n(1)\,2^{n-1} = (n + 2)\,2^{n-1}$

Thus, statemnen-2 is true and is a correct reason for Statement-1.

17. $8^{2n} - 62^{2n+1}$

$= (9 - 1)^{2n} - (63 - 1)^{2n+1}$

$= ({}^{2n}C_0\,9^{2n} - {}^{2n}C_1\,9^{2n-1} + {}^{2n}C_2\,9^{2n-2} - \ldots - {}^{2n}C_{2n-1}\,(9) + {}^{2n}C_{2n})$

$- ({}^{2n+1}C_0\,(63^{2n+1}) - {}^{2n+1}C_1\,(63^{2n})$

$+ {}^{2n+1}C_2\,(63^{2n-1}) - \ldots + {}^{2n+1}C_1\,(63) - {}^{2n+1}C_0)$

$= 9m + 1 + 1 = 9m + 2$ for some integer m

Thus, when $8^{2n} - 62^{2n+1}$ is divided by 9, the remainder is 2.

18. We have

$$(1 + x)^{10} = \sum_{j=0}^{10} ({}^{10}C_j)x^j$$

Differentiating both the side w.r.t. x, we get

$$10(1 + x)^9 = \sum_{j=1}^{10} j({}^{10}C_j)x^{j-1} \qquad (1)$$

Again differentiating both the sides w.r.t, x, we get

$$(10)\ (9)\ (1 + x)^8 = \sum_{j=1}^{10} j\ \ (j - 1)\ ({}^{10}C_j)x^{j-2} \qquad (2)$$

Putting $x = 1$ in (1) and (2), we get

$$S_2 = \sum_{j=1}^{10} j({}^{10}C_j) = 10(2^9)$$

and $S_1 = \sum_{j=1}^{10} j(j-1)\ ({}^{10}C_j) = (10)\ (9)\ (2^8) = (90)\ (2^8)$

Adding the above two equations, we get

$$S_3 = \sum_{j=1}^{n} [j + j(j-1)]\ ({}^{10}C_j) = (10)\ (2^8)\ (2 + 9)$$

$\Rightarrow S_3 = (55)\ (2^9)$

Thus, Statement-1is true but Statement-2 is false.

19. $1 - x - x^2 + x^3 = (1 - x) - x^2\,(1 - x)$

$= (1 - x)\ (1 - x^2)$

We have $(1 - x - x^2 + x^3)^6 = (1 - x)^6\ (1 - x^2)^6$

Coefficient of x^7 in $(1 - x - x^2 + x^3)^6$

$=$ Coefficient of x^7 in $(1 - {}^6C_1\,x + {}^6C_2\,x^2 - \ldots$

$+ {}^6C_6\,x^6)\ (1 - {}^6C_1\,x^2 + {}^6C_2\,x^4 - {}^6C_3\,x^6 + \ldots)$

$= (-\,{}^6C_5)\ (-\,{}^6C_1) + (-\,{}^6C_3)\ ({}^6C_2)$

$+ (-\,{}^6C_1)\ (-\,{}^6C_3)$

$= 36 - 300 + 120 = -\,144$

20. For Statement-2, write

$n = 7k + r$ where $r = -\,3, -\,2, -\,1, 0, 1, 2, 3.$

Now $n^7 - n = (7k + r)^7 - (7k + r)$

$\Rightarrow n^7 - n - (r^7 - r)$ is a multiple of 7.

Thus, $n^7 - n$ is a divisible of 7 if and only if $r^7 - r$ is a divisible of 7.

For $r = -\,3$, $r^7 - r = (-3)^7 - (-3)$

$= (-3)\ [3^6 - 1]$

$= (-3)\ (128)$

is a divisible of 7.

For $r = -2$, $r^7 - r = (-\,2)^7 - (-\,2)$

$= -\,128 + 2 = -\,126$

is a divisible of 7.

Similarly, for $r = -\,1, 0, 1, 2, 3$, $r^7 - r$ is divisible by 7.

Thus, $n^7 - n$ is divisible by 7.

$\Rightarrow (n + 7)^7 - (n + 1)$ is divisible by 7.

$\therefore\ (n + 1)^7 - (n + 1) - (n^7 - n)$ is divisible by 7

$\Rightarrow (n + 1)^7 - n^7 - 1$ is divisible by 7.

Thus, Statement-1 is true.

Statement-1 and Statement-2 are both true.

Hence Statement-2 is a correct explanation for Statement-1.

21. Using binomial theorem we have

$$(\sqrt{3} + 1)^{2n} - (\sqrt{3} - 1)^{2n}$$

$$= 2\left[{}^{2n}C_1(\sqrt{3})^{2n-1} + {}^{2n}C_3(\sqrt{3})^{2n-3} + \cdots + {}^{2n}C_{2n-1}(\sqrt{3})\right]$$

$$= 2\sqrt{3}\ \ [{}^{2n}C_1\ (3^{n-1}) + {}^{2n}C_3\ (3^{n-2}) + \ldots + {}^{2n}C_{2n-1}]$$

This is an irrational number.

22. We have

$$\frac{x+1}{x^{2/3} - x^{1/3} + 1} = x^{1/3} + 1$$

and $\dfrac{x+1}{x - x^{1/2}} = \dfrac{x-1}{\sqrt{x}(\sqrt{x} - 1)} = 1 + x^{-1/2}$

$(r + 1)^{\text{th}}$ term of $\left(\dfrac{x+1}{x^{2/3} - x^{1/3} + 1} + \dfrac{x-1}{x - x^{1/2}}\right)^{10}$

$= (x^{1/3} - x^{-1/2})^{10}$ is

$T_{r+1} = {}^{10}C_r\ (x^{1/3})^{10-r}\ (x^{-1/2})^r$

Note that T_{r+1} will be independent of x if

$\dfrac{10 - r}{3} - \dfrac{r}{2} = 0 \Rightarrow r = 4$. Thus, term independent of x equals ${}^{10}C_4 = 210$.

23. $T_7 = T_{6+1} = {}^9C_6 \left(\dfrac{3}{84^{1/3}}\right)^{9-6} (\sqrt{3}\ln x)^6$

$= (84)\left(\dfrac{3^3}{84}\right)(3^3 (\ln x)^6) = 729$

$\Rightarrow (\ln x)^6 = 1$

$\Rightarrow \ln x = \pm 1 \Rightarrow x = e,\ 1/e$

Thus, $x = e$.

24. See solution to Question 4.

25. $T_{r+1} = {}^{15}C_r (x^2)^{15-r} \left(\dfrac{2}{x}\right)^r$

$= {}^{15}C_r\, 2^r\, x^{30-3r}$.

For coefficient of x^{15}, set

$30 - 3r = 15 \Rightarrow r = 5$

and for term independent of x, set

$30 - 3r = 0 \Rightarrow r = 10$

The required ratio is

${}^{15}C_5\, 2^5 : {}^{15}C_{10}\, 2^{10} = 1 : 32$

26. $T_{r+1} = {}^{10}C_r (2^{1/2})^{10-r} (3^{1/5})^r$

$= {}^{10}C_r\, 2^5\, 2^{-r/2}\, 3^{r/5}\ (0 \le r \le 10)$

For rational terms, both $r/2$ and $r/5$ must be integers.

This is possible if $r = 0$ or $r = 10$

Thus, required sum

$= {}^{10}C_0\, 2^5 + {}^{10}C_{10}\, 2^5\, 2^{-5}\, 3^2 = 41$.

27. $(1 + ax + bx^2)(1 - 2x)^{18}$

$= (1 + ax + bx^2)\,[1 - {}^{18}C_1 (2x) + {}^{18}C_2 (2x)^2 - {}^{18}C_3 (2x)^3 + {}^{18}C_4 (2x)^4 - \ldots]$

Coefficient of x^3

$= -\,{}^{18}C_3 (2^3) + ({}^{18}C_2)2^2\, a - ({}^{18}C_1)(2)\, b = 0$

Coefficient of x^4

$= {}^{18}C_4\, 2^4 - {}^{18}C_3 (2^3)(a) + {}^{18}C_2 (2^2)(b) = 0$

$\Rightarrow b = -\dfrac{544}{3} + 17a$

and $b = -80 + \dfrac{32}{3}a$

$\Rightarrow \dfrac{-544}{3} + 17a = -80 + \dfrac{32}{3}a$

$\Rightarrow a = 16$

$\therefore\ b = 272/3$

28. $(1 + x)^{101} (1 + x^2 - x)^{100}$

$= (1 + x)(1 + x)^{100} (1 - x + x^2)^{100}$

$= (1 + x)(1 - x^3)^{100}$

$= (1 - x^3)^{100} + x(1 - x^3)^{100}$

$= \sum_{r=0}^{100} (-1)^r\, ({}^{100}C_r)\, (x^{3r} + x^{3r+1})$

Thus, number of terms is 202.

29. We have

$E = (1 + x)^{1000} + x(1 + x)^{999} + x^2(1 + x)^{998} + \ldots + x^{1000}$

$$= \frac{(1+x)^{1000}\left[1-\left(\dfrac{x}{1+x}\right)^{1001}\right]}{1-x/(1+x)} = (1 + x)^{1001} - x^{1001}$$

$\therefore$ Coefficient of x^{50} in E

$= {}^{1001}C_{50} = \dfrac{(1001)!}{(50)!(951)!}$

30. $\left(2+\dfrac{x}{3}\right)^{55} = \sum_{r=0}^{55} {}^{55}C_r \left(\dfrac{x}{3}\right)^r (2^{55-r})$

$= \sum_{r=0}^{55} {}^{55}C_r \left(\dfrac{2^{55-r}}{3^r}\right) x^r$

We are given coefficients in two consecutive powers are equal

$\Rightarrow {}^{55}C_r \left(\dfrac{2^{55-r}}{3^r}\right) = {}^{55}C_{r+1} \left(\dfrac{2^{54-r}}{3^{r+1}}\right)$

$\Rightarrow 6 = \dfrac{55!}{(r+1)!(54-r)!} \cdot \dfrac{r!(55-r)!}{55!}$

$\Rightarrow 6 = \dfrac{55-r}{r+1}$

$\Rightarrow 6r + 6 = 55 - 4 \Rightarrow r = 7$

Thus, these terms are 8th and 9th.

31. Replacing x by $x - 1$, we get

$\sum_{i=0}^{5} a_i (1+x-1)^i = 1 + (x - 1)^4 + (x - 1)^5$

$\Rightarrow \sum_{i=0}^{5} a_i\, x^i = 1 + (1 - x)^4 - (1 - x)^5$

a_2 = coefficient of x^2 on RHS

$= {}^4C_2 - {}^5C_2 = 6 - 10 = -4.$

32. $(1 + x^n + x^{253})^{10} = \sum\limits_{\substack{r,s\geq 0\\ r+s\leq 10}} \dfrac{10!\,x^{253r}\,x^{ns}}{r!s!(10-r-s)!}$

To obtain coefficient of 1012, we set

$253r + ns = 1012$

$\Rightarrow r = 4,\ s = 0.$

$\therefore$ required coefficient $= \dfrac{10!}{4!0!6!}$

$= {}^{10}C_4$

33. $(1-2\sqrt{x})^{50} = 1 + {}^{50}C_1\ (-2\sqrt{x}) + {}^{50}C_2\ (-2\sqrt{x})^2$

$+ {}^{50}C_3\ (-2\sqrt{x})^3 + {}^{50}C_4\ (-2\sqrt{x})^4$

$+ \ldots + {}^{50}C_{49}\ (-2\sqrt{x})^{49}$

$+ {}^{50}C_{50}\ \left(-2\sqrt{x}\right)^{50}$

The sum of coefficients of the integral powers of

$= 1 + {}^{50}C_2\ (-2)^2 + {}^{50}C_4\ (-2)^4 + \ldots + {}^{50}C_{50}\ (-2)^{50}$

$= \dfrac{1}{2}\ [(1 + (-2))^{50} + (1 - (-2))^{50}]$

$= \dfrac{1}{2}\ (3^{50} + 1)$

34. Let the first term be the $(r + 1)$th term.

We have

$t_{r+1} = {}^nC_r\, x^r$

${}^nC_r : {}^nC_{r+1} : {}^nC_{r+2} = 1 : 7 : 42$

$\Rightarrow \dfrac{{}^nC_r}{{}^nC_{r+1}} = \dfrac{1}{7}$ and $\dfrac{{}^nC_{r+1}}{{}^nC_{r+2}} = \dfrac{7}{42}$

$\Rightarrow \dfrac{r+1}{n-r} = \dfrac{1}{7}$ and $\dfrac{r+2}{n-r-1} = \dfrac{1}{6}$

$\Rightarrow n = 8r + 7$ and $n = 7r + 13$

$\therefore 8r + 7 = 7r + 13 \Rightarrow r = 6$

Thus, first of these terms is the 7th term.

35. General term, T_{r+1}

of $\left(2x^2 - \dfrac{1}{x}\right)^8$ is

$T_{r+1} = {}^8C_r(2x^2)^{8-r}\left(-\dfrac{1}{x}\right)^r$

$= {}^8C_r\ (-1)^r\ 2^{8-r}\ x^{16-3r}$

To obtain term independent of x in the expansion of

$$\left(1 - \frac{1}{x} + 3x^5\right)\left(2x^2 - \frac{1}{x}\right)^8 \qquad (1)$$

we set $16 - 3r = 0$, $16 - 3r = 1$ and $16 - 3r = -5$

But $16 - 3r = 0$ has no solution;

$16 - 3r = 1 \Rightarrow r = 5$

and $16 - 3r = -5 \Rightarrow r = 7$

Thus, term independent of x in (1)

$= (-1)\ ({}^8C_5)\ (-1)^5\ 2^{8-5} + 3({}^8C_7)\ (-1)^7\ 2^{8-7}$

$= (56)\ (8) - 3(8)\ (2) = 400$

36. Number of terms in the expansion of $\left(1 - \dfrac{2}{x} + \dfrac{4}{x^2}\right)^n$

is ${}^{n+2}C_2 = \dfrac{1}{2}\ (n + 2)\ (n + 1)$

$\Rightarrow \dfrac{1}{2}\ (n + 1)\ (n + 1) = 28 \Rightarrow n = 7$

Sum of the coefficients is obtained by putting $x = 1$ in the given expression. Thus, required sum $= (1 - 2 + 4)^7 = 3^7 = 2187.$

37. $\sum\limits_{i=0}^{2016} a_j x^i = (1 + x)^{2016} + x(1 + x)^{2015} + x^2(1 + x)^{2014}$

$+ \ldots + x^{2016}$

$= \dfrac{(1+x)^{2016}\left[1 - \left(\dfrac{x}{1+x}\right)^{2017}\right]}{1 - \dfrac{x}{1+x}}$

$= (1 + x)^{2017} - x^{2017}$

$\therefore a_{17}$ = coefficient of x^{17}

$= {}^{2017}C_{17} = \dfrac{2017!}{17!2000!}$

38. $T_{r+1} = {}^{18}C_r\ (x^{1/3})^{18-r}\left(\dfrac{1}{2x^{1/3}}\right)^r$

$= {}^{18}C_r\ x^{6-2r/3}\left(\dfrac{1}{2}\right)^r$

For coefficient of x^{-2}, $6 - 2r/3 = -2 \Rightarrow 8 = 2r/3$ $\Rightarrow r = 12$

and for coefficient of x^{-4},

$6 - 2r/3 = -4 \Rightarrow 10 = 2r/3 \Rightarrow r = 15$

$\therefore\ m = {}^{18}C_{12}\left(\frac{1}{2}\right)^{12},\ n = {}^{18}C_{15}\left(\frac{1}{2}\right)^{15}$

Thus, $\frac{m}{n} = \frac{{}^{18}C_{12}}{{}^{18}C_{15}}\ (2^3)$

$= \frac{18!}{12!6!}\cdot\frac{15!3!}{18!}\ (2^3)$

$= \frac{15\times 14\times 13}{6\times 5\times 4}\cdot(8) = 182$

Previous Years' B-Architecture Entrance Examination Questions

1. $T_{r+1} = {}^{n}C_r\ (x^3)^{n-r}\left(-\frac{1}{x^2}\right)^r$

$= {}^{n}C_r\ (-1)^r\ x^{3n-5r}$

For coefficient of x^5, set $3n - 5r = 5$

$\Rightarrow r = (3n - 5)/5 = l$ (say)

For coefficient of x^{10}, set $3n - 5r = 10$

$\Rightarrow r = (3n - 10)/5 = m$ (say)

Note that $l - m = 1$.

We are given

${}^{n}C_l\ (-1)^l + {}^{n}C_m\ (-1)^m = 0$

$\Rightarrow {}^{n}C_l = {}^{n}C_m \Rightarrow l + m = n.$

$\Rightarrow \frac{3n-5}{5} + \frac{3n-10}{5} = n$

$\Rightarrow 6n - 15 = 5n \Rightarrow n = 15.$

Coefficient of third term

$= {}^{15}C_2\ (-1)^2 = 105$

2. a_1 = coefficient of x in

$(1 + x)\ (1 + x + x^2)\ (1 + x + x^2 + x^3)$

$\ldots\ (1 + x + x^2 + \ldots + x^n)$

= coefficient of x in $(1 + x)^n$

$= {}^{n}C_1 = n$

3. Let $a = 7^{\text{th}}$ term from the beginning

$= T_7 = T_{6+1} = {}^{n}C_6\ (2^{1/3})^{n-6}\ (3^{-1/3})^6$

and let $b = 7^{\text{th}}$ term from the end

$= (n + 2 - 7)$th or $(n - 5)$th term from the beginning

$= {}^{n}C_{n-6}\ (2^{1/3})^{n-(n-6)}\ (3^{-1/3})^{n-6}$

$= {}^{n}C_6\ (2^{1/3})^6\ (3^{-1/3})^{n-6}$

We are given

$\frac{a}{b} = \frac{1}{6}$

$\frac{(2^{1/3})^{n-6}(3^{-1/3})^6}{(2^{1/3})^6(3^{-1/3})^{n-6}} = \frac{1}{6}$

$\Rightarrow \left(\frac{(2^{1/3})}{(3^{-1/3})}\right)^{n-12} = \frac{1}{6}$

$\Rightarrow 6^{(n-12)/3} = 6^{-1}$

$\Rightarrow n - 12 = -3 \Rightarrow n = 9.$

4. $7^{128} = (7^2)^{64} = (50 - 1)^{64} = (1 - 50)^{64}$

$= 1 + \sum_{k=1}^{64} {}^{64}C_k(-50)^k$

Thus, remainder when 7^{128} is divided by 10 is 1.

5. For $0 \le j \le 8$,

$\frac{1}{(j+1)(j+2)}\ ({}^{8}C_j)$

$= \frac{8!}{(j+1)(j+2)j!(8-j)!}$

$= \frac{1}{10\times 9}\frac{10!}{(j+2)!(10-(j+2))!}$

$= \frac{1}{90}({}^{10}C_{j+2})$

Thus,

$S = \frac{1}{90}\left(\sum_{j=0}^{10} {}^{10}C_{j+2}\right)$

$= \frac{1}{90}\left(\sum_{k=0}^{10} {}^{10}C_k - {}^{10}C_0 - {}^{10}C_1\right)$

$= \frac{1}{90}\ (2^{10} - 1 - 10) = \frac{1013}{90}$

6. $\sum_{j=0}^{n} a^{n-j}b^j = a^n + a^{n-1}\ b + a^{n-2}\ b^2 + \ldots + ab^{n-1} + b^n$

$= \frac{a^n[1-(b/a)^{n+1}]}{1-b/a}$ [sum of a G.P.]

$= \frac{a^{n+1} - b^{n+1}}{a - b}$

Also, coefficient of x^m in $(\alpha x + \beta)^m$ is $(m + 1)\ \alpha^m\ \beta$

$\therefore$ Statement-2 is true.

Next, $\sum_{j=0}^{n} (-1)^j \; (2x + 3)^{n-j} \; (5 - 2x)^j$

$= \sum_{j=0}^{n} (2x+3)^{n-j} \; (2x - 5)^j$

$= \dfrac{(2x+3)^{n+1} - (2x-5)^{n+1}}{(2x+3)-(2x-5)}$

$= \dfrac{1}{8} \; [(2x + 3)^{n+1} - (2x - 5)^{n+1}]$

Coefficient of x^n is

$\dfrac{1}{8} \; [{}^{n+1}C_n \, 2^n \, (3) - {}^{n+1}C_n \, 2^n \, (-5)]$

$= (n + 1) \, 2^n$

$\therefore$ Statement-1 is true and Statement-2 is correct explanation for it.

7. $x^n = [(1 + x) - 1]^n = [1 - (1 - x)]^n$

$= \sum_{k=0}^{n} {}^nC_k \; (1 + x)^{n-k} \, (-1)^k$

$= \sum_{k=0}^{n} {}^nC_k \; (-1)^k \, (1 - x)^k$

$\therefore$ a_k = coefficient of $(1 + x)^k$ in

$\sum_{k=0}^{n} {}^nC_k \; (1 + x)^{n-k} \, (-1)^k = (-1)^{n-k} \, {}^nC_{n-k} = (-1)^{n-k} \, {}^nC_k$

and $b_k = {}^nC_k \, (-1)^k$

For $n = 101$, $k = 51$, we get

$(a_{51}, b_{51}) = ({}^{101}C_{51}, -{}^{101}C_{51})$

8. $T_3 = {}^5C_2 \left(\dfrac{1}{x}\right)^3 (x^{\log_{10} x})^2$

$= 10 \; x^{2\log_{10} x - 3}$

As $T_3 = 1000$, we get

$x^{2\log_{10} x - 3} = 100$

$(2a - 3)a = 2$ where $a = \log_{10} x$

$\Rightarrow 2a^2 - 3a - 2 = 0$

$\Rightarrow (2a + 1) \, (a - 2) = 0$

As $x > 1$, $a = \log_{10} x > 0$, thus,

$a = 2 \Rightarrow \log_{10} x = 2 \Rightarrow x = 100$

9. Sum of the coefficients in the expansion of $(x + y)^n$ is 2^n. Therefore,

$2^n = 2048 = 2^{11} \Rightarrow n = 11.$

As n is odd, the greatest value of ${}^nC_r$ is ${}^nC_k$ where

$k = \dfrac{1}{2} \; (n - 1)$ or $k = \dfrac{1}{2} \; (n + 1).$

Here $n = 11$, therefore $k = 5$ or 6.

Thus, greatest coefficient is ${}^{11}C_6$.

10. $(1 + x + x^2)^8 = \sum_{\substack{p,q,r \ge 0 \\ P+q+r=8}} \dfrac{8!}{p!q!r!} \; 1^p \, x^p (x^2)^r$

For a_5, we require, $q + 2r = 5$,

$\Rightarrow q = 5, r = 0, p = 3$ or $q = 3, r = 1, p = 4,$

or $q = 1, r = 2, p = 5.$

Thus, coefficient of x^5 is

$\dfrac{8!}{5!3!} + \dfrac{8!}{3!1!4!} + \dfrac{8!}{1!2!5!} = 504$

11. Coefficient to t^{24} in $(1 + t^2)^{12} \, (1 + t^{12}) \, (1 + t^{24})$

= Coefficients of t^{24} in $(1 + {}^{12}C_1 \, t^2 + {}^{12}C_2 \, t^4 + \ldots)$
$(1 + t^{12} + t^{24})$

$= {}^{12}C_{12} + {}^{12}C_6 + 1 = {}^{12}C_6 + 2$

12. Let

S = sum of the last 30 coefficients in $(1 + x)^{59}$

$= {}^{59}C_{30} + {}^{59}C_{31} + \ldots + {}^{59}C_{59}$ (1)

Using ${}^nC_r = {}^nC_{n-r}$, we get

$S = {}^{59}C_{29} + {}^{59}C_{28} + \ldots + {}^{59}C_0$ (2)

Adding (1) and (2), we get

$2S = {}^{59}C_0 + {}^{59}C_1 + \ldots + {}^{59}C_{59} = 2^{59}$

$\Rightarrow S = 2^{58}.$

13. We have

$(1 - x)^m \, (1 + x)^n$

$= (1 - mx + {}^mC_2 \, x^2 - \ldots) \, (1 + nx + {}^nC_2 \, x^2 + \ldots)$

$= 1 + (n + m)x + ({}^mC_2 - mn + {}^nC_2)x^2 + \ldots$

We are given

$n - m = 3, \; {}^mC_2 - mn + {}^nC_2 = -4$

$\Rightarrow n - m = 3, \; \dfrac{1}{2} \; (m^2 - 2mn + n^2 - (m + n)) = -4$

$\Rightarrow n - m = 3, \; (m - n)^2 - (m + n) = -8$

$\Rightarrow n - m = 3,\ m + n = 17$

$\therefore\ n = 10,\ m = 7$

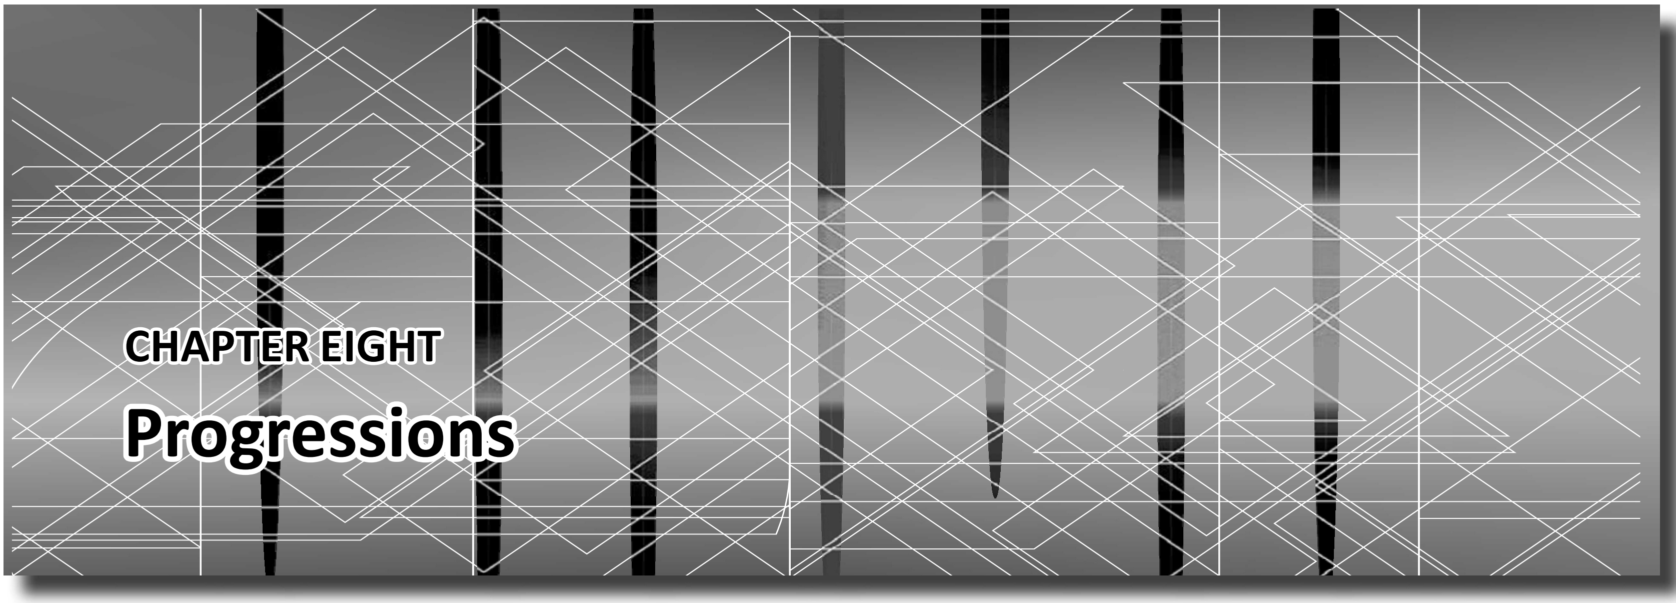
$\Rightarrow m : n = 7 : 10$

14. Mean of binomial coefficients in the expansion of $(a + b)^{2n-3}$ is

$$\frac{1}{2n-3+1}\left[{}^{2n-3}C_0 + {}^{2n-3}C_1 + \dots + {}^{2n-3}C_{2n-3}\right]$$

$$= \frac{1}{2(n-1)}\,2^{2n-3} = \frac{2^{2(n-2)}}{n-1} = 16 = 2^4$$

$\Rightarrow n = 5$



CHAPTER EIGHT

Progressions

SEQUENCES

A sequence is a function whose domain is the set of natural numbers. If the range of a sequence is a subset of real numbers (complex numbers), then it is called a *real sequence* (*complex sequence*).

If $f: \mathbf{N} \to \mathbf{C}$, is a sequence, we usually denote it by

$$\langle f(1), f(2), f(3), \cdots\rangle = \langle f(n)\rangle$$

If $t_n = f(n)$, then the sequence is written as $\langle t_1, t_2, t_3, \cdots\rangle$

ARITHMETIC PROGRESSION

A sequence of numbers $\langle t_n\rangle$ is said to be in arithmetic progression (A.P.) when the difference $t_n - t_{n-1}$ is a constant for all $n \in \mathbf{N}$, $n > 1$. This constant is called the common difference of the A.P., and it is usually denoted by the letter d.

If a is the first term and d the common difference of the A.P., then its nth term t_n is given by

$$t_n = a + (n - 1)d$$
$$t_n = t_m + (n - m)d$$

The sum S_n of the first n terms of such an A.P. is given by

$$S_n = \frac{n}{2}[2a + (n - 1)d] = \frac{n}{2}(a + l)$$

where l is the last term, that is, the nth term of the A.P.

Some Facts About A.P.

1. If a fixed number is added to (subtracted from) each term of a given A.P., then the resulting sequence is also an A.P., and it has the same common difference as that of the given A.P.
2. If each term of an A.P. is multiplied by a fixed constant (or divided by a non-zero fixed constant), then the resulting sequence is also an A.P.
3. If $a_1, a_2, a_3, \cdots$ and $b_1, b_2, b_3, \cdots$ are two arithmetic progressions, then $a_1 + b_1, a_2 + b_2, a_3 + b_3, \cdots$ is also an A.P.
4. If $a_1, a_2, a_3, \ldots$ are in A.P., then

   $$a_m - a_n = (m - n)d$$

   where d is the common difference of the A.P.

Illustration 1

If 20th term of an A.P. is 25 and 25th term is 15, find 17th term of the A.P.

If d is the common difference of the A.P., then

$(25 - 20)d = a_{25} - a_{20} = 15 - 25$

$\Rightarrow d = -2.$

Also $a_{17} - a_{20} = (17 - 20)d = 6$

$\Rightarrow a_{17} = 25 + 6 = 31$

5. If we have to take three terms in A.P. whose sum is known, it is convenient to take them as $a - d$, a, $a + d$. In general, if we have to take $(2r + 1)$ terms in A.P., we take them as $a - rd$, $a - (r - 1)d$, $\cdots$, $a - d$, a, $a + d$, $\cdots$, $a + rd$.
6. If we have to take four terms in A.P., whose sum is known, we take them as $a - 3d$, $a - d$, $a + d$, $a + 3d$.
7. The *arithmetic mean A* of any two numbers a and b is given by $(a + b)/2$. It is to be noted that the sequence a, A, b is in A.P.

   If $a_1, a_2, \cdots, a_n$ are n numbers, then the arithmetic mean A, of these numbers is given by

   $$A = \frac{1}{n}(a_1 + a_2 + \cdots + a_n)$$

8. The n numbers $A_1, A_2, \cdots, A_n$ are said to be *n arithmetic means between a and b* if $a, A_1, A_2, \cdots, A_n, b$ is an A.P. Here a is the first term and b is the $(n + 2)$th term of the A.P. If d is the common difference of this A.P., then

   $$b = a + (n + 2 - 1)d = a + (n + 1)d \Rightarrow d = \frac{b - a}{n + 1}$$

   Thus,

   $$A_1 = a + \frac{b - a}{n + 1}, A_2 = a + \frac{2(b - a)}{n + 1},$$
   $$\cdots A_n = a + \frac{n(b - a)}{n + 1}$$

TIP

Sometimes, it is useful to use $A_n = b - d$ etc.

Sum of n Arithmetic means $A_1 + A_2 + \ldots + A_n = \frac{n}{2}(a + b)$

GEOMETRIC PROGRESSION

A sequence is said to be in geometric progression (G.P.) when its first term is non-zero and each of its succeeding terms is r times the preceding term, where r is some fixed non-zero number. The fixed number r is known as the *common ratio* of the G.P. It is clear from the definition that no term of a G.P. is zero. If a is the first term of a G.P. and r its common ratio, then its nth term, t_n, is given by

$$t_n = ar^{n-1}$$

The sum S_n of the first n terms of such a G.P. is given by

$$S_n = \begin{cases} \dfrac{a(r^n - 1)}{r - 1} & \text{if } r \neq 1 \\ na & \text{if } r = 1 \end{cases}.$$

If $-1 < x < 1$, then

$$\lim_{n \to \infty} x^n = 0.$$

Therefore, the sum of the infinite G.P.

$$1 + x + x^2 + \cdots = \frac{1}{1 - x}.$$

Thus $(1 - x)^{-1} = 1 + x + x^2 + x^3 + \cdots \; (-1 < x < 1) \qquad (1)$

Differentiating both the sides w.r.t. x, we get

$$(1 - x)^{-2} = 1 + 2x + 3x^2 + 4x^3 + \cdots \; (-1 < x < 1) \qquad (2)$$

Differentiating (1) $(m - 1)$ times w.r.t. x, we get for $-1 < x < 1$

$$(m - 1)!\,(1 - x)^{-m} = (m - 1)! + m!x + \frac{(m+1)!}{2!}x^2 + \frac{(m+2)!}{3!}x^3 + \cdots$$

$$\Rightarrow \quad (1 - x)^{-m} = 1 + {}^{m}C_1\,x + {}^{m+1}C_2\,x^2 + {}^{m+2}C_3\,x^3 + \cdots \qquad (3)$$

for $-1 < x < 1$

Also, if n is any real number, then

$$(1 - x)^{-n} = 1 + nx + \frac{n(n+1)}{2!}x^2 + \frac{n(n+1)(n+2)}{3!}x^3 + \cdots \; (-1 < x < 1)$$

If $-1 < r < 1$, then the sum of the infinite G.P.

$$a + ar + ar^2 + \cdots = \frac{a}{1 - r}$$

Some Facts About G.P.

1. If each term of a G.P. is multiplied (divided) by a fixed non-zero constant, then the resulting sequence is also a G.P.
2. If $a_1, a_2, a_3, \cdots$ and $b_1, b_2, b_3, \cdots$ are two geometric progressions, then the sequence $a_1b_1, a_2b_2, a_3b_3, \cdots$ is also a G.P.
3. The *geometric mean* G of two positive numbers a and b is given by $\sqrt{ab}$. It is to be noted that a, G and b are in G.P. If $a_1, a_2, \cdots, a_n$ are n positive numbers, then their geometric mean is given by

   $$G = (a_1\, a_2 \cdots a_n)^{1/n}$$
4. The n numbers $G_1, G_2, \ldots G_n$ are said to be n geometric means between two positive real numbers a and b if $a, G_1, G_2, \ldots, G_n, b$ forms a G.P. Let r be the common ratio of this G.P., then

   $b = (n + 2)$th term of the G.P.

   $= ar^{n+2-1} = ar^{n+1}$

   $\Rightarrow r = \left(\frac{b}{a}\right)^{1/(n+1)}$

   Thus, $G_1 = a\left(\frac{b}{a}\right)^{1/(n+1)}$, $G_2 = a\left(\frac{b}{a}\right)^{2/(n+1)}$

   $\ldots, G_n = a\left(\frac{b}{a}\right)^{n/(n+1)}$

   Also, note that

   $G_1\, G_2 \ldots G_n = (ab)^{n/2}$
5. If we have to take three terms in G.P., we take them as a/r, a, ar and four terms as a/r^3, a/r, ar, ar^3.
6. If $a_1, a_2, a_3, \cdots$ is a G.P. ($a_i > 0\ \forall i$), then $\log a_1, \log a_2, \log a_3, \cdots$ is an A.P. In this case the converse also holds.

   Suppose $a_1, a_2, a_3, \cdots$ is a G.P. Let $a_i = AR^{i-1}$, where A is the first term and R is the common ratio of the G.P. Then

   $$\log a_i = \log A + (i - 1)\log R$$

   This shows that $\log a_1, \log a_2, \log a_3, \cdots$ is an A.P. whose first term is $\log A$ and the common difference is $\log R$. Conversely, assume that $\log a_1, \log a_2, \log a_3, \cdots$ is an A.P. Suppose that $\log a_i = a + (i - 1)d$, where a is the first term and d is the common difference of the A.P. Then

   $$a_i = \alpha^{a + (i-1)d} = \alpha^a (\alpha^d)^{i-1}$$

   where α is the base of the logarithm. This shows that $a_1, a_2, a_3, \cdots$ is a G.P., with the first term α^a and common ratio α^d.

ARITHMETICO-GEOMETRIC SEQUENCE

Suppose $a_1, a_2, \cdots, a_n, \cdots$ is an A.P., and $b_1, b_2, \cdots, b_n, \cdots$ is a G.P. Then the sequence $a_1 b_1, a_2 b_2, \cdots, a_n b_n, \cdots$ is said to be an arithmetico-geometric sequence. An arithmetico-geometric sequence is of the form

$$ab, (a + d)br, (a + 2d)br^2, (a + 3d)br^3, \cdots$$

Sum to n term of an Arithemtico-Geometric series.

Let $S_n = ab + (a + d)br + (a + 2d)br^2 + \cdots +$

$[a + (n - 2)d]br^{n-2} + [a + (n - 1)d]br^{n-1} \cdots \qquad (1)$

We multiply each term by r and write the first term below the second, the second below the third and so on.

$$rS_n = abr + (a + d)br^2 + \cdots + [a + (n - 3)d]br^{n-2} + [a + (n - 2)d]br^{n-1} + [a + (n - 1)d]br^n$$

Subtracting, we get

$$(1 - r)S_n = ab + dbr + dbr^2 + \cdots + dbr^{n-2} + dbr^{n-1} - [a + (n - 1)d]br^n$$

$$= ab + \frac{dbr(1 - r^{n-1})}{1 - r} - [a + (n - 1)d]br^n$$

$$\Rightarrow S_n = \frac{ab}{1 - r} + \frac{dbr(1 - r^{n-1})}{(1 - r)^2} - \frac{[a + (n - 1)d]br^n}{1 - r}, \; r \neq 1$$

If $-1 < r < 1$, then

$$\lim_{n \to \infty} r^n = 0 \quad \text{and} \quad \lim_{n \to \infty} nr^n = 0$$

Therefore, the sum of an infinite number of terms of the series in (1) is

$$S = \frac{ab}{1 - r} + \frac{dbr}{(1 - r)^2} \qquad (-1 < r < 1)$$

HARMONIC PROGRESSION

The sequence $a_1, a_2, \cdots, a_n, \cdots$ where $a_i \neq 0$ for each i is said to be in harmonic progression (H.P.) if the sequence $1/a_1, 1/a_2, \cdots, 1/a_n, \cdots$ is in A.P. Note that a_n, the nth term of the H.P., is given by

$$a_n = \frac{1}{a + (n - 1)d} \quad \text{where } a = \frac{1}{a_1} \text{ and } d = \frac{1}{a_2} - \frac{1}{a_1}$$

Some Facts about H.P.

1. If a and b are two non-zero numbers, then the *harmonic mean* of a and b is a number H such that the sequence a, H, b is a H.P. We have

   $$\frac{1}{H} = \frac{1}{2}\left(\frac{1}{a} + \frac{1}{b}\right) \quad \text{or} \quad H = \frac{2ab}{a + b}$$

   If $a_1, a_2, \cdots, a_n$ are n non-zero numbers, then the harmonic mean H of these numbers is given by

   $$\frac{1}{H} = \frac{1}{n}\left(\frac{1}{a_1} + \frac{1}{a_2} + \cdots + \frac{1}{a_n}\right)$$

2. The n numbers $H_1, H_2, \cdots, H_n$ are said to be *harmonic means between a and b* if $a, H_1, H_2, \cdots, H_n, b$ are in H.P., that is, if $1/a, 1/H_1, 1/H_2, \cdots, 1/H_n, 1/b$ are in A.P. Let d be the common difference of this A.P. Then

   $$\frac{1}{b} = \frac{1}{a} + (n + 2 - 1)d$$

   $$\Rightarrow d = \frac{1}{n + 1}\left(\frac{1}{b} - \frac{1}{a}\right) = \frac{a - b}{(n + 1)\, ab}$$

   Thus

   $$\frac{1}{H_1} = \frac{1}{a} + \frac{a - b}{(n + 1)ab},$$

   $$\frac{1}{H_2} = \frac{1}{a} + \frac{2(a - b)}{(n + 1)ab}, \cdots, \frac{1}{H_n} = \frac{1}{a} + \frac{n(a - b)}{(n + 1)ab}$$

   From here, we can get the values of $H_1, H_2, \cdots, H_n$.

SUMMATION OF SOME SERIES OF NATURAL NUMBERS

1. $\displaystyle\sum_{k=1}^{n} k = 1 + 2 + 3 + \ldots + n = \frac{1}{2}\, n(n + 1)$

2. $\displaystyle\sum_{k=1}^{n} k^2 = 1^2 + 2^2 + \ldots + n^2 = \frac{1}{6}\, n(n + 1)\, (2n + 1)$

3. $\displaystyle\sum_{k=1}^{n} k^3 = 1^3 + 2^3 + \ldots + n^3 = \left(\sum_{k=1}^{n} k\right)^2$

   $$= (1 + 2 + 3 + \ldots + n)^2$$

   $$= \left[\frac{1}{2} n(n+1)\right]^2 = \frac{1}{4}\, n^2(n + 1)^2$$

4. To find $\displaystyle\sum_{k=1}^{n} k^4$ and $\displaystyle\sum_{k=1}^{n} k^5$ we can use the identities:

   $$k^5 - (k - 1)^5 = 5k^4 - 10k^3 + 10k^2 - 5k + 1$$

   $$\text{and } k^6 - (k - 1)^6 = 6k^5 - 15k^4 + 20k^3 - 15k^2 + 6k - 1$$

The first one gives

$$\sum_{k=1}^{n} \{k^5 - (k - 1)^5\} = 5 \sum_{k=1}^{n} k^4 - 10 \sum_{k=1}^{n} k^3 + 10 \sum_{k=1}^{n} k^2 - 5 \sum_{k=1}^{n} k + n$$

$$\Rightarrow \quad n^5 + 10 \left\{\frac{1}{4} n^2 (n+1)^2\right\} - 10 \left\{\frac{1}{6} n(n+1)(2n+1)\right\} + 5\left\{\frac{1}{2} n\,(n+1)\right\} - n = 5\sum_{k=1}^{n} k^4$$

Similarly we can use 2nd identity to obtain sum of $\displaystyle\sum_{k=1}^{n} k^5$.

SUM OF THE PRODUCTS OF TWO TERMS OF A SEQUENCE

To obtain the sum $\displaystyle\sum_{i<j} a_i a_j$, we use the identity

$$2 \sum_{i<j} a_i a_j = (a_1 + a_2 + \ldots + a_n)^2 - (a_1^2 + a_2^2 + \ldots + a_n^2)$$

METHOD OF DIFFERENCE FOR SUMMATION OF SERIES

If possible express *r*th term as difference of two terms as follows:

$$t_r = f(r) - f(r \pm 1).$$

Illustration 2

If the given series is 1.3.5 + 3.5.7 + 5.7.9 + …

then $t_r = (2r - 1)(2r + 1)(2r + 3)$

and $t_{r+1} = (2r + 1)(2r + 3)(2r + 5)$

$\Rightarrow \quad (2r + 5)t_r = (2r - 1)t_{r+1}$

$\Rightarrow \quad (2r - 3)t_r + 8t_r = (2r - 1)t_{r+1}$

$\Rightarrow \quad 8t_r = f(r + 1) - f(r)$

where
$$\begin{aligned} f(r) &= (2r - 3)t_r \\ &= (2r - 3)(2r - 1)(2r + 1)(2r + 3) \\ &= (4r^2 - 9)(4r^2 - 1) \end{aligned}$$

This gives

$$8\sum_{r=1}^{n} t_r = \sum_{r=1}^{n} \{f(r+1) - f(r)\} = f(n+1) - f(1)$$

$$\begin{aligned} \Rightarrow \quad 8\sum_{r=1}^{n} t_r &= [4(n+1)^2 - 9][4(n+1)^2 - 1] \\ &\quad - (4 - 9)(4 - 1) \\ &= 16(n+1)^4 - 40(n+1)^2 + 9 + 15 \end{aligned}$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = 2(n+1)^4 - 5(n+1)^2 + 3$$

SOLVED EXAMPLES

Concept-based

Straight Objective Type Questions

Example 1: Suppose $a_1, a_2, \ldots$ are in A.P. If $a_8 : a_5 = 3 : 2$, then $a_{17} : a_{23}$ is:

(a) 1 : 2 (b) 3 : 4

(c) 4 : 11 (d) 8 : 11

Ans. (b)

Solution: Let *a* be the first term and *d* be the common difference of the A.P. $a_1, a_2, a_3, \ldots$ Then

$$\frac{3}{2} = \frac{a_8}{a_5} = \frac{a + 7d}{a + 4d}$$

$\Rightarrow \quad 3a + 12d = 2a + 14d \Rightarrow a = 2d.$

Now,
$$\frac{a_{17}}{a_{23}} = \frac{a + 16d}{a + 22d} = \frac{2d + 16d}{2d + 22d} = \frac{18}{24} = \frac{3}{4}$$

Example 2: If 7th term of an A.P. is 9 and 9th term of the A.P. is 7, then 20th term of the A.P. is

(a) – 2 (b) – 3

(c) – 4 (d) – 6

Ans. (c)

Solution: If *d* is common difference of the A.P., then

$$2d = a_9 - a_7 = 7 - 9 = -2$$

$\Rightarrow \quad d = -1.$

$\therefore \quad a_{20} = a_9 + (20 - 9)d = 7 - 11 = -4$

Example 3: Suppose *m*th term of an A.P. is 1/*n* and *n*th term of the A.P. is 1/*m*. If *r*th term of the A.P. is 1, then *r* is equal to

(a) *mn* (b) *m* + *n*

(c) *m* – *n* (d) *m* + *n* – 1

Ans. (a)

Solution: Let *d* be the common difference of the A.P., then

$$(m - n)d = a_m - a_n = \frac{1}{n} - \frac{1}{m}$$

$\Rightarrow \quad d = \dfrac{1}{mn}$

Now $\quad a_r - a_m = (r - m)d$

$\Rightarrow \quad 1 = a_r = \dfrac{1}{n} + (r - m)\dfrac{1}{mn} = \dfrac{r}{mn}$

$\Rightarrow \quad r = mn.$

Example 4: The number of terms of the A.P. 1, 4, 7, . . . that must be taken to obtain a sum of 715 is

(a) 24 (b) 23

(c) 22 (d) 21

Ans. (c)

Solution: Here $a = 1$, $d = 3$ and $S_n = 715$. We have

$$715 = \frac{n}{2}[2a + (n - 1)d] = \frac{n}{2}[2(1) + (n - 1)(3)]$$

$\Rightarrow \quad 1430 = 3n^2 - n$ or $3n^2 - n - 1430 = 0$

$$\Rightarrow \quad n = \frac{1}{6}\left(1 \pm \sqrt{1 + 3 \times 4 \times 1430}\right) = \frac{1}{6}(1 \pm 131)$$

$$= 22, -65/3$$

As *n* must be a natural number $n = 22$

Example 5: If sum of first 20 terms of an A.P. is equal to sum of first 30 terms of the A.P. then sum of the first 50 terms of the A.P. is

(a) – 1 (b) 0
(c) 10 (d) 25

Ans. (b)

◎ **Solution:** Let a be the first term and d be the common difference of the A.P., then

$$S_{20} = S_{30}$$

$$\Rightarrow \quad \frac{20}{2}[2a + (20 - 1)d] = \frac{30}{2}[2a + (30 - 1)d]$$

$$\Rightarrow \quad 2a + 49d = 0$$

Now, $S_{50} = \frac{50}{2}[2a + (50 - 1)d] = 0.$

◉ **Example 6:** If for every $n \in \mathbf{N}$, sum to n terms of an A.P. is $5n^2 + 7n$ then its 10th term is

(a) 7/2 (b) 570
(c) 102 (d) 52

Ans. (c)

◎ **Solution:** We have

$$a_r = S_r - S_{r-1}$$

$$\Rightarrow \quad a_{10} = S_{10} - S_9 = 5(10^2 - 9^2) + 7(10 - 9) = 102$$

◉ **Example 7:** If the sum of three numbers in A.P. is 24 and their product is 440, then common difference of the A.P. can be

(a) 3 (b) 2
(c) 5 (d) – 5

Ans. (a)

◎ **Solution:** Let the three number in A.P. be $a - d, a, a + d$. Then

$$24 = (a - d) + a + (a + d) = 3a$$

$$\Rightarrow \quad a = 8$$

Also, $440 = (a - d)\,a(a + d) = 8(64 - d^2)$

$$\Rightarrow \quad d^2 = 64 - 55 = 9 \Rightarrow d = \pm 3.$$

$\therefore$ d can be 3.

◉ **Example 8:** The digits of a three digit number N are in A.P. If sum of the digits is 15 and the number obtaind by reversing the digits of the number is 594 less than the original number, then $\frac{1000}{N - 252}$ is equal to

(a) 5/6 (b) 5/3
(c) 0.06 (d) 0.03

Ans. (b)

◎ **Solution:** Let three digits of N be:

Hundred's digit = $a - d$
ten's digit = a,
and unit's digit = $a + d$

$$(a - d) + a + (a + d) = 15 \Rightarrow a = 5$$

and

$$N = 100(5 - d) + 50 + (5 + d) \qquad (1)$$

Number obtained by reversing digits of N is

$$N_1 = 100(5 + d) + 50 + (5 - d) \qquad (2)$$

Now,

$$594 = N - N_1 = 100(-2d) + 2d$$

$$\Rightarrow \quad 2d = -6 \Rightarrow d = -3$$

Thus, $N = 852$ and

$$\frac{1000}{N - 252} = \frac{1000}{600} = \frac{5}{3}$$

◉ **Example 9:** If sum of four numbers in A.P. is 28 and product of two middle terms is 45, then product of the first and last terms is

(a) 11 (b) 13
(c) 15 (d) 17

Ans. (b)

◎ **Solution:** Let four numbers in A.P. be

$$a - 3d,\ a - d,\ a + d,\ a + 3d$$

We are given

$$28 = (a - 3d) + (a - d) + (a + d) + (a + 3d) = 4a$$

$$\Rightarrow \quad a = 7$$

Also, $(a - d)(a + d) = 45$

$$\Rightarrow \quad 49 - d^2 = 45 \Rightarrow d = \pm 2.$$

Now, $(a - 3d)(a + 3d) = a^2 - 9d^2 = 13$

◉ **Example 10:** n arithmetic means are inserted between 3 and 17. If the ratio of first to last mean is 1 : 3, then n is equal to:

(a) 4 (b) 5
(c) 6 (d) 8

Ans. (c)

◎ **Solution:** Let the n arithmetic means between 3 and 17 be $A_1, A_2, \ldots, A_n$. If d is the common difference, then,

$$d = \frac{17 - 3}{n + 1} = \frac{14}{n + 1}$$

Also, $\frac{A_1}{A_n} = \frac{1}{3} \Rightarrow \frac{3 + d}{17 - d} = \frac{1}{3}$

$$\Rightarrow \quad \frac{3 + 14/(n+1)}{17 - 14/(n+1)} = \frac{1}{3} \Rightarrow \frac{3n + 17}{17n + 3} = \frac{1}{3} \Rightarrow n = 6$$

◉ **Example 11:** Suppose $a, b, c > 0$ and $p \in \mathbf{R}$. If

$$(a^2 + b^2)p^2 - 2(ab + bc)p + (b^2 + c^2) = 0 \qquad (1)$$

then a, b, c are in

(a) A.P (b) G.P
(c) H.P. (d) A.G.P.

Ans. (b)

◎ **Solution:** Write (1) as

$$(a^2p^2 - 2abp + b^2) + (b^2p^2 - 2bcp + c^2) = 0$$

$$\Rightarrow \quad (ap - b)^2 + (bp - c)^2 = 0$$

As $ap - b,\ bp - c \in \mathbf{R}$.

from (2), we get

$$ap - b = 0,\ bp - c = 0$$

$$\Rightarrow \quad p = \frac{b}{a} = \frac{c}{b}$$

$\Rightarrow$ a, b, c are in G.P.

Example 12: Suppose $(m + n)$th term of a G.P. is p and $(m - n)$th term is q, then its nth is

(a) $\sqrt{pq}$ (b) $p\left(\frac{q}{p}\right)^{m/n}$

(c) $p\left(\frac{q}{p}\right)^{m/2n}$ (d) $\sqrt{\frac{p}{q}}$

Ans. (c)

Solution: Let a be the first term and r be the common ratio. We have

$$p = a_{m+n} = ar^{m+n-1}$$

$$q = a_{m-n} = ar^{m-n-1}$$

$$\Rightarrow \quad \frac{p}{q} = \frac{a_{m+n}}{a_{m-n}} = r^{2n} \Rightarrow r = \left(\frac{p}{q}\right)^{1/2n}$$

Now, $a_n = ar^{n-1} = \dfrac{ar^{m+n-1}}{r^m}$

$$= p\left(\frac{p}{q}\right)^{-m/2n} = p\left(\frac{q}{p}\right)^{m/2n}$$

Example 13: The number of terms of the G.P. $3, \frac{3}{2}, \frac{3}{4}, \ldots$ needed to obtain a sum of $\frac{3069}{512}$ is:

(a) 9 (b) 10

(c) 11 (d) 12

Ans. (b)

Solution: Here $a = 3$, $r = 1/2$.

Let the number of terms needed be n, then

$$\frac{3069}{512} = S_n = \frac{3\left(1 - (1/2)^n\right)}{1 - 1/2}$$

$$\Rightarrow \quad \frac{1023}{1024} = 1 - \left(\frac{1}{2}\right)^n$$

$$\Rightarrow \quad \left(\frac{1}{2}\right)^n = \frac{1}{1024} \Rightarrow n = 10$$

Example 14: Sum to 25 terms of the series 0.5 + 0.55 + 0.555 + . . . is:

(a) $\frac{5}{81}(224 - 10^{-25})$ (b) $\frac{5}{9}(224 - 10^{-25})$

(c) $\frac{5}{81}(224 - 10^{-24})$ (d) none of these

Ans. (a)

Solution: Let

$$S = 0.5 + 0.55 + 0.555 + \ldots + \text{upto 25 terms}$$

$$= \frac{5}{9}[0.9 + 0.99 + 0.999 + \ldots + \text{upto 25 terms}]$$

$$= \frac{5}{9}\left[(1 - 0.1) + (1 - (0.1)^2) + (1 - (0.1)^3) + \ldots + (1 - (0.1)^{25})\right]$$

$$= \frac{5}{9}\left[25 - \frac{(0.1)\left(1 - (0.1)^{25}\right)}{1 - 0.1}\right]$$

$$= \frac{5}{81}\ [224 - 10^{-25}]$$

Example 15: The sum of three numbers in A.P. is 21. If the second number is reduced by 1 while third is increased by 1, three resulting numbers form an increasing G.P., the common ratio of the G.P. is

(a) 2 (b) 3

(c) 4 (d) 7

Ans. (a)

Solution: Let three numbers in A.P. be $a - d, a, a + d$.

As $21 = (a - d) + a + (a + d) = 3a$

$\Rightarrow$ $a = 7$

Also, $7 - d, 7 - 1, 7 + d + 1$ are in G.P.

$\Rightarrow$ $6^2 = (7 - d)(8 + d)$

$\Rightarrow$ $36 = 56 - d - d^2$

$\Rightarrow$ $d^2 + d - 20 = 0$

$\Rightarrow$ $(d + 5)(d - 4) = 0 \Rightarrow d = -5, 4$

As, $7 - d, 6, 8 + d$ is an increasing G.P., $d = 4$. The common ratio of the G.P. is $\dfrac{6}{7 - d} = \dfrac{6}{7 - 4} = 2$.

LEVEL 1

Straight Objective Type Questions

Example 16: If one geometric G and two arithmetic means A_1 and A_2 are inserted between two distinct positive numbers, then

$$\left(\frac{2A_1 - A_2}{G}\right)\left(\frac{2A_2 - A_1}{G}\right)$$

is equal to

(a) 0 (b) 1

(c) – 1.5 (d) – 2.5

Ans. (b)

◎ **Solution:** Let two distinct positive numbers be a and b. Then $G^2 = ab$

Let common difference of the A.P. a, A_1, A_2, b. be d.

We have

$$2A_1 - A_2 = 2(a + d) - (a + 2d) = a$$

and $2A_2 - A_1 = 2(b - d) - (b - 2d) = b$

Thus, $\left(\dfrac{2A_1 - A_2}{G}\right)\left(\dfrac{2A_2 - A_1}{G}\right) = \dfrac{ab}{G^2} = 1$

● **Example 17:** If sum of the infinite G.P. $p + 1 + \dfrac{1}{p} + \dfrac{1}{p^2} + \ldots$, $(p > 2)$ is 49/6, then sum of the 3rd term and the 4th term of the G.P. is

(a) $\dfrac{8}{49}$ (b) $\dfrac{1}{7}$

(c) $\dfrac{6}{7}$ (d) $\dfrac{23}{49}$

Ans. (a)

◎ **Solution:** For $p > 1$,

$$\frac{49}{6} = p + 1 + \frac{1}{p} + \frac{1}{p^2} + \ldots = \frac{p}{1 - 1/p}$$

$\Rightarrow$ $\dfrac{49}{6} = \dfrac{p^2}{p - 1}$

$\Rightarrow$ $6p^2 - 49p + 49 = 0$

$\Rightarrow$ $6p^2 - 42p - 7p + 49 = 0$

$\Rightarrow$ $(6p - 7)(p - 7) = 0$

As $p > 2, p = 7$

Thus, $a_3 + a_4 = p\left(\dfrac{1}{p}\right)^2 + p\left(\dfrac{1}{p}\right)^3$

$$= \frac{1}{7} + \frac{1}{49} = \frac{8}{49}$$

● **Example 18:** If $a_1, a_2, a_3, \ldots, a_n, \ldots$ are in A.P. such that $a_4 - a_7 + a_{10} = m$, then sum of the first 13 terms of the A.P. is

(a) 10 m (b) 12 m

(c) 13 m (d) 15 m

Ans. (c)

◎ **Solution:** Let d be the common difference of the A.P., then

$$m = a_4 - a_7 + a_{10} = a_4 + (a_{10} - a_7)$$

$$= a_1 + 3d + 3d = a_1 + 6d$$

Now,

$$S_{13} = \frac{13}{2}\,[2a_1 + (13 - 1)d] = 13m.$$

● **Example 19:** If $(20)^{19} + 2(21)(20)^{18} + 3(21)^2(20)^{17} + \ldots + 20(21)^{19} = k(20)^{19}$ then k is equal to

(a) 400 (b) 100

(c) 441 (d) 420

Ans. (a)

◎ **Solution:** Dividing by $(20)^{19}$, we can write

$k = 1 + 2x + 3x^2 + \ldots + 20x^{19}$

where $x = 21/20$.

$$k = \frac{d}{dx}[x + x^2 + \ldots + x^{20}]$$

$$= \frac{d}{dx}\left[\frac{x(x^{20} - 1)}{x - 1}\right]$$

$$= \frac{(x - 1)(21x^{20} - 1) - x(x^{20} - 1)}{(x - 1)^2}$$

$$= \frac{20x^{21} - 21x^{20} + 1}{(x - 1)^2}$$

But $20x^{21} - 21x^{20}$

$$= 20\left(\frac{21}{20}\right)^{21} - 21\left(\frac{21}{20}\right)^{21} = 0$$

$\therefore$ $k = \dfrac{1}{(21/20 - 1)^2} = 400$

● **Example 20:** Three positive numbers form an increasing G.P. If the middle term in this G.P. is tripled, the new numbers are in A.P. Then the common ratio of G.P.is:

(a) $3 + 2\sqrt{2}$ (b) $2\sqrt{2} - \sqrt{3}$

(c) $2 + 2\sqrt{3}$ (d) $2\sqrt{2} + \sqrt{3}$

Ans. (a)

◎ **Solution:** Let the three positive numbers in the increasing G.P. be

$$\frac{a}{r}, a, ar \text{ where } r > 1.$$

We are given, $\dfrac{a}{r}$, $3a$, ar are in A.P.

$\therefore$ $\dfrac{a}{r} + ar = 2(3a)$

$\Rightarrow$ $r^2 - 6r + 1 = 0$

$\Rightarrow$ $r = 3 \pm 2\sqrt{2}$

As $r > 1, r = 3 + 2\sqrt{2}$

● **Example 21:** Suppose m arithmetic means are inserted between 1 and 31. If the ratio of the second mean to the mth mean is 1 : 4, then m is equal to

(a) 7 (b) 9

(c) 11 (d) 15

Ans. (b)

◎ **Solution:** Let m arithmetic means between 1 and 31 be $A_1, A_2, \ldots, A_m$, then $1, A_1, A_2 \ldots A_m, 31$ is an A.P. Let d be the common difference of this A.P. Now,

$$31 = (m+2)\text{th term of the A.P.}$$

$$= 1 + (m + 2 - 1)d$$

$$\Rightarrow \qquad d = \frac{30}{m+1}.$$

Also, $A_2 = 1 + 2d,\ A_m = 1 + md = 31 - d.$

Now, $\dfrac{A_2}{A_m} = \dfrac{1}{4} \Rightarrow 4A_2 = A_m$

$\Rightarrow \qquad 4(1 + 2d) = 31 - d \Rightarrow d = 3$

Thus $\dfrac{30}{m+1} = 3 \Rightarrow m = 9.$

◉ **Example 22:** In a geometric progression the ratio of the sum of the first 5 terms to the sum of their reciprocals is 49 and sum of the first and the third term is 35. The fifth term of the G.P. is

(a) 7 (b) 7/2
(c) 7/4 (d) 7/8

Ans. (c)

◎ **Solution:** Let five terms in G.P. be $\dfrac{a}{r^2}, \dfrac{a}{r}, a, ar, ar^2$

Then

$$\frac{a\left(r^{-2}+r^{-1}+1+r+r^2\right)}{(1/a)\left(r^2+r+1+r^{-1}+r^{-2}\right)} = 49$$

$\Rightarrow \qquad a^2 = 49 \Rightarrow a = \pm 7.$

Also, $\dfrac{a}{r^2} + a = 35$

Therefore $\quad a = -7$ is not possible

Thus, $\quad a = 7$ and $a/r^2 = 28.$

Now, fifth term $= ar^2 = a\left(\dfrac{a}{28}\right) = \dfrac{7}{4}$

◉ **Example 23:** If $|x| < 1$, and rth term of a series is $1 + x + x^2 + \ldots + x^{r-1}$, then sum to n terms of the series is

(a) $\dfrac{n+(n+1)x - x^{n+1}}{(1-x)^2}$ (b) $\dfrac{n-(n+1)x + x^{n+1}}{(1-x)^2}$

(c) $\dfrac{(n+1)x - x^{n+1} - n}{(1-x)^2}$ (d) $\dfrac{n-(n+1)x - x^{n+1}}{(1-x)^2}$

Ans. (b)

◎ **Solution:** $t_r = 1 + x + x^2 + \ldots x^{r-1} = \dfrac{1-x^r}{1-x}$

Now,
$$\sum_{r=1}^{n} t_r = \sum_{r=1}^{n}\left(\frac{1-x^r}{1-x}\right)$$

$$= \frac{n}{1-x} - \frac{1}{1-x}\sum_{r=1}^{n} x^r$$

$$= \frac{n}{1-x} - \frac{1}{1-x}\,\frac{x(1-x^n)}{1-x}$$

$$= \frac{1}{(1-x)^2}\left[n - nx - x + x^{n+1}\right]$$

$$= \frac{1}{(1-x)^2}\left[n - (n+1)x + x^{n+1}\right]$$

◉ **Example 24:** Let m be a positive integer, then

$$S = \sum_{k=1}^{m} k\left(\frac{1}{k} + \frac{1}{k+1} + \frac{1}{k+2} + \ldots + \frac{1}{m}\right)$$

is equal to:

(a) $\dfrac{1}{4}\ m(m+2)$ (b) $\dfrac{1}{4}\ m(m+3)$

(c) $\dfrac{1}{4}\ m(m+4)$ (d) $\dfrac{1}{4}\ m(m+6)$

Ans. (b)

◎ **Solution:**

$$S = \left(1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{m}\right)$$

$$+\ 2\left(\frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{m}\right)$$

$$+\ 3\left(\frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{m}\right)$$

$$+ \ldots$$

$$+\ (m-1)\left(\frac{1}{m-1} + \frac{1}{m}\right) + m\left(\frac{1}{m}\right)$$

$$= (1)\,(1) + \frac{1}{2}(1+2) + \frac{1}{3}(1+2+3)$$

$$+\ \frac{1}{4}(1+2+3+4)$$

$$+ \ldots + \frac{1}{m}(1+2+3+\ldots+m)$$

$$= \sum_{k=1}^{m}\frac{1}{k}(1+2+\ldots+k)$$

$$= \sum_{k=1}^{m}\frac{1}{k}\cdot\frac{k(k+1)}{2} = \frac{1}{2}\sum_{k=1}^{m}(k+1)$$

$$= \frac{m}{4}\left[2 + (m+1)\right]$$

$$= \frac{1}{4}\ m(m+3)$$

◉ **Example 25:** Let $f(n) = \left[\dfrac{1}{5} + \dfrac{3n}{100}\right]n$, where $[x]$ denotes the greatest integer less than or equal to x. Then $\displaystyle\sum_{n=1}^{61} f(n)$

(a) 2013 (b) 1869
(c) 1947 (d) 1661

Ans. (d)

Solution: If $\frac{3n}{100} < 0.8$ or $n \le 26$, then

$$\left[\frac{1}{5}+\frac{3n}{100}\right] = 0.$$

If $0.8 \le \frac{3n}{100} < 1.8$, or $27 \le n \le 59$

then $\left[\frac{1}{5}+\frac{3n}{100}\right] = 1$

For $n = 60, 61$ $\left[\frac{1}{5}+\frac{3n}{100}\right] = 2.$

$$\text{Thus, } \sum_{n=1}^{61} f(n) = \sum_{n=27}^{59} n + \sum_{n=60}^{61} 2n$$

$$= \frac{1}{2}(33)(27+59) + 2(60+61)$$

$$= 1661$$

Example 26: Sum of the series $S = 1^2 - 2^2 + 3^2 - 4^2 + \ldots - 2008^2 + 2009^2$ is

(a) 2019045 (b) 1005004
(c) 2000506 (d) none of these

Ans. (a)

Solution: We can write S as

$$S = (1-2)(1+2) + (3-4)(3+4) + \ldots + (2007 - 2008)(2007+2008) + 2009^2$$

$$= -[1+2+3+4+\ldots+2008] + 2009^2$$

$$= -\frac{1}{2}(2008)(2009) + 2009^2 = 2019045$$

Example 27: The value of n for which $704 + \frac{1}{2}(704) + \frac{1}{4}(704) + \ldots$ upto n terms $= 1984 - \frac{1}{2}(1984) + \frac{1}{4}(1984) - \ldots$ upto n terms is

(a) 5 (b) 3
(c) 4 (d) 10

Ans. (a)

Solution: According to the given condition

$$(704)(2)\left\{1-\frac{1}{2^n}\right\} = \frac{(1984)(2)}{3}\left\{1-\frac{(-1)^n}{2^n}\right\}$$

$$\Rightarrow \quad 128 = \frac{2112}{2^n} - 1984\frac{(-1)^n}{2^n}$$

If n is odd, we get $2^n = 32$ or $n = 5$
If n is even, we get $128 = 128/2^n \Rightarrow n = 0$.

Example 28: The positive integer n for which $2{\times}2^2 + 3{\times}2^3 + 4{\times}2^4 + \ldots + n{\times}2^n = 2^{n+10}$ is

(a) 510 (b) 511
(c) 512 (d) 513

Ans. (d)

Solution: We have

$$2^{n+10} = 2\times 2^2 + 3\times 2^3 + 4\times 2^4 + \ldots + n\times 2^n$$

$$\Rightarrow \quad 2(2^{n+10}) = 2\times 2^3 + 3\times 2^4 + \ldots + (n-1)\times 2^n + n\times 2^{n+1}$$

Subtracting, we get

$$-2^{n+10} = 2{\cdot}2^2 + 2^3 + 2^4 + \ldots + 2^n - n{\cdot}2^{n+1}$$

$$= 8 + \frac{8\left(2^{n-2}-1\right)}{2-1} - n\times 2^{n+1}$$

$$= 2^{n+1} - (n)2^{n+1}$$

$$\Rightarrow \quad 2^{10} = 2n - 2 \quad \Rightarrow \quad n = 513$$

Example 29: Sum of the series $S = 1 + \frac{1}{2}(1+2) + \frac{1}{3}(1+2+3) + \frac{1}{4}(1+2+3+4) + \ldots$ upto 20 terms is

(a) 110 (b) 111
(c) 115 (d) 116

Ans. (c)

Solution: Let t_k denote the kth term of the series. Then

$$t_k = \frac{1}{k}(1+2+3+\ldots+k) = \frac{1}{k}\frac{k(k+1)}{2} = \frac{k+1}{2}.$$

$$\text{Thus,} \quad S = \frac{1}{2}[2+3+4+\ldots+21] = \frac{10}{2}(2+21) = 115$$

Example 30: If $1^2 + 2^2 + 3^2 + \ldots + 2009^2 = (2009)(4019)(335)$ and $(1)(2009) + (2)(2008) + (3)(2007) + \ldots + (2009)(1) = (2009)(335)(x)$, then x equals

(a) 2011 (b) 2009
(c) 2008 (d) 2007

Ans. (a)

Solution: Let

$$S = (1)(2009) + (2)(2008) + (3)(2007) + \ldots + (2009)(1)$$

and $K = 1^2 + 2^2 + 3^2 + \ldots + 2009^2$

Adding, we get

$$S + K = (2010)[1+2+3+\ldots+2009]$$

$$\Rightarrow (2009)(335)(x) + (2009)(4019)(335) = (2010)(1005)(2009)$$

$$\Rightarrow \quad x = 2011$$

Example 31: If $x > 0$, and $\log_2 x + \log_2\left(\sqrt{x}\right) + \log_2\left(\sqrt[4]{x}\right) + \log_2\left(\sqrt[8]{x}\right) + \log_2\left(\sqrt[16]{x}\right) + \ldots = 4$

then x equals

(a) 2 (b) 3
(c) 4 (d) 5

Ans. (c)

Solution: We can write the given equation as

$$\log_2\left(x^{1+\frac{1}{2}+\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\cdots}\right)=4$$

$$\Rightarrow \quad \log_2(x^2)=4 \quad \Rightarrow \quad x^2=2^4 \quad \Rightarrow \quad x=4$$

Example 32: If $(1 + 3 + 5 + \ldots + p) + (1 + 3 + 5 + \ldots + q) = (1 + 3 + 5 + \ldots + r)$ where each set of parentheses contains the sum of consecutive odd integers as shown, the smallest possible value of $p + q + r$, (where $p > 6$) is

(a) 12 (b) 21
(c) 45 (d) 54

Ans. (b)

Solution: We know that

$$1 + 3 + 5 + \ldots + (2k - 1) = k^2$$

Thus, the given equation can be written as

$$\left(\frac{p+1}{2}\right)^2+\left(\frac{q+1}{2}\right)^2=\left(\frac{r+1}{2}\right)^2$$

$$\Rightarrow \quad (p + 1)^2 + (q + 1)^2 = (r + 1)^2$$

Therefore, $(p + 1, q + 1, r + 1)$ forms a Pythagorean triplet. As $p > 6, p + 1 > 7$.

The first Pythagorean triplet containing a number > 7 is $(6, 8, 10)$.

$\therefore$ We may take $p + 1 = 8, q + 1 = 6, r + 1 = 10$

$$\Rightarrow \quad p + q + r = 21.$$

Example 33: Let $a_1, a_2, \ldots, a_{10}$ be in A.P. and $h_1, h_2, \ldots, h_{10}$ be in H.P. If $a_1 = h_1 = 2$ and $a_{10} = h_{10} = 3$, then $a_4 h_7$ is

(a) 2 (b) 3
(c) 5 (d) 6

Ans. (d)

Solution: Let d be the common difference of the A.P., then

$$3 = a_{10} = 2 + 9d \quad \Rightarrow \quad d = 1/9$$

$$\therefore \quad a_4 = 2 + 3d = 7/3$$

Next, let D be the common difference of the A.P. $\frac{1}{h_1}, \frac{1}{h_2}, \ldots, \frac{1}{h_{10}}$ Then

$$\frac{1}{3}=\frac{1}{h_{10}}=\frac{1}{2}+9D \quad \Rightarrow \quad D=-\frac{1}{54}$$

$$\therefore \quad \frac{1}{h_7}=\frac{1}{h_1}+6D=\frac{7}{18} \quad \Rightarrow \quad h_7=\frac{18}{7}$$

Hence, $a_4 h_7 = (7/3)(18/7) = 6$.

Example 34: Suppose a, b, c are in A.P. and a^2, b^2, c^2 are in G.P. If $a < b < c$ and $a + b + c = 3/2$, then the value of a is

(a) $\frac{1}{2\sqrt{2}}$ (b) $\frac{1}{2\sqrt{3}}$
(c) $\frac{1}{2}-\frac{1}{\sqrt{3}}$ (d) $\frac{1}{2}-\frac{1}{\sqrt{2}}$

Ans. (d)

Solution: We have $a + c = 2b \Rightarrow 3b = a + b + c = 3/2 \Rightarrow b = 1/2$

Thus, $a + c = 1$ and $a^2 c^2 = b^4 = 1/16$

$\Rightarrow \quad a^2(1 - a)^2 = 1/16 \quad \Rightarrow \quad a(1 - a) = \pm 1/4$

$\Rightarrow 4a^2 - 4a \pm 1 = 0 \quad \Rightarrow \quad (2a - 1)^2 = 0$ or $(2a - 1)^2 = 2$

$$\Rightarrow \quad a=\frac{1}{2} \text{ or } a=\frac{1}{2}\pm\frac{1}{\sqrt{2}}$$

As $a < b < c$ and $b = \frac{1}{2}$, we get $a = \frac{1}{2}-\frac{1}{\sqrt{2}}$

Example 35: Let $S_1, S_2, \ldots$ be squares such that for each $n \geq 1$, the length of a side of S_n equals the length of a diagonal of S_{n+1}. If the length of a side of S_1 is 10 cm, then the smallest value of n for which Area $(S_n) < 1$ is

(a) 7 (b) 8
(c) 9 (d) 10

Ans. (b)

Solution: Let a_n denote the length of a side of S_n. We are given

Length of a side of S_n = Length of a diagonal of S_{n+1}

$$\Rightarrow \quad a_n=\sqrt{2}\;a_{n+1} \quad \Rightarrow \quad \frac{a_{n+1}}{a_n}=\frac{1}{\sqrt{2}}.$$

Thus, $a_1, a_2, a_3, \ldots$ is a G.P. with first term 10 and common ratio $1/\sqrt{2}$. Therefore,

$$a_n = 10\left(1/\sqrt{2}\right)^{n-1}$$

Also, Area $(S_n) = a_n^2 < 1$

$\Rightarrow \quad [10\,(1/\sqrt{2}\,)^{n-1}]^2 < 1 \quad \Rightarrow \quad 100 < 2^{n-1}$

$\Rightarrow$ smallest possible value of n is 8.

Example 36: Let T_r be the rth term of an AP, for $r = 1, 2, \ldots$. If for some positive integers m and n, we have $T_m = \frac{1}{n}$ and $T_n = \frac{1}{m}$, the T_{m+n} equals

(a) $\frac{1}{mn}$ (b) $\frac{1}{m}+\frac{1}{n}$
(c) $\frac{1}{m}$ (d) 0

Ans. (c)

◎ **Solution:** Let a be the first term and d be the common difference of the given A.P. Then according to the hypothesis,

$$T_m - T_n = \frac{1}{n} - \frac{1}{m}$$

$$\Rightarrow \quad (m-n)d = \frac{m-n}{mn} \quad \Rightarrow \quad d = \frac{1}{mn}.$$

$$\Rightarrow \quad T_{m+n} - T_m = (m+n-m)\,\frac{1}{mn} = \frac{1}{m}$$

◉ **Example 37:** Consider an infinite geometric series with the first term a and common ratio r. If its sum is 4 and the second term is 3/4, then

(a) $a = 4/7,\ r = 3/7$ (b) $a = 2,\ r = 3/8$
(c) $a = 3/2,\ r = 1/2$ (d) $a = 3,\ r = 1/4$

Ans. (d)

◎ **Solution:** We have

$$\frac{a}{1-r} = 4 \text{ and } ar = \frac{3}{4} \quad \Rightarrow \quad r = \frac{3}{4a}.$$

Thus, $$\frac{a}{1-3/4a} = 4 \quad \Rightarrow \quad a^2 - 4a + 3 = 0 \Rightarrow a = 1, 3$$

When $a = 1$, $r = 3/4$ and when $a = 3$, $r = 1/4$.

◉ **Example 38:** If the sum of first $2n$ terms of the A.P. 2, 5, 8, …, is equal to the sum of first n terms of the A.P. 57, 59, 61, …, then n equals

(a) 10 (b) 12
(c) 11 (d) 13

Ans. (c)

◎ **Solution:** Sum to $2n$ terms of 2, 5, 8, … is

$$\frac{2n}{2}\,[2(2) + (2n-1)(3)] = n(6n+1)$$

and sum to n terms of 57, 59, 61, …, is

$$\frac{n}{2}\,[2(57) + (n-1)(2)] = n(56+n)$$

According to given condition

$$n(6n+1) = n(56+n) \Rightarrow 6n+1 = 56+n \Rightarrow n = 11$$

◉ **Example 39:** For a positive integer n, let

$$a(n) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots + \frac{1}{(2^n)-1}. \text{ Then}$$

(a) $a(100) < 100$ (b) $a(100) > 100$
(c) $a(200) < 100$ (d) none of these

Ans. (a)

◎ **Solution:** We have

$$a(n) = 1 + \left(\frac{1}{2} + \frac{1}{3}\right) + \left(\frac{1}{4} + \cdots + \frac{1}{7}\right)$$

$$+ \left(\frac{1}{8} + \cdots + \frac{1}{15}\right) + \cdots + \left(\frac{1}{2^{n-1}} + \frac{1}{2^{n-1}+1} + \cdots + \frac{1}{(2^n)-1}\right)$$

$$< 1 + \frac{2}{2} + \frac{4}{4} + \frac{8}{8} + \cdots + \frac{2^{n-1}}{2^{n-1}} = n$$

Thus, $a(100) < 100$.

◉ **Example 40:** If $x > 1$, $y > 1$, $z > 1$ are in G.P., then $\frac{1}{1+\ln x}, \frac{1}{1+\ln y}, \frac{1}{1+\ln z}$ are in

(a) A.P. (b) G.P.
(c) H.P. (d) none of these

Ans. (c)

◎ **Solution:** As x, y, z are in G.P. $\Rightarrow y^2 = xz$

$$\Rightarrow \quad \ln(y^2) = \ln(xz) \quad \Rightarrow \quad 2\ln(y) = \ln(x) + \ln(z)$$

$$\Rightarrow \quad 2(1 + \ln(y)) = (1 + \ln(x)) + (1 + \ln(z))$$

$$\Rightarrow \quad 1 + \ln(x),\ 1 + \ln(y),\ 1 + \ln(z) \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{1}{1+\ln(x)}, \frac{1}{1+\ln(y)}, \frac{1}{1+\ln(z)} \text{ are in H.P.}$$

◉ **Example 41:** Let x be the arithmetic mean and y, z be the two geometric means between any two positive numbers. Then value of $\frac{y^3+z^3}{xyz}$ is

(a) 2 (b) 3
(c) $\frac{1}{2}$ (d) $\frac{3}{2}$

Ans. (a)

◎ **Solution:** Let two positive numbers be a and b. Then $x = (a+b)/2$. Also, a, y, z, b are in G.P. If r is the common ratio of this G.P., then $b = ar^3 \Rightarrow r = (b/a)^{1/3}$.
We have

$$\frac{y^3+z^3}{xyz} = \frac{a^3r^3 + a^3r^6}{x(ar)(ar^2)} = \frac{a(1+r^3)}{x} = \frac{a+b}{(a+b)/2} = 2$$

◉ **Example 42:** The sum to n terms of the series $\frac{1}{1^3} + \frac{1+2}{1^3+2^3} + \frac{1+2+3}{1^3+2^3+3^3} + \ldots$ is

(a) $\frac{n}{n+1}$ (b) $\frac{n}{2(n+1)}$

(c) $\frac{2n}{n+1}$ (d) $\frac{2}{n(n+1)}$

Ans. (c)

◎ **Solution:** If t_n denotes the nth term of the series, then

$$t_n = \frac{1+2+3+\cdots+n}{1^3+2^3+3^3+\cdots+n^3} = \frac{\frac{1}{2}n(n+1)}{\frac{1}{4}n^2(n+1)^2}$$

$$= \frac{2}{n(n+1)} = 2\left[\frac{1}{n} - \frac{1}{n+1}\right]$$

$$\Rightarrow \quad \sum_{k=1}^{n} t_k = 2\left\{\left(1-\frac{1}{2}\right)+\left(\frac{1}{2}-\frac{1}{3}\right)+\cdots+\left(\frac{1}{n}-\frac{1}{n+1}\right)\right\}$$

$$= 2\left(1-\frac{1}{n+1}\right) = \frac{2n}{n+1}$$

Example 43: Let $\sum_{r=1}^{n} r^4 = f(n)$, then $\sum_{r=1}^{n} (2r-1)^4$ is equal to

(a) $f(2n) - 16f(n)$ (b) $f(2n) - 7f(n)$
(c) $f(2n-1) - 8f(n)$ (d) none of these

Ans. (a)

Solution: We have

$$\sum_{r=1}^{n} (2r-1)^4 = \sum_{r=1}^{2n} r^4 - \sum_{r=1}^{n} (2r)^4 = f(2n) - 16f(n)$$

Example 44: The sum of first n terms of the series $1^2 + 2 \times 2^2 + 3^2 + 2 \times 4^2 + 5^2 + 2 \times 6^2 + \ldots$ is $n(n+1)^2/2$ when n is even. When n is odd the sum of the series is

(a) $n^2(3n+1)/4$ (b) $n^2(n+1)/2$
(c) $n^3(n-1)/2$ (d) none of these

Ans. (b)

Solution: Let $n = 2m$, then

$$S_{2m} = 1^2 + 2\times2^2 + 3^2 + 2\times4^2 + \ldots + (2m-1)^2 + 2(2m)^2$$
$$= 2m(2m+1)^2/2 = m(2m+1)^2$$

When $n = 2m - 1$,

$$S_{2m-1} = 1^2 + 2\times2^2 + 3^2 + 2\times4^2 + \ldots + (2m-1)^2$$
$$= S_{2m} - 2(2m)^2 = m(2m+1)^2 - 2(2m)^2$$
$$= m\,[4m^2 + 4m + 1 - 8m] = m(2m-1)^2$$
$$= n^2\,(n+1)/2$$

Example 45: If the first and $(2n+1)$th terms of an A.P.; G.P. and H.P. are equal and their $(n+1)$th terms are a, b and c respectively, then

(a) $a > b > c$ (b) $ac = b^2$
(c) $a + b = c$ (d) none of these

Ans. (b)

Solution: Let A be the first term, D be the common difference and B be the $(2n+1)$th term of the A.P., then

$$B = A + 2nD \Rightarrow D = \frac{B-A}{2n}.$$

Also, $\quad a = A + (n+1-1)D = \dfrac{A+B}{2}.$

Similarly, $\quad b = \sqrt{AB}$ and $c = \dfrac{2AB}{A+B}.$

Clearly, we have $\quad b^2 = ac$

Example 46: If $a_{n+1} = \dfrac{1}{1-a_n}$ for $n \geq 1$ and $a_3 = a_1$, then $(a_{2022})^{2022}$ equals

(a) -1 (b) 1
(c) 0 (d) none of these

Ans. (b)

Solution: We have $a_2 = \dfrac{1}{1-a_1}$ and

$$a_3 = \frac{1}{1-a_2} = \frac{1}{1-1/(1-a_1)} = \frac{1-a_1}{-a_1}$$

Since $a_3 = a_1$, we get $-a_1^2 = 1 - a_1$
$\Rightarrow a_1^2 - a_1 + 1 = 0 \Rightarrow a_1 = -\omega$ or $-\omega^2$

We have $\quad a_5 = \dfrac{1}{1-a_4} = \dfrac{1}{1-1/(1-a_3)} = \dfrac{1-a_3}{-a_3} = \dfrac{1-a_1}{-a_1}$

$$= a_3 = a_1$$

Continuing in this way we obtain
$a_1 = a_3 = a_5 = a_7 = a_9 = a_{11} = \ldots = a_{2022}$
Thus, $(a_{2022})^{2022} = (-\omega)^{2022}$ or $(-\omega^2)^{2022} = 1$

Example 47: If $f(x+y) = f(xy)\ \forall\ x, y\ \varepsilon\ \mathbf{R}$, and $f(2013) = 2013$, then $f(-2013)$ equals

(a) 2013 (b) 0
(c) -2013 (d) none of these

Ans. (a)

Solution: $f(2013) = f(2013 + 0) = f[(2013\,(0)] = f(0)$
$\Rightarrow \quad f(0) = 2013$
Also, $\quad f(-2013) = f(-2013 + 0) = f(0) = 2013.$
It can also be seen that f is a constant function.

Example 48: If $\sum_{r=1}^{n} t_r = \dfrac{1}{12}\,n(n+1)(n+2)$, the value $\sum_{r=1}^{n} \dfrac{1}{t_r}$ is

(a) $\dfrac{2n}{n+1}$ (b) $\dfrac{n-1}{(n+1)!}$

(c) $\dfrac{4n}{n+1}$ (d) $\dfrac{3n}{n+2}$

Ans. (c)

Solution: We have $t_r = \sum_{k=1}^{r} t_k - \sum_{k=1}^{r-1} t_k$

$$= \frac{1}{12}\,r(r+1)(r+2) - \frac{1}{12}\,(r-1)(r)(r+1)$$

$$= \frac{1}{4}\,r(r+1)$$

Now, $\dfrac{1}{t_r} = \dfrac{4}{r(r+1)} = 4\left(\dfrac{1}{r} - \dfrac{1}{r+1}\right)$

$$\Rightarrow \quad \sum_{r=1}^{n} \frac{1}{t_r} = 4\sum_{r=1}^{n}\left(\frac{1}{r} - \frac{1}{r+1}\right) = 4\left(1 - \frac{1}{n+1}\right) = \frac{4n}{n+1}$$

Example 49: Sum to n term of the series $\dfrac{1}{2} + \dfrac{3}{4} + \dfrac{7}{8} + \dfrac{15}{16} + \cdots$ is

(a) $\dfrac{n}{2^n}$ (b) $\dfrac{n+1}{2^{n+1}}$

(c) $n + 1 - \dfrac{1}{2^n}$ (d) $n - 1 + \dfrac{1}{2^n}$

Ans. (d)

Solution: We have $t_r = 1 - \dfrac{1}{2^r}$ for $r \geq 1$.

$$\text{Thus,} \quad \sum_{r=1}^{n} t_r = \sum_{r=1}^{n}\left(1 - \frac{1}{2^r}\right) = n - \frac{(1/2)\left(1 - 1/2^n\right)}{1 - 1/2}$$

$$= n - 1 + \frac{1}{2^n}$$

Example 50: If $0 < \phi < \dfrac{\pi}{2}$, and $x = \displaystyle\sum_{n=0}^{\infty} \cos^{2n}\phi$, $y = \displaystyle\sum_{n=0}^{\infty} \sin^{2n}\phi$ and $z = \displaystyle\sum_{n=0}^{\infty} \cos^{2n}\phi \sin^{2n}\phi$, then

(a) $xyz = xz + y$ (b) $xyz = xz + z$

(c) $xyz = x + y + z$ (d) $xyz = yz + z$

Ans. (c)

Solution: We have $x = \dfrac{1}{1 - \cos^2\phi} = \dfrac{1}{\sin^2\phi}$

and $y = \dfrac{1}{\cos^2\phi}$

$$\text{Also,} \quad z = \frac{1}{1 - \cos^2\phi \sin^2\phi} = \frac{1}{1 - \dfrac{1}{xy}} = \frac{xy}{xy - 1}$$

$$\Rightarrow \quad xyz - z = xy \quad \text{or} \quad xyz = xy + z$$

$$\text{But} \quad \frac{1}{x} + \frac{1}{y} = 1 \quad \Rightarrow \quad x + y = xy$$

$$\therefore \quad xyz = x + y + z$$

Example 51: The sum to n terms of the series $\dfrac{1}{\sqrt{7}+\sqrt{10}} + \dfrac{1}{\sqrt{10}+\sqrt{13}} + \dfrac{1}{\sqrt{13}+\sqrt{16}} + \cdots$ is

(a) $\dfrac{1}{3}\left(\sqrt{7+3n} - \sqrt{7}\right)$ (b) $\dfrac{\sqrt{4+3n} - 2}{3}$

(c) $\dfrac{1}{3}\left(\sqrt{10+3n} - \sqrt{10}\right)$ (d) none of these

Ans. (a)

Solution: We have

$$t_r = \frac{1}{\sqrt{4+3r} + \sqrt{7+3r}} = \frac{\sqrt{7+3r} - \sqrt{4+3r}}{3}$$

Thus, sum to n terms is equal to

$$\frac{1}{3}\left[\left(\sqrt{10} - \sqrt{7}\right) + \left(\sqrt{13} - \sqrt{10}\right) + \cdots + \left(\sqrt{7+3n} - \sqrt{4+3n}\right)\right]$$

$$= \frac{1}{3}\left(\sqrt{7+3n} - \sqrt{7}\right)$$

Example 52: If $S_n = \displaystyle\sum_{r=1}^{n} t_r = \dfrac{1}{6}\, n(2n^2 + 9n + 13)$, then $\displaystyle\sum_{r=1}^{n} \sqrt{t_r}$ equals

(a) $\dfrac{1}{2}\, n(n+1)$ (b) $\dfrac{1}{2}\, n(n+2)$

(c) $\dfrac{1}{2}\, n(n+3)$ (d) $\dfrac{1}{2}\, n(n+5)$

Ans. (c)

Solution: We have $t_n = S_n - S_{n-1}\ \forall\ n \geq 2$

$$\therefore \quad t_n = \frac{1}{6}\, n(2n^2 + 9n + 13) - \frac{1}{6}\,(n-1)\,\{(2(n-1)^2 + 9(n-1) + 13\}$$

$$= \frac{1}{6}\,[2(n^3 - (n-1)^3) + 9(n^2 - (n-1)^2) + 13(n - n + 1)]$$

$$= \frac{1}{6}\,[6n^2 - 6n + 2 + 9(2n - 1) + 13]$$

$$= \frac{1}{6}\,(6n^2 + 12n + 6)$$

$$= (n+1)^2$$

Also, $t_1 = S_1 = 4 = (1+1)^2$

$$\therefore \sum_{r=1}^{n} \sqrt{t_r} = \sum_{r=1}^{n} (r+1) = \frac{1}{2}\,(n+1)(n+2) - 1 = \frac{1}{2}\, n(n+3)$$

Example 53: The interior angles of a convex polygon are in A.P. If the smallest angle is 100° and the common difference is 4°, then the number of sides is

(a) 5 (b) 7

(c) 36 (d) 44

Ans. (a)

Solution: We know that the sum of the interior angles of a convex polygon of n sides is $(n-2)\,(180°)$. We are given $a = 100$ and $d = 4$.

$$\therefore \quad \frac{n}{2}\,[2(100) + (n-1)(4)] = (n-2)(180)$$

$$\Rightarrow \quad n^2 - 41n + 180 = 0 \quad \Rightarrow \quad n = 5, 36$$

If $n = 36$, then interior angles of the polygon are 100°, 104°, …, 176°, 180°, 184°, …, 244°.

But no interior angle can be 180°. Therefore, $n = 5$

Example 54: If a and x are positive integers such that $x < a$ and $\sqrt{a-x}$, $\sqrt{x}$, $\sqrt{a+x}$ are in A.P., then least possible value of a is

(a) 5 (b) 7
(c) 11 (d) none of these

Ans. (a)

Solution: We have $2\sqrt{x} = \sqrt{a+x} + \sqrt{a-x}$

$$\Rightarrow 2\sqrt{x} = \frac{2x}{\sqrt{a+x}-\sqrt{a-x}} \Rightarrow \sqrt{a+x}-\sqrt{a-x} = \sqrt{x}$$

$$\therefore\ 3\sqrt{x} = 2\sqrt{a+x} \Rightarrow 4(a+x) = 9x \Rightarrow a = \frac{5}{4}x$$

As a and x are positive integers, least possible value of x is 4 and that of a is 5.

Example 55: If $\frac{1}{1^2}+\frac{1}{2^2}+\frac{1}{3^2}+\cdots$ upto $\infty = \frac{\pi^2}{6}$, then value of $\frac{1}{1^2}+\frac{1}{3^2}+\frac{1}{5^2}+\cdots$ up to ∞ is

(a) $\frac{\pi^2}{4}$ (b) $\frac{\pi^2}{6}$
(c) $\frac{\pi^2}{8}$ (d) $\frac{\pi^2}{12}$

Ans. (c)

Solution: We have $\frac{1}{1^2}+\frac{1}{3^2}+\frac{1}{5^2}+\cdots$ upto ∞

$$= \frac{1}{1^2}+\frac{1}{2^2}+\frac{1}{3^2}+\frac{1}{4^2}+\frac{1}{5^2}+\frac{1}{6^2}\cdots \text{ upto } \infty$$

$$-\frac{1}{2^2}\left[1+\frac{1}{2^2}+\frac{1}{3^2}+\cdots\right]$$

$$= \frac{\pi^2}{6}-\frac{1}{4}\left(\frac{\pi^2}{6}\right) = \frac{\pi^2}{8}$$

Example 56: If the length of sides of a right triangle are in A.P., then the sines of the acute angle are

(a) 3/5, 4/5 (b) $\sqrt{2/3}, \sqrt{1/3}$
(c) $\sqrt{\frac{\sqrt{5}-1}{2}}, \sqrt{\frac{\sqrt{5}+1}{2}}$ (d) $\sqrt{\frac{\sqrt{3}-1}{2}}, \sqrt{\frac{\sqrt{3}+1}{2}}$

Ans. (a)

Solution: Let the sides of the triangle be $a - d$, a, $a + d$ where $a > d > 0$.

By the Pythagorean theorem, we have

$$(a + d)^2 = (a - d)^2 + a^2$$

$$\Rightarrow \quad 4ad = a^2 \quad \Rightarrow \quad d = a/4$$

We have $\sin\theta = \frac{a}{a+d} = \frac{4}{5}$

and $\sin(90° - \theta) = 3/5$

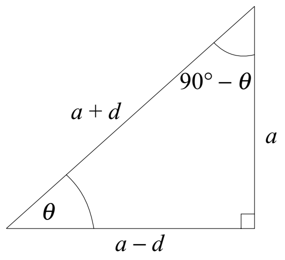


Fig. 8.1

Example 57: If exp $\{(\sin^2 x + \sin^4 x + \sin^6 x + \ldots$ upto $\infty) \ln 2\}$ satisfies the equation $x^2 - 17x + 16 = 0$ then value of $\frac{2\cos x}{\sin x + 2\cos x}$ $(0 < x < \pi/2)$ is

(a) $\frac{1}{2}$ (b) $\frac{3}{2}$
(c) $\frac{5}{2}$ (d) none of these

Ans. (a)

Solution: We have $\sin^2 x + \sin^4 x + \sin^6 x + \ldots$

$$= \frac{\sin^2 x}{1-\sin^2 x} = \tan^2 x$$

Therefore, $\alpha = \exp\{(\sin^2 x + \sin^4 x + \sin^6 x + \ldots \text{ upto } \infty) \ln 2\}$

$= \exp\{\tan^2 x \ln 2\} = \exp\{\ln 2^{\tan^2 x}\}$

$= 2^{\tan^2 x}$

As α satisfies the equation $x^2 - 17x + 16 = 0$ we get

$$\alpha = 1 \text{ or } \alpha = 16$$

Since $0 < x < \pi/2$, $\tan^2 x > 0 \Rightarrow \alpha = 2^{\tan^2 x} > 1$. Therefore,

$$2^{\tan^2 x} = 16 = 2^4 \Rightarrow \tan^2 x = 4 \Rightarrow \tan x = 2 \quad [\because \tan x > 0]$$

Thus, $\frac{2\cos x}{\sin x + 2\cos x} = \frac{2}{\tan x + 2} = \frac{2}{2+2} = \frac{1}{2}$

Example 58: Let $f(x)$ be a polynomial function of second degree. If $f(1) = f(-1)$ and a, b, c are in A.P., then $f'(a)$, $f'(b)$, $f'(c)$ are in

(a) G.P. (b) H.P.
(c) A.G.P. (d) A.P.

Ans. (d)

Solution: Let $f(x) = Ax^2 + Bx + C$.

$$f(1) = f(-1) \Rightarrow A + B + C \Rightarrow A - B + C$$

$$\Rightarrow \quad 2B = 0 \Rightarrow B = 0.$$

$$\therefore \quad f(x) = Ax^2 + C \Rightarrow f'(x) = 2Ax$$

As a, b, c are in A.P., $2Aa$, $2Ab$, $2Ac$ are in A.P., i.e., $f'(a)$, $f'(b), f'(c)$ are in A.P.

◉ **Example 59:** If $\exp\{(\tan^2 x - \tan^4 x + \tan^6 x - \tan^8 x + \ldots)\log_e 16\}$, $0 < x < \pi/4$, satisfies the quadratic equation $x^2 - 3x + 2 = 0$, then value of $\cos^2 x + \cos^4 x$ is

(a) 4/5 (b) 21/16
(c) 17/11 (d) 19/31

Ans. (b)

◎ **Solution:** We have

$$\tan^2 x - \tan^4 x + \tan^6 x - \tan^8 x + \ldots$$

$$= \frac{\tan^2 x}{1-\left(-\tan^2 x\right)} = \frac{\tan^2 x}{\sec^2 x} = \sin^2 x$$

Therefore

$$y = \exp\{(\tan^2 x - \tan^4 x + \tan^6 x - \tan^8 x + \ldots)\log_e 16\}$$
$$= \exp\{(\sin^2 x)\log_e 16\}$$
$$= \exp\{\log_e(16^{\sin^2 x})\} = 16^{\sin^2 x}$$

As y satisfies $x^2 - 3x + 2 = 0$, we get $y = 1$ or $y = 2$

$\Rightarrow$ $16^{\sin^2 x} = 1$ or $16^{\sin^2 x} = 2$

Since $0 < x < \pi/4$, $0 < \sin x < 1/\sqrt{2}$ $\Rightarrow$ $0 < \sin^2 x < 1/2$

$\therefore$ $16^{\sin^2 x} = 1$ is not possible.

Thus, $16^{\sin^2 x} = 2 \Rightarrow \sin^2 x = 1/4$

Thus, $\cos^2 x + \cos^4 x = (1 - \sin^2 x) + (1 - \sin^2 x)^2 = 21/16$

◉ **Example 60:** If $1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11} + \cdots = \frac{\pi}{4}$, then value of $\frac{1}{1\cdot 3} + \frac{1}{5\cdot 7} + \frac{1}{9\cdot 11} + \cdots$ is

(a) $\frac{\pi}{8}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{34}$

Ans. (a)

◎ **Solution:** We have

$$\frac{\pi}{4} = \left(1-\frac{1}{3}\right)+\left(\frac{1}{5}-\frac{1}{7}\right)+\left(\frac{1}{9}-\frac{1}{11}\right)+\cdots$$

$$= \frac{2}{1\cdot 3}+\frac{2}{5\cdot 7}+\frac{2}{9.11}+\cdots$$

$$\Rightarrow \quad \frac{1}{1\cdot 3}+\frac{1}{5\cdot 7}+\frac{1}{9\cdot 11}+\cdots = \frac{\pi}{8}$$

◉ **Example 61:** For x ε **R**, let $[x]$ denote the greatest integer $\le x$. Largest natural number n for which

$$E = \left[\frac{\pi}{2}\right]+\left[\frac{1}{100}+\frac{\pi}{2}\right]+\left[\frac{2}{100}+\frac{\pi}{2}\right]\ldots+\left[\frac{n}{100}+\frac{\pi}{2}\right] < 43,$$

is

(a) 41 (b) 42
(c) 43 (d) 97

Ans. (a)

◎ **Solution:** Since $3.14 < \pi < 3.142$, $1.57 < \pi/2 < 1.571$

Thus, $\left[\frac{\pi}{2}+\frac{n}{100}\right] = 1$ for $n = 0, 1, 2, \ldots, 42$

Thus, largest natural number n for which $E < 43$ is 41.

◉ **Example 62:** If the ratio of sums to n terms of two A.P.'s is $(5n + 7) : (3n + 2)$, then the ratio of their 17th terms is

(a) 172 : 99 (b) 172 : 101
(c) 175 : 99 (d) 175 : 101

Ans. (b)

◎ **Solution:** Let two A.P.'s be

$$a, a + d, a + 2d, a + 3d, \ldots$$

and $A, A + D, A + 2D, A + 3D, \ldots$

According to the given condition,

$$\frac{\frac{n}{2}[2a+(n-1)d]}{\frac{n}{2}[2A+(n-1)D]} = \frac{5n+7}{3n+2} \quad \Rightarrow \quad \frac{a+\frac{n-1}{2}d}{A+\frac{n-1}{2}D} = \frac{5n+7}{3n+2}$$

Putting $\frac{n-1}{2} = 16$ or $n = 33$, we get

$$\frac{a+16d}{A+16D} = \frac{5(33)+7}{3(33)+2} = \frac{172}{101}$$

◉ **Example 63:** If $H_1, H_2, \ldots, H_n$ are n harmonic means between a and $b(\ne a)$, then value of $\frac{H_1+a}{H_1-a}+\frac{H_n+b}{H_n-b}$ is equal to

(a) $n + 1$ (b) $n - 1$
(c) $2n$ (d) $2n + 3$

Ans. (c)

◎ **Solution:** As $a, H_1, H_2, \ldots, H_n$ b are in H.P.,

$$\frac{1}{a}, \frac{1}{H_1}, \frac{1}{H_2} \cdots \frac{1}{H_n}, \frac{1}{b} \text{ are in A.P.}$$

Let d be the common difference of this A.P., then

$$\frac{1}{b} = \frac{1}{a} + (n+1)d$$

and $$\frac{1}{H_n} - \frac{1}{H_1} = (n-1)d$$

Now, $$\frac{H_1+a}{H_1-a} = \frac{1/a+1/H_1}{1/a-1/H_1} = \frac{1/a+1/H_1}{-d}$$

and $$\frac{H_n+b}{H_n-b} = \frac{1/b+1/H_n}{1/b-1/H_n} = \frac{1/b+1/H_n}{d}$$

$$\therefore \frac{H_1+a}{H_1-a}+\frac{H_n+b}{H_n-b} = \frac{1/a+1/H_1}{-d}+\frac{1/b+1/H_n}{d}$$

$$= \frac{1}{d}\left[\left(\frac{1}{b}-\frac{1}{a}\right)+\left(\frac{1}{H_n}-\frac{1}{H_1}\right)\right] = 2n$$

Example 64: If three positive real numbers a, b, c are in A.P. such that $abc = 4$, then the minimum possible value of b is

(a) $2^{3/2}$ (b) $2^{2/3}$

(c) $2^{1/3}$ (d) $2^{5/2}$

Ans. (b)

Solution: Let d be the common difference of the A.P., then

$$4 = abc = (b - d)b\,(b + d) = b(b^2 - d^2)$$

$$\Rightarrow \quad b^3 = 4 + bd^2 \ge 4 \qquad [\because\ b > 0,\ d^2 \ge 0]$$

$$\Rightarrow \quad b \ge 2^{2/3}$$

Thus, minimum possible value of b is $2^{2/3}$, that is the case when $d = 0$.

Example 65: For $0 < x < \pi$ the values of x which satisfy the relation $9^{1+|\cos x|+\cos^2 x+|\cos^3 x|+\cdots \text{ upto } \infty} = 3^4$ are given by

(a) $\frac{\pi}{3}, \frac{2\pi}{3}$ (b) $\frac{\pi}{3}, \frac{3\pi}{4}$

(c) $\frac{\pi}{4}, \frac{3\pi}{4}$ (d) $\frac{\pi}{3}, \frac{\pi}{4}$

Ans. (a)

Solution: Since $0 < x < \pi$, $-1 < \cos x < 1 \Rightarrow$ $0 \le |\cos x| < 1$. We can write the given expression as $9^{1/(1-|\cos x|)} = 81 = 9^2$

$$\Rightarrow \quad \frac{1}{1-|\cos x|} = 2 \quad \Rightarrow \quad 1 - |\cos x| = \frac{1}{2}$$

$$\Rightarrow \quad |\cos x| = 1/2 \quad \Rightarrow \quad \cos x = \pm 1/2$$

$$\Rightarrow \quad x = \pi/3 \text{ or } 2\pi/3$$

Example 66: The sum upto $(2n + 1)$ terms of the series $a^2 - (a + d)^2 + (a + 2d)^2 - (a + 3d)^2 + \ldots$ is

(a) $a^2 + 3nd^2$

(b) $a^2 + 2nad + n(n - 1)d^2$

(c) $a^2 + 3nad + n(n - 1)d^2$

(d) $(a + nd)^2 + n(n + 1)d^2$

Ans. (d)

Solution: We can write the sum upto $(2n + 1)$ terms as

$[a + (a + d)]\,(-d) + [(a + 2d) + (a + 3d)]\,(-d) + \ldots$

$[(a + (2n - 2)\,d) + (a + (2n - 1)d]\,(-d) + (a + 2nd)^2$

$$= (-d)\,[a + (a + d) + (a + 2d) + \ldots$$
$$+ a + (2n - 1)d] + (a + 2nd)^2$$
$$= (-d)\,\frac{2n}{2}\,\{a + a + (2n - 1)\,d\} + (a + 2nd)^2$$
$$= -2nad - n(2n - 1)d^2 + a^2 + 4\,n(ad) + 4n^2d^2$$
$$= a^2 + 2nad + n(2n + 1)d^2 = (a + nd)^2 + n(n + 1)d^2$$

Example 67: Value of $y = (0.36)^{\log_{0.25}\left(\frac{1}{3}+\frac{1}{3^2}+\frac{1}{3^3}+\ldots \text{ upto } \infty\right)}$ is

(a) 0.9 (b) 0.8

(c) 0.6 (d) 0.25

Ans. (c)

Solution: We have

$$S = \frac{1}{3}+\frac{1}{3^2}+\frac{1}{3^3}+\cdots = \frac{1/3}{1-1/3} = \frac{1}{2}$$

$$\therefore \quad y = (0.36)^{\log_{0.25}(1/2)}$$

$$\Rightarrow \quad \log y = \frac{\log(1/2)}{\log(0.25)}\,\log(0.36)$$

$$= \frac{-\log 2}{-\log 4}\log(0.36) = \frac{1}{2}\log(0.36) = \log 0.6$$

$$\Rightarrow \quad y = 0.6$$

Example 68: Sum to n terms of the series

$S = 1 + 2\left(1+\frac{1}{n}\right)+3\left(1+\frac{1}{n}\right)^2 + \cdots$ is given by

(a) n^2 (b) $(n + 1)^2$

(c) $n(n + 1)$ (d) none of these

Ans. (a)

Solution: Let $x = 1 + 1/n$. Then

$$S = 1 + 2x + 3x^2 \ldots + nx^{n-1}$$

$$\Rightarrow \quad xS = x + 2x^2 + \ldots + (n - 1)x^{n-1} + nx^n$$

Subtracting, we get

$$(1 - x)S = 1 + x + x^2 + \ldots + x^{n-1} - nx^n$$
$$= \frac{1-x^n}{1-x} - nx^n$$

$$\Rightarrow \quad \left(-\frac{1}{n}\right)S = (-n)\left[1-\left(1+\frac{1}{n}\right)^n\right] - n\left(1+\frac{1}{n}\right)^n = -n$$

$$\Rightarrow \quad S = n^2$$

Example 69: Suppose a, b, c are positive real numbers. If a, b, c are in A.P. and a^2, b^2, c^2 are in H.P., then

(a) $a = b = c$ (b) $2b = 3a + c$

(c) $b^2 = \sqrt{ac/8}$ (d) none of these

Ans. (a)

Solution: We have $2b = a + c$ and $b^2 = \frac{2a^2c^2}{a^2+c^2}$

$$\therefore \quad \left(\frac{a+c}{2}\right)^2 = \frac{2a^2c^2}{a^2+c^2} \Rightarrow (a + c)^2\,(a^2 + c^2) = 8a^2c^2$$

$$\Rightarrow \quad (a^2 + c^2)^2 + 2ac(a^2 + c^2) - 8a^2c^2 = 0$$

$$\Rightarrow \quad (a^2 + c^2 + 4ac)(a^2 + c^2 - 2ac) = 0$$

$$\Rightarrow \quad [(a + c)^2 + 2ac](a - c)^2 = 0$$

$$\Rightarrow \quad a - c = 0 \text{ or } (a + c)^2 + 2ac = 0$$

As $(a + c)^2 + 2ac > 0$, we get $a = c \Rightarrow a = b = c$

Example 70: If $0 < \theta, \phi < \pi/2$ and $x = \sum_{n=0}^{\infty} \sin^{2n}\phi$, $y = \sum_{n=0}^{\infty} \cos^{2n}\theta$ and $z = \sum_{n=0}^{\infty} \cos^n(\theta + \phi)\cos^n(\theta - \phi)$, then

(a) $xyz + 1 = yz - zx$ (b) $xyz - 1 = yz + zx$
(c) $xyz - xy = yz - zx$ (d) $xyz + 1 = yz + zx$

Ans. (c)

Solution: We have $x = \dfrac{1}{1 - \sin^2\phi} = \dfrac{1}{\cos^2\phi}$,

$$y = \frac{1}{1 - \cos^2\theta} = \frac{1}{\sin^2\theta},$$

Also, $\cos(\theta + \phi)\cos(\theta - \phi) = \cos^2\phi - \sin^2\theta = \dfrac{1}{x} - \dfrac{1}{y}$

As, $0 < \cos^2\phi < 1$, $0 < \sin^2\theta < 1$, $-1 < \cos^2\phi - \sin^2\theta < 1$

$$\Rightarrow \quad -1 < \frac{1}{x} - \frac{1}{y} < 1$$

Thus, $$z = \sum_{n=0}^{\infty}\left(\frac{1}{x} - \frac{1}{y}\right)^n = \frac{1}{1 - \left(\dfrac{1}{x} - \dfrac{1}{y}\right)} = \frac{xy}{xy - y + x}$$

$$\Rightarrow \quad z(xy - y + x) = xy \quad \text{or} \quad xyz - xy = yz - xz$$

Example 71: If a, b, c are in H.P. then $a - \dfrac{b}{2}, \dfrac{b}{2}, c - \dfrac{b}{2}$ are in

(a) A.P. (b) G.P.
(c) A.G.P. (d) H.P.

Ans. (b)

Solution: $b = \dfrac{2ac}{a + c}$, and

$$\left(a - \frac{b}{2}\right)\left(c - \frac{b}{2}\right) = ac - \frac{b}{2}(a + c) + \frac{b^2}{4}$$

$$= ac - ac + \frac{b^2}{4} = \frac{b^2}{4}$$

Example 72: Sum to n terms of the series $\dfrac{1}{(1 + x)(1 + 2x)} + \dfrac{1}{(1 + 2x)(1 + 3x)} + \dfrac{1}{(1 + 3x)(1 + 4x)} + \dots$ is

(a) $\dfrac{nx}{(1 + x)(1 + nx)}$ (b) $\dfrac{n}{(1 + x)[1 + (n + 1)x]}$

(c) $\dfrac{x}{(1 + x)(1 + (n - 1)x)}$ (d) none of these

Ans. (b)

Solution: If t_r denotes the rth term of the series, then

$$x\,t_r = \frac{x}{(1 + rx)(1 + (r + 1)x)} = \frac{1}{1 + rx} - \frac{1}{1 + (r + 1)x}$$

$$\Rightarrow \quad x\sum_{r=1}^{n} t_r = \sum_{r=1}^{n}\left[\frac{1}{1 + rx} - \frac{1}{1 + (r + 1)x}\right]$$

$$= \frac{1}{1 + x} - \frac{1}{1 + (n + 1)x}$$

$$= \frac{nx}{(1 + x)(1 + (n + 1)x)}$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = \frac{n}{(1 + x)[1 + (n + 1)x]}$$

Example 73: If $a_1, a_2, \dots a_n$ are in H.P. then the expression $a_1a_2 + a_2a_3 + \dots + a_{n-1}a_n$ is equal to

(a) $(n - 1)a_1 a_n$ (b) $n(a_1 - a_n)$
(c) $(n - 1)(a_1 - a_n)$ (d) $na_1 a_n$

Ans. (a)

Solution: $a_1, a_2, \dots a_n$ are in H.P.

$$\Rightarrow \quad \frac{1}{a_1}, \frac{1}{a_2}, \dots \frac{1}{a_n} \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{1}{a_2} - \frac{1}{a_1} = \frac{1}{a_3} - \frac{1}{a_2} = \cdots \frac{1}{a_n} - \frac{1}{a_{n-1}} = d \text{ (say)}$$

$$\Rightarrow \quad a_1a_2 = \frac{1}{d}(a_1 - a_2),\ a_2a_3 = \frac{1}{d}(a_2 - a_3), \dots$$

$$a_{n-1}a_n = \frac{1}{d}(a_{n-1} - a_n)$$

Thus, $$a_1a_2 + a_2a_3 + \dots + a_{n-1}a_n$$

$$= \frac{1}{d}[a_1 - a_2 + a_2 - a_3 + \dots + a_{n-1} - a_n]$$

$$= \frac{1}{d}(a_1 - a_n)$$

But $$\frac{1}{a_n} = \frac{1}{a_1} + (n - 1)d \ \Rightarrow\ \frac{a_1 - a_n}{a_n a_1} = (n - 1)d$$

$$\therefore \quad a_1a_2 + a_2a_3 + \dots + a_{n-1}a_n = (n - 1)a_1 a_n$$

Example 74: If the sum of the series $2 + \dfrac{5}{x} + \dfrac{25}{x^2} + \dfrac{125}{x^3} + \dots$ is finite, then

(a) $|x| > 5$ (b) $-5 < x < 5$
(c) $|x| < 5/2$ (d) $|x| > 5/2$

Ans. (a)

Solution: We can rewrite the series as

$$1 + 1 + \frac{5}{x} + \left(\frac{5}{x}\right)^2 + \left(\frac{5}{x}\right)^3 + \dots$$

We can sum up this series if $\left|\frac{5}{x}\right| < 1 \quad \Leftrightarrow \quad |x| > 5$

Example 75: In a G.P. consisting of positive terms, each term equals the sum of the next two terms. Then common ratio of the G.P. is

(a) $\frac{1}{2}(1-\sqrt{5})$ (b) $\frac{1}{2}\sqrt{5}$

(c) $\sqrt{5}$ (d) $\frac{1}{2}(\sqrt{5}-1)$

Ans. (d)

Solution: We are given

$$ar^n = ar^{n+1} + ar^{n+2} \ \forall \ n \geq 1$$

$$\Rightarrow \quad 1 = r + r^2 \Rightarrow r^2 + r - 1 = 0 \Rightarrow r = \frac{1}{2}(-1 \pm \sqrt{5})$$

As G.P. is of positive terms, $r > 0$. Thus, $r = \frac{1}{2}(\sqrt{5}-1)$

Example 76: Suppose a, b, c, are in A.P. and $-1 < a, b, c < 1$. Let $x = \sum_{n=0}^{\infty} a^n$, $y = \sum_{n=0}^{\infty} b^n$, $z = \sum_{n=0}^{\infty} c^n$, then x, y, z are in

(a) A.P. (b) G.P.

(c) H.P. (d) none of these

Ans. (c)

Solution: We have $\quad x = \frac{1}{1-a},\ y = \frac{1}{1-b},\ z = \frac{1}{1-c}.$

As a, b, c are in A.P., $-a, -b, -c$ are in A.P. $\Rightarrow 1-a, 1-b, 1-c$ are in A.P.

$\Rightarrow \frac{1}{1-a}, \frac{1}{1-b}, \frac{1}{1-c}$ are in H.P.

Example 77: If $\log_5 2$, $\log_5(2^x - 5)$ and $\log_5(2^x - 7/2)$ are in A.P., then x is equal to

(a) 7 (b) 3

(c) 4, 5 (d) 8

Ans. (b)

Solution: As $\log_5 2$, $\log_5(2^x - 5)$, $\log_5(2^x - 7/2)$ are in A.P., we get

$$2\log_5(2^x - 5) = \log_5 2 + \log_5(2^x - 7/2)$$

$$\Rightarrow \quad (2^x - 5)^2 = 2(2^x - 7/2)$$

$$\Rightarrow (2^x)^2 - 12\,(2^x) + 32 = 0 \quad \Rightarrow \quad (2^x - 4)\,(2^x - 8) = 0$$

$$\Rightarrow \qquad 2^x = 2^2, 2^3 \qquad \Rightarrow \qquad x = 2, 3.$$

Clearly, $x \neq 2$. Therefore $x = 3$

Example 78: Sum of the series $\sum_{r=1}^{n} r \log \frac{r+1}{r}$ is

(a) $\log \frac{(n+1)^n}{n!}$ (b) $\frac{\log(n+1)}{n!}$

(c) $n! \log(n+1)$ (d) none of these

Ans. (a)

Solution: Let $t_r = r \log \frac{r+1}{r} = r\,[\log(r+1) - \log r]$

$$= (r+1)\log(r+1) - r\log r - \log(r+1)$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = \sum_{r=1}^{n} \{(r+1)\log(r+1) - r\log r\} - \sum_{r=1}^{n} \log(r+1)$$

$$= (n+1)\log(n+1) - 1\log 1 - \log(n+1)!$$

$$= \log \frac{(n+1)^{n+1}}{(n+1)!} = \log \frac{(n+1)^n}{n!}$$

Example 79: Let A_1, A_2 be two arithmetic means, G_1, G_2 be two geometric means, and H_1, H_2 be two harmonic means between two positive numbers a and b, then values $\frac{G_1 G_2}{H_1 H_2} \cdot \frac{H_1 + H_2}{A_1 + A_2}$ is

(a) $\frac{1}{2}$ (b) $\frac{3}{2}$

(c) 1 (d) 2

Ans. (c)

Solution: We have $A_1 + A_2 = a + b$,

$$G_1 G_2 = ab \text{ and } \frac{1}{H_1} + \frac{1}{H_2} = \frac{1}{a} + \frac{1}{b}.$$

$$\therefore \quad \frac{G_1 G_2}{H_1 H_2} \cdot \frac{H_1 + H_2}{A_1 + A_2} = \frac{G_1 G_2}{A_1 + A_2}\left(\frac{1}{H_1} + \frac{1}{H_2}\right)$$

$$= \frac{ab}{a+b}\left(\frac{1}{a} + \frac{1}{b}\right) = 1.$$

Example 80: Sum of the series $S_n = (n)\,(n) + (n-1)\,(n+1) + (n-2)\,(n+2) + \ldots + 1(2n-1)$ is

(a) $\frac{1}{6}\,n\,(n+1)\,(n+2)$ (b) $\frac{1}{3}n^3 - n^2$

(c) n^3 (d) none of these.

Ans. (d)

Solution: $S_n = \sum_{r=0}^{n-1} (n-r)\,(n+r) = \sum_{r=0}^{n-1} (n^2 - r^2)$

$$= n^3 - \frac{1}{6}(n-1)\,n(2n-1)$$

Example 81: Suppose for each $n \in \mathbf{N}$, $1^4 + 2^4 + 3^4 + \ldots + n^4 = an^5 + bn^4 + cn^3 + dn^2 + en + f$, then value of b is

(a) 1/5 (b) 1/2

(c) 1/3 (d) 1

Ans. (b)

Solution: We have

$$1^4 + 2^4 + \ldots + n^4 = an^5 + bn^4 + cn^3 + dn^2 + en + f \qquad (1)$$

and $\qquad 1^4 + 2^4 + \ldots + n^4 + (n+1)^4$

$$= a(n+1)^5 + b(n+1)^4 + c(n+1)^3 + d(n+1)^2 + e(n+1) + f \qquad (2)$$

Subtracting (1) from (2), we get

$$(n+1)^4 = a[(n+1)^5 - n^5] + b[(n+1)^4 - n^4] + c\,[(n+1)^3 - n^3] + d[(n+1)^2 - n^2] + e\,[(n+1) - n]$$

Comparing coefficients fo n^4, we get

$$1 = 5a \quad \Rightarrow \quad a = 1/5$$

Comparing coefficient fo n^3, we get

$$4 = a\,({}^5C_2) + 4b \Rightarrow b = 1/2.$$

◉ **Example 82:** Value of $S = 2012 + \frac{1}{3}\left(2011 + \frac{1}{3}\left(2010 + \frac{1}{3}(2009 + \dots + \frac{1}{3}\left(2 + \frac{1}{3}(1)\right)\dots\right)\right)$ is

(a) 3018 (b) 3017.5

(c) $3017.5 - \frac{1}{4}\left(\frac{1}{3}\right)^{2011}$ (d) $3018 - \frac{1}{4}\left(\frac{1}{3}\right)^{2011}$

Ans. (c)

◎ **Solution:** Note that

$$S = 2012 + \frac{1}{3}(2011) + \frac{1}{3^2}(2010) + \frac{1}{3^3}(2009) + \dots + \frac{1}{3^{2011}}$$

This is an A.G.P. with $a = 2012$, $b = 1$, $d = -1$, $r = 1/3$, $n = 2012$

Thus,
$$S = \frac{2012}{1 - 1/3} + \frac{(-1)(1)(1 - (1/3)^{2011})}{1 - 1/3} - \frac{[2012 + (2012 - 1)(-1)](1)(1/3)^{2012}}{(1 - 1/3)^2}$$

$$= 3018 - \frac{1}{2}\left[1 - \left(\frac{1}{3}\right)^{2011}\right] - \frac{1}{4}\left(\frac{1}{3}\right)^{2010}$$

$$= 3017.5 - \frac{1}{4}\left(\frac{1}{3}\right)^{2011}$$

◉ **Example 83:** Suppose a, b, c are positive real numbers satisfying the system of equations

$$(a^2 + ab + b^2)(b^2 + bc + c^2)(c^2 + ca + a^2) = abc \qquad (1)$$

and
$$(a^4 + a^2b^2 + b^4)(b^4 + b^2c^2 + c^4)(c^4 + c^2a^2 + a^4) = a^3b^3c^3 \qquad (2)$$

then

(a) $a = b = c = 1/3$

(b) $abc = 1$

(c) $\frac{1}{3}(a + b + c) = (abc)^{1/2}$

(d) a, b, c are in G.P.

Ans. (a)

◎ **Solution:** We have $a^4 + a^2b^2 + b^4 = (a^2 + b^2)^2 - a^2b^2 = (a^2 + ab + b^2)(a^2 - ab + b^2)$ etc.

Thus, dividing (2) by (1), we get

$$(a^2 - ab + b^2)(b^2 - bc + c^2)(c^2 - ca + a^2) = a^2b^2c^2 \qquad (3)$$

But A.M. ≥ G.M.

$$\Rightarrow \quad \frac{1}{2}(x^2 + y^2) \ge x^2y^2$$

and the equality holds if and only if $x = y$.

$$\Rightarrow \quad x^2 - xy + y^2 \ge xy \ \forall\ x, y > 0$$

and the equality holds if and only if $x = y$.

Thus, equality in (3) can hold if and only if $a = b = c$.

Putting this in (1), we obtain

$$(3a^2)^3 = a^3 \quad \Rightarrow \quad a^3 = (1/3)^3 \text{ or } a = 1/3.$$

$$\therefore \quad a = b = c = 1/3.$$

◉ **Example 84:** Suppose a, b, c are distinct positive real numbers such that a, $2b$, $3c$ are in A.P. and a, b, c are in G.P. The common ratio of G.P. is

(a) 2 (b) 1/2

(c) 1/3 (d) 3

Ans. (c)

◎ **Solution:** We have $2(2b) = a + 3c$ and $b^2 = ac$

$$\therefore \quad \frac{1}{16}(a + 3c)^2 = ac$$

$$\Rightarrow \quad a^2 + 9c^2 + 6ac = 16ac$$

$$\Rightarrow \quad a^2 - 10ac + 9c^2 = 0$$

$$\Rightarrow \quad (a - c)(a - 9c) = 0 \Rightarrow a = 9c \ [\because \ a \ne c]$$

$$\Rightarrow \quad \frac{c}{a} = \frac{1}{9} \text{ or } r^2 = \frac{1}{9} \Rightarrow r = \frac{1}{3}$$

$[\because a, b, c > 0]$

◉ **Example 85:** Let S_n denote the sum of the cubes of first n natural numbers and s_n denote the sum of the first n natural numbers. Then $\sum_{r=1}^{n} \frac{S_r}{s_r}$ equals

(a) $\frac{1}{2}n(n + 1)$ (b) $\frac{1}{2}(n + 1)(n + 2)$

(c) $\frac{1}{6}n(n + 1)(n + 2)$ (d) $\frac{1}{4}n^2(n + 1)^2$

Ans. (c)

◎ **Solution:** We have

$$S_r = 1^3 + 2^3 + \dots r^3 = \frac{1}{4}r^2(r + 1)^2$$

$$s_r = 1 + 2 + \dots + r = \frac{1}{2}r(r + 1)$$

$$\Rightarrow \quad \frac{S_r}{s_r} = \frac{1}{2}r(r + 1) = \frac{1}{2}(r^2 + r)$$

$$\Rightarrow \quad \sum_{r=1}^{n}\frac{S_r}{s_r} = \frac{1}{2}\sum_{r=1}^{n}(r^2+r)$$

$$= \frac{1}{2}\left[\frac{1}{6}n(n+1)(2n+1)+\frac{1}{2}n(n+1)\right]$$

$$= \frac{1}{12}n(n+1)(2n+1+3) = \frac{1}{6}n(n+1)(n+2)$$

◉ **Example 86:** The sum to infinity of the series

$S = 1+\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\ldots$ is

(a) 4 (b) 6

(c) 2 (d) 3

Ans. (d)

◎ **Solution:** Let $S = 1+\frac{2}{3}+\frac{6}{3^2}+\frac{10}{3^3}+\frac{14}{3^4}+\ldots$

$$\frac{1}{3}S = \frac{1}{3}+\frac{2}{3^2}+\frac{6}{3^3}+\frac{10}{3^4}+\ldots$$

Subtracting, we get

$$\frac{2}{3}S = 1+\frac{1}{3}+\frac{4}{3^2}+\frac{4}{3^3}+\frac{4}{3^4}+\ldots$$

$$= 1+\frac{1}{3}+\frac{4/3^2}{1-1/3} = \frac{4}{3}+\frac{2}{3} = 2$$

$$\Rightarrow \quad S = 3$$

◉ **Example 87:** Sum of the series $P = \frac{1}{2\sqrt{1}+\sqrt{2}}$

$+\frac{1}{3\sqrt{2}+2\sqrt{3}}+\ldots+\frac{1}{100\sqrt{99}+99\sqrt{100}}$ is

(a) 1/10 (b) 3/10

(c) 9/10 (d) 1/2

Ans. (c)

◎ **Solution:** Let t_r denote the rth term of the series, then

$$t_r = \frac{1}{(r+1)\sqrt{r}+r\sqrt{r+1}} = \frac{1}{\sqrt{r(r+1)}}\ \frac{1}{\sqrt{r+1}+\sqrt{r}}$$

$$= \frac{\sqrt{r+1}-\sqrt{r}}{\sqrt{r(r+1)}} = \frac{1}{\sqrt{r}}-\frac{1}{\sqrt{r+1}}$$

Thus, $$P = \sum_{r=1}^{99}\left[\frac{1}{\sqrt{r}}-\frac{1}{\sqrt{r+1}}\right] = 1-\frac{1}{\sqrt{100}} = \frac{9}{10}$$

◉ **Example 88:** Let $x = \sqrt{2\sqrt{2\sqrt{2\sqrt{2\ldots \text{upto } \infty}}}}$ and

$y = \sqrt{2+\sqrt{2+\sqrt{2+\sqrt{2+\ldots \text{upto } \infty}}}}$, then $x - y$ equals

(a) 0 (b) 1

(c) 2 (d) none of these

Ans. (a)

◎ **Solution:** We have

$$x^2 = 2x \text{ and } y^2 = 2 + y$$

$$\Rightarrow \quad x(x-2) = 0 \text{ and } (y-2)(y+1) = 0$$

$$\Rightarrow \quad x = 2,\ y = 2 \qquad [\because \quad x, y > 0]$$

$$\Rightarrow \quad x - y = 0$$

◉ **Example 89:** If $[x]$ denotes the greatest integer $\le x$, then value of $S = \left[\sqrt{1}\right]+\left[\sqrt{2}\right]+\left[\sqrt{3}\right]+\ldots+\left[\sqrt{2024}\right]$ is

(a) 59000 (b) 58750

(c) 59730 (d) 65138

Ans. (c)

◎ **Solution:** For any positive integer k and x, we have

$$[\sqrt{x}] = k \Leftrightarrow k^2 \le x < (k+1)^2 \Leftrightarrow x \in [k^2, k^2+2k)$$

$$\therefore \quad [\sqrt{x}] = 1 \quad \text{for } x = 1, 2, 3,$$

$$[\sqrt{x}] = 2 \quad \text{for } x = 4, 5, 6, 7, 8,$$

$$[\sqrt{x}] = 3 \quad \text{for } x = 9, 10, 11, 12, 13, 14, 15,$$

$$\vdots \quad \vdots \quad \vdots$$

$$[\sqrt{x}] = 44 \quad \text{for } x = 1936, \ldots, 2024$$

Thus,

$$S = (1)(3) + (2)(5) + 3(7) + \ldots + 44(89)$$

$$= \sum_{k=1}^{44}(k)(2k+1) = 2\sum_{k=1}^{44}(k)^2+\sum_{k=1}^{44}(k)$$

$$= \frac{2}{6}(44)(45)(89)+\frac{1}{2}(44)(45)$$

$$= 59730$$

◉ **Example 90:** A person is to count 4500 currency notes. Let a_n denote the number of notes he counts in the n^{th} minute. If $a_1 = a_2 = \ldots = a_{10} = 150$ and $a_{10}, a_{11}, \ldots$ are in an A.P. with common difference –2, then the time taken by him to count all the notes is

(a) 125 minutes (b) 135 minutes

(c) 24 minutes (d) 34 minutes

Ans. (d)

◎ **Solution:** Suppose he takes n minutes to count 4500 notes. We have $a_1 + a_2 + \ldots + a_{10} = 10(150)$, $a_{11} = 148$ and $a_{11}, a_{12}, \ldots, a_n$ is an A.P. with common difference $d = -2$. We are given

$$a_1 + a_2 + \ldots + a_{10} + a_{11} + \ldots + a_n = 4500$$

$$\Rightarrow \quad a_{11} + a_{12} + \ldots + a_n = 3000$$

$$\Rightarrow \quad \frac{n-10}{2}[a_{11} + a_n] = 3000$$

$$\Rightarrow \quad \frac{1}{2}(n-10)[148 + 148 + (n-11)(-2)] = 3000$$

$$\Rightarrow \quad (n-10)(148 - n + 11) = 3000$$

$$\Rightarrow \quad (n-10)(159 - n) = 3000$$

$$\Rightarrow \quad n^2 - 169n + 4590 = 0$$

$$\Rightarrow \quad n^2 - 135n - 34n + 4590 = 0$$

$$\Rightarrow \quad (n-135)(n-34) = 0 \quad \Rightarrow \quad n = 135, 34$$

All the notes get counted in 34 minutes.

Example 91: A man saves ₹ 200 in each of the first three months of his service. In each of the subsequent months his savings was ₹ 40 more than the savings of the immediately previous month. His total savings from the start of service will be ₹ 11040 after

(a) 21 months (b) 18 months
(c) 19 months (d) 20 months

Ans. (a)

Solution: Suppose his total savings is ₹ 11040 after n months. His savings are

$$200, 200, 200, 240, 280, \dots \text{ upto } n \text{ terms}$$

Note that

$$200, 240, 280, \dots \text{ upto } (n-2) \text{ terms}$$

is an A.P. whose sum is 10640.

Thus,

$$\frac{1}{2}(n-2)[2(200)+(n-3)(40)] = 10640$$

$$\Rightarrow (n-2)(n+7) = 532$$

$$\Rightarrow n^2 + 5n - 546 = 0 \Rightarrow n = -26, 21$$

As $n > 0$, $n = 21$.

Example 92: Let a_n be the nth term of an A.P. If $\sum_{r=1}^{100} a_{2r} = \alpha$ and $\sum_{r=1}^{100} a_{2r-1} = \beta$, then the common difference of the A.P. is:

(a) $\alpha - \beta$ (b) $\frac{1}{100}(\alpha - \beta)$
(c) $\beta - \alpha$ (d) $\frac{1}{200}(\alpha - \beta)$

Ans. (b)

Solution: Let d the common difference of the A.P., then

$$\alpha - \beta = \sum_{r=1}^{100}\left(a_{2r} - a_{2r-1}\right) = \sum_{r=1}^{100} d = 100d$$

$$\Rightarrow d = \frac{1}{100}(\alpha - \beta).$$

Example 93: If m times the mth term of an A.P. with non-zero common difference equals n times the nth term of the A.P., where $m \neq n$, then $(m + n)$th term of this A.P. is

(a) $(m + n)$ times mth term
(b) zero
(c) $m + n$
(d) $-(m + n)$

Ans. (b)

Solution: Let a be the first term and d be the common difference of the A.P. We thve

$$ma_m = na_n$$

$$\Rightarrow \quad m[a + (m-1)d] = n[a + (n-1)d]$$

$$\Rightarrow \quad (m-n)(a-d) + (m^2 - n^2)d = 0$$

$$\Rightarrow \quad (m-n)[a - d + (m+n)d] = 0$$

$$\Rightarrow \quad a + (m + n - 1)d = 0 \qquad [\because m \neq n]$$

$$\Rightarrow \quad a_{m+n} = 0$$

Example 94: Let $a_1, a_2, \dots$ be in H.P. with $a_1 = 5$ and $a_{20} = 25$. The least positive integer n for which $a_n < 0$ is

(a) 22 (b) 23
(c) 24 (d) 25

Ans. (d)

Solution: $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \dots$ are in A.P.

Let d be the common difference of this A.P., then

$$\frac{1}{a_{20}} - \frac{1}{a_1} = 19d$$

$$\Rightarrow \quad \frac{1}{25} - \frac{1}{5} = 19d \Rightarrow d = -\frac{4}{475}$$

Now, $$a_n < 0 \Rightarrow \frac{1}{5} - \frac{(n-1)4}{475} < 0$$

$$\Rightarrow \quad n - 1 > 95/4 \Rightarrow n \geq 25.$$

Thus, least value of n is 25.

Example 95: A species has an initial population 4^{10}. At the end of first day, the population increases by 50%. At the end of second day, it decreases by the same percentage. If the process continues in the same pattern, the number of days for the population to reach 3^{10} is

(a) 10 (b) 20
(c) 50 (d) 100

Ans. (b)

Solution: Let a_n be the population at the end of nth day, then

$$a_n = \begin{cases} 4^{10}\left(\frac{3}{2}\right)^{n/2}\left(\frac{1}{2}\right)^{n/2} & \text{if } n \text{ is even} \\ 4^{10}\left(\frac{3}{2}\right)^{(n+1)/2}\left(\frac{1}{2}\right)^{(n-1)/2} & \text{is } n \text{ is odd} \end{cases}$$

$$= \begin{cases} 4^{10}(3/4)^{n/2} & \text{if } n \text{ is even} \\ 4^{10}\left(\frac{3}{4}\right)^{(n-1)/2}\left(\frac{3}{2}\right) & \text{if } n \text{ is odd} \end{cases}$$

As all answers are even natural numbers we set $a_n = 3^{10}$ assuming n to be even.

$$\Rightarrow \quad 4^{10}\left(\frac{3}{4}\right)^{n/2} = 3^{10} \Rightarrow n = 20$$

Remark

- ❖ $a_n = 3^{10}$ is not possible for any odd n.

Example 96: The sum of first three terms of an increasing A.P. is 9 and sum of their squares is 35. The sum to n terms of the series is

(a) $3n^2$ (b) $2n^2$
(c) $6n - 2n^2$ (d) n^2

Ans.(d)

Solution: Let d be common difference of the A.P., then

$$(a_2 - d) + a_2 + (a_2 + d) = 9$$

and $$(a_2 - d)^2 + a_2^2 + (a_2 + d)^2 = 35$$

$$\Rightarrow \quad a_2 = 3 \text{ and } 3a_2^2 + 2d^2 = 35$$

$$\Rightarrow \quad d = 2.$$

$$S_n = \frac{n}{2}[2a_1 + (n-1)d] = \frac{n}{2}\,[2a_2 + (n-3)d]$$

$$= \frac{n}{2}\,[2(3) + (n-3)\,(2)] = n^2$$

Example 97: The series of natural numbers is divided into groups (1), (2, 3, 4), (5, 6, 7, 8, 9), and so on. The sum of first and last term of the nth group is

(a) $2\,(n^2 - n + 1)$ (b) $n^2 - 2n + 2$
(c) $n^2 + n$ (d) $n^2 - n + 2$

Ans. (a)

Solution: Note that the nth group contain $(2n - 1)$ natural number and the last term of the nth group is

$$1 + 3 + 5 + \ldots + (2n - 1) = n^2$$

$$\therefore \text{ First terms of } n\text{th group is } (n-1)^2 + 1$$

Thus, sum of first and last term of nth group is

$$n^2 + (n-1)^2 + 1 = 2(n^2 - n + 1)$$

Example 98: In an arithmetic progression of 16 distinct terms with $a_1 = 16$, the sum is equal to square of the last term. The common difference of the A.P. is

(a) 8/15 (b) – 4/5
(c) – 8/5 (d) – 8/15

Ans. (c)

Solution: We are given

$$\frac{16}{2}\,[a_1 + a_{16}] = a_{16}^2$$

$$\Rightarrow \quad a_{16}^2 - 8a_{16} - (8)\,(16) = 0$$

$$\Rightarrow \quad (a_{16} - 16)\,(a_{16} + 8) = 0$$

As $a_{16} \neq 16 = a_1$, $a_{16} = -8$

Now, $a_{16} - a_1 = -24 \Rightarrow 15d = -24$

$$\Rightarrow \quad d = -8/5$$

Assertion-Reason Type Questions

Example 99: Suppose $\dfrac{a-x}{px} = \dfrac{a-y}{qy} = \dfrac{a-z}{rz}$.

Statement-1: If p, q, r are in A.P., then x, y, z are in H.P.
Statement-2: If p, q, r are in H.P., then x, y, z are in G.P.

Ans. (c)

Solution: Suppose

$$\frac{a-x}{px} = \frac{a-y}{qy} = \frac{a-z}{rz} = k \text{ (say)}$$

$$\Rightarrow \quad p = \frac{a-x}{kx},\ q = \frac{a-y}{ky},\ r = \frac{a-z}{kz}$$

Now, p, q, r are in A.P.

$$\Rightarrow \quad \frac{a-x}{kx}, \frac{a-y}{ky}, \frac{a-z}{kz} \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{a}{x} - 1, \frac{a}{y} - 1, \frac{a}{z} - 1 \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{a}{x}, \frac{a}{y}, \frac{a}{z} \text{ are in A.P.} \quad \Rightarrow \quad x, y, z \text{ are in H.P.}$$

Next, p, q, r are in H.P.

$$\Rightarrow \quad \frac{kx}{a-x}, \frac{ky}{a-y}, \frac{kz}{a-z} \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{x}{a-x}, \frac{y}{a-y}, \frac{z}{a-z} \text{ are in A.P.}$$

$$\Rightarrow \quad \frac{x}{a-x} + 1, \frac{y}{a-y} + 1, \frac{z}{a-z} + 1 \text{ are in A.P.}$$

$\Rightarrow$ $a - x, a - y, a - z$ are in H.P.

Nothing can be said about x, y, z.

Example 100: Let a, b, c, d, e be five non-zero numbers such that a, b, c are in A.P., b, c, d are in G.P, and c, d, e are in H.P.

Statement-1: If $a = 2$, $e = 18$, $b > 0$, then $b = 4$ and $c = 6$.
Statement-2: If $a = 2$, $e = 18$, $c = -6$, then $b < 0$.

Ans. (b)

Solution: $a + c = 2b$, $c^2 = bd$ and $d = \dfrac{2ce}{c+e}$.

Now, $$a = 2, e = 18 \quad \Rightarrow \quad b = \frac{2+c}{2},\ d = \frac{36c}{c+18}.$$

$$\therefore \quad c^2 = \frac{1}{2}(2+c)\left(\frac{36c}{c+18}\right)$$

$$\Rightarrow \quad c(c + 18) = 18(c + 2)$$

$$\Rightarrow \quad c^2 = 36 \quad \Rightarrow \quad c = \pm 6.$$

If $c = 6$, then $b = \dfrac{2+6}{2} = 4$

If $c = -6$, then $b = \dfrac{2-6}{2} = -2 < 0$.

◉ **Example 101:** Suppose a, b, c, d are four real numbers and

$$\Delta(x) = \begin{vmatrix} x+a & x+b & x+a-c \\ x+b & x+c & x-1 \\ x+c & x+d & x-b+d \end{vmatrix},$$

Statement-1: If a, b, c, d are in A.P. and $\int_0^2 \Delta(x)\,dx = -4$, then common difference of the A.P. is ± 1

Statement-2: If a, b, c, d are in A.P., then $\Delta(x)$ is independent of x.

Ans. (b)

◎ **Solution:** Let D be the common difference of the A.P. Using $R_3 \to R_3 - R_2$ and $R_2 \to R_2 - R_1$, we get

$$\Delta(x) = \begin{vmatrix} x+a & x+b & x+a-c \\ D & D & 2D-1 \\ D & D & 2D+1 \end{vmatrix}$$

Again using $C_1 \to C_1 - C_2$, we get

$$\Delta(x) = \begin{vmatrix} -D & x+b & x+a-d \\ 0 & D & 2D-1 \\ 0 & D & 2D+1 \end{vmatrix} = -2D^2$$

Now, $\int_0^2 (-2D^2)dx = -4 \;\Rightarrow\; 4D^2 = 4 \;\Rightarrow\; D = \pm 1$

Also, $\Delta(x)$ is independent of x.

◉ **Example 102:** Suppose a^2, b^2, c^2 are in A.P.

Statement-1: $\dfrac{a}{b+c}, \dfrac{b}{c+a}, \dfrac{c}{a+b}$ are in H.P.

Statement-2: $b + c$, $c + a$, $a + b$ are in H.P.

Ans. (d)

◎ **Solution:** a^2, b^2, c^2 are in A.P.

$\Rightarrow$ $a^2 + bc + ca + ab,\ b^2 + bc + ca + ab,\ c^2 + ab + bc + ca$ are in A.P.

$\Rightarrow$ $(a + b)(a + c),\ (b + a)(b + c),\ (c + a)(c + b)$ are in A.P.

Dividing by $(b + c)(c + a)(a + b)$, we get

$$\frac{1}{b+c}, \frac{1}{c+a}, \frac{1}{a+b} \text{ are in A.P.} \qquad (1)$$

$\Rightarrow$ $b + c$, $c + a$, $a + b$ are in H.P.

and $\dfrac{a+b+c}{b+c}, \dfrac{a+b+c}{c+a}, \dfrac{a+b+c}{a+b}$ are in A.P.

$\Rightarrow$ $\dfrac{a}{b+c}+1, \dfrac{b}{c+a}+1, \dfrac{c}{a+b}+1$ are in A.P.

$\Rightarrow$ $\dfrac{a}{b+c}, \dfrac{b}{c+a}, \dfrac{c}{a+b}$ are in A.P.

◉ **Example 103:** The natural numbers are divided into rows as follows:

$$\begin{array}{ccccc} & & 1 & & \\ & 2 & 3 & 4 & \\ 5 & 6 & 7 & 8 & 9 \\ \multicolumn{5}{c}{\cdots\cdots\cdots\cdots} \end{array}$$

Statement-1: Sum of the numbers in the 10th row is a number which can be written as sum of two cubes in two different ways.

Statement-2: Sum of the numbers in the rth row is $\dfrac{1}{3}(r^3 + (r + 1)^3)$ if $r \ge 2$.

Ans. (c)

◎ **Solution:** The rth row contains $(2r - 1)$ numbers and its last term is r^2.

When read from right to left the rth row forms an A.P. with first term r^2 and common difference – 1.

$\therefore$ sum of the terms in the rth row

$$= \frac{2r-1}{2}[2(r^2) + (2r - 1 - 1)(-1)]$$

$$= (2r - 1)(r^2 - r + 1) = r^3 + (r - 1)^3$$

Sum of the terms in the 10th row

$$= 10^3 + 9^3 = 1729 = 12^3 + 1^3$$

◉ **Example 104:** **Statement-1:** The sum of the series

$$1 + (1 + 2 + 4) + (4 + 6 + 9) + (9 + 12 + 16) + \ldots + (361 + 380 + 400) \text{ is } 8000$$

Statement-2: $\displaystyle\sum_{k=1}^{n}\left(k^3 - (k-1)^3\right) = n^3$

for each natural number n.

Ans. (a)

◎ **Solution:** Statement-2 is true since

$$\sum_{k=1}^{n}\left(k^2 - (k-1)^3\right) = (1^3 - 0^3) + (2^3 - 1^3) + \ldots + (n^3 - (n-1)^3) = n^3$$

$$\Rightarrow \quad \sum_{k=1}^{n}(k-(k-1))\left((k^2 + k(k-1) + (k-1)^2\right) = n^3$$

$$\Rightarrow \quad \sum_{k=1}^{n}\left(k^2 + k(k-1) + (k-1)^2\right) = n^3$$

Putting $n = 20$, we get

$$\sum_{k=1}^{20}\left((k-1)^2 + k(k-1) + k^2\right) = 20^3$$

$\Rightarrow$ $1 + (1 + 2 + 4) + (4 + 6 + 9) + \ldots + (361 + 380 + 400) = 8000$

Thus, Statement-1 is also true and Statement-2 is a correct reason for it.

Example 105: Statement-1: For every natural number $n \geq 2$,

$$\frac{1}{\sqrt{1}}+\frac{1}{\sqrt{2}}+\ldots+\frac{1}{\sqrt{n}} > \sqrt{n}$$

Statement-2: For every natural number $n \geq 2$,

$\sqrt{n(n+1)} < n + 1$

Ans. (b)

Solution: As $n < n + 1 \; \forall \; n \geq 2$

$\Rightarrow \quad n(n + 1) < (n + 1)^2 \; \forall \; n \geq 2$

$\Rightarrow \quad \sqrt{n(n+1)} < n + 1 \; \forall \; n \geq 2$

Thus, Statement-2 is true.

Also, for $n \geq 2$

$$\frac{1}{\sqrt{1}}+\frac{1}{\sqrt{2}}+\ldots+\frac{1}{\sqrt{n}}$$

$$> \underbrace{\frac{1}{\sqrt{n}}+\frac{1}{\sqrt{n}}+\ldots+\frac{1}{\sqrt{n}}}_{n \text{ times}}$$

$$\Rightarrow \quad \frac{1}{\sqrt{1}}+\frac{1}{\sqrt{2}}+\ldots+\frac{1}{\sqrt{n}} > \sqrt{n}$$

$\therefore$ Statement-1 is true.

Thus, both the statements are correct but Statement-2 is not a correct explanation of Statement-1.

LEVEL 2

Straight Objective Type Questions

Example 106: If $(1- y)\,(1 + 2x + 4x^2 + 8x^3 + 16x^4 + 32x^5) = 1 - y^6$, $(y \neq 1)$, then a value y/x is

(a) 1/2 (b) 2

(c) 1/4 (d) 4

Ans. (b)

Solution: We can rewrite the given expression as

$$(1 - y)\,\frac{\left[1-(2x)^6\right]}{1-2x} = 1 - y^6,$$

one of the possible values of y is clearly $2x$. Therefore, one of the possible values of y/x is 2.

Example 107: If $\frac{22}{7}$ and π appear as two distinct terms of an A.P., then common difference of the A.P. must be

(a) an integer

(b) a rational number

(c) an irrational number

(d) 0

Ans. (c)

Solution: Let the A.P. be $a_1, a_2, \ldots$ suppose

$$a_m = \frac{22}{7} \text{ and } a_n = \pi$$

If d is the common difference of the A.P., then

$$(m - n)d = a_m - a_n = \frac{22}{7} - \pi$$

$$\Rightarrow \quad d = \frac{1}{m-n}\left(\frac{22}{7} - \pi\right)$$

which is a irrational number as π is an irrational number.

Example 108: Let $a_m = \underbrace{111\ldots1}_{m \text{ times}}$, then which of the following is a prime number?

(a) a_4 (b) a_5

(c) a_{91} (d) a_{100}

Ans. (b)

Solution: Show that a_5 is not divisible by any prime upto 105.

Example 109: Let $I_n = \int\limits_0^{\pi/4} \tan^n x \, dx$. Then $I_2 + I_4$, $I_3 + I_5$, $I_4 + I_6$, $I_5 + I_7$, …are in

(a) A.P. (b) G.P.

(c) H.P. (d) none of these

Ans. (c)

Solution: We have for $r \geq 2$,

$$I_r + I_{r+2} = \int_0^{\pi/4} \tan^r x\,(1+\tan^2 x)\,dx$$

$$= \int_0^{\pi/4} \tan^r x \sec^2 x \, dx$$

$$= \frac{1}{r+1}\tan^{r+1} x\Big]_0^{\pi/4} = \frac{1}{r+1}$$

Thus, the given sequence becomes,

$$\frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \ldots$$

This is clearly an H.P.

Example 110: If a, b, c are in A.P. p, q, r are in H.P. and ap, bq, cr are in G.P., then $\frac{p}{r}+\frac{r}{p}$ is equal to

(a) $\frac{a}{c}+\frac{c}{a}$ (b) $\frac{a}{c}-\frac{c}{a}$

(c) $\frac{b}{q}+\frac{q}{b}$ (d) $\frac{b}{q}-\frac{a}{p}$

Ans. (a)

◎ **Solution:** According to the given condition

$$2b = a + c,\ q = \frac{2pr}{p+r} \text{ and } b^2q^2 = (ap)\,(cr)$$

Substituting values of b and q from first two expressions in the last expression, we get

$$\frac{(a+c)^2}{4}\left(\frac{2pr}{p+r}\right)^2 = (ac)\,(pr)$$

$$\Rightarrow \quad \frac{(a+c)^2}{ac} = \frac{(p+r)^2}{pr} \quad \Rightarrow \quad \frac{a}{c}+\frac{c}{a} = \frac{p}{r}+\frac{r}{p}$$

● **Example 111:** Sum to n terms of the series $\frac{1}{1\cdot2\cdot3\cdot4}+\frac{1}{2\cdot3\cdot4\cdot5}+\frac{1}{3\cdot4\cdot5\cdot6}+\cdots$ is

(a) $\frac{1}{24}-\frac{1}{n}$ (b) $\frac{1}{18}-\frac{1}{3(n+1)(n+2)(n+3)}$

(c) $\frac{1}{2^n}-\frac{1}{n^2}$ (d) $\frac{1}{18}-\frac{1}{3(n+3)(n+4)}$

Ans. (b)

◎ **Solution:** Let t_r denote the rth term of the given series, then

$$t_r = \frac{1}{r(r+1)(r+2)(r+3)} \text{ and}$$

$$t_{r+1} = \frac{1}{(r+1)(r+2)(r+3)(r+4)}$$

$$\Rightarrow \quad rt_r = \frac{1}{(r+1)(r+2)(r+3)} \text{ and}$$

$$(r+4)t_{r+1} = \frac{1}{(r+1)(r+2)(r+3)}$$

Thus, $rt_r - (r+4)t_{r+1} = 0$

$\Rightarrow$ $rt_r - (r+1)t_{r+1} = 3t_{r+1}$

Putting $r = 1, 2, \ldots, n-2, n-1$, we get

$1t_1 - 2t_2 = 3t_2$

$2t_2 - 3t_3 = 3t_3$

$3t_3 - 4t_4 = 3t_4$

$\ldots$

$(n-2)t_{n-2} - (n-1)t_{n-1} = 3t_{n-1}$

$(n-1)t_{n-1} - nt_n = 3t_n$

Adding above expressions, we get

$$t_1 - nt_n = 3(t_2 + t_3 + \ldots + t_n)$$

$$\Rightarrow \quad 4t_1 - nt_n = 3(t_1 + t_2 + \ldots + t_n)$$

$$\Rightarrow \quad \frac{1}{1\cdot2\cdot3}-\frac{1}{(n+1)(n+2)(n+3)} = 3S_n$$

$$\Rightarrow \quad S_n = \frac{1}{3}\left[\frac{1}{6}-\frac{1}{(n+1)(n+2)(n+3)}\right]$$

● **Example 112:** Sum to n terms of the series $\frac{1}{5!}+\frac{1!}{6!}+\frac{2!}{7!}+\frac{3!}{8!}+\ldots$ is

(a) $\frac{2}{5!}-\frac{1}{(n+1)!}$ (b) $\frac{1}{4}\left(\frac{1}{4!}-\frac{n!}{(n+4)!}\right)$

(c) $\frac{1}{4}\left(\frac{1}{3!}-\frac{3!}{(n+2)!}\right)$ (d) none of these

Ans. (b)

◎ **Solution:** We have $t_r = \frac{(r-1)!}{(r+4)!}$ and $t_{r+1} = \frac{r!}{(r+5)!}$

Now, $rt_r - (r+5)t_{r+1} = \frac{r!}{(r+4)!}-\frac{r!}{(r+4)!} = 0$

$\Rightarrow \quad rt_r - (r+1)t_{r+1} = 4t_{r+1}$

$\Rightarrow \quad 4\sum_{r=1}^{n-1} t_{r+1} = \sum_{r=1}^{n-1}[rt_r - (r+1)\,t_{r+1}]$

$\Rightarrow \quad 4(t_2 + t_3 + \ldots + t_n) = 1t_1 - nt_n$

$\Rightarrow \quad 4(t_1 + t_2 + \ldots t_n) = 5t_1 - nt_n$

$$= 5\left(\frac{0!}{5!}\right)-\frac{n(n-1)!}{(n+4)!} = \frac{1}{4!}-\frac{n!}{(n+4)!}$$

$$\Rightarrow t_1 + t_2 + \ldots + t_n = \frac{1}{4}\left[\frac{1}{4!}-\frac{n!}{(n+4)!}\right]$$

● **Example 113:** Sum to n terms of the series $\frac{1^3}{1}+\frac{1^3+2^3}{1+3}+\frac{1^3+2^3+3^3}{1+3+5}+\ldots$ is

(a) $\frac{n}{24}\,(n^2 + 9n + 13)$ (b) $\frac{n}{24}\,(2n^2 + 7n + 15)$

(c) $\frac{n}{24}\,(2n^2 + 9n + 13)$ (d) $\frac{n}{24}\,(n^2 + 11n + 11)$

Ans. (c)

◎ **Solution:** Let t_r denote the rth term of the series, then

$$t_r = \frac{1^3+2^3+\ldots+r^3}{1+3+\ldots+(2r-1)} = \frac{\frac{1}{4}r^2(r+1)^2}{r^2}$$

$$= \frac{1}{4}(r+1)^2$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = \frac{1}{4}\sum_{r=1}^{n}(r+1)^2 = \frac{1}{4}\left[\sum_{r=1}^{n+1} r^2 - 1\right]$$

$$= \frac{1}{4}\left[\frac{(n+1)\,(n+2)\,(2n+3)}{6} - 1\right]$$

$$= \frac{1}{24}\ [2n^3 + 9n^2 + 13n + 6 - 6]$$

$$= \frac{n}{24}(2n^2 + 9n + 13)$$

◉ **Example 114:** Sum of the series $\sum_{r=1}^{n} \frac{r}{(r+1)!}$ is

(a) $1 - \frac{1}{n!}$ (b) $1 - \frac{1}{(n+1)!}$

(c) $2 - \frac{1}{(n+1)!}$ (d) none of these

Ans. (b)

◎ **Solution:** Let t_r denote the rth term of the series, then

$$t_r = \frac{r}{(r+1)!} = \frac{r+1-1}{(r+1)!} = \frac{1}{r!} - \frac{1}{(r+1)!}$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = \sum_{r=1}^{n}\left(\frac{1}{r!} - \frac{1}{(r+1)!}\right) = 1 - \frac{1}{(n+1)!}$$

◉ **Example 115:** Sum to n terms of the series $\frac{1}{1.2.3} + \frac{3}{2.3.4} + \frac{5}{3.4.5} + \frac{7}{4.5.6} + \ldots$ is

(a) $\frac{n(n+1)}{2(n+2)(n+3)}$ (b) $\frac{n(3n+1)}{4(n+1)(n+2)}$

(c) $\frac{1}{6} - \frac{5}{(n+1)(n+4)}$ (d) none of these

Ans. (b)

◎ **Solution:** We have $t_r = \frac{2r-1}{r(r+1)(r+2)}$ and

$$t_{r+1} = \frac{2r+1}{(r+1)(r+2)(r+3)}$$

$$\Rightarrow \quad rt_r = \frac{2r-1}{(r+1)(r+2)},\ (r+3)t_{r+1} = \frac{2r+1}{(r+1)(r+2)}$$

$$\Rightarrow \quad rt_r - (r+3)t_{r+1} = \frac{-2}{(r+1)(r+2)}$$

$$\Rightarrow \quad rt_r - (r+1)t_{r+1} + 2\left(\frac{1}{r+1} - \frac{1}{r+2}\right) = 2t_{r+1}$$

$$\Rightarrow \quad \sum_{r=1}^{n-1}[rt_r - (r+1)t_{r+1}] + 2\sum_{r=1}^{n-1}\left(\frac{1}{r+1} - \frac{1}{r+2}\right) = 2\sum_{r=1}^{n-1} t_{r+1}$$

$$\Rightarrow \quad t_1 - nt_n + 1 - \frac{2}{n+1} = 2(t_2 + t_3 + \ldots + t_n)$$

$$\Rightarrow \quad 3t_1 - nt_n + 1 - \frac{2}{n+1} = 2\sum_{r=1}^{n} t_r$$

$$\frac{1}{2} - \frac{n(2n-1)}{n(n+1)(n+2)} + \frac{n-1}{n+1} = 2\sum_{r=1}^{n} t_r$$

$$\therefore \quad 2\sum_{r=1}^{n} t_r = \frac{(n+1)(n+2) - 2(2n-1) + 2(n-1)(n+2)}{2\,(n+1)(n+2)}$$

$$\Rightarrow \quad \sum_{r=1}^{n} t_r = \frac{n(3n+1)}{4(n+1)(n+2)}$$

◉ **Example116:** If $\frac{48}{(2)(3)} + \frac{47}{(3)(4)} + \frac{46}{(4)(5)} + \ldots + \frac{2}{(48)(49)} + \frac{1}{(49)(50)}$

$$= \frac{51}{k} + k\left(1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{50}\right)$$

then k is equal to

(a) 2 (b) – 1

(c) – 1/2 (d) 1

Ans. (b)

◎ **Solution:** Let $t_r = \frac{50-r}{r(r+1)}$, $r \geq 2$.

We have $\sum_{r=2}^{49} \frac{50-r}{r(r+1)}$

$$= 50\sum_{r=2}^{49}\left(\frac{1}{r} - \frac{1}{r+1}\right) - \sum_{r=2}^{49} \frac{1}{r+1}$$

$$= 50\left(\frac{1}{2} - \frac{1}{50}\right) - \sum_{r=2}^{49} \frac{1}{r+1}$$

$$= 24 - \sum_{r=1}^{50} \frac{1}{r} + \left(1 + \frac{1}{2}\right)$$

$$= \frac{51}{2} - \sum_{r=1}^{50} \frac{1}{r}$$

$$\therefore \quad k = -1$$

EXERCISES

Concept-based Straight Objective Type Questions

1. Let $a_n = \left[\log\left(\frac{7}{5}\right)\right]^n$ and $b_n = \log_5 (a_n)\ \forall\ n \in \mathbf{N}$. Then $b_1, b_2, b_3, \ldots$ are in

(a) A.P. (b) G.P.
(c) H.P. (d) A.G.P.

2. Suppose a, b, c are positive and form an increasing G.P. If $a + b + c = xb$, then

(a) $x > 3$ (b) $x > 4$
(c) $x > \sqrt{5}$ (d) $x > \sqrt{3} + \sqrt{5}$

3. If for each $n \in \mathbf{N}$, $S_n = nA + \frac{1}{2}n(n + 1)B$ is sum of the first n terms of an A.P., the common difference of the A.P. is

(a) $A + B$ (b) $A + 2B$
(c) B (d) $B/2$

4. An A.P. consists of $2n$ terms. If two middle terms are $\alpha - \beta$ and $\alpha + \beta$, then sum of the $2n$ terms of the A.P. is

(a) $2n\alpha$ (b) $2n\beta$
(c) $2n(\alpha + \beta)$ (d) $2n(\alpha - \beta)$

5. If nth terms of the arithmetic progressions
3, 10, 17, 24, . . .
and 63, 65, 67, 69, . . .
are equal, then n is equal to

(a) 71 (b) 37
(c) 11 (d) 13

6. Suppose $a, c \in \mathbf{Q}$ and $b \in \mathbf{R} - \mathbf{Q}$, then which one of the following can be true?

(a) $a, b + 2, c$ are in A.P. (b) $a, b + 1, c$ are in G.P.
(c) $a, b - 3, c$ are in H.P. (d) $a, b - 2, c$ are in A.P.

7. Suppose $a, b, c > 0$, $x, y, z > 1$ and a, b, c are in G.P. If $a^{\log x} = b^{\log y} = c^{\log z}$, then

(a) x, y, z are in A.P. (b) x, y, z are in G.P.
(c) x, y, z are in H.P. (d) none of these

8. The ratio of the sum of first three terms of a G.P. to the sum of first 6 terms of the G.P. is 125 : 152, then common ratio of the G.P. is

(a) $\frac{2}{3}$ (b) $\frac{3}{4}$
(c) $\frac{3}{5}$ (d) $\frac{2}{5}$

9. There are four numbers of which the first three are in G.P. and the last three are in A.P. with common difference 9. If the first and last number are equal, the sum of the four numbers is

(a) 18 (b) 21
(c) 24 (d) 27

10. Suppose A.M. of two positive numbers be 7 and G.M. between them be 5. The A.M. between their squares is

(a) 57 (b) 73
(c) 78 (d) 37

11. Sum of an infinite G.P. is 2 and sum of their cubes is 24, then 5th term of the G.P. is

(a) 3/16 (b) 3/8
(c) – 3/8 (d) – 3/16

12. Suppose a, b are two positive numbers. The product of three arithmetic means inserted between a, b is 15/2 and product of three arithmetic means inserted between $1/a$ and $1/b$ is 5/18. Then ab is equal to:

(a) 9 (b) 6
(c) 3 (d) 1

13. If $\frac{a+b}{1-ab}, b, \frac{b+c}{1-bc}$ are in A.P., then $\frac{1}{a}, b, \frac{1}{c}$ are in

(a) A.P. (b) G.P.
(c) H.P. (d) A.G.P.

14. The sum of the infinite series

$$\frac{5}{17} + \frac{55}{(17)^2} + \frac{555}{(17)^3} + \cdots$$

is

(a) $\frac{1}{17}$ (b) $\frac{85}{112}$
(c) $\frac{85}{324}$ (d) $\frac{19}{289}$

15. Sum of the series

$$\sum_{r=1}^{2016} (-1)^r (a + rd)$$

is

(a) $a + 2016d$ (b) $2015d$
(c) 0 (d) $1008d$

LEVEL 1

Straight Objective Type Questions

16. If $5a - b$, $2a + b$, $a + 2b$ are in A.P. and $(a - 1)^2$, $(ab + 1)$, $(b + 1)^2$ are in G.P., $a \neq 0$, then a is equal to

(a) 2, – 1/4 (b) –2, – 1/4
(c) – 2, 1/4 (d) 2, 1/4

17. If $a + c \neq b$ and $\frac{1}{a} + \frac{1}{c} + \frac{1}{a-b} + \frac{1}{c-b} = 0$, then a, b, c are in

(a) A.P. (b) G.P.
(c) H.P. (d) A.G.P.

18. In an A.P., the first term is 1 and sum of the first p terms is 0, then sum of the first $(p + q)$ terms is

(a) $\frac{q(p+q)}{1-p}$ (b) $\frac{q}{1-p}$
(c) $\frac{(p+q)p}{1-p}$ (d) $\frac{2(p+q)}{1-p}$

19. If both the A.M. between m and n and G.M. between two distinct positive numbers a and b are equal to $\frac{ma+nb}{m+n}$, then n is equal to

(a) $\frac{a\sqrt{b}}{\sqrt{a}+\sqrt{b}}$ (b) $\frac{2a\sqrt{b}}{\sqrt{a}+\sqrt{b}}$
(c) $\frac{\sqrt{ab}}{\sqrt{a}+\sqrt{b}}$ (d) $\frac{1}{\sqrt{a}+\sqrt{b}}$

20. Product of two positive integers a and b is 192. Let $g = hcf\,(a, b)$ and $l = lcm\,(a, b)$. If the ratio of A.M. between g and l to the H.M. between g and l is $\frac{169}{48}$, then smaller of a, b is

(a) 8, 24 (b) 12, 16
(c) 4, 12 (d) 6, 24

21. The least positive integer n such that $1 - \frac{2}{3} - \frac{2}{3^2} - \dots - \frac{2}{3^{n-1}} < \frac{1}{100}$ is

(a) 4 (b) 5
(c) 6 (d) 7

22. Let the positive numbers a, b, c, d be in A.P. Then abc, abd, acd, bcd are

(a) Not in A.P./G.P./H.P. (b) in A.P.
(c) in G.P. (d) in H.P.

23. The harmonic mean of the roots of the equation $(5 + \sqrt{2})x^2 - (4 + \sqrt{2})x + 8 + 2\sqrt{2} = 0$ is

(a) 2 (b) 4
(c) 6 (d) 8

24. If $\cos (x - y)$, $\cos x$ and $\cos (x + y)$ are in H.P. then value of $\cos x \sec (y/2)$ is

(a) $\pm\sqrt{2}$ (b) $\pm\sqrt{3}$
(c) ± 2 (d) ± 1

25. For a positive integer n, let $a(n) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots + \frac{1}{(2^n) - 1}$. Then

(a) $a(200) > 100$ (b) $a(100) > 100$
(c) $a(50) < 25$ (d) none of these

26. Let $S = \frac{4}{19} + \frac{44}{19^2} + \frac{444}{19^3} + \dots$ upto ∞. Then S is equal to

(a) 38/81 (b) 4/19
(c) 36/171 (d) none of these

27. If $a, b, c, \dots$ are in G.P., and $a^{1/x} = b^{1/y} = c^{1/z} = \dots$, then $x, y, z, \dots$ are in

(a) H.P. (b) G.P.
(c) A.P. (d) none of these

28. If $a^x = b^y = c^z = d^u$ and a, b, c, d are in G.P., then x, y, z, u are in

(a) A.P. (b) G.P.
(c) H.P. (d) none of these

29. If a, b, c, d and p are distinct real numbers such that $(a^2 + b^2 + c^2)p^2 - 2(ab + bc + cd)p + (b^2 + c^2 + d^2) \leq 0$, then a, b, c, d are in

(a) A.P. (b) G.P.
(c) H.P. (d) none of these

30. If a, b, c are in A.P., then $2^{ax+1}, 2^{bx+1}, 2^{cx+1}$, $x \in \mathbf{R}$, are in

(a) A.P. (b) G.P. and when $x > 0$
(c) G.P. only when $x < 0$ (d) G.P. for all x

31. The rational number which is equal to the number $2.\overline{357}$ with recurring decimal is

(a) $\frac{2355}{1001}$ (b) $\frac{2370}{999}$
(c) $\frac{2355}{999}$ (d) $\frac{2359}{991}$

32. The sum to infinity of the series $1+\frac{4}{5}+\frac{7}{5^2}+\frac{10}{5^3}+\dots$ is
    (a) $\frac{16}{35}$ (b) $\frac{11}{8}$
    (c) $\frac{35}{16}$ (d) $\frac{17}{6}$

33. If the sum to n terms of an A.P. is $3n^2 + 5n$, while $T_m = 164$, then value of m is
    (a) 25 (b) 26
    (c) 27 (d) 28

34. If G_1 and G_2 are two geometric means and A is the arithmetic mean inserted between two positive numbers then the value of $\frac{G_1^2}{G_2}+\frac{G_2^2}{G_1}$ is
    (a) $A/2$ (b) A
    (c) $2A$ (d) none of these

35. If A_1, A_2 be two arithmetic means and G_1, G_2 be two geometric means between two positive numbers a and b, then $\frac{A_1+A_2}{G_1G_2}$ is equal to
    (a) $\frac{ab}{a+b}$ (b) $\frac{2ab}{a+b}$
    (c) $\frac{a+b}{2ab}$ (d) $\frac{a+b}{ab}$

36. The first and last terms of an A.P. are a and l respectively. If s is the sum of all the terms of the A.P., then the common difference of the A.P. is
    (a) $\frac{l^2-a^2}{s-(l+a)}$ (b) $\frac{l^2-a^2}{2s-(l+a)}$
    (c) $\frac{l^2+a^2}{2s-(l+a)}$ (d) $\frac{l^2+a^2}{s-(l-a)}$

37. The value of $x = 2^{1/4}\, 4^{1/8}\, 8^{1/16}\, 16^{1/32} \dots$ is
    (a) 2 (b) 3/2
    (c) 1 (d) 1/2

38. The sum of an infinite number of terms of a G.P. is 20, and the sum of their squares is 100, then the first term of the G.P. is
    (a) 5 (b) 8/5
    (c) 3/5 (d) 8

39. The eighth term of a geometric progression is 128 and common ratio is 2. The product of the first five terms is
    (a) 4^6 (b) 4^5
    (c) 4^3 (d) 4^8

40. If l, m, n are positive and are respectively the pth, qth and rth terms of a G.P., then
    $$\Delta = \begin{vmatrix} \log l & p & 1 \\ \log m & q & 1 \\ \log n & r & 1 \end{vmatrix} \text{ is equal to}$$
    (a) pqr (b) $p+q+r$
    (c) $p+q+r+pqr$ (d) 0

41. Let a_1, a_2, a_3 … be terms of an A.P. If $\frac{a_1+a_2+\dots+a_p}{a_1+a_2+\dots+a_q} = \frac{p^2}{q^2}$, $p \neq q$ then $\frac{a_6}{a_{21}}$ equals
    (a) $\frac{11}{41}$ (b) $\frac{41}{11}$
    (c) $\frac{7}{2}$ (d) $\frac{2}{7}$

42. The sum to 10 terms of the series $\sqrt{2}+\sqrt{6}+\sqrt{18}+\sqrt{54}+\dots$ is
    (a) $121\left(\sqrt{6}+\sqrt{2}\right)$ (b) $\frac{121}{2}\left(\sqrt{3}+1\right)$
    (c) $243\left(\sqrt{3}+1\right)$ (d) $243\left(\sqrt{3}-1\right)$

43. If $1^2 + 2^2 + \dots + n^2 = 1015$, then value of n is
    (a) 15 (b) 14
    (c) 13 (d) 16

44. $1^2 + (1^2 + 2^2) + (1^2 + 2^2 + 3^2) + \dots$ upto 22nd terms is
    (a) 23276 (b) 22736
    (c) 22738 (d) 227152

45. Suppose a, b, c are distinct real numbers. If a, b, c are in A.P. and a^2, b^2, c^2 are in H.P., then
    (a) $-\frac{a}{2}$, b, c are in G.P.
    (b) $a + b = c$
    (c) $a = b + c$
    (d) a, b, c are in G.P.

46. If mth term of an A.P. is n and nth term in m, then its rth term is
    (a) $m + n - r$ (b) $m + n + r$
    (c) $m - n + r$ (d) $r - (m + n)$

47. If a, b, c are positive real numbers that are in G.P., then the equations $ax^2 + 2bx + c = 0$ and $dx^2 + 2ex + f = 0$ have a common root if a/d, b/e, c/f are in
    (a) A.P. (b) G.P.
    (c) H.P. (d) none of these

48. If $\log_{10}2$, $\log_{10}(2^x + 1)$ and $\log_{10}(2^x + 3)$ are in A.P., then
(a) $x = 0$ (b) $x = 1$
(c) $x = \frac{1}{2}\log_{10}2$ (d) $x = \frac{1}{2}\log_{2}5$

49. Suppose $\frac{1}{2}x$, $|x + 1|$, $|x - 1|$ are in A.P., then sum to 10 terms of the A.P. is
(a) 54 (b) 36
(c) 28 (d) none of these

50. The harmonic mean and geometric mean of two positive numbers are in the ratio 4 : 5, then two numbers are in the ratio
(a) 4 : 1 (b) 3 : 1
(c) 2 : 1 (d) 1 : 3

51. The sum to 16 terms of the series
$$1^3 + \frac{1+2^3}{1+3} + \frac{1^3+2^3+3^3}{1+3+5} + \frac{1^3+2^3+3^3+4^3}{1+3+5+7} + \ldots \text{ is}$$
(a) 445 (b) 446
(c) 447 (d) 448

52. If $\log(a + c) + \log(a + c - 2b) = 2\log(a - c)$, then
(a) a, b, c are in A.P.
(b) a, b, c are in G.P.
(c) a, b, c are in H.P.
(d) $b + c$, $c + a$, $a + b$ are in H.P.

53. The sum of integers from 1 to 100 that are divisible by 2 or 5 is
(a) 3050 (b) 3150
(c) 3250 (d) 3350

54. The common difference d of the A.P. in which $T_7 = 9$ and $T_1T_2T_7$ is least is
(a) 33/2 (b) 5/4
(c) 33/20 (d) 7/3

55. If $3^{2\sin 2\theta - 1}$, 14, $3^{4-2\sin 2\theta}$ are first three terms of an A.P., then its fifth term is given by
(a) 25 (b) 40
(c) 53 (d) – 12

56. The sum to n terms of the series $\frac{3}{2} + \frac{5}{4} + \frac{9}{8} + \frac{17}{16} + \ldots$ is equal to
(a) $n + 1 - 2^{-n}$ (b) $1 + 2^{-n}$
(c) $2^n - 1$ (d) $2^n - n + 1$

57. The sum of first n terms of the series
$1^2 + 2(2^2) + 3^2 + 2(4^2) + 5^2 + 2(6^2) + \ldots$ is $n(n + 1)^2/2$ when n is even. When n is odd, the sum is
(a) $n(n - 1)^2/2$ (b) $n^2(n + 1)/2$
(c) $n(n + 2)/3$ (d) $n(n + 3)/2$

58. Sum to n terms of the series $\tan^{-1}\left(\frac{1}{3}\right) + \tan^{-1}\left(\frac{1}{7}\right) + \tan^{-1}\left(\frac{1}{13}\right) + \ldots$ is
(a) $\tan^{-1}\left(\frac{n}{n+2}\right)$ (b) $\tan^{-1}\left(\frac{2n-1}{2n+1}\right)$
(c) $\tan^{-1}\left(\frac{1}{3n}\right)$ (d) $\tan^{-1}\left(\frac{1}{2n}\right)$

59. Sum to 30 terms of the series $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \ldots$ is
(a) $\frac{116}{465}$ (b) $\frac{495}{1984}$
(c) $\frac{435}{791}$ (d) $\frac{485}{791}$

60. If $n!$, $3(n!)$ and $(n + 1)!$ are in G.P., then $n!$, $5(n!)$ and $(n + 1)!$ are in
(a) A.P. (b) G.P.
(c) H.P. (d) none of these

61. If $S_n = 81 + 54 + 36 + 24 + \ldots$ upto n terms, then value of
$$x = \frac{S_n - 4S_{n-1} + 6S_{n-2} - 4S_{n-3} + S_{n-4}}{S_{n-1} - 4S_{n-2} + 6S_{n-3} - 4S_{n-4} + S_{n-5}} \text{ is equal}$$
(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{1}{2}$ (d) 2

62. The sum to n terms of the series $1^2 + (1)(2) + 3^2 + (3)(4) + 5^2 + (5)(6) + 7^2 + \ldots$ upto n terms when n is odd is
(a) $\frac{1}{12}(n + 1)(4n^2 - n + 3)$
(b) $\frac{1}{12}n(4n^2 + 3n - 4)$
(c) $\frac{1}{6}(n + 1)(4n^2 - n + 5)$
(d) none of these

63. If $L = \lim\limits_{n\to\infty} (1 + 3^{-1})(1 + 3^{-2})(1 + 3^{-4})(1 + 3^{-8}) \ldots (1 + 3^{-2^n})$, then
(a) $L = \frac{2}{3}$ (b) $L = \frac{3}{2}$
(c) $L = 1$ (d) $L = 2$

64. Suppose $a_1, a_2, \ldots, a_n$ are n distinct odd natural numbers not divisible by any prime greater than 5, then value of the expression $\frac{1}{a_1}+\frac{1}{a_2}+\ldots\frac{1}{a_n}$ cannot exceed
    (a) 2 (b) 1
    (c) 1/2 (d) none of these

65. Coefficient of x^{99} in the expansion of $(x-1)(x-3)(x-5)\ldots(x-199)$ is
    (a) – 100 (b) – 1000
    (c) –10000 (d) – 100000

66. Sum to n terms of the series $1+(1+2)+(1+2+3)+\ldots$ is
    (a) $\frac{1}{2}n(n+1)(n+2)$ (b) $\frac{1}{3}n(n+1)(n+2)$
    (c) $\frac{1}{4}n(n+1)(2n+1)$ (d) $\frac{1}{6}n(n+1)(n+2)$

67. If $x=\sum_{n=0}^{\infty}a^n$, $y=\sum_{n=0}^{\infty}b^n$, $0<a<b<1$, and $z=\sum_{n=0}^{\infty}\left(\frac{a}{b}\right)^n$, then
    (a) $x+yz=x(y+z)$ (b) $xyz=x+y+z$
    (c) $xy+z=y(x+z)$ (d) none of these

68. If the sum of an infinite decreasing G.P. is 3 and sum of the cubes of its terms is 108/13, then common ratio is given by
    (a) $\frac{1}{5}$ (b) $\frac{1}{4}$
    (c) $\frac{1}{3}$ (d) $\frac{1}{2}$

69. The sum of the series $S=\sum_{r=1}^{n}\log\left(\frac{a^{r+1}}{b^{r-1}}\right)$ is
    (a) $\frac{n}{2}\log\left(\frac{a^{n-1}}{b^n}\right)$ (b) $\frac{n}{2}\log\left(\frac{a^{n+3}}{b^{n-1}}\right)$
    (c) $\frac{n}{2}\log\left(\frac{a^{n+2}}{b^{n-1}}\right)$ (d) none of these

70. Fifth term of a G.P. is 2, then the product of its 9 terms is
    (a) 256 (b) 512
    (c) 1024 (d) 204

71. If s is the sum to infinity of a G.P., whose first term is a, then the sum of the first n terms of the G.P. is
    (a) $s\left[1-\left(1-\frac{a}{s}\right)^n\right]$ (b) $s\left(1-\frac{a}{s}\right)^n$
    (c) $a\left[1-\left(1-\frac{a}{s}\right)^n\right]$ (d) $\frac{a}{s}\left[1-\left(1-\frac{a}{s}\right)^n\right]$

72. For a sequence $<a_n>$, $a_1=5$, and $\frac{a_{r+1}}{a_r}=\frac{1}{2}\forall\ r$, then $\sum_{n=1}^{\infty}a_{2n-1}$ is
    (a) 20/7 (b) 20/5
    (c) 20/3 (d) 20

73. If H.M. and G.M. of two positive numbers are in the ratio 12 : 13, then the numbers are in the ratio
    (a) 1 : 2 (b) 2 : 3
    (c) 3 : 5 (d) 4 : 9

74. The H.M. between two numbers is 16/5, their A.M. is A and G.M. is G. If $2A+G^2=26$ then the numbers are
    (a) 6, 8 (b) 4, 8
    (c) 2, 8 (d) 1, 8

75. If $a_r=a+(r-1)d$ is rth term of an A.P., then $a_n^2-2a_{n-1}^2+a_{n-2}^2$ is independent of
    (a) n (b) d
    (c) a (d) a and n both

76. If $A=1+r^a+r^{2a}+r^{3a}+\ldots$ upto ∞ and $B=1+r^b+r^{2b}+r^{3b}+\ldots$upto ∞, then $\frac{a}{b}$ is equal to
    (a) $\frac{\log(1+A)}{\log(1+B)}$ (b) $\frac{\log(A-1)}{\log(B-1)}$
    (c) $\log_B A$ (d) none of these

77. Suppose $a_1=45$, $a_2=41$ and $a_k=2a_{k-1}-a_{k-2}\ \forall\ k\geq 3$, then, value of
    $$S=\frac{1}{12}\left[a_1^2-a_2^2+a_3^2-a_4^2+\ldots+a_{11}^2-a_{12}^2\right]$$ is
    (a) 89 (b) 90
    (c) 91 (d) 92

78. Suppose $P(x)=1-x+x^2-x^3+\ldots+x^{2012}$ is expressed as a polynomial in y, as $Q(y)=a_0+a_1y+\ldots+a_{2012}y^{2012}$ where $y=x-2$, then $\sum_{i=0}^{2012}a_i$ equals
    (a) $\frac{1}{4}(3^{2013}+1)$ (b) $\frac{1}{3}(3^{2013}-1)$
    (c) 0 (d) 1

79. The sum of first 26 terms of an A.P. $a_1, a_2, a_3, \ldots$. if $a_2 + a_6 + a_9 + a_{18} + a_{21} + a_{25} = 165$, is
   (a) 705 (b) 715
   (c) 725 (d) 735

80. If the sum of first n terms of an A.P. is cn^2, then the sum of squares of these n terms is
   (a) $\dfrac{n(4n^2-1)c^2}{6}$ (b) $\dfrac{n(4n^2+1)c^2}{3}$
   (c) $\dfrac{n(4n^2-1)c^2}{3}$ (d) $\dfrac{n(4n^2+1)c^2}{6}$

Assertion-Reason Type Questions

81. **Statement-1 :** If $S_n = \sum_{k=1}^{n} a_k = 3n^2 + 2n - 7$ for each n, then, $a_1, a_2, a_3, \ldots$ are in A.P.

   Statement-2 : Sum to n terms of an A.P. is always of the form $an^2 + bn$.

82. **Statement-1 :** The largest interval for which we can find the sum of the series

   $1 + (2x - 1) + (2x - 1)^2 + (2x - 1)^3 + \ldots$ is (0, 1).

   Statement-2 : An infinite geometric series

   $$a + ar + ar^2 + \ldots$$

   can be summed up if $|r| < 1$.

83. **Statement-1 :** If $a, b, c > 0$ and the expression

   $(a + c)x^2 + \left(\sqrt{(a+c)^2 + 4b^2}\right) x + b > 0$ $\forall\ x \in \mathbf{R}$, then a, b, c are in G.P.

   Statement-2 : $ax^2 + bx + c > 0\ \forall\ x \in \mathbf{R}$ if and only if $a > 0$ and $b^2 - 4ac < 0$.

84. Let α, β be roots of $ax^2 + 2bx + c = 0$ and $\Delta = b^2 - ac$.

   Statement-1 : If $\alpha + \beta, \alpha^2 + \beta^2, \alpha^3 + \beta^3$ are in G.P. then $c\Delta = 0$

   Statement-2 : If $\alpha, \alpha\beta, \beta$ are in A.P. then $b + c = 0$

85. Suppose four distinct positive numbers a_1, a_2, a_3, a_4 are in G.P.

   Let $b_1 = a_1$, $b_2 = b_1 + a_2$, $b_3 = b_2 + a_3$ and $b_4 = b_3 + a_4$.
   Statement-1: The numbers b_1, b_2, b_3, b_4 are neither in A.P. nor in G.P.
   Statement-2: The numbers b_1, b_2, b_3, b_4 are in H.P.

LEVEL 2

Straight Objective Type Questions

86. The nth term of the sequence $2\frac{1}{2}, 1\frac{7}{13}, 1\frac{1}{9}, \frac{20}{23} \ldots$ is
   (a) $\dfrac{15}{5n+3}$ (b) $\dfrac{20}{5n+4}$
   (c) $\dfrac{20}{5n+3}$ (d) $\dfrac{20}{5n+2}$

87. H.M. between $\dfrac{1}{28}$ and $\dfrac{1}{10}$ is
   (a) $\dfrac{1}{19}$ (b) $\dfrac{1}{18}$
   (c) $\dfrac{1}{17}$ (d) $\dfrac{1}{16}$

88. If $a\left(\dfrac{1}{b}+\dfrac{1}{c}\right), b\left(\dfrac{1}{c}+\dfrac{1}{a}\right), c\left(\dfrac{1}{a}+\dfrac{1}{b}\right)$ are in A.P., then
   (a) a, b, c are in A.P. (b) a, b, c are in G.P.
   (c) a, b, c are in H.P. (d) none of these

89. If $a_1, a_2, \ldots, a_n$ are in A.P., with common difference $d \neq 0$, then sum of the series $\sin d\,[\operatorname{cosec} a_1 \operatorname{cosec} a_2 + \operatorname{cosec} a_2 \operatorname{cosec} a_3 + \ldots + \operatorname{cosec} a_{n-1} \operatorname{cosec} a_n]$ is
   (a) $\sec a_1 - \sec a_n$ (b) $\operatorname{cosec} a_1 - \operatorname{cosec} a_n$
   (c) $\cot a_1 - \cot a_n$ (d) $\tan a_1 - \tan a_n$

90. If $H_n = 1+\dfrac{1}{2}+\dfrac{1}{3}+\ldots+\dfrac{1}{n}$, then value of

   $1+\dfrac{3}{2}+\dfrac{5}{3}+\ldots+\dfrac{2n-1}{n}$ is

(a) $H_n + n$ (b) $2n - H_n$
(c) $n - 1 + H_n$ (d) $H_n + 2n$

91. If a, b, c are in H.P., then $\dfrac{a}{b+c-a}, \dfrac{b}{c+a-b}, \dfrac{c}{a+b-c}$ are in
(a) A.P. (b) G.P.
(c) H.P. (d) A.G.P.

92. Sum of all the terms in the nth row of the triangle

1
2 3
4 5 6
7 8 9 10
. . . .
. . . .

is
(a) $\dfrac{1}{2}n^2(n+1)$ (b) $\dfrac{1}{2}n(n^2+1)$
(c) $n(n^2+1)$ (d) $n^2(n+1)$

93. Let a and b be two positive real numbers. Suppose A_1, A_2 are two arithmetic means; G_1, G_2 are two geometric means and H_1, H_2 are two harmonic means between a and b, then $\dfrac{A_1 + A_2}{H_1 + H_2}$ is equal to
(a) $\dfrac{2(a^2+b^2)+5ab}{9\,ab}$ (b) $\dfrac{a^2+b^2}{9\,ab}+5$
(c) $\dfrac{a^2+b^2+5(a+b)}{9\,ab}$ (d) $\dfrac{a^2+b^2+7(a+b)}{3\,(a+b)\,ab}$

94. Let $a\,(n) = 1 - \dfrac{1}{2} + \dfrac{1}{3} + \ldots + (-1)^{n-1}\dfrac{1}{n}$, then $\dfrac{1}{n+1} + \dfrac{1}{n+2} + \ldots + \dfrac{1}{2n}$ is equal to
(a) $a\,(2n)$ (b) $a\,(2n) - a\,(n)$
(c) $a\,(3n) - a\,(2n)$ (d) none of these

95. In Fig. 8.2 each square is filled with the arithmetic mean of the numbers in the boxes sharing a side with it. If the first square is filled with 5, then value of x is
(a) 5 (b) 0
(c) – 5 (d) cannot be determined.

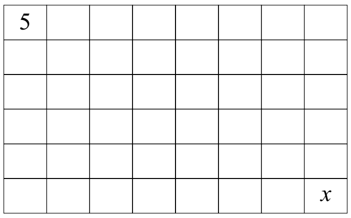

Fig. 8.2

96. Let a, b and c be three real numbers satisfying

$$[a\quad b\quad c]\begin{bmatrix}1 & 9 & 5\\ 8 & 2 & 5\\ 7 & 3 & 5\end{bmatrix} = [0\quad 0\quad 0] \qquad (1)$$

and let $b = 6$. If α and β are the roots of the quadratic equation $ax^2 + bx + c = 0$, then $\sum_{n=0}^{\infty}\left(\dfrac{1}{\alpha}+\dfrac{1}{\beta}\right)^n$ is
(a) 6 (b) 7
(c) 6/7 (d) ∞

Previous Years' AIEEE/JEE Main Questions

1. Fifth term of a G.P. is 2, then the product of its 9 terms is
(a) 256 (b) 512
(c) 1024 (d) 2048 **[2002]**

2. The value of $2^{1/4}\,.\,4^{1/8}\,.\,8^{1/16}\ldots$ upto ∞ is
(a) 1 (b) 2
(c) $\dfrac{3}{2}$ (d) 4 **[2002]**

3. If 1, $\log_9(3^{1-x}+2)$, $\log_3(4(3^x)-1)$ are in A.P., then x equals
(a) $\log_3 4$ (b) $1 - \log_3 4$
(c) $1 - \log_4 3$ (d) $\log_4 3$ **[2002]**

4. $1^3 - 2^3 + 3^3 - 4^3 + \ldots + 9^3$ equals
(a) 425 (b) – 425
(c) 475 (d) – 475 **[2002]**

5. The sum of integers from 1 to 100 that are divisible by 2 or 5 is
(a) 3000 (b) 3050
(c) 3600 (d) 3250 **[2002]**

6. Sum of an infinite G.P. is 20 and sum of their squares is 100. The common ratio of the G.P. is
(a) $\dfrac{1}{5}$ (b) $\dfrac{2}{5}$
(c) $\dfrac{3}{5}$ (d) $\dfrac{4}{5}$ **[2002]**

7. Let $f(x)$ be a polynomial function of second degree. If $f(1) = f(-1)$ and a, b, c are in A.P., then $f'(a), f'(b)$, and $f'(c)$ are in

   (a) G.P. (b) H.P.
   (c) A.G.P. (d) A.P. **[2003]**

8. Let T_r be the rth term of an A.P. whose first term is a and common difference is d. If for some positive integers $m, n, m \neq n$, $T_m = \frac{1}{n}$ and $T_n = \frac{1}{m}$, then $a - d$ equals

   (a) $\frac{1}{mn}$ (b) 1
   (c) 0 (d) $\frac{1}{m} + \frac{1}{n}$ **[2004]**

9. The sum of the first n terms of the series

   $1^2 + 2.2^2 + 3^2 + 2.4^2 + 5^2 + 2.6^2 + \dots$ is $\frac{1}{2}n(n + 1)^2$

   when n is even. When n is odd the sum is

   (a) $\frac{1}{4}n(n + 1)^2$ (b) $\frac{1}{2}n^2(n + 1)$
   (c) $\frac{3}{2}n(n + 1)$ (d) $\frac{1}{4}n^2(n + 1)^2$ **[2004]**

10. If a, b, c are in A.P. are $|a| < 1$, $|b| < 1$, $|c| < 1$, and $x = \sum_{n=0}^{\infty} a^n$, $y = \sum_{n=0}^{\infty} b^n$, $z = \sum_{n=0}^{\infty} c^n$, then x, y, z are in

    (a) A.P. (b) G.P.
    (c) H.P. (d) A.G.P. **[2005]**

11. If the expression in powers of x of the function $\frac{1}{(1-ax)(1-bx)}$ is $a_0 + a_1x + a_2x^2 + a_3x^3 + \dots$, then a_n is

    (a) $\frac{b^{n+1} - a^{n+1}}{b - a}$ (b) $\frac{b^n - a^n}{b - a}$
    (c) $\frac{a^n - b^n}{b - a}$ (d) $\frac{a^{n+1} - b^{n+1}}{b - a}$ **[2006]**

12. Let $a_1, a_2, a_3, \dots$ be terms of an A.P. if

    $$\frac{a_1 + a_2 + \dots + a_p}{a_1 + a_2 + \dots + a_q} = \frac{p^2}{q^2},\ p \neq q,$$

    then $\frac{a_6}{a_{21}}$ equals

    (a) $\frac{11}{41}$ (b) $\frac{41}{11}$
    (c) $\frac{7}{2}$ (d) $\frac{2}{7}$ **[2006]**

13. If $a_1, a_2, \dots a_n$ are in H.P., then the expression $a_1a_2 + a_2a_3 + \dots + a_{n-1}a_n$ is equal to

    (a) $(n - 1)\,a_1 a_n$ (b) $n(a_1 - a_n)$
    (c) $(n - 1)(a_1 - a_n)$ (d) $n\,a_1 a_n$ **[2006]**

14. In a geometric progression consisting of positive terms, each term equals the sum of the next two terms. Then common ratio of the G.P. is

    (a) $\frac{1}{2}(1 - \sqrt{5})$ (b) $\frac{1}{2}\sqrt{5}$
    (c) $\sqrt{5}$ (d) $\frac{1}{2}(\sqrt{5} + 1)$ **[2007]**

15. **Statement-1:** For every natural number $n \geq 2$,

    $$\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \cdots \frac{1}{\sqrt{n}} > \sqrt{n}$$

    Statement-2: For every natural number $n \geq 2$, $\sqrt{n(n+1)} < n + 1$. **[2008]**

16. The sum to infinity of the series $S = 1 + \frac{2}{3} + \frac{6}{3^2} + \frac{10}{3^3} + \frac{14}{3^4} + \dots$, is

    (a) 4 (b) 6
    (c) 2 (d) 3 **[2009]**

17. A person is to count 4500 currency notes. Let a_n denote the number of notes he counts in the n^{th} minute. If $a_1 = a_2 = \dots a_{10} = 150$ and $a_{10}, a_{11}, \dots$ are in A.P. with common difference -2, then the time taken by him to count all the notes is

    (a) 125 minutes (b) 135 minutes
    (c) 24 minutes (d) 34 minutes **[2010]**

18. A man saves ₹ 200 in each of the first three months of his service. In each of the subsequent months his saving is ₹ 40 more than the saving of the immediately previous month. His total saving from the start of the service will be ₹ 11040 after.

    (a) 21 months (b) 18 months
    (c) 19 months (d) 20 months **[2011]**

19. Let a_n be the nth term of a_n A.P.

    If $\sum_{r=1}^{100} a_{2r} = \alpha$ and $\sum_{r=1}^{100} a_{2r-1} = \beta$, then

    common difference of the A.P. is

    (a) $\alpha - \beta$ (b) $\frac{1}{100}(\alpha - \beta)$
    (c) $\beta - \alpha$ (d) $\frac{1}{200}(\alpha - \beta)$ **[2011]**

20. If 100 times the 100th term of an A.P. with non zero common difference equals the 50 times its 50th term, then the 150 term of this A.P. is

(a) 150 times its 50^{th} term
(b) 150
(c) zero
(d) –150 **[2012]**

21. **Statement-1 :** The sum of the series 1 + (1+2 +4) + (4 + 6 + 9) + (9 + 12 + 16) + ... + (361 + 380 + 400) is 800.

Statement-2 : $\sum_{k=1}^{n}\left(k^3-(k-1)^3\right)=n^3$, for any natural number n **[2012]**

22. If x, y, z are in A.P. and $\tan^{-1} x$, $\tan^{-1} y$ and $\tan^{-1} z$ are also in A.P., then

(a) $2x = 3y = 6z$ (b) $6x = 3y = 2z$
(c) $6x = 4y = 3z$ (d) $x = y = z$ **[2013]**

23. The sum of first 20 terms of the sequence 0.7, 0.77, 0.777, . . . is

(a) $\frac{7}{9}(99 - 10^{-20})$ (b) $\frac{7}{81}(179 + 10^{-20})$

(c) $\frac{7}{9}(99 + 10^{-20})$ (d) $\frac{7}{81}(179 - 10^{-20})$ **[2013]**

24. Given sum of the first n terms of an A.P. is $2n + 3n^2$. Another A.P. is formed with the same first term and is double the common difference, the sum of n terms of the new A.P. is

(a) $n + 4n^2$ (b) $6n^2 - n$
(c) $n^2 + 4n$ (d) $3n + 2n^2$ **[2013, online]**

25. The sum

$$\frac{3}{1^2}+\frac{5}{1^2+2^2}+\frac{7}{1^2+2^2+3^2}+\ldots \text{ upto 11 terms}$$

is

(a) $\frac{7}{2}$ (b) $\frac{11}{4}$

(c) $\frac{11}{2}$ (d) $\frac{60}{11}$ **[2013, online]**

26. Given a sequence of 4 numbers, first three of which are in G.P., and the last three are in A.P. with common difference six. If first and last term of the sequence are equal, then the last term is

(a) 16 (b) 8
(c) 4 (d) 2 **[2013, online]**

27. The value of

$1^2 + 3^2 + 5^2 + \ldots + 25^2$

is

(a) 2925 (b) 1469
(c) 1728 (d) 1456 **[2013, online]**

28. Let $a_1, a_2, a_3, \ldots$ be an A.P. such that

$$\frac{a_1+a_2+\ldots+a_p}{a_1+a_2+\ldots+a_q}=\frac{p^2}{q^2};\ p \neq q$$

Then $\frac{a_6}{a_{21}}$ is equal to

(a) $\frac{41}{11}$ (b) $\frac{121}{1681}$

(c) $\frac{11}{41}$ (d) $\frac{121}{1861}$ **[2013, online]**

29. The sum of the series

$2^2 + 2(4^2) + 3(6^2) + \ldots$ upto 10 terms is

(a) 11300 (b) 11200
(c) 12100 (d) 12300 **[2013, online]**

30. If $S=\tan^{-1}\left(\frac{1}{n^2+n+1}\right)+\tan^{-1}\left(\frac{1}{n^2+3n+3}\right)$

$+\ldots+\tan^{-1}\left(\frac{1}{1+(n+19)(n+20)}\right)$, then

$\tan(S)$ is equal to

(a) $\frac{20}{401+20n}$ (b) $\frac{n}{n^2+20n+1}$

(c) $\frac{20}{n^2+20n+1}$ (d) $\frac{n}{401+20n}$

[2013, online]

31. If $a_1, a_2, a_3, \ldots, a_n \ldots$ are in A.P. such that

$a_4 - a_7 + a_{10} = m$, then sum of the first 13 terms of the A.P. is

(a) $10\,m$ (b) $12\,m$
(c) $13\,m$ (d) $15\,m$ **[2013, online]**

32. Three positive numbers form an increasing G.P. If the middle term in this G.P. is doubled, the new numbers are in A.P. Then the common ratio of the G.P. is

(a) $3+\sqrt{2}$ (b) $2-\sqrt{3}$

(c) $2+\sqrt{3}$ (d) $\sqrt{2}+\sqrt{3}$ **[2014]**

33. If $(10)^9 + 2(11)^1(10)^8 + 3(11)^2(10)^7 + \ldots + 10(11)^9 = k(10)^9$, then k is equal to

(a) $\frac{441}{100}$ (b) 100

(c) 110 (d) $\frac{221}{10}$ **[2014]**

34. Given an A.P. whose terms are all positive integers. The sum of its nine terms is greater than 200 and less than 220. If the second term in it is 12, then its 4th term is

(a) 8 (b) 16
(c) 20 (d) 24 **[2014, online]**

35. If the sum

$$\frac{3}{1^2}+\frac{5}{1^2+2^2}+\frac{7}{1^2+2^2+3^2}+\ldots+\text{ upto}$$

20 terms is equal to $\frac{k}{21}$, then k is equal to

(a) 120 (b) 180
(c) 240 (d) 60 **[2014, online]**

36. In a geometric progression, if the ratio of the sum of first 5 terms to the sum of their reciprocals is 49, and the sum of the first and the third term is 35. Then the first term of this geometric progression is

(a) 7 (b) 21
(c) 28 (d) 42 **[2014, online]**

37. The sum of the first 20 terms common between the series 3 + 7 + 11 + 15 + . . . and 1 + 6 + 11 + 16 + . . ., is

(a) 4000 (b) 4020
(c) 4200 (d) 4220 **[2014, online]**

38. Let G be the geometric mean of two positive numbers a and b, and M be the arithmetic mean of $\frac{1}{a}$ and $\frac{1}{b}$. If $\frac{1}{M}$: G is 4 : 5, then a : b can be

(a) 1 : 4 (b) 1 : 2
(c) 2 : 3 (d) 3 : 4 **[2014, online]**

39. The least positive integer n such that $1-\frac{2}{3}-\frac{2}{3^2}-\ldots-\frac{2}{3^{n-1}}<\frac{1}{100}$, is

(a) 4 (b) 5
(c) 6 (d) 7 **[2014, online]**

40. The number of terms in an A.P. is even: the sum of the odd terms in it is 24 and that the even terms is 30. If the last terms exceeds the first term by $10\frac{1}{2}$, then the number of terms in the A.P. is

(a) 4 (b) 8
(c) 12 (d) 16 **[2014, online]**

41. Let $f(n)=\left[\frac{1}{3}+\frac{3n}{100}\right]n$, where [$n$] denotes the greatest integer less than or equal to n. then $\sum_{n=1}^{56} f(n)$ is equal to

(a) 56 (b) 689
(c) 1287 (d) 1399 **[2014, online]**

42. If m is the A.M. of two distinct real number l and n (l, $n > 1$) and G_1, G_2 and G_3 are three geometric between l and n, then $G_1^4 + 2G_2^4 + G_3^4$ equals,

(a) $4l^2 mn$ (b) $4lm^2n$
(c) $4lmn^2$ (d) $4l^2m^2n^2$ **[2015]**

43. The sum of first 9 terms of the series

$$\frac{1^3}{1}+\frac{1^3+2^3}{1+3}+\frac{1^3+2^3+3^3}{1+3+5}+\ldots\text{ is}$$

(a) 71 (b) 96
(c) 142 (d) 192 **[2015]**

4. The value of $\sum_{r=16}^{30}(r+2)(r-3)$ is equal to

(a) 7785 (b) 7780
(c) 7775 (d) 7770 **[2015, online]**

45. The sum of the 3rd and the 4th terms of a G.P. is 60 and the product of its first three terms is 1000. If the first term of this G.P. is positive, then its 7th term is:

(a) 7290 (b) 320
(c) 640 (d) 2430 **[2015, online]**

46. If $\sum_{n=1}^{5}\frac{1}{n(n+1)(n+2)(n+3)}=\frac{k}{3}$, then k is equal to

(a) $\frac{55}{336}$ (b) $\frac{17}{105}$
(c) $\frac{1}{6}$ (d) $\frac{19}{112}$ **[2015, online]**

47. If the 2nd, 5th and 9th terms of a non-constant A.P. are in G.P., then the common ratio of this G.P. is

(a) $\frac{8}{5}$ (b) $\frac{4}{3}$
(c) 1 (d) $\frac{7}{4}$ **[2016]**

48. If the sum of the first ten terms of the series

$$\left(1\frac{3}{5}\right)^2+\left(2\frac{2}{5}\right)^2+\left(3\frac{1}{5}\right)^2+4^2+\left(4\frac{4}{5}\right)^2+\cdots,\text{is}\frac{16}{5}m,$$

then m is equal to

(a) 102 (b) 101
(c) 100 (d) 99 **[2016, online]**

49. Let a_1, a_2, a_3, …, a_n, … be in A.P. If $a_3 + a_7 + a_{11} + a_{15} = 72$, then the sum of its first 17 terms is equal to

(a) 306 (b) 204
(c) 153 (d) 612 **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. If the first three terms of a sequence $\frac{1}{16}$, a, b, $\frac{1}{6}$ are in G.P. and the last three are in H.P., then the values of a and b respectively are

   (a) $\frac{1}{12}, \frac{4}{9}$ (b) $\frac{4}{7}, \frac{3}{4}$

   (c) $\frac{1}{9}, \frac{1}{12}$ (d) $-\frac{1}{4}, 1$ **[2006]**

2. If a, x, b are in H.P. and a, y, z, b are in G.P., then the value of $\frac{yz}{x\left(y^3+z^3\right)}$ is

   (a) ab (b) $\frac{1}{2ab}$

   (c) $\frac{1}{2}ab$ (d) $2ab$ **[2006]**

3. If $x = 1 + a + a^2 + \ldots$ ($|a| < 1$) and $y = 1 + b + b^2 + \ldots$ ($|b| < 1$), then sum of the series $1 + ab + a^2b^2 + \ldots$ is

   (a) $\frac{xy}{x-y-1}$ (b) $\frac{xy}{x-y+1}$

   (c) $\frac{xy}{x+y+1}$ (d) $\frac{xy}{x+y-1}$ **[2007]**

4. If three distinct positive numbers a, b, c are in A.P. such that $abc = 4$, then value of b is always

   (a) greater than $(2)^{2/3}$ (b) less than $(2)^{2/3}$

   (c) equal to $(2)^{2/3}$ (d) equal to $(2)^{3/2}$ **[2007]**

5. The value of the sum

   $$\sum_{i=1}^{20} i\left[\frac{1}{i}+\frac{1}{i+1}+\frac{1}{i+2}+\ldots+\frac{1}{20}\right]$$

   is

   (a) 100 (b) 105

   (c) 110 (d) 115 **[2008]**

6. The sum of the numbers between 200 and 400 that are divisible by 7 is

   (a) 8729 (b) 7511

   (c) 6328 (d) 5712 **[2009]**

7. Let a, b and c be distinct real numbers. If a, b, c are in geometric progression and $a + b + c = xb$, then x lies in the set

   (a) $(1, 3)$ (b) $(-1, 0) \cup (1, 2)$

   (c) $(-\infty, -1) \cup (3, \infty)$ (d) $(0, 1)$ **[2010]**

8. If the sum of first n terms of two A.P.'s are in the ratio $3n + 8 : 7n + 15$, then the ratio of 12th term is

   (a) 8 : 7 (b) 7 : 16

   (c) 74 : 169 (d) 13 : 47 **[2012]**

9. A tree, in each year grows 5 cm less than it grew in the previous year. If it grew half a metre in the first year, then the height of the tree (in metres) when it ceases to grow, is

   (a) 3.00 (b) 2.75

   (c) 2.50 (d) 2.00 **[2013]**

10. If $\frac{48}{(2)(3)} + \frac{47}{(3)(4)} + \frac{46}{(4)(5)} + \ldots + \frac{2}{(48)(49)} + \frac{1}{(49)(50)} = \frac{51}{2} + K\left(1+\frac{1}{2}+\frac{1}{3}+\ldots+\frac{1}{50}\right)$, then K equals

    (a) -1 (b) $-\frac{1}{2}$

    (c) 1 (d) 2 **[2014]**

11. If $\log_{10} 2$, $\log_{10}(2^x - 1)$ and $\log_{10}(2^x + 3)$ are three consecutive terms of an A.P. for

    (a) no real x (b) exactly one real x

    (c) exactly two real x (d) more than two real x **[2014]**

12. Let a, b, c, d and and e be real numbers such that $a > b > 0$ and $c > 0$. If $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in A.P., b, c, d are in G.P. and c, d, e are in A. P., then $\frac{ab^2}{(2a-b)^2}$ is equal to

    (a) c (b) $\sqrt{de}$

    (c) e (d) d **[2015]**

13. If $\sum_{k=1}^{n} \phi(k) = \frac{2n}{n+1}$, then $\sum_{k=1}^{10} \frac{1}{\phi(k)}$ is equal to

    (a) $\frac{11}{20}$ (b) 220

    (c) $\frac{55}{18}$ (d) 110 **[2015]**

14. Let a, b, c, d and e be distinct positive number. If a, b, c and $\frac{1}{c}, \frac{1}{d}, \frac{1}{e}$ both are in A.P. and b, c, d are in G.P. then

(a) a, b, c are in G.P (b) a, b, c are in A.P.
(c) a, c, e are in A.P. (d) a, c, e are in G.P.

Hints and Solutions

Concept-based

1. $a_1, a_2, a_3, \ldots$ is a G.P.

   $\Rightarrow \log_5 a_1, \log_5 a_2, \log_5 a_3, \ldots$ are in A.P.

2. If $r > 1$ is the common ratio of the G.P., then $\frac{b}{r} + b + br = xb \Rightarrow x - 1 = r + \frac{1}{r} > 2$.

3. Use : $a_n = S_n - S_{n-1}$ and $d = a_n - a_{n-1}$.

4. Middle terms are nth and $(n + 1)$th terms.

   $\alpha - \beta = t_n = a + (n - 1)d$

   and $\alpha + \beta = t_{n+1} = a + nd$

   $S_{2n} = \frac{2n}{2}[2a + (2n - 1)d] = 2n\alpha$

5. Use : $3 + 7(n - 1) = 63 + 2(n - 1)$

6. For example, if $a = 2$, $b = \sqrt{2} - 1$, $c = 1$, then a, $b + 1$, c forms a G.P.

7. $a^{\log x} = b^{\log y} = c^{\log z} = k$ (say)

   $\Rightarrow a = k^{1/\log x}, b = k^{1/\log y}, c = k^{1/\log z}$

   Now, a, b, c are in G.P.

   $\Rightarrow \frac{1}{\log x}, \frac{1}{\log y}, \frac{1}{\log z}$ are in A.P.

   $\Rightarrow \log x, \log y, \log z$ are in H.P.

   However, nothing can be said about x, y, z.

8. $S_3 = \frac{a(1-r^3)}{1-r}$, $S_6 = \frac{a(1-r^6)}{1-r}$

   $\frac{S_3}{S_6} = \frac{125}{152} \Rightarrow \frac{1-r^3}{1-r^6} = \frac{125}{152}$

$\Rightarrow 1 + r^3 = \dfrac{152}{125} \Rightarrow r^3 = \dfrac{27}{125} = \left(\dfrac{3}{5}\right)^3$

$\Rightarrow r = 3/5$

9. As the common difference is 9, we let the four numbers be

$a, a - 18, a - 9, a$

As $a, a - 18, a - 9$ are in G.P.

$(a - 18)^2 = a(a - 9)$

$\Rightarrow a^2 - 36a + 324 = a^2 - 9a$

$\Rightarrow 27a = 324 \Rightarrow a = 12$

Thus, sum of the four numbers is 21

10. Let two positive numbers be a, b. Then

$a + b = 2(7) = 14$ and $\sqrt{ab} = 5$ or $ab = 25$

Now, $a^2 + b^2 = (a + b)^2 - 2ab = 196 - 50 = 146$

$\Rightarrow \dfrac{1}{2}(a^2 + b^2) = 73.$

11. $\dfrac{a}{1-r} = 2, \dfrac{a^3}{1-r^3} = 24$

$\therefore \dfrac{8(1-r)^3}{1-r^3} = 24 \Rightarrow \dfrac{1-2r+r^2}{1+r+r^2} = 3$

$\Rightarrow 2r^2 + 5r + 2 = 0 \Rightarrow r = -2, -1/2$

As $|r| < 1$, $r = -1/2$, $a = 3$.

Now, $t_5 = ar^4 = 3/16$

12. Let three arithmetic means between a and b be a_1, a_2, a_3. Then a, a_1, a_2, a_3, b are in A.P. Let common difference of this A.P. be d. Then

$d = \dfrac{1}{4}(b - a)$

$a_1 = a + b = \dfrac{1}{4}(3a + b)$

$a_2 = a + 2d = \dfrac{1}{2}(a + b)$

$a_3 = a + 3d = \dfrac{1}{4}(a + 3b)$

If A_1, A_2, A_3 are arithmetic means between $1/a$ and $1/b$, then

$A_1 = \dfrac{1}{4}\left(\dfrac{3}{a}+\dfrac{1}{b}\right) = \dfrac{a+3b}{4ab}$

$A_2 = \dfrac{1}{2}\left(\dfrac{1}{a}+\dfrac{1}{b}\right) = \dfrac{a+b}{2ab}$

$A_3 = \dfrac{1}{4}\left(\dfrac{1}{a}+\dfrac{3}{b}\right) = \dfrac{3a+b}{4ab}$

Now, $\dfrac{1}{64}(3a + b)(a + b)(a + 3b) = \dfrac{15}{2}$

and $\dfrac{1}{64(ab)^3}(a + 3b)(a + b)(3a + b) = \dfrac{5}{18}$

Thus, $(ab)^3 = \dfrac{15/2}{5/18} = 27$

$\Rightarrow ab = 3.$

13. $b - \dfrac{a+b}{1-ab} = \dfrac{b+c}{1-bc} - b$

$\Rightarrow \dfrac{b-ab^2-a-b}{1-ab} = \dfrac{b+c-b+b^2c}{1-bc}$

$\Rightarrow -\dfrac{a(b^2+1)}{1-ab} = \dfrac{c(1+b^2)}{1-bc}$

$\Rightarrow -a + abc = c - abc$

$\Rightarrow 2abc = a + c$

$2b = \dfrac{1}{a}+\dfrac{1}{c}$

$\therefore \dfrac{1}{a}, b, \dfrac{1}{c}$ are in A.P.

14. Let

$S = \dfrac{5}{17}+\dfrac{55}{(17)^2}+\dfrac{555}{(17)^3}+\ldots$

$\dfrac{1}{17}S = \dfrac{5}{(17)^2}+\dfrac{55}{(17)^3}+\ldots$

Subtracting, we get

$\left(1-\dfrac{1}{17}\right)S = \dfrac{5}{17}+\dfrac{50}{(17)^2}+\dfrac{500}{(17)^3}+\dfrac{5000}{(17)^4}+\ldots$

$\dfrac{16}{17}S = \dfrac{5/17}{1-10/17} = \dfrac{5}{7} \Rightarrow S = \dfrac{85}{112}$

15. $\sum_{r=1}^{2016}(-1)^r(a + rd) = a\sum_{r=1}^{2016}(-1)^r + d\sum_{r=1}^{2016}(-1)^r(r)$

But $\sum_{r=1}^{2016}(-1)^r = 0$ and $\sum_{r=1}^{2016}(-1)^r(r) = 1008$

Level 1

16. $2(2a + b) = (5a - b) + (a + 2b) \Rightarrow b = 2a.$

Also, $(a - 1)^2(b + 1)^2 = (ab + 1)^2$

$\Rightarrow (a - 1)(b + 1) = \pm(ab + 1)$

$\Rightarrow (a - 1)(2a + 1) = \pm(2a^2 + 1)$

$2a^2 - a - 1 = 2a^2 + 1$

or $2a^2 - a - 1 = -2a^2 - 1$

$\Rightarrow a = -2,\ a = 1/4$

17. $\dfrac{1}{a} + \dfrac{1}{c-b} + \dfrac{1}{c} + \dfrac{1}{a-b} = 0$

$\Rightarrow \dfrac{a+c-b}{a(c-b)} + \dfrac{a+c-b}{c(a-b)} = 0$

As $a + c - b \neq 0,\ a(c - b) + c(a - b) = 0$

$\Rightarrow b = \dfrac{2ac}{a+c} \Rightarrow a, b, c$ are in H.P.

18. $0 = S_p = \dfrac{p}{2}[2a + (p - 1)d] \Rightarrow d = \dfrac{2}{1-p}$

$S_{p+q} = \dfrac{p+q}{2}[2a + (p + q - 1)d]$

$= \dfrac{1}{2}(p + q)\,[2a + (p - 1)d + qd]$

$= \dfrac{(p+q)q}{1-p}$

19. $\dfrac{ma+nb}{m+n} = \dfrac{1}{2}(m + n) = \sqrt{ab}$ (1)

$\Rightarrow ma + nb = \sqrt{ab}\ (m + n)$

$\Rightarrow m\sqrt{a}\left(\sqrt{a}-\sqrt{b}\right) = n\sqrt{b}\left(\sqrt{a}-\sqrt{b}\right)$

$\Rightarrow \dfrac{m}{\sqrt{b}} = \dfrac{n}{\sqrt{a}} = k\text{(say)}$ (2)

From (1) and (2)

$\dfrac{1}{2}k\left(\sqrt{a}+\sqrt{b}\right) = \sqrt{ab} \Rightarrow k = \dfrac{2\sqrt{ab}}{\sqrt{a}+\sqrt{b}}$

Thus, $n = k\sqrt{a} = \dfrac{2a\sqrt{b}}{\sqrt{a}+\sqrt{b}}$

20. We have $gl = ab = 192$.

Also, $\dfrac{1}{2}(g + l) : \dfrac{2gl}{g+l} = 169 : 48$

$\Rightarrow \dfrac{(g+l)^2}{4gl} = \dfrac{169}{48}$

$\Rightarrow (g + l)^2 = \dfrac{169}{48}(4)\,(192) = 13^2\,(4)^2$

$\Rightarrow g + l = 52$

Note that g, l are roots of

$t^2 - (g + l)t + gl = 0$

or $t^2 - 52t + 192 = 0$

$\Rightarrow t = 4, 48.$

$\therefore\ g = 4,\ l = 48$

Let $a = 4a_1$, $b = 4b_1$, where $hcf\,(a_1, b_1) = 1$.

Also, $4a_1\,b_1 = 48 \Rightarrow a_1\,b_1 = 12$.

$\Rightarrow a_1 = 1,\ b_1 = 12$ or $a_1 = 3,\ b_1 = 4$

Thus, smaller of a, b, is 4 or 12.

21. $\dfrac{99}{100} < \dfrac{2}{3} + \dfrac{2}{3^2} + \ldots + \dfrac{2}{3^{n-1}}$

$\Rightarrow \dfrac{(2/3)\left[1-(1/3)^{n-1}\right]}{1-1/3} > \dfrac{99}{100}$

$\Rightarrow \dfrac{1}{100} > \dfrac{1}{3^{n-1}} \Rightarrow 3^{n-1} > 100$

$\Rightarrow n - 1 > 5 \Rightarrow n > 6$

Thus, least value of n is 7.

22. a, b, c, d are in A.P.

$\Rightarrow \dfrac{1}{a}, \dfrac{1}{b}, \dfrac{1}{c}, \dfrac{1}{d}$ are in H.P.

$\Rightarrow \dfrac{1}{d}, \dfrac{1}{c}, \dfrac{1}{b}, \dfrac{1}{a}$ are in H.P.

Now multiply each term by $abcd$

23. $\alpha + \beta = \dfrac{4+\sqrt{2}}{5+\sqrt{2}},\ \alpha\beta = \dfrac{8+2\sqrt{2}}{5+\sqrt{2}}$

H.M. $= \dfrac{2\,\alpha\,\beta}{\alpha+\beta} = \dfrac{16+4\sqrt{2}}{4+\sqrt{2}} = 4$

24. $\dfrac{2}{\cos x} = \dfrac{1}{\cos(x-y)} + \dfrac{1}{\cos(x+y)}$

$\Rightarrow 2(\cos^2 x - \sin^2 y) = 2\cos x\,\cos x\,\cos y.$

$\Rightarrow \cos^2 x(1 - \cos y) = \sin^2 y = 1 - \cos^2 y$

$\Rightarrow \cos^2 x = 1 + \cos y = 2\cos^2\left(\dfrac{y}{2}\right).$

$\Rightarrow \cos x\,\sec\left(\dfrac{y}{2}\right) = \pm\sqrt{2}.$

25. $a(2n) = 1 + \dfrac{1}{2} + \dfrac{1}{3} + \dfrac{1}{4} + \ldots + \dfrac{1}{2^{2n}-1}$

$> 1 + \dfrac{1}{2} + \left(\dfrac{1}{3}+\dfrac{1}{4}\right) + \left(\dfrac{1}{5}+\dfrac{1}{6}+\dfrac{1}{7}+\dfrac{1}{8}\right) + \ldots$

$+ \left(\dfrac{1}{2^{2n-1}+1} + \ldots + \dfrac{1}{2^{2n}}\right) - \dfrac{1}{2^{2n}}$

$> \dfrac{1}{2} + \dfrac{1}{2} + \dfrac{2}{4} + \dfrac{4}{8} + \ldots + \dfrac{2^{2n-1}}{2^{2n}} + \left(\dfrac{1}{2} - \dfrac{1}{2^{2n}}\right) > \dfrac{n}{2}$ if $n > 1$

$\therefore\ a(200) > 100.$

26. $$S = \frac{4}{19} + \frac{44}{19^2} + \frac{444}{19^3} + \ldots \qquad (1)$$

$$\frac{1}{19}S = \frac{4}{19^2} + \frac{44}{19^3} + \ldots \qquad (2)$$

Subtracting (2) from (1), we get

$$\left(\frac{18}{19}\right)S = \frac{4}{19} + \frac{40}{19^2} + \frac{400}{19^3} + \ldots$$

$$= \frac{4/19}{1 - 10/19} = \frac{4}{9}$$

$$\Rightarrow \quad S = \frac{19}{18} \times \frac{4}{9} = \frac{38}{81}$$

27. $a^{1/x} = b^{1/y} = c^{1/z} = \ldots = k(\text{say})$

$$\Rightarrow \quad \frac{\log a}{x} = \frac{\log b}{y} = \frac{\log c}{z} = \ldots \log k,$$

Now, use $\log a, \log b, \log c \ldots$ are in A.P.

28. $a^x = b^y = c^z = d^u$

$\Rightarrow x \log a = y \log b = z \log c = u \log d$

$$\Rightarrow \quad \frac{\log a}{1/x} = \frac{\log b}{1/y} = \frac{\log c}{1/z} = \frac{\log d}{1/u}$$

Now, use $\log a, \log b, \log c, \log u$ are in A.P.

29. $(a^2p^2 - 2abp + b^2) + (b^2p^2 - 2bcp + c^2) + (c^2p^2 - 2cdp + d^2) \le 0$

$\Rightarrow (ap - b)^2 + (bp - c)^2 + (cp - d)^2 \le 0$

As a, b, c, d and p are real this is possible if and only if

$ap - b = 0,\ bp - c = 0,\ cp - d = 0$

$$\Rightarrow \quad \frac{b}{a} = \frac{c}{b} = \frac{d}{c} \quad \Rightarrow \quad a, b, c, d \text{ are in G.P.}$$

30. a, b, c are in A.P. $\Rightarrow$ $2^{ax}, 2^{bx}, 2^{cx}$ are in G.P.

$\Rightarrow 2^{ax+1}, 2^{bx+1}, 2^{cx+1}$ are in G.P.

31. $$2\cdot\overline{357} = 2 + \frac{357}{1000} + \frac{357}{(1000)^2} + \ldots$$

$$= 2 + \frac{357/1000}{1 - 1/1000} = 2 + \frac{357}{999} = \frac{2355}{999}$$

32. $$S = 1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots \qquad (1)$$

$$\frac{1}{5}S = \frac{1}{5} + \frac{4}{5^2} + \frac{7}{5^3} + \ldots \qquad (2)$$

Subtracting (2) from (1), we get

$$\frac{4}{5}\ S = 1 + \frac{3}{5} + \frac{3}{5^2} + \frac{3}{5^3} + \ldots = 1 + \frac{3/5}{1 - 1/5}$$

$$= 1 + \frac{3}{4} = \frac{7}{4}$$

$$\Rightarrow \quad S = \frac{35}{16}.$$

33. $T_m = S_m - S_{m-1}$

$\Rightarrow 164 = 3m^2 + 5m - [3(m-1)^2 + 5(m-1)$

$= 6m + 2$

$\Rightarrow \quad m = 27.$

34. $G_1 = ar,\ G_2 = ar^2$ where $r = \left(\frac{b}{a}\right)^{1/3}$.

$$\frac{G_1^{\,2}}{G_2} + \frac{G_2^{\,2}}{G_1} = \frac{G_1^{\,3} + G_2^{\,3}}{G_1\,G_2} = \frac{a^3r^3 + a^3r^6}{a^2\,r^3}$$

$$= a + ar^3 = a + b = 2A$$

35. Use $A_1 + A_2 = a + b$ and $G_1\,G_2 = ab$.

36. Let n be the number of terms. Then

$$s = \frac{n}{2}(a + l) \Rightarrow n = \frac{2s}{a + l}.$$

Also,

$$d = \frac{l - a}{n - 1} = \frac{(l - a)(l + a)}{2s - (l + a)} = \frac{l^2 - a^2}{2s - (l + a)}$$

37. $x = 2^S$

where $$S = \frac{1}{4} + \frac{2}{8} + \frac{3}{16} + \frac{4}{32} + \ldots$$

$$\Rightarrow \frac{1}{2}S = \frac{1}{8} + \frac{2}{16} + \frac{3}{32} + \ldots$$

Subtracting, we get

$$\frac{1}{2}S = \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \ldots = \frac{1/4}{1 - 1/2}$$

$$= \frac{1}{4} \times 2 = \frac{1}{2}$$

$\Rightarrow \qquad S = 1.$

$\therefore \qquad x = 2$

38. $$\frac{a}{1 - r} = 20 \text{ and } \frac{a^2}{1 - r^2} = 100.$$

$$\Rightarrow \quad \frac{400\,(1 - r)^2}{1 - r^2} = 100$$

$$\Rightarrow \quad \frac{1 - r}{1 + r} = \frac{1}{4} \Rightarrow 4 - 4r = 1 + r$$

$\Rightarrow r = 3/5$

Thus, $$\frac{a}{2/5} = 20 \Rightarrow a = 8$$

39. $ar^7 = 128 = 2^7$ and $r = 2 \Rightarrow a = 1.$

Product of first five terms = $a^5 r^{10} = 1024$.

40. $l = AR^{p-1}$, $m = AR^{q-1}$, $n = AR^{r-1}$

$$\Delta = \begin{vmatrix} a+(p-1)d & p & 1 \\ a+(q-1)d & q & 1 \\ a+(r-1)d & r & 1 \end{vmatrix}$$

where $a = \log A$, $d = \log R$.

Use $C_1 \to C_1 - (a-d)C_3 - dC_3$ to show $\Delta = 0$.

41. $$\frac{\frac{p}{2}[2a+(p-1)d]}{\frac{q}{2}[2a+(q-1)d]} = \frac{p^2}{q^2} \Rightarrow \frac{a+\frac{p-1}{2}d}{a+\frac{q-1}{2}d} = \frac{p}{q}$$

Now, put $p = 11$ and $q = 41$.

42. $a = \sqrt{2}$, $r = \sqrt{3}$

$$S_{10} = \frac{a(r^{10}-1)}{r-1} = \frac{\sqrt{2}(3^5-1)}{\sqrt{3}-1}$$

$$= \frac{\sqrt{2}(242)(\sqrt{3}+1)}{(\sqrt{3}-1)(\sqrt{3}+1)} = 121(\sqrt{6}+\sqrt{2})$$

43. $\frac{1}{6}n(n+1)(2n+1) = 1015$

$\Rightarrow (2n)(2n+1)(2n+2) = (28)(29)(30)$

$\Rightarrow 2n = 28$ or $n = 14$.

44. $$t_r = 1^2 + 2^2 + \ldots + r^2 = \frac{1}{6}r(r+1)(2r+1)$$

$$= \frac{1}{6}(2r^3 + 3r^2 + r)$$

$$\therefore \sum_{r=1}^{n} t_r = \frac{1}{3}\cdot\frac{1}{4}n^2(n+1)^2$$

$$+ \frac{1}{2}\cdot\frac{1}{6}n(n+1)(2n+1) + \frac{1}{12}n(n+1)$$

$$= \frac{1}{12}n(n+1)[n^2 + n + 2n + 1 + 1]$$

$$= \frac{1}{12}n(n+1)(n^2 + 3n + 2)$$

$$= \frac{1}{12}n(n+1)^2(n+2)$$

$$\therefore \sum_{r=1}^{22} t_r = \frac{1}{12}(22)(23)^2(24) = 23276$$

45. $2b = a + c$, $b^2 = \dfrac{2a^2c^2}{a^2+c^2}$

$$\Rightarrow \frac{(a+c)^2}{4} = \frac{2a^2c^2}{a^2+c^2}$$

$\Rightarrow (a^2 + c^2)^2 + 2ac(a^2 + c^2) - 8a^2c^2 = 0$

$\Rightarrow (a^2 + c^2 + 4ac)(a^2 + c^2 - 2ac) = 0$

$\Rightarrow [(a+c)^2 + 2ac](a-c)^2 = 0$

$\Rightarrow (a+c)^2 + 2ac = 0$ $\quad [\because \ a \neq c]$

$\Rightarrow 4b^2 + 2ac = 0$

$\Rightarrow -\dfrac{a}{2}$, b, c are in G.P.

46. $a_m = n$, $a_n = m$

$\Rightarrow (m-n)d = a_n - a_n = -(m-n)$

$\Rightarrow d = -1$.

Now, $a_r - a_m = (r-m)(-1)$

$\Rightarrow a_r = a_m - r + m = m + n - r$.

47. As $b^2 = ac$, $ax^2 + 2bx + c = 0$ can be written as

$ax^2 + 2\sqrt{ac}\,x + c = 0 \Rightarrow (\sqrt{a}\,x + \sqrt{c})^2 = 0$

$\Rightarrow x = -\sqrt{\dfrac{c}{a}}, -\sqrt{\dfrac{c}{a}}$.

$\therefore -\sqrt{\dfrac{c}{a}}$ is a root of $dx^2 + 2ex + f = 0$

$$\Rightarrow d\left(\frac{c}{a}\right) - 2e\sqrt{\frac{c}{a}} + f = 0.$$

$$\Rightarrow \frac{d}{a} - 2e\sqrt{\frac{1}{ac}} + \frac{f}{c} = 0.$$

$$\Rightarrow 2\frac{e}{b} = \frac{d}{a} + \frac{f}{c} \Rightarrow \frac{d}{a}, \frac{e}{b}, \frac{f}{c} \text{ are in A.P.}$$

48. 2, $2^x + 1$, $2^x + 3$ are in G.P.

$\Rightarrow (2^x + 1)^2 = 2(2^x + 3) \Rightarrow 2^{2x} = 5$

$\Rightarrow x = \dfrac{1}{2}\log_2 5$

49. As $\frac{1}{2}x$, $|x+1|$, $|x-1|$ are in A.P.

$$2|x+1| = \frac{1}{2}x + |x-1| \qquad (1)$$

If $x < -1$, then (1) give us

$$-2(x+1) = \frac{1}{2}x - (x-1)$$

$\Rightarrow x = -2$

In this case common difference is 2 and sum to 10 terms is

$$\frac{10}{2}[2(-1) + (9)(2)] = 85$$

If $-1 \le x < 1$,

$$2(x+1) = \frac{1}{2}\, x - (x-1) \Rightarrow x = -2/5$$

In this case common difference is 4/5, and sum to 10 terms is

$$\frac{10}{2}\left[2\left(-\frac{1}{5}\right)+(9)\left(\frac{4}{5}\right)\right] = 34$$

If $x \ge 1$, then (1) becomes

$$2x + 2 = \frac{1}{2}\, x + x - 1$$

$$\Rightarrow \frac{1}{2}\, x = -3$$

Not possible as $x \ge 1$.

50. $\dfrac{2ab}{a+b} : \sqrt{ab} = 4 : 5 \Rightarrow \dfrac{2\sqrt{ab}}{a+b} = \dfrac{4}{5}$

$$\Rightarrow \frac{a+b}{\sqrt{ab}} = \frac{5}{2}$$

$$\Rightarrow \sqrt{\frac{a}{b}} + \sqrt{\frac{b}{a}} = \frac{5}{2} \quad \Rightarrow \quad \sqrt{\frac{a}{b}} = 2, \frac{1}{2}$$

$$\Rightarrow \quad a : b = 4 : 1 \text{ or } 1 : 4$$

51. $t_r = \dfrac{1^3+2^3+\ldots+r^3}{1+3+\ldots(2r-1)} = \dfrac{r^2\,(r+1)^2}{4r^2} = \dfrac{(r+1)^2}{4}$

Thus, $\displaystyle\sum_{r=1}^{16} t_r = \frac{1}{4}\left(\sum_{r=1}^{17} r^2 - 1\right)$

$$= \frac{1}{4}\left(\frac{1}{6}(17)\,(18)\,(35) - 1\right) = 446$$

52. Given equation implies

$$(a+c)\,(a+c-2b) = (a-c)^2$$

$$\Rightarrow (a+c)^2 - (a-c)^2 = 2b(a+c)$$

$$\Rightarrow \quad 4ac = 2b(a+c)$$

$$\Rightarrow b = \frac{2ac}{a+c} \Rightarrow a, b, c \text{ are in H.P.}$$

53. Required sum

$$= (2+4+\ldots+100) + (5+10+\ldots+100) - (10+20+\ldots+100)$$

$$= \frac{50}{2}(2+100) + \frac{20}{2}(5+100) - \frac{10}{2}(10+100)$$

$$= (50)\,(51) + (10)\,(105) - 550$$

$$= 2550 + 1050 - 550 = 3050$$

54. $T_1\, T_2\, T_7 = (T_7 - 6d)\,(T_7 - 5d)T_7$

$$= 9(9-6d)\,(9-5d)$$

$$= 729\left(d - \frac{3}{2}\right)\left(d - \frac{9}{5}\right)$$

But $(x-a)\,(x-b)$ is least when $x = \dfrac{1}{2}\,(a+b)$.

$\therefore\ T_1\, T_2\, T_7$ is least when $d = \dfrac{1}{2}\left(\dfrac{3}{2}+\dfrac{9}{5}\right) = \dfrac{33}{20}$

55. We have $\dfrac{t}{3} + \dfrac{81}{t} = 28$ where $t = 3^{2\sin 2\theta}$

$$\Rightarrow t^2 - 84t + 243 = 0 \Rightarrow t = 3, 81$$

But $1/9 \le t \le 9$. Thus, $t = 3$.

$\therefore\ a_1 = 1,\ d = 13 \quad \Rightarrow \quad a_5 = a_1 + 4d = 53.$

56. Write the given series as

$$\left(1+\frac{1}{2}\right)+\left(1+\frac{1}{2^2}\right)+\left(1+\frac{1}{2^3}\right)\ldots+\left(1+\frac{1}{2^n}\right)$$

$$= n + \frac{\frac{1}{2}\left(1-\frac{1}{2^n}\right)}{1-1/2} = n + 1 - \frac{1}{2^n}$$

57. We have $S_{2m} = \dfrac{2m\,(2m+1)^2}{2} = m(2m+1)^2$

$$\Rightarrow S_{2m-1} = m(2m+1)^2 - 2(2m)^2 = m(2m-1)^2$$

Now, put $n = 2m - 1$.

58. $a_r = \tan^{-1}\left(\dfrac{1}{1+r(r+1)}\right) = \tan^{-1}\left(\dfrac{r+1-r}{1+(r+1)r}\right)$

$$= \tan^{-1}(r+1) - \tan^{-1}(r)$$

Thus, $S_n = \displaystyle\sum_{r=1}^{n} a_r = \tan^{-1}(n+1) - \tan^{-1}(1)$

$$= \tan^{-1}\left(\frac{n+1-1}{1+(n+1)\,(1)}\right) = \tan^{-1}\left(\frac{n}{n+2}\right)$$

59. $t_r = \dfrac{1}{r\,(r+1)\,(r+2)} = \dfrac{1}{2r} - \dfrac{1}{r+1} + \dfrac{1}{2(r+2)}$

[split into partial fractions]

$$= \frac{1}{2}\left(\frac{1}{r} - \frac{1}{r+1}\right) - \frac{1}{2}\left(\frac{1}{r+1} - \frac{1}{r+2}\right)$$

$$\Rightarrow \quad S_n = \sum_{r=1}^{n} t_r = \frac{1}{2}\left(1 - \frac{1}{n+1}\right) - \frac{1}{2}\left(\frac{1}{2} - \frac{1}{n+2}\right)$$

$$= \frac{1}{2}\,\frac{n}{n+1} - \frac{n}{4\,(n+2)}$$

Thus, $S_{30} = \dfrac{1}{2}\,\dfrac{30}{31} - \dfrac{30}{4(32)} = \dfrac{30}{4}\left[\dfrac{64-31}{(31)\,(32)}\right] = \dfrac{495}{1984}$

60. $9(n!)^2 = n!(n+1)! \quad \Rightarrow \quad 9 = n + 1 \Rightarrow n = 8$

This shows that 8!, 5(8!), 9(8!) are in A.P.

61. Here $a = 81$, $r = \dfrac{2}{3}$.

Also, $S_n - S_{n-1} = ar^{n-1}$.

Let y = numerator of x, then

$$y = (S_n - S_{n-1}) - 3(S_{n-1} - S_{n-2})$$
$$+ 3(S_{n-2} - S_{n-3}) - (S_{n-3} - S_{n-4})$$
$$= ar^{n-1} - 3ar^{n-2} + 3ar^{n-3} - ar^{n-4}$$
$$= ar^{n-4}(r^3 - 3r^2 + 3r - 1)$$

Thus, $x = r = \dfrac{2}{3}$.

62. Let $n = 2m - 1$, then

$$S_{2m-1} = 1^2 + (1)(2) + 3^2 + (3)(4) + \ldots (2m-3)(2m-2) + (2m-1)^2$$
$$= \sum_{r=1}^{2m-1} r^2 + \sum_{r=1}^{m-1}\left[(2r-1)(2r) - (2r)^2\right]$$
$$= \frac{1}{6}(2m-1)(2m)(4m-1) - 2\sum_{r=1}^{m-1} r$$
$$= \frac{1}{3}m(2m-1)(4m-1) - (m-1)m$$
$$= \frac{1}{3}\left(\frac{n+1}{2}\right)n(2n+1) - \left(\frac{n+1}{2}\right)\left(\frac{n-1}{2}\right)$$
$$= \frac{1}{12}(n+1)[2n(2n+1) - 3(n-1)]$$
$$= \frac{1}{12}(n+1)(4n^2 - n + 3)$$

63. $(1 - 3^{-1})L = \lim\limits_{n\to\infty} (1 - 3^{-1})(1 + 3^{-1})(1 + 3^{-2})(1 + 3^{-4}) \ldots (1 + 3^{-2^n})$

$$\frac{2}{3}L = \lim_{n\to\infty}(1 - 3^{-2})(1 + 3^{-2})(1 + 3^{-4}) \ldots (1 + 3^{-2^n})$$
$$= \lim_{n\to\infty}(1 - 3^{-2^2})(1 + 3^{-4}) \ldots (1 + 3^{-2^n})$$
$$= \ldots = \lim_{n\to\infty}(1 - 3^{-2^{n+1}}) = 1$$

$\Rightarrow \qquad L = 3/2$

64. Note that

$$\frac{1}{a_1} + \frac{1}{a_2} + \ldots + \frac{1}{a_n}$$
$$< \left(1 + \frac{1}{3} + \frac{1}{3^2} + \ldots\right)\left(1 + \frac{1}{5} + \frac{1}{5^2} + \ldots\right)$$
$$= \left(\frac{1}{1 - 1/3}\right)\left(\frac{1}{1 - 1/5}\right) = \frac{15}{8} < 2$$

65. Coefficient of x^{99}

$= -(1 + 3 + 5 + \ldots 199) = -100^2 = -10000$

66. $t_r = 1 + 2 + \ldots + r = \dfrac{1}{2}r(r+1) = \dfrac{1}{2}(r^2 + r)$

$$\sum_{r=1}^{n} t_r = \frac{1}{2}\left[\frac{1}{6}n(n+1)(2n+1) + \frac{1}{2}n(n+1)\right]$$
$$= \frac{1}{6}n(n+1)(n+2)$$

67. $x = \dfrac{1}{1-a}$, $y = \dfrac{1}{1-b}$, $z = \dfrac{1}{1 - a/b} = \dfrac{b}{b-a}$

$$z = \frac{y-1}{y} \cdot \frac{yx}{y-x} = \frac{xy - x}{y - x}$$

$\Rightarrow yz - xz = xy - x \;\Rightarrow\; x + yz = x(y + z).$

68. $\dfrac{a}{1-r} = 3$, $\dfrac{a^3}{1-r^3} = \dfrac{108}{13}$ where $|r| < 1$.

$$\therefore \frac{27(1-r)^3}{1-r^3} = \frac{108}{13}$$
$$\Rightarrow \frac{1 - 2r + r^2}{1 + r + r^2} = \frac{4}{13}$$

$\Rightarrow 13 - 26r + 13r^2 = 4 + 4r + 4r^2$

$\Rightarrow 9r^2 - 30r + 9 = 0 \Rightarrow 3r^2 - 10r + 3 = 0.$

$\Rightarrow (3r - 1)(r - 3) = 0 \Rightarrow r = 1/3 \qquad [\because |r| < 1]$

69. $S = \displaystyle\sum_{r=1}^{n} [(r+1)\log a - (r-1)\log b]$

$$= \frac{n}{2}[(2 + n + 1)\log a - (0 + n - 1)\log b]$$
$$= \frac{n}{2}\log\left(\frac{a^{n+3}}{b^{n-1}}\right)$$

70. $t_5 = ar^4 = 2$.

We have $t_1 t_2 \ldots t_9 = a^9 r^{1+2+\ldots+8}$

$= a^9 r^{36} = (ar^4)^9 = 2^9 = 512$

71. $s = \dfrac{a}{1-r} \Rightarrow 1 - r = \dfrac{a}{s} \Rightarrow r = 1 - \dfrac{a}{s}$

$$S_n = \frac{a(1 - r^n)}{1 - r} = \frac{a}{a/s}\left[1 - \left(1 - \frac{a}{s}\right)^n\right]$$
$$= s\left[1 - \left(1 - \frac{a}{s}\right)^n\right]$$

72. Note that $< a_n >$ is a G.P. with first term equal to 5 and common ratio 1/2.

$$\therefore \quad \sum_{n=1}^{\infty} a_{2n-1} = \frac{a_1}{1-r^2} = \frac{5}{1-1/4} = 20/3.$$

73. $\frac{2ab}{a+b} : \sqrt{ab} = 12 : 13 \quad \Rightarrow \quad \frac{2\sqrt{ab}}{a+b} = \frac{12}{13}$

$$\Rightarrow \sqrt{\frac{a}{b}} + \sqrt{\frac{b}{a}} = \frac{13}{6}$$

$$\Rightarrow \sqrt{\frac{a}{b}} = \frac{2}{3} \text{ or } \frac{3}{2} \Rightarrow a : b = 4 : 9 \text{ or } 9 : 4$$

74. $\frac{2ab}{a+b} = \frac{16}{5}$, $a + b + ab = 26$

$$\Rightarrow \quad a + b = \frac{5}{8} ab, \; a + b + ab = 26$$

$$\therefore \; \frac{13}{8} ab = 26 \Rightarrow ab = 16 \text{ and } a + b = 10$$

Thus, numbers are 2 and 8.

75. $a_n^2 - 2a_{n-1}^2 + a_{n-2}^2$

$$= (a_n - a_{n-1})(a_n + a_{n-1}) - (a_{n-1} - a_{n-2})(a_{n-1} + a_{n-2})$$
$$= d(a_n + a_{n-1} - a_{n-1} - a_{n-2}) = d(2d) = 2d^2$$

76. $A = \frac{1}{1-r^a}$, $B = \frac{1}{1-r^b}$

$$\Rightarrow \quad 1 - r^a = \frac{1}{A}, \; 1 - r^b = \frac{1}{B}$$

$\Rightarrow a \log r = \log(1 - 1/A)$ and

$b \log r = \log(1 - 1/B)$

$$\therefore \; \frac{a}{b} = \frac{\log(1 - A^{-1})}{\log(1 - B^{-1})}$$

77. Note that $a_k - a_{k-1} = a_{k-1} - a_{k-2} \; \forall \; k \geq 3$ implies $a_1, a_2, a_3 \ldots, a_{12}$ are in A.P.

Also, $d = -4$. We have

$$12S = (a_1 - a_2)(a_1 + a_2) + (a_3 - a_4)(a_3 + a_4) + \ldots + (a_{11} - a_{12})(a_{11} + a_{12})$$
$$= 4(a_1 + a_2 + \ldots + a_{12})$$
$$= 4 \times \frac{12}{2}[2a_1 + (12 - 1)(-4)]$$

$$\Rightarrow \quad S = 2[2(45) - 44] = 92$$

78. We have

$$P(x) = \frac{1 - (-x)^{2013}}{1 - (-x)} = \frac{1 + x^{2013}}{1 + x}$$

Also $\sum_{i=0}^{2012} a_i = Q(1) = P(3)$ $\quad [\because y = 1 = x - 2]$

$$= \frac{1}{4}(3^{2013} + 1)$$

79. We have

$a_1 + a_{26} = a_2 + a_{25} = a_3 + a_{24} = \ldots = a_9 + a_{18}$.

Thus,

$a_2 + a_6 + a_9 + a_{18} + a_{21} + a_{25} = 165$

$\Rightarrow \; (a_2 + a_{25}) + (a_6 + a_{21}) + (a_9 + a_{18}) = 165$

$\Rightarrow \; 3(a_1 + a_{26}) = 165 \quad \Rightarrow \quad a_1 + a_{26} = 55$

$\therefore \; a_1 + a_2 + \ldots + a_{26} = \frac{26}{2}(a_1 + a_{26})$

$= 13 \times 55 = 715$

80. We are given $S_n = cn^2$. Now,

$t_n = S_n - S_{n-1} = cn^2 - c(n-1)^2 = (2n-1)c$

We have

$$t_1^2 + t_2^2 + \ldots + t_n^2 = \sum_{k=1}^{n} c^2 (2k-1)^2$$
$$= c^2 \sum_{k=1}^{n} \left(4k^2 - 4k + 1\right)$$
$$= c^2 \left[\frac{4}{6} n(n+1)(2n+1) - \frac{4}{2} n(n+1) + n\right]$$
$$= \frac{c^2}{3} n\left[2\left(2n^2 + 3n + 1\right) - 6n - 6 + 3\right]$$
$$= \frac{1}{3} n\left(4n^2 - 1\right)c^2$$

81. Sum to n terms of an A.P. is of the form $an + bn^2$ and not of the form $c + bn + an^2$ where $c \neq 0$.

82. $|2x - 1| < 1 \quad \Rightarrow \quad -1 < 2x - 1 < 1$

$\Rightarrow \quad 0 < x < 1$

83. As $a + c > 0$, we must have

$(a + c)^2 + 4b^2 - 4(a + c)b < 0$

$\Rightarrow (2b - a - c)^2 < 0$

This is not possible as $2b - a - c \in \mathbf{R}$.

84. $(\alpha^2 + \beta^2)^2 = (\alpha + \beta)(\alpha^3 + \beta^3)$

$\Rightarrow \alpha^4 + \beta^4 + 2\alpha^2\beta^2 = \alpha^4 + \alpha\beta^3 + \alpha^3\beta + \beta^4$

$\Rightarrow \alpha\beta(\alpha - \beta)^2 = 0$

$\Rightarrow \alpha\beta[(\alpha + \beta)^2 - 4\alpha\beta] = 0$

$$\Rightarrow \frac{c}{a}\left[\frac{4b^2}{a^2}-\frac{4c}{a}\right] = 0 \quad \Rightarrow \quad c\Delta = 0$$

Next, α, $\alpha\beta$, β are in A.P. $\Rightarrow$ $\alpha + \beta = 2\alpha\beta$

$$\Rightarrow -\frac{2b}{a}=\frac{2c}{a} \quad \Rightarrow \quad b + c = 0$$

85. Let $a_1 = a$, $a_2 = ar$, $a_3 = ar^2$ and $a_4 = ar^3$.

As a_1, a_2, a_3, a_4 are distinct, $r \neq 1$

$b_1 = a$, $b_2 = a + ar = a(1 + r)$,

$b_3 = a(1 + r + r^2)$

and $b_4 = a(1 + r + r^2 + r^3)$.

As $b_2 - b_1 = ar \neq ar^2 = b_3 - b_2$.

$\Rightarrow b_1, b_2, b_3, b_4$ are not in A.P.

$$\frac{b_2}{b_1} = 1 + r \neq \frac{1+r+r^2}{1+r}=\frac{b_3}{b_2}$$

$\Rightarrow b_1, b_2, b_3, b_4$ are not in G.P.

Next, $\dfrac{1}{b_2}-\dfrac{1}{b_1}=\dfrac{-r}{a(1+r)}$

$$\frac{1}{b_3}-\frac{1}{b_2}=\frac{-r^2}{a(1+r)\left(1+r+r^2\right)}$$

Since $\dfrac{1}{b_2}-\dfrac{1}{b_1}\neq\dfrac{1}{b_3}-\dfrac{1}{b_2}$ we get b_1, b_2, b_3, b_4 cannot be in H.P.

Level 2

86. The given sequence can be written as

$$\frac{5}{2},\frac{20}{13},\frac{10}{9},\frac{20}{23},\cdots$$

The reciprocal of the numbers in the sequence are

$$\frac{8}{20},\frac{13}{20},\frac{18}{20},\frac{23}{20},\cdots$$

This is an A.P.

nth term of this A.P. is

$$a_n = \frac{8+5(n-1)}{20} = \frac{3+5n}{20}$$

Thus, nth term of the given sequence is $\dfrac{20}{5n+3}$.

87. H.M. between a and b is

$$\frac{2ab}{a+b} = \frac{2(1/28)(1/10)}{1/28+1/10} = \frac{1}{19}$$

88. $a\left(\dfrac{1}{b}+\dfrac{1}{c}\right)$, $b\left(\dfrac{1}{c}+\dfrac{1}{a}\right)$, $c\left(\dfrac{1}{a}+\dfrac{1}{b}\right)$ are in A.P.

$\Rightarrow a\left(\dfrac{1}{b}+\dfrac{1}{c}\right)+1$, $b\left(\dfrac{1}{c}+\dfrac{1}{a}\right)+1$, $c\left(\dfrac{1}{a}+\dfrac{1}{b}\right)+1$ are in A.P.

$\Rightarrow a\left(\dfrac{bc+ca+ab}{abc}\right)$, $b\left(\dfrac{bc+ca+ab}{abc}\right)$,

$c\left(\dfrac{bc+ca+ab}{abc}\right)$ are in A.P.

$\Rightarrow a, b, c$ are in A.P.

89. $\sin d\,[\operatorname{cosec} a_1 \operatorname{cosec} a_2 + \operatorname{cosec} a_2 \operatorname{cosec} a_3 + \cdots + \operatorname{cosec} a_{n-1} \operatorname{cosec} a_n]$

$$= \frac{\sin(a_2-a_1)}{\sin a_1 \sin a_2}+\frac{\sin(a_3-a_2)}{\sin a_2 \sin a_3}+\cdots+\frac{\sin(a_n-a_{n-1})}{\sin a_{n-1}\sin a_n}$$

$= (\cot a_1 - \cot a_2) + (\cot a_2 - \cot a_3)$

$+ \cdots + (\cot a_{n-1} - \cot a_n)$

$= \cot a_1 - \cot a_n$

90. $1 + \dfrac{3}{2} + \dfrac{5}{3} + \cdots + \dfrac{2n-1}{n}$

$$= (2-1) + \left(2-\frac{1}{2}\right)+\left(2-\frac{1}{3}\right)+\cdots+\left(2-\frac{1}{n}\right)$$

$= 2n - H_n$

91. a, b, c are in H.P.

$\Rightarrow \dfrac{1}{a},\dfrac{1}{b},\dfrac{1}{c}$ are in A.P.

$\Rightarrow \dfrac{a+b+c}{a}-2$, $\dfrac{a+b+c}{b}-2$, $\dfrac{a+b+c}{c}-2$ are in A.P.

$\Rightarrow \dfrac{b+c-a}{a}$, $\dfrac{c+a-b}{b}$, $\dfrac{a+b-c}{c}$ are in A.P.

$\Rightarrow \dfrac{a}{b+c-a}$, $\dfrac{b}{c+a-b}$, $\dfrac{c}{a+b-c}$ are in H.P.

92. Last term of the nth row

$= 1 + 2 + 3 + \cdots + n = \dfrac{1}{2}n(n+1)$

Note that sum of the terms in the nth row

= sum to n terms of an A.P. whose first term in $\dfrac{1}{2}n(n+1)$ and common difference is (-1).

$$= \frac{1}{2}n\left[2\left(\frac{1}{2}\right)n(n+1)+(n-1)(-1)\right]=\frac{1}{2}n(n^2+1)$$

93. We have

$$A_1 = a + \frac{1}{3}(b - a) = \frac{2a+b}{3}$$

and $A_2 = \dfrac{a+2\,b}{3}$

$\therefore\ A_1 + A_2 = a + b$

Also, $\dfrac{1}{H_1} = \dfrac{1}{3}\left(\dfrac{2}{a}+\dfrac{1}{b}\right) = \dfrac{1}{3}\left(\dfrac{2b+a}{ab}\right)$

and $\dfrac{1}{H_2} = \dfrac{1}{3}\left(\dfrac{2a+b}{ab}\right)$

Also, $\dfrac{1}{H_1}+\dfrac{1}{H_2} = \dfrac{1}{a}+\dfrac{1}{b}$

$\Rightarrow H_1 + H_2 = \dfrac{a+b}{ab} H_1\, H_2$

Therefore,

$$\frac{A_1 + A_2}{H_1 + H_2} = \frac{ab}{H_1\,H_2} = \frac{ab}{9}\,\frac{(a+2b)\,(2a+b)}{(ab)^2}$$

$$= \frac{2\,(a^2+b^2)+5\,ab}{9\,ab}$$

94. $\dfrac{1}{n+1}+\dfrac{1}{n+2}+\cdots+\dfrac{1}{2n}$

$$= \left(1+\frac{1}{2}+\cdots+\frac{1}{2n}\right) - \left(1+\frac{1}{2}+\cdots+\frac{1}{n}\right)$$

$$= \left(1-\frac{1}{2}+\frac{1}{3}-\frac{1}{4}+\cdots+\frac{1}{2n-1}-\frac{1}{2n}\right)$$

$$+\ 2\left(\frac{1}{2}+\frac{1}{4}+\cdots+\frac{1}{2n}\right) - \left(1+\frac{1}{2}+\cdots+\frac{1}{n}\right)$$

$= a\ (2n)$

95. Let m be the minimum number filled in the boxes. Let a, b, c, d be the numbers in the boxes sharing a side with the box containing m, then

$m = \dfrac{1}{4}\ (a + b + c + d)$

$\Rightarrow (a - m) + (b - m) + (c - m) + (d - m) = 0 \qquad (1)$

As $a - m \ge 0,\ b - m \ge 0\ ,\ c - m \ge 0,\ d - m \ge 0,$

(1) is possible if and only if

$a - m = 0,\ b - m = 0,\ c - m = 0\ d - m = 0$

Thus, each of the box contains m.

As the first box contains 5, $m = 5$.

Therefore, $x = 5$

96. $a + 8b + 7c = 0$

$9a + 2b + 3c = 0$

$5a + 5b + 5c = 0$

as $b = 6$, we get $a = 1$, $c = -7$

The roots of quadratic equation

$x^2 + 6x - 7 = 0 \Rightarrow x = 1, -7$

Now, $\dfrac{1}{\alpha}+\dfrac{1}{\beta} = 1-\dfrac{1}{7} = \dfrac{6}{7}$

Thus, $\displaystyle\sum_{n=0}^{\infty}\left(\frac{1}{\alpha}+\frac{1}{\beta}\right)^n = \sum_{n=0}^{\infty}\left(\frac{6}{7}\right)^n = \frac{1}{1-6/7} = 7$

Previous Year's AIEEE/JEE Main Questions

1. $t_5 = 2$. Let r be the common ratio of the G.P. $t_1t_2t_3t_4t_5t_6t_7t_8t_9$

$= \left(\dfrac{2}{r^4}\right)\left(\dfrac{2}{r^3}\right)\left(\dfrac{2}{r^2}\right)\left(\dfrac{2}{r}\right)(2)(2r)(2r^2)(2r^3)(2r^4)$

$= 2^9 = 512.$

2. Let $E = 2^{1/4}4^{1/8}8^{1/16}\ \ldots = 2^5$

where

$S = \dfrac{1}{4}+\dfrac{2}{8}+\dfrac{3}{16}+\dfrac{4}{32}+\cdots$

$\Rightarrow\quad \dfrac{1}{2}S = \dfrac{1}{8}+\dfrac{2}{16}+\dfrac{3}{32}+\cdots$

Subtracting, we get

$\dfrac{1}{2}S = \dfrac{1}{4}+\dfrac{1}{8}+\dfrac{1}{16}+\dfrac{1}{32}+\cdots$

$= \dfrac{1/4}{1-1/2} = \dfrac{1}{2}$

$\Rightarrow S = 1$

$\therefore\ E = 2^1 = 2$

3. 1, $\log_9\ (3^{1-x} + 2)$, $\log_3\ (4(3^x) - 1)$ are in A.P.

$\Rightarrow 1,\ \dfrac{\log_3(3^{1-x}+2)}{\log_3 9}$, $\log_3\ (4(3^x) - 1)$ are in A.P.

$\Rightarrow 2,\ \log_3\ (3^{1-x} + 2),\ 2\log_3\ (4(3^x) - 1)$ are in A.P.

$\Rightarrow 3^2,\ 3^{1-x} + 2,\ (4(3^x) - 1)^2$ are in G.P.

$\Rightarrow (3^{1-x} + 2)^2 = 3^2\ (4(3^x) - 1)^2$

$\Rightarrow \dfrac{3}{y}+2 = 3(4(y) - 1)$ where $y = 3^x$

$\Rightarrow 12y^2 - 5y - 3 = 0$

$\Rightarrow (4y - 3)\ (3y + 1) = 0$

$\Rightarrow y = 3/4 \qquad [\because\ 3y + 1 > 0]$

$\Rightarrow 3^x = 3/4 \Rightarrow x = 1 - \log_3 4$

4. $1^3 - 2^3 + 3^3 - 4^3 + \cdots - 8^3 + 9^3$

$= (1^3 - 2^3) + (3^3 - 4^3) + \cdots + (7^3 - 8^3) + 9^3$

$= (1 - 2)\,(1^2 + 2^2 + 2) + (3 - 4)\,(3^2 + 4^2 + (3)(4))$

$+ (5 - 6)\,(5^2 + 6^2 + (5)\,(6))$

$+ (7 - 8)\,(7^2 + 8^2 + (7)(8)) + 9^3$

$= -\,(1^2 + 2^2 + 3^2 + \cdots 8^2)$

$- (2 + 12 + 30 + 56) + 9^3$

$= 9^3 - \frac{1}{6}(8)(9)(17) - 100$

$= 729 - 204 - 100 = 425$

5. Let $S_1 = \{2x \mid 1 \le x \le 50\}$

$S_2 = \{5x \mid 1 \le x \le 20\}$

$S_1 \cap S_2 = \{10x \mid 1 \le x \le 10\}$

Required sum

$= \sum_{x\in S_1} x + \sum_{x\in S_2} x - \sum_{x\in S_1 n S_2} x$

$= 2\left(\frac{50}{2}\right)(51) + 5\left(\frac{20}{2}\right)(21) - 10\left(\frac{10}{2}\right)(11)$

$= (50)\,(51) + 5(10)\,(21) - 5(10)\,(11)$

$= (50)\,[51 + 21 - 11] = 3050$

6. $\frac{a}{1-r} = 20,\ \frac{a^2}{1-r^2} = 100$

$\Rightarrow 20\left(\frac{a}{1+r}\right) = 100 \quad \Rightarrow \frac{a}{1+r} = 5$

$\therefore \frac{a/(1-r)}{a/(1+r)} = \frac{20}{5} \Rightarrow \frac{1+r}{1-r} = 4$

$\Rightarrow 1 + r = 4 - 4r$

$\Rightarrow 5r = 3 \Rightarrow r = 3/5.$

7. Let $f(x) = Ax^2 + Bx + C$

As $f(1) = f(-1)$, $B = 0$

$\therefore f(x) = Ax^2 + C$

$\Rightarrow f'(x) = 2Ax$

Now, a, b, c are in A.P.

$\Rightarrow 2Aa$, $2Ab$, $2Ac$ are in A.P.

$\Rightarrow f'(a), f'(b), f'(c)$ are in A.P.

8. $T_m = \frac{1}{n}$ and $T_n = \frac{1}{m}$

$\Rightarrow a + (m-1)d = \frac{1}{n}$ and $a + (n-1)d = \frac{1}{m}$

Subtracting we get

$(m-n)d = \frac{1}{n} - \frac{1}{m} \quad \Rightarrow d = \frac{1}{mn}.$

Thus, $a - d = \frac{1}{n} - md$

$= \frac{1}{n} - \frac{1}{n} = 0$

9. Let $n = 2m$, then

$1^2 + 2\cdot 2^2 + 3^2 + 2\cdot 4^2 + 5^2 + 2\cdot 6^2 + \ldots + (2m-1)^2 + 2(2m)^2$

$= \frac{1}{2}(2m)(2m+1)^2$

$\Rightarrow 1^2 + 2\cdot 2^2 + 3^2 + 2\cdot 4^2 + \cdots + (2m-1)^2$

$= m(4m^2 + 4m + 1) - 8m^2$

$= m(2m - 1)^2$

Putting $n = 2m - 1$, we get desired sum.

$= \frac{1}{2}n^2(n+1)$

10. We have $x = \frac{1}{1-a}$, $y = \frac{1}{1-b}$, $z = \frac{1}{1-c}$

a, b, c are in A.P.

$\Rightarrow 1 - a$, $1 - b$, $1 - c$ are in A.P.

$\Rightarrow \frac{1}{1-a}, \frac{1}{1-b}, \frac{1}{1-c}$ are in H.P.

11. $\frac{1}{(1-ax)(1-bx)} = \frac{1}{(b-a)x}\left[\frac{1}{1-b} - \frac{1}{1-ax}\right]$

$= \frac{1}{(b-a)x}\left[(1-bx)^{-1} - (1-ax)^{-1}\right]$

Thus, coefficient of x^n in $\frac{1}{(1-ax)(1-bx)}$ is $\frac{1}{(b-a)x}$ × [coefficient of x^{n+1} in $(1 - bx)^n$ – coefficient of x^{n+1} in $(1 - ax)^n$]

$= \frac{1}{b-a}\{b^{n+1} - a^{n+1}\}$

12. Let d be the common difference of the A.P., then

$$\frac{\frac{p}{2}[2a_1 + (p-1)d]}{\frac{q}{2}[2a_1 + (q-1)d]} = \frac{p^2}{q^2}$$

$$\Rightarrow \frac{a_1 + \frac{1}{2}(p-1)d}{a_1 + \frac{1}{2}(q-1)d} = \frac{p}{q}$$

Putting $p = 11$ and $q = 41$, we get

$$\frac{a_6}{a_{21}} = \frac{11}{41}$$

13. $a_1, a_2, \ldots a_n$ are in H.P.

$\Rightarrow \quad \frac{1}{a_1}, \frac{1}{a_2}, \ldots \frac{1}{a_n}$ are in A.P.

$$\Rightarrow \quad \frac{1}{a_2} - \frac{1}{a_1} = \frac{1}{a_3} - \frac{1}{a_2} = \cdots \frac{1}{a_n} - \frac{1}{a_{n-1}} = d \text{ (say)}$$

$$\Rightarrow \quad a_1a_2 = \frac{1}{d}(a_1 - a_2), a_2a_3 = \frac{1}{d}(a_2 - a_3), \cdots$$

$$\Rightarrow a_{n-1}a_n = \frac{1}{d}(a_1 - a_n)$$

Thus, $\quad a_1a_2 + a_2a_3 + \cdots + a_{n-1}a_n$

$$= \frac{1}{d}[a_1 - a_2 + a_2 - a_3 + \cdots + a_{n-1} - a_n]$$

$$= \frac{1}{d}(a_1 - a_n)$$

But $\frac{1}{a_n} = \frac{1}{a_1} + (n-1)d \Rightarrow \frac{a_1 - a_n}{a_na_1} = (n-1)d$

$\therefore \quad a_1a_2 + a_2a_3 + \cdots a_{n-1}a_n = (n-1)a_1a_n$

14. $ar^n = ar^{n+1} + ar^{n+2}$, $a > 0$, $r > 0$

$\Rightarrow \quad 1 = r + r^2 \Rightarrow r^2 + r - 1 = 0$

$\Rightarrow \quad r = \frac{1}{2}(\sqrt{5} + 1)$ as $r > 0$

15. As $n < n + 1 \ \forall \ n \geq 2$

$\Rightarrow \quad n(n+1) < (n+1)^2 \ \forall \ n \geq 2$

$\Rightarrow \quad \sqrt{n(n+1)} < n + 1 \ \forall \ n \geq 2$

Thus, Statement-2 is true.

Also, for $n \geq 2$

$$\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \cdots + \frac{1}{\sqrt{n}}$$

$$> \underbrace{\frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n}} + \cdots + \frac{1}{\sqrt{n}}}_{n \text{ times}}$$

$$\Rightarrow \quad \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \cdots + \frac{1}{\sqrt{n}} > \sqrt{n}$$

$\therefore$ Statement-1 is true.

Thus, both the statements are correct but Statement-2 is not a correct explanation of Statement-1.

16. Let $S = 1 + \frac{2}{3} + \frac{6}{3^2} + \frac{10}{3^3} + \frac{14}{3^4} +$

$$\frac{1}{3}S = \frac{1}{3} + \frac{2}{3^2} + \frac{6}{3^3} + \frac{10}{3^4} + \cdots$$

Subtracting, we get

$$\frac{2}{3}S = 1 + \frac{1}{3} + \frac{4}{3^2} + \frac{4}{3^3} + \frac{4}{3^4} + \cdots$$

$$= 1 + \frac{1}{3} + \frac{4/3^2}{1 - 1/3} = \frac{4}{3} + \frac{2}{3} = 2$$

$\Rightarrow \quad S = 3$

17. Suppose he takes n minutes to count 4500 notes. We have $a_1 + a_2 + \cdots + a_{10} = 10(150)$, $a_{11} = 148$ and $a_{11}, a_{12}, \ldots, a_n$ is an A.P. with common difference $d = -2$.

We are given.

$a_1 + a_2 + \ldots + a_{10} + a_{11} + \ldots + a_n = 4500$

$\Rightarrow \quad a_{11} + a_{12} + \ldots + a_n = 3000$

$$\Rightarrow \quad \frac{n-10}{2}[a_{11} + a_n] = 3000$$

$$\Rightarrow \quad \frac{1}{2}(n-10)[148 + 148 + (n-11)(-2)] = 3000$$

$\Rightarrow \quad (n - 10)(148 - n + 11) = 3000$

$\Rightarrow \quad (n - 10)(159 - n) = 3000$

$\Rightarrow \quad n^2 - 169n + 4590 = 0$

$\Rightarrow \quad n^2 - 135n - 34n + 4590 = 0$

$\Rightarrow \quad (n - 135)(n - 34) = 0 \quad \Rightarrow \quad n = 135, 34$

All the notes get counted in 34 minutes.

18. Suppose his total saving is ₹ 11040 after n months. His savings are

200, 200, 200, 240, 280, ... upto n terms

Note that

200, 240, 280, ... upto $(n - 2)$ terms is an A.P. whose sum is 10640.

Thus,

$$\frac{1}{2}(n-2)[2(200) + (n-3)(40)] = 10640$$

$\Rightarrow (n - 2)(n + 7) = 532$

$\Rightarrow \quad n^2 + 5n - 546 = 0$

$\Rightarrow n = -26, 21$

As $n > 0$, $n = 21$.

19. Let d the common difference of the A.P. then

$$\alpha - \beta = \sum_{r=1}^{100}(a_{2r} - a_{2r-1}) = \sum_{r=1}^{100} d = 100d$$

$$\Rightarrow d = \frac{1}{100}(a - \beta).$$

20. We have

$100a_{100} = 500a_{50}$

$\Rightarrow \quad 100\,[a + 99d] = 50[a + 49d]$

$\Rightarrow \quad (100 - 50)a = 50(49 - 2 \times 99)d$

$\Rightarrow \quad a = -149d \quad \Rightarrow \quad a + 149d = 0$

or $\quad a_{150} = 0$

21. Statement-2 is true since

$$\sum_{k=1}^{n}\left(k^2 - (k-1)^3\right) = (1^3 - 0^3) + (2^3 - 1^3) + \cdots + (n^3 - (n-1)^3) = n^3$$

$$\Rightarrow \quad \sum_{k=1}^{n}(k-(k-1))\left(k^2 + k(k-1) + (k-1)^2\right) = n^3$$

$$\Rightarrow \quad \sum_{k=1}^{n}\left(k^2 + k(k-1) + (k-1)^2\right) = n^3$$

Putting $n = 20$, we get

$$\sum_{k=1}^{20}\left((k-1)^2 + k(k-1) + k^2\right) = 20^3$$

$$\Rightarrow \quad 1 + (1 + 2 + 4) + (4 + 6 + 9) + \cdots + (361 + 380 + 400) = 8000$$

22. $2y = x + z$

and $2\tan^{-1} y = \tan^{-1} x + \tan^{-1} z$

$$\Rightarrow \quad \tan^{-1}\left(\frac{2y}{1-y^2}\right) = \tan^{-1}\left(\frac{x+z}{1-xz}\right)$$

$$\Rightarrow \quad \frac{2y}{1-y^2} = \frac{x+z}{1-xz}$$

$\Rightarrow \quad y^2 = xz \quad [\because 2y = x + z]$

$\Rightarrow \quad \frac{1}{4}(x+z)^2 = xz \;\Rightarrow\; (x - z)^2 = 0$

$\Rightarrow \quad x = z$

$\therefore\; 2y = 2x \Rightarrow \; y = x$

$\Rightarrow x = y = z$

23. $S = 0.7 + 0.77 + 0.777 + \cdots +$ upto 20 terms

$= \frac{7}{9}[0.9 + 0.99 + 0.999 + \cdots$ upto 20 terms$]$

$= \frac{7}{9}[20 - (0.1 + 0.01 + 0.001 + \cdots$ upto 20 terms$)]$

$$= \frac{7}{9}\left[20 - \frac{(1/10)\left(1-(1/10)^{20}\right)}{1 - 1/10}\right]$$

$$= \frac{7}{81}\left[179 + 10^{-20}\right]$$

24. $S_n = 2n + 3n^2$

$a = S_1 = 2 + 3 = 5$

$a + (a + d) = S_2 = 2(2) + 3(2^2) = 16$

$\therefore\; d = 16 - 10 = 6$

Sum of required A.P.

$$= \frac{n}{2}[2a + (n-1)(2d)]$$

$$= \frac{n}{2}[2(5) + (n-1)(2)(6)]$$

$= 6n^2 - n$

25. $$a_r = \frac{2r+1}{1^2 + 2^2 + \ldots + r^2}$$

$$= \frac{(2r+1)}{(1/6)r(r+1)(2r+1)}$$

$$= \frac{6}{r(r+1)} = 6\left(\frac{1}{r} - \frac{1}{r+1}\right)$$

$$\therefore\; \sum_{r=1}^{11} a_r = 6\left(1 - \frac{1}{12}\right) = \frac{11}{2}$$

26. Let first three numbers be

$a/r,\ a,\ ar$

and last three numbers be

$a,\ ar,\ 2ar - a$

We are given

$ar - a = 6$

and $\quad 2ar - a = a/r$

$\Rightarrow 2r^2 - r = 1$

$\Rightarrow (2r + 1)\,(r - 1) = 0$

$\Rightarrow r = -1/2,\ 1$

$r \neq 1$ is not possible, for then $a\,(1) - a = 6$ or $0 = 16$

Let $r = -1/2$.

Thus, $a(-1/2) - a = 6 \quad \Rightarrow a = -4$

$\therefore$ last term = first term = $a/r = 8$

27. $1^2 + 3^2 + 5^2 + \cdots + 25^2$

$$= \sum_{r=1}^{13}(2r-1)^2 = \sum_{r=1}^{13}(4r^2 - 4r + 1)$$

$$= 4\left(\frac{1}{6}\right)(13)(14)(27) - \frac{4}{2}(13)(14) + (13)$$

$= 2925$

28. See Solution to Question 12.

29. $\sum_{k=1}^{10} k(2k)^2 = 4\sum_{k=1}^{10} k^3$

$\frac{4}{4}(10)^2(10+1)^2 = 12100$

30. $t_k = \tan^{-1}\left(\frac{1}{1+(n+k-1)(n+k)}\right)$

$= \tan^{-1}\left(\frac{(n+k)-(n+k-1)}{1+(n+k)(n+k-1)}\right)$

$= \tan^{-1}(n+k) - \tan^{-1}(n+k-1)$

$\therefore\ S = \sum_{k=1}^{20} t_k = \tan^{-1}(n+20) - \tan^{-1}(n)$

$= \tan^{-1}\left(\frac{20}{1+n(n+20)}\right)$

$\Rightarrow \tan(S) = \frac{20}{n^2+20n+1}$

31. Let d be the common difference of the A.P., then

$m = a_4 - a_7 + a_{10} = a_4 + (a_{10} - a_7)$

$= a_1 + 3d + 3d = a_1 + 6d$

Now,

$S_{13} = \frac{13}{2}[2a_1 + (13-1)d] = 13m$

32. Let three positive numbers in G.P. be

$\frac{a}{r}$, a, ar, $a > 0$, $r > 1$

Now, $2(2a) = \frac{a}{r} + ar$

$\Rightarrow r^2 - 4r + 1 = 0$

$\Rightarrow r = 2+\sqrt{3}$ as $r > 1$.

33. $k = 1 + 2\left(\frac{11}{10}\right) + 3\left(\frac{11}{10}\right)^2 + \cdots + 10\left(\frac{11}{10}\right)$

$\frac{11}{10}k = \frac{11}{10} + 2\left(\frac{11}{10}\right)^2 + \cdots + 9\left(\frac{11}{10}\right)^9 + 10\left(\frac{11}{10}\right)^{10}$

Subtracting, we get

$-\frac{1}{10}k = 1 + \frac{11}{10} + \left(\frac{11}{10}\right)^2 + \cdots + \left(\frac{11}{10}\right)^9 - 10\left(\frac{11}{10}\right)^{10}$

$= \frac{(11/10)^{10} - 1}{11/10 - 1} - 10\left(\frac{11}{10}\right)^{10}$

$= 10\left(\frac{11}{10}\right)^{10} - 10 - 10\left(\frac{11}{10}\right)^{10}$

$k = 100$

34. $S_9 = \frac{9}{2}[2a + (9-1)d] = 9(a + 4d)$

$200 < 9(a + 4d) < 220$

As $a + 4d$ is a positive integer

$a + 4d = 23, 24$

Also, $a + d = 12$

$\therefore\ 3d = 11, 12$

As d is an integer, $d = 4$

Thus, $t_4 = a + 3d = (a + 4d) - d = 20$

[$a + 4d = 23$ is not possible]

35. From Question 25,

$a_r = 6\left(\frac{1}{r} - \frac{1}{r+1}\right)$

$\Rightarrow \sum_{r=1}^{20} a_r = 6\left(1 - \frac{1}{21}\right) = \frac{120}{21} = \frac{k}{21}$

$\therefore\ k = 120$

36. Let first 5 terms of the G.P. be

$\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$

Reciprocals are

$\frac{r^2}{a}, \frac{r}{a}, \frac{1}{a}, \frac{1}{ar}, \frac{1}{ar^2}$

We are given $\frac{a/r^2 + a/r + a + ar + ar^2}{r^2/a + r/a + 1/a + 1/ar + 1/ar^2} = 49$

$\Rightarrow a^2 = 49 \Rightarrow a = \pm 7$

Also, $\frac{a}{r^2} + a = 35$

As $r^2 > 0$, $a = 7$

and $\frac{1}{r^2} + 1 = 5 \Rightarrow r^2 = \frac{1}{4}$

$\therefore$ first term $= a/r^2 = 28$

37. Two A.P. are

3, 7, 11, 15, 19, 23, 27, 31, …

and 1, 6, 11, 16, 21, 26, 31, …

Common terms are

11, 31, 51, …

Its an A.P. with first term 11, and common ratio 20.

Thus, sum to 20 common terms is

$$\frac{20}{2}[2(11)+(20-1)(20)]=4020$$

38. $G = \sqrt{ab}$,

$$M = \frac{1}{2}\left(\frac{1}{a}+\frac{1}{b}\right) = \frac{a+b}{2ab}$$

$$\frac{1/M}{G}=\frac{4}{5} \quad \Rightarrow MG = \frac{5}{4}$$

$$\Rightarrow \frac{a+b}{2\sqrt{ab}}=\frac{5}{4} \quad \Rightarrow \sqrt{\frac{a}{b}}+\sqrt{\frac{b}{a}}=\frac{5}{2}$$

$$\Rightarrow \sqrt{\frac{a}{b}}=2, \frac{1}{2}$$

$$\Rightarrow \frac{a}{b}=4, \frac{1}{4}$$

$\therefore$ $a : b = 1 : 4$

39. Let S_n denote the sum to n terms of the given geometric series, that is,

$$S_n = 1-\frac{2}{3}-\frac{2}{3^2}-\frac{2}{3^3}\cdots-\frac{2}{3^{n-1}}$$

$$= 1-\frac{(2/3)\left[1-(1/3)^{n-1}\right]}{1-1/3}$$

$$= 1-1+\left(\frac{1}{3}\right)^{n-1} = \left(\frac{1}{3}\right)^{n-1}$$

Now, $\left(\frac{1}{3}\right)^{n-1} < \frac{1}{100}$

$\Rightarrow 3^{n-1} > 100 \;\Rightarrow n-1 \geq 5 \quad \Rightarrow n \geq 6$

Thus, least value of n is 6.

40. Let the A.P. be a, $a + d$, ..., $a + (2n - 1)d$

It is given

$$a + (a+2d) + \cdots + (a + (2n-2)d) = 24 \quad (1)$$

and $(a + d) + (a + 3d) + ...+ (a + (2n - 1)d) = 30$ (2)

From (1) and (2), we get

$$\underbrace{d+d+\cdots+d}_{n\text{ times}}=6 \;\Rightarrow nd = 6$$

Also,

$$a + (2n-1)d - a = 10\frac{1}{2}=\frac{21}{2} = \frac{21}{2}$$

$$(2n-1)d = \frac{21}{2}$$

$$\Rightarrow \frac{6(2n-1)}{2n}=\frac{21}{2} \quad \Rightarrow \frac{2n-1}{n}=\frac{7}{4}$$

$\therefore$ number of terms in the A.P. is 8.

41. $\frac{3n}{100}<\frac{2}{3} \quad \Rightarrow 9n < 200$

$\Rightarrow n < 200/9$

$\Rightarrow n \leq 22$

Next,

$\frac{2}{3}\leq\frac{3n}{100}<\frac{5}{3} \quad \Rightarrow 200 \leq 9n < 500$

$\Rightarrow \; 23 \leq n \leq 55.$

$$\therefore \sum_{n=1}^{56} f(n) = \sum_{n=1}^{22} f(n)+\sum_{n=23}^{55} f(n)+f(56)$$

$$= 0+\sum_{n=23}^{55} n+2(56)$$

$$= \frac{33}{2}(23+55)+112=1399$$

42. $m = (l + n)/2$

Also, l, G_1, G_2, G_3, n are in G.P.

Let its common ratio be r, then

$n = lr^4 \Rightarrow r^4 = n/l.$

Now, $G_1^4 + 2G_2^4 + G_3^4$

$= l^4\, [r^4 + 2(r^2)^4 + (r^3)^4]$

$$= l^4\left[\frac{n}{l}+\frac{2n^2}{l^2}+\frac{n^3}{l^3}\right]$$

$= ln\, (l^2 + 2nl + n^2)$

$= ln\, (l + n)^2 = 4lm^2n$

43. $$t_r = \frac{1^3+2^3+\cdots+r^3}{1+3+\cdots+(2r-1)}$$

$$= \frac{r^2(r+1)^2/4}{r^2}$$

$$= \frac{1}{4}(r+1)^2$$

$$\Rightarrow \sum_{r=1}^{9} t_r = \frac{1}{4}\sum_{r=1}^{9}(r+1)^2$$

$$= \frac{1}{4}\left[\sum_{r=1}^{10} r^2-1\right]$$

$$= \frac{1}{4}\left[\frac{1}{6}(10)(10+1)(20+1)-1\right]$$

$= 96$

44. $\sum_{r=16}^{30}(r+2)(r-3)$

$= \sum_{r=1}^{15}(r+15+2)(r+15-3)$

$= \sum_{r=1}^{15}(r+17)(r+12)$

$= \sum_{r=1}^{15}(r^2+29r+204)$

$= \frac{1}{6}(15)(16)(31)+\frac{29}{2}(15)(16)+(204)(15)$

$= 7780$

45. $ar^2 + ar^3 = 60$ (1)

and $(a)(ar)(ar^2) = 1000$ (2)

(2) $\Rightarrow (ar)^3 = 10^3 \Rightarrow ar = 10$

$\therefore$ (1) gives us

$10r + 10r^2 = 60 \Rightarrow r^2 + r - 6 = 0$

$\Rightarrow (r + 3)(r - 2) = 0 \Rightarrow r = -3, 2.$

As $a > 0$, $ar = 10$, therefore, $r = 2$.

Thus, $t_7 = ar^6 = (ar)r^5 = 10(2^5) = 320$

46. $\frac{k}{3} = \sum_{n=1}^{5}\frac{1}{n(n+1)(n+2)(n+3)}$

$= \sum_{n=1}^{5}\left[\frac{1}{6n}-\frac{1}{2(n+1)}+\frac{1}{2(n+2)}-\frac{1}{6(n+3)}\right]$

$= \sum_{n=1}^{5}\left[\frac{1}{6}\left(\frac{1}{n}-\frac{1}{n+1}\right)-\frac{1}{3}\left(\frac{1}{n+1}-\frac{1}{n+2}\right)\right.$

$\left.+\frac{1}{6}\left(\frac{1}{n+2}-\frac{1}{n+3}\right)\right]$

$\Rightarrow \frac{k}{3} = \frac{1}{6}\left(1-\frac{1}{6}\right)-\frac{1}{3}\left(\frac{1}{2}-\frac{1}{7}\right)+\frac{1}{6}\left(\frac{1}{3}-\frac{1}{8}\right)$

$\Rightarrow k = \frac{1}{2}\left(\frac{5}{6}\right)-\frac{5}{14}+\frac{1}{2}\left(\frac{5}{24}\right)$

$= \frac{5}{2}\left[\frac{1}{6}-\frac{1}{7}+\frac{1}{24}\right] = \frac{5}{2}\left(\frac{11}{168}\right) = \frac{55}{336}$

47. Let a_n denotes the nth term of the A.P., then

$\frac{a_5}{a_2} = \frac{a_9}{a_5} = r$ (say)

$\Rightarrow \frac{a_5 - a_2}{a_2} = \frac{a_9 - a_5}{a_5}$

$\Rightarrow \frac{3d}{a_2} = \frac{4d}{a_5}$ [d = common difference of the A.P.]

$\Rightarrow r = \frac{a_5}{a_2} = \frac{4}{3}$

48. Note that

$1\frac{3}{5}, 2\frac{2}{5}, 3\frac{1}{5}, 4, 4\frac{4}{5}, \ldots$

forms an A.P. with first term $a = 1\frac{3}{5}$ and common difference $d = \frac{4}{5}$

Sum to 10 terms

$= \sum_{k=1}^{10}[a+(k-1)d]^2$

$= 10a^2 + 2ad(1 + 2 + \ldots + 9) + d^2(1^2 + 2^2 + \ldots + 9^2)$

$= 10a^2 + (ad)(9)(10) + d^2\left(\frac{1}{6}\right)(9)(10)(19)$

$= 10\left(\frac{8}{5}\right)^2 + \left(\frac{8}{5}\right)\left(\frac{4}{5}\right)(9)(10) + \left(\frac{4}{5}\right)^2(15)(19)$

$= \frac{16}{5}[8 + 36 + 57] = \frac{16}{5}(101)$

$\therefore m = 101$

49. For A.P.

$a_r + a_s = 2a_1 + (r + s - 2)d$

$\therefore a_3 + a_{15} + 2a_1 + 16d = 2a_9$

Similarly $a_7 + a_{11} = 2a_9$.

Now, $72 = 4a_9 \Rightarrow a_9 = 18$

Sum to first 17 terms

$= \frac{17}{2}[2a_1 + (17 - 1)d]$

$= 17a_9 = (17)(18) = 306$

Previous Years' B-Architecture Entrance Examination Questions

1. $\frac{1}{16}$, a, b are in G.P.

$\Rightarrow a^2 = b/16$ (1)

Also, as a, b, 1/6 are in H.P.

$$b = \frac{2(a)(1/6)}{a+1/6} = \frac{2a}{6a+1} \qquad (2)$$

From (1) and (2)

$16a^2 = \frac{2a}{6a+1}$

$\Rightarrow 8a\ (6a + 1) = 1$ $\quad [\because\ a \neq 0]$

$\Rightarrow 48a^2 + 8a - 1 = 0$

$\Rightarrow (12a - 1)\ (4a + 1) = 0$

$\Rightarrow a = 1/12,\ a = -1/4$

When $a = 1/12,\ b = 1/9$

When $a = -1/4,\ b = 1$

2. $x = \dfrac{2ab}{a+b}$

Let common ratio of G.P. a, y, z, b be r, then $r^3 = b/a$ and

$y = ar,\ z = b/r$

$\therefore\ yz = ab$

and $y^3 + z^3 = a^3r^3 + \dfrac{b^3}{r^3}$

$= a^3\left(\dfrac{b}{a}\right) + b^3\left(\dfrac{a}{b}\right)$

$= ab\ (a + b)$

$\Rightarrow x(y^3 + z^3) = \dfrac{2ab}{a+b}(ab)(a+b) = 2a^2b^2$

$\therefore\ \dfrac{yz}{x(y^3+z^3)} = \dfrac{ab}{2(ab)^2} = \dfrac{1}{2ab}$

3. $x = 1 + a + a^2 + \cdots = \dfrac{1}{1-a}$

$y = \dfrac{1}{1-b}$

$\Rightarrow a = 1 - 1/x,\ b = 1 - 1/y$

Now, $1 + ab + a^2b^2 + \ldots$

$= \dfrac{1}{1-ab} = \dfrac{1}{1-(1-1/x)(1-1/y)}$

$= \dfrac{xy}{x+y-1}$

4. $3b = a + b + c \geq 3(abc)^{1/3}$

$\Rightarrow b \geq 4^{1/3} = 2^{2/3}$

5. $\displaystyle\sum_{i=1}^{20} i\left(\frac{1}{i}+\frac{1}{i+1}+\frac{1}{i+2}+\ldots+\frac{1}{20}\right)$

$= \left(\dfrac{1}{1}+\dfrac{1}{2}+\cdots+\dfrac{1}{20}\right)$

$+2\left(\dfrac{1}{2}+\dfrac{1}{3}+\cdots+\dfrac{1}{20}\right)+3\left(\dfrac{1}{3}+\cdots+\dfrac{1}{20}\right) +20\left(\dfrac{1}{20}\right)$

$= (1)(1)+\dfrac{1}{2}(1+2)+\dfrac{1}{3}(1+2+3)+\cdots$

$+\dfrac{1}{20}(1+2+\cdots+20)$

$= \displaystyle\sum_{k=1}^{20}\frac{1}{k}(1+2+\cdots+k) = \frac{1}{2}\sum_{k=1}^{20}(k+1)$

$= \dfrac{1}{2}\cdot\dfrac{1}{2}(20)(2 + 21) = 115$

6. Required numbers are

203, 210, …, 399

Now, $399 = 203 + 7\ (n - 1)$

$\Rightarrow 57 = 29 + (n - 1) \Rightarrow n = 29$

Thus, required sum is

$= \dfrac{29}{2}[203+399] = 8729$

7. $a + b + c = xb$

$\Rightarrow \dfrac{b}{r}+b+br = xb$, where r is common ratio of the G.P and $r \neq 1$

$\Rightarrow r+\dfrac{1}{r} = (x - 1)$

But $r+\dfrac{1}{r} < -2$ or $r+\dfrac{1}{r} > 2$

$\therefore\ x - 1 < -2$ or $x - 1 > 2$

$\Rightarrow x < -1$ or $x > 3$

$\Rightarrow x \in (-\infty, -1) \cup (3, \infty)$

8. Let two A.P.'s be

$a,\ a + d,\ a + 2d, \ldots$

and $A,\ A + D,\ A + 2D, \ldots$

We are given

$$\frac{\frac{n}{2}[2a+(n-1)d]}{\frac{n}{2}[2A+(n-1)D]} = \frac{3n+8}{7n+15}$$

$$\Rightarrow \frac{a+\frac{n-1}{2}d}{A+\frac{n-1}{2}D} = \frac{3n+8}{7n+15}$$

Put $(n - 1)/2 = 11$ or $n = 23$.

$$\therefore\ \frac{a+11d}{A+11D} = \frac{3(23)+8}{7(23)+15} = \frac{77}{176} = \frac{7}{16}$$

9. Let a_n denote the growth of height in the nth year. We have

$a_1 = 50$ cm, $a_r = 50 - 5(r - 1) = 55 - 5r$

The tree ceases to grow in the rth year where $a_r = 0$
$\Rightarrow r = 11$

So height of tree is

$a_1 + a_2 + \cdots + a_9$

$= \frac{10}{2}[50+5]\text{cm} = 275 \text{ cm} = 2.75 \text{ m}$

10. rth term of the series is

$$t_r = \frac{49-r}{(r+1)(r+2)}$$

$$= \frac{50}{r+1} - \frac{51}{r+2}$$

$$= 50\left(\frac{1}{r+1} - \frac{1}{r+2}\right) - \frac{1}{r+2}$$

$$\Rightarrow \sum_{r=1}^{48} t_r = 50\sum_{r=1}^{48}\left(\frac{1}{r+1} - \frac{1}{r+2}\right) - \sum_{r=1}^{48}\left(\frac{1}{r+2}\right)$$

$$= 50\left(\frac{1}{2} - \frac{1}{50}\right) - \sum_{r=1}^{48}\frac{1}{r+2}$$

$$= \frac{51}{2} - \sum_{r=1}^{50}\left(\frac{1}{r}\right)$$

$\therefore K = -1$

11. $2, 2^x - 1, 2^x + 3$ are in G.P.

$\Rightarrow (2^x - 1)^2 = 2(2^x + 3)$

$\Rightarrow 2^{2x} - 2(2^x) + 1 = 2(2^x) + 6$

$\Rightarrow 2^{2x} - 4(2^x) - 5 = 0$

$\Rightarrow (2^x - 5)\ (2x + 1) = 0$

$\Rightarrow 2^x = 5 \quad [\because 2^x + 1 > 0]$

Thus, there is exactly one value of x.

12. Let r be the common ratio of the G.P. b, c, d, then

$b = \frac{c}{r}$, $c = c$, $d = cr$

As c, d, e, are in A.P.

$e = 2d - c = 2cr - c = c(2r - 1)$

Also, $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in A.P.

$$\Rightarrow \frac{1}{a} = \frac{2}{b} - \frac{1}{c} = \frac{2r}{c} - \frac{1}{c} = \frac{2r-1}{c}$$

Also, $\frac{2}{b} - \frac{1}{a} = \frac{1}{c}$

$$\Rightarrow \frac{2a-b}{ab} = \frac{1}{c}$$

$$\therefore \frac{ab^2}{(2a-b)^2} = \frac{ab^2}{(ab/c)^2} = \frac{c^2}{a}$$

$= c(2r - 1) = e$

13. Let $S_n = \sum_{k=1}^{n}\phi(k) = \frac{2n}{n+1}$

$$\Rightarrow \phi(n) = S_n - S_{n-1} = \frac{2n}{n+1} - \frac{2(n-1)}{n}$$

$$= \frac{2[n^2 - (n^2 - 1)]}{(n+1)n} = \frac{2}{n(n+1)}$$

$$\Rightarrow \frac{1}{\phi(n)} = \frac{n(n+1)}{2}$$

$$\Rightarrow \sum_{k=1}^{10}\frac{1}{\phi(n)} = \frac{1}{2}\sum_{k=1}^{10}(k^2 + k)$$

$$= \frac{1}{2}\cdot\frac{1}{6}(10)(11)(21) + \frac{1}{2}\cdot\frac{1}{2}(10)(11)$$

$= 220$

14. $2b = a + c$, $\frac{2}{d} = \frac{1}{c} + \frac{1}{e}$, $c^2 = bd$

Now, $\frac{2ce}{c+e} = d = \frac{c^2}{b}$

$$\Rightarrow \frac{e}{c+e} = \frac{c}{2b} = \frac{c}{a+c}$$

$\Rightarrow ae + ce = c^2 + ce$

$\Rightarrow c^2 = ae \Rightarrow a, c, e$ are in G.P.

CHAPTER NINE

Limits and Continuity

LIMITS

Let f be a function defined in some neighbourhood of c, but not necessarily at the point c. We are interested in the behaviour of $f(x)$ when the distance between x and c is small, i.e., $|x - c|$ is small. Specifically, we would like to know whether there is some real number l such that $f(x)$ approaches l as x approaches c. We write

$$\lim_{x \to c} f(x) = l$$

to indicate that the difference between $f(x)$ and l can be made arbitrarily small (smaller than any pre-assigned positive number) simply by requiring that x be sufficiently close to c but different from c.

Take a positive number ε. $\lim_{x \to c} f(x) = l$, if $|f(x) - l| < \varepsilon$ for all x sufficiently close to c but different from it. That is, there exists a positive number δ such that if $0 < |x - c| < \delta$, then $|f(x) - l| < \varepsilon$.

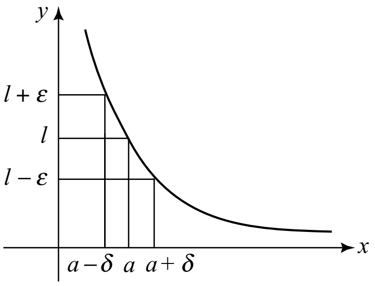

Fig. 9.1

ONE-SIDED LIMITS

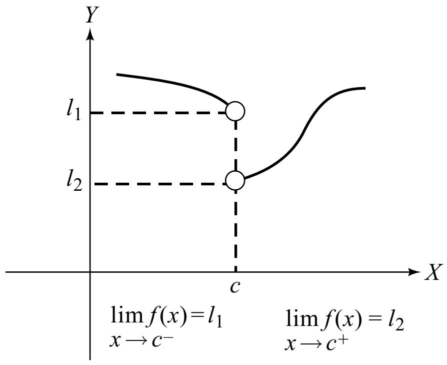
The *left-hand limit* is written as

$$\lim_{x \to c-} f(x) = l$$

If x approaches c from its left, then it crosses over values of the form $c - h$, $h > 0$, the difference between $f(x)$ and l can be made arbitrarily small. More precisely, $\lim\limits_{x \to c-} f(x) = l$ if for each $\varepsilon > 0$, there exists a $\delta > 0$ such that if $c - \delta < x < c$, then $|f(x) - l| < \varepsilon$.

Similarly we define, the *right-hand limit* written as

$$\lim_{x \to c+} f(x) = l$$



Y
l_1
l_2
X
c
$\lim\limits_{x \to c^-} f(x) = l_1$
$\lim\limits_{x \to c^+} f(x) = l_2$

Fig. 9.2

If $\lim_{x \to c+} f(x) = \lim_{x \to c-} f(x)$, then the limit of $f(x)$ as $x \to c$ exists and is written as $\lim_{x \to c} f(x)$. The limit of a function $f(x)$ may not exists in any of the following situations:

1. $\lim_{x \to c+} f(x)$ does not exist, i.e., $f(x)$ becomes infinitely small or large as $x \to c+$. For example, as $x \to 0+$, the function $f(x) = 1/x$ becomes infinitely large, as in this case x crosses over values which are positive but sufficiently small.
2. $\lim_{x \to c-} f(x)$ does not exist as for example, in $f(x) = 1/x$ as $x \to 0-$, where x crosses over values which are negative, so that $f(x)$ becomes infinitely small.
3. Both $\lim_{x \to c+} f(x)$ and $\lim_{x \to c-} f(x)$ exist but are unequal. for example, in $f(x) = \begin{cases} 1, & x > c \\ -1, & x < c \end{cases}$ In this case, $\lim_{x \to c+} f(x) = 1$ and $\lim_{x \to c-} f(x) = -1$.

x	$c + .001$	$c + .01$	$c + .1$	$c - .001$	$c - .01$	$c - .1$
$f(x)$	1	1	1	–1	–1	–1

FREQUENTLY USED LIMITS

1. $\lim\limits_{x\to 0} \dfrac{\sin x}{x} = 1 = \lim\limits_{x\to 0} \cos x = \lim\limits_{x\to 0} \dfrac{\tan x}{x}$

$$= \lim_{x\to 0} \frac{\sin^{-1} x}{x} = \lim_{x\to 0} \frac{\tan^{-1} x}{x}.$$

2. $\lim\limits_{x\to 0} (1 + x)^{1/x} = e = \lim\limits_{x\to\infty} \left(1+\dfrac{1}{x}\right)^x$.
3. $\lim\limits_{x\to 0} \dfrac{\log_a (1+x)}{x} = \log_a e \quad (a > 0,\ a \neq 1)$.

   In particular taking $a = e$, $\lim\limits_{x\to 0} \dfrac{\log (1+x)}{x} = 1$.
4. $\lim\limits_{x\to 0} \dfrac{a^x - 1}{x} = \log a \quad (a > 0)$.

   In particular, $\lim\limits_{x\to 0} \dfrac{e^x - 1}{x} = \log e = 1$.
5. $\lim\limits_{x\to 0} \dfrac{(1+x)^m - 1}{x} = m,\ m \in \mathbf{R}$.
6. $\lim\limits_{x\to\infty} \dfrac{\log x}{x^m} = 0 \quad (m > 0)$.
7. $\lim\limits_{x\to a} \dfrac{x^n - a^n}{x - a} = na^{n-1}$.

SOME THEOREMS ON LIMITS

The calculation of limits is based on the following theorems. If $\lim\limits_{x\to c} f(x)$ and $\lim\limits_{x\to c} g(x)$ exist, then

1. $\lim\limits_{x\to c} (f(x) \pm g(x)) = \lim\limits_{x\to c} f(x) \pm \lim\limits_{x\to c} g(x)$.
2. $\lim\limits_{x\to c} [kf(x)] = k \lim\limits_{x\to c} f(x)$ where k is a scalar.
3. $\lim\limits_{x\to c} (f(x) \cdot g(x)) = \lim\limits_{x\to c} f(x) \cdot \lim\limits_{x\to c} g(x)$.
4. $\lim\limits_{x\to c} \dfrac{f(x)}{g(x)} = \dfrac{\lim\limits_{x\to c} f(x)}{\lim\limits_{x\to c} g(x)}$ (provided $\lim\limits_{x\to c} g(x) \neq 0$).
5. If $f(x) > 0$ and $\lim\limits_{x\to a} f(x) = L$ then $L \geq 0$

For many elementary functions (e.g., polynomial, trigonometric, logarithmic and exponential), we have

$$\lim_{x\to c} f(x) = f\left(\lim_{x\to c} x\right) = f(c),$$

in general, for continuous functions.

COMPUTATION OF LIMITS

Suppose we have find $\lim\limits_{x\to a} \dfrac{f(x)}{g(x)}$

1. If f, g are Polynomial, Trigonometric, Logarithmic or Exponential function such that $g(a) \neq 0$. Then $\lim\limits_{x\to a} \dfrac{f(x)}{g(x)} = \dfrac{f(a)}{g(a)}$ provided $f(a)$ and $g(a)$ are finite.

Illustration 1

Evaluate $\lim\limits_{x\to 2} \dfrac{x^2 + x + 2}{x^3 + 1}$

Since the numerator and denominator are polynomials and if $f(x) = x^2 + x + 2$ and $g(x) = x^3 + 1$ then $f(2) = 4 + 2 + 2 = 8$ and $g(2) = 8 + 1 = 9$, thus

$$\lim_{x\to 2} \frac{f(x)}{g(x)} = \frac{f(2)}{g(2)} = \frac{8}{9}.$$

Illustration 2

Evaluate $\lim\limits_{x\to 0} \dfrac{3 + \sin x}{\cos x}$

Since the numerator and denominator are trigonometric function and if $f(x) = 3 + \sin x$ and $g(x) = \cos x$ then $f(0) = 3$ and $g(0) = 1$, thus

$$\lim_{x\to 0} \frac{3 + \sin x}{\cos x} = \frac{3 + 0}{1} = 3$$

2. If $g(a) = 0$ and $f(a) = 0$ and f, g are polynomials then $(x - a)$ is a factor of both f and g. In such a case we factorise the numerator and denominator and cancel out the common factor and then the situation is as above.

Illustration 3

$$\lim_{x\to 1} \frac{x^3 - 1}{x^2 - 1}$$

If $f(x) = x^3 - 1$ and $g(x) = x^2 - 1$ then $f(1) = g(1) = 0$. Therefore $x - 1$ is a factor of $x^3 - 1$ and $x^2 - 1$, hence

$$\lim_{x\to 1} \frac{x^3 - 1}{x^2 - 1} = \lim_{x\to 1} \frac{(x-1)\left(x^2 + x + 1\right)}{(x-1)(x+1)}$$

$$= \lim_{x\to 1} \frac{x^2 + x + 1}{x + 1}$$

$$= \frac{1+1+1}{1+1} = \frac{3}{2}.$$

3. If f and g are of the form $\sqrt{p(x)} - \sqrt{q(x)}$ and $\sqrt{r(x)} - \sqrt{s(x)}$ where $p(x)$, $q(x)$, $r(x)$, $s(x)$ are polynomials such that $f(a) = g(a) = 0$ then we use rationalisation of the denominator and numerator, e.g.

Illustration 4

$$\lim_{x\to a}\frac{\sqrt{4a+3x}-\sqrt{x+6a}}{\sqrt{2a+5x}-\sqrt{3a+4x}}$$

$$= \lim_{x\to a}\frac{(2x-2a)\left(\sqrt{2a+5x}+\sqrt{3a+4x}\right)}{(x-a)\left(\sqrt{4a+3x}+\sqrt{x+6a}\right)}$$

(Rationalizing the numerator and denominator)

$$= 2\lim_{x\to a}\frac{\sqrt{2a+5x}+\sqrt{3a+4x}}{\sqrt{4a+3x}+\sqrt{x+6a}} = \frac{2\,(2\sqrt{7a})}{2\sqrt{7a}} = 2.$$

4. $\lim\limits_{x\to 0}\dfrac{a^{f(x)}-1}{g(x)}$, where $f(x)\to 0$ as $x\to 0$

and $\lim\limits_{x\to 0}\dfrac{f(x)}{g(x)}$ exist

then $\lim\limits_{x\to 0}\dfrac{a^{f(x)}-1}{g(x)} = \lim\limits_{x\to 0}\dfrac{a^{f(x)}-1}{f(x)}\cdot\dfrac{f(x)}{g(x)}$

$$= \log a \lim_{x\to 0}\frac{f(x)}{g(x)}$$

Illustration 5

$$\lim_{x\to 0}\frac{a^{\sin x}-1}{x\cos x}$$

$$= \lim_{x\to 0}\frac{a^{\sin x}-1}{\sin x}\frac{\sin x}{x}\cdot\frac{1}{\cos x} = \log a.1.1 = \log a$$

5. $\lim\limits_{x\to 0}(1+f(x))^{1/g(x)}$, where $f(x)\to 0$ as $x\to 0$ and

$\lim\limits_{x\to 0}\dfrac{f(x)}{g(x)} = l$ exist

then

$$\lim_{x\to 0}(1+f(x))^{1/g(x)} = \lim_{x\to 0}(1+f(x))^{1/f(x).(f(x)/g(x))}$$

$$= e^{l}$$

Illustration 6

To find $\lim\limits_{x\to 0}(1+(x^2+3x))^{1/\sin x}$, write the required limit as

$$\lim_{x\to 0}(1+(x^2+3x)^{[1/(x^2+3x)]\,(x(x+3)/\sin x)}$$

$$= \lim_{x\to 0}(1+(x^2+3x))^{[(1/(x^2+3x)]\,(x(x+3)/\sin x)}$$

$$= \lim_{x\to 0}(1+(x^2+3x))^{(1/(x^2+3x))\,(x/\sin x)\,(x+3)}$$

$$= e^{1.3} = e^{3}$$

L'HÔPITAL'S RULES FOR CALCULATING LIMITS

1. (0/0 *form*) If f and g are differentiable functions on (0, δ) (see the definition of differentiability in the next chapter) such that
   (i) $g'(x)\neq 0$ for any $x\in(0,\delta)$
   (ii) $\lim\limits_{x\to 0+} f(x) = 0 = \lim\limits_{x\to 0+} g(x)$
   (iii) $\lim\limits_{x\to 0+}\dfrac{f'(x)}{g'(x)} = L$, then
   $\lim\limits_{x\to 0+}\dfrac{f(x)}{g(x)} = L.$
2. (L′ Hôpital's rule when $x\to\infty$). If f and g are differentiable functions on $[a,\infty)$ such that
   (i) $\lim\limits_{x\to\infty} f(x) = \lim\limits_{x\to\infty} g(x) = 0$
   (ii) $\lim\limits_{x\to\infty}\left(\dfrac{f'(x)}{g'(x)}\right) = L$, then $\lim\limits_{x\to\infty}\dfrac{f(x)}{g(x)} = L.$
3. (∞/∞ *form*). If f and g are differentiable functions on (0, δ) such that
   (i) $g'(x)\neq 0$ for any $x\in(0,\delta)$
   (ii) $f(x)\to\infty$, $g(x)\to\infty$ as $x\to 0+$
   (iii) $\lim\limits_{x\to 0+}\dfrac{f'(x)}{g'(x)} = L$, then $\lim\limits_{x\to 0+}\dfrac{f(x)}{g(x)} = L$

Illustration 7

What is wrong with the following application of L'Hôpital's rule?

$$\lim_{x\to 1}\frac{x^3+3x-4}{2x^2+x-3} = \lim_{x\to 1}\frac{3x^2+3}{4x+1} = \lim_{x\to 1}\frac{6x}{4} = \frac{3}{2}.$$

The expression $\dfrac{3x^2+3}{4x+1}$ is not of $\dfrac{0}{0}$ form as $x\to 1$. Therefore, it is not correct to apply L'Hôpital rule. In fact

$$\lim_{x\to 1}\frac{3x^2+3}{4x+1} = \frac{\lim\limits_{x\to 1}\left(3x^2+3\right)}{\lim\limits_{x\to 1}(4x+1)} = \frac{6}{5}.$$

4. The following illustrations will show the methods of converting 0°, 1^∞, 0^∞, ∞^∞, $\infty-\infty$ etc., to the forms $\dfrac{0}{0}$ and $\dfrac{\infty}{\infty}$.

Illustration 8

$$\lim_{x\to 0+}(\sin x)^{x}$$

It is of the form 0^0. If L is the limit sought, then

$$\log L = \lim_{x\to 0+} x \log \sin x = \lim_{x\to 0+} \frac{\log \sin x}{1/x}\left(\frac{\infty}{\infty}\right)$$

$$= \lim_{x\to 0+} \frac{-\cos x}{\sin x\left(\frac{-1}{x^2}\right)} = \lim_{x\to 0} \frac{x\cos x}{(\sin x)/x} = \frac{0}{1} = 0$$

Thus $L = 1$

Illustration 9

$$\lim_{x\to 0} (1 - 3x)^{4/x} \quad (1^{\infty} \text{ form})$$

If L is the required limit then

$$\log L = \lim_{x\to 0} \frac{4\log(1-3x)}{x}\left(\frac{0}{0}\right) = \lim_{x\to 0} \frac{4(-3)}{1-3x} = -12$$

Thus $L = e^{-12}$

USE OF SERIES EXPANSION IN FINDING LIMITS

The following series expansions are useful in evaluating limits

1. $(1 + x)^p = 1 + px + \frac{p(p-1)}{2!}x^2 + \frac{p(p-1)(p-2)}{3!}x^3 + \ldots$ (for $|x| < 1$ and $p \in \mathbf{Q}$, the set of rational numbers)
2. $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots$
3. $a^x = 1 + x(\log_e a) + \frac{x^2}{2!}(\log_e a)^2 + \ldots$
4. $\log(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots \quad (|x| < 1)$
5. $\log(1 - x) = -\left(x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots\right) \quad (|x| < 1)$
6. $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots$
7. $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots$
8. $\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \cdots$
9. $\sin^{-1} x = x + \frac{1}{2}\frac{x^3}{3} + \frac{1}{2}\cdot\frac{3}{4}\frac{x^5}{5} + \cdots \quad (-1 < x < 1)$
10. $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots \quad (-1 < x < 1)$

Illustration 10

$$\lim_{x\to 0} \frac{(1+x)^{1/x} - e}{x}$$

Let $y = (1 + x)^{1/x}$

$$\Rightarrow \log y = \frac{1}{x}\log(1 + x) = \frac{1}{x}\left[x - \frac{x^2}{2} + \frac{x^3}{3} - \cdots\right]$$

$$= \left[1 - \frac{x}{2} + \frac{x^2}{3} - \cdots\right]$$

$$\Rightarrow y = e^{\left[1 - \frac{x}{2} + \frac{x^2}{3} - \cdots\right]} = e\cdot e^{-\frac{x}{2} + \frac{x^2}{3} - \cdots}$$

$$= e\left[1 + \left(-\frac{x}{2} + \frac{x^2}{3} - \cdots\right) + \frac{1}{2}\left(-\frac{x}{2} + \frac{x^2}{3} - \cdots\right)^2 + \cdots\right]$$

Thus $\frac{y-e}{x}$

$$= e\left[-\frac{1}{2} + \frac{x}{3} + \text{terms containing } x^2 \text{ and higher powers of } x\right]$$

$$\therefore \lim_{x\to 0} \frac{(1+x)^{1/x} - e}{x} = -\frac{e}{2}.$$

SEQUENTIAL LIMITS

A sequence is a function whose domain is the set of natural numbers. If f: $\mathbf{N} \to \boldsymbol{R}$ then we write $f(1) = f_1, f(2) = f_2 \cdots$, $f(n) = f_n, \cdots$ A sequence which has finite limit is said to be convergent. Thus $\lim_{n\to\infty} a_n = a$ if for any $\in\, > 0$ there exists a number N(depending on $\in$) > 0 such that $|a_n - a| < \,\in$ holds true for all $n > N$.

Illustration 11

$\lim_{n\to\infty} \frac{1}{n} = 0$, $\lim_{n\to\infty} \frac{1}{n^2} = 0$ so $\left\langle\frac{1}{n}\right\rangle, \left\langle\frac{1}{n^2}\right\rangle$ are convergent sequences. If $x_n = \frac{2n-1}{2n+1}$ then $\lim_{n\to\infty} x_n = 1$.

$\lim_{x\to a} f(x) = l$ if and only if for every sequence x_n (of values of x) such that $\lim_{n\to\infty} x_n = a$ we have $\lim_{n\to\infty} f(x_n) = l$.

The above criterion is very useful in showing $\lim_{x\to a} f(x)$ (for a given f) does not exist. It is enough to give a sequence x_n with $\lim\limits_{n\to\infty} x_n = a$ such that $\lim\limits_{n\to\infty} f(x_n)$ does not exist. Alternatively, give two sequences x_n and x'_n such that $\lim\limits_{n\to\infty} x_n = a = \lim\limits_{n\to\infty} x'_n$ but $\lim\limits_{n\to\infty} f(x_n) \neq \lim\limits_{n\to\infty} f(x'_n)$.

Illustration 12

To show that $\lim\limits_{x\to 1} \sin\dfrac{1}{x-1}$ does not exist let $f(x) = \sin\dfrac{1}{(x-1)}$ and choose $x_n = 1+\dfrac{1}{n\pi}$, $x'_n = 1+\dfrac{2}{(4n+1)\pi}$, so $\lim\limits_{n\to\infty} x_n = 1 = \lim\limits_{n\to\infty} x'_n$. Now $f(x_n) = \sin n\pi = 0$ so $\lim\limits_{n\to\infty} f(x_n) = 0$. $f(x_n) = \sin\dfrac{4n+1}{2}\pi = 1$. Hence $\lim\limits_{n\to\infty} f(x'_n) = 1$. Thus $\lim\limits_{n\to\infty} f(x)$ does not exist.

SOME USEFUL RESULTS ON LIMITS

1. If $\lim\limits_{x\to c} f(x) = l$ with $l \neq 0$ and $\lim\limits_{x\to c} g(x) = 0$ then $\lim\limits_{x\to c}\dfrac{f(x)}{g(x)}$ does not exist.
2. (Sandwich theorem) If f, g and h are functions having a common domain D and defined near a. Suppose that $h(x) \leq f(x) \leq g(x)$ for $x \in D$ and $\lim\limits_{x\to a} h(x) = \lim\limits_{x\to a} g(x) = l$ then $\lim\limits_{x\to a} f(x) = l$.
3. $\lim\limits_{x\to 0} e^x = 1$, $\lim\limits_{x\to\infty} e^x = \infty$, $\lim\limits_{x\to\infty} e^{-x} = 0$,

   $\lim\limits_{x\to-\infty} e^x = 0$, $\lim\limits_{x\to a}\dfrac{e^x - e^a}{x-a} = e^a$.

Illustration 13

To show $\lim\limits_{x\to 0} x\sin\dfrac{1}{x} = 0$.

For values of x near 0, $0 \leq x\sin\dfrac{1}{x} \leq x$ and $\lim\limits_{x\to 0} x = 0$ so by Sandwich theorem $\lim\limits_{x\to 0} x\sin\dfrac{1}{x} = 0$.

Illustration 14

Find $\lim\limits_{x\to 0+}\dfrac{[x]}{x}$

For $x \in (0, 1)$, $[x] = 0$ so $\dfrac{[x]}{x} = 0$

Hence $\lim\limits_{x\to 0+}\dfrac{[x]}{x} = 0$.

CONTINUITY

In ordinary language, to say that a certain process is continuous implies that it goes on without interruption and without abrupt changes. In mathematics, the word continuous has much the same meaning. We shall first introduce the idea of continuity at a point c, and then that of continuity on an interval.

The function f is said to *continuous* at $x = c$ if $\lim_{x\to c} f(x) = f(c)$ or, equivalently, $\lim_{h\to 0} f(c+h) = f(c)$.

The function f is said to be *continuous on an open interval* (a, b) if it is continuous at each point of (a, b).

The function f is said to be *continuous on a closed interval* $[a, b]$ if

(i) f is continuous at each point of (a, b),

(ii) $\lim\limits_{x\to a+} f(x) = f(a)$, (i.e., right hand side continuity at a)

(iii) $\lim\limits_{x\to b-} f(x) = f(b)$. (i.e., left hand side continuity at b)

Graphically, $f(x)$ is continuous if its graph can be drawn on paper without raising the pencil. A function f is said to be *discontinuous* at c if it is not continuous at that point. A function f is said to be *discontinuous on an interval* if it is discontinuous at least at one point of the interval. A function f is discontinuous at c under any of the following circumstances:

(i) f is not defined at c (e.g., $f(x) = 1/x$ at $x = 0$).
(ii) $\lim_{x\to c} f(x)$ does not exist.
(iii) f is defined at c and $\lim_{x\to c} f(x)$ exists but $\lim_{x\to c} f(x) \neq f(c)$. For example.

$$f(x) = \begin{cases} \dfrac{x^3-1}{x-1} & x \neq 1 \\ 4 & x = 1 \end{cases}$$

But

$$\lim_{x\to 1} f(x) = \lim_{x\to 1}(x^2+x+1) = 3 \neq f(1)$$

One can prove that if f and g are continuous at $x = c$ and α is a scalar, then $f + g$, αf, fg, max (f, g) and min (f, g) are continuous at c. Moreover, if $g(c) \neq 0$, then the quotient f/g is also continuous at c.

If g is continuous at c and f is continuous at $g(c)$, then the composition $f\,o\,g$ is continuous at c.

All elementary functions (e.g., polynomial, trigonometric, logarithmic, exponential and inverse trigonometric functions) are continuous at each point of their domains.

Illustration 15

Examine the continuity at origin

$$f(x) = \begin{cases} \dfrac{|x|}{x} & , x \neq 0 \\ 1 & , x = 0 \end{cases}$$

$$\lim_{x\to 0+} \frac{|x|}{x} = \lim_{x\to 0+} \frac{x}{x} = 1 \text{ but } \lim_{x\to 0-} \frac{|x|}{x}$$

$$= -\lim_{x\to 0-} \frac{x}{x} = -1. \text{ So } f \text{ is not continuous at } x = 0.$$

FUNCTIONS CONTINUOUS ON A CLOSED INTERVAL

A function $f(x)$, continuous on the interval $[a, b]$, possesses the following properties:

1. $f(x)$ is bounded on $[a, b]$, i.e., there exist $k, K \in \boldsymbol{R}$ such that $k \le f(x) \le K$ for all $x \in [a, b]$.
2. $f(x)$ has minimum and maximum values on $[a, b]$.
3. *Intermediate Value Theorem* If $m = \min f(x)$ and $M = \max f(x)$ for $a \le x \le b$, then for any A satisfying the inequalities $m \le A \le M$, there exists a point $x_0 \in [a, b]$ for which $f(x_0) = A$, i.e., *a* continuous function assumes every value between any two of its values.
4. If f is monotonically increasing on an open interval I and $x_0 \in I$ then

   $\lim\limits_{x\to x_0+} f(x)$ and $\lim\limits_{x\to x_0-} f(x)$ are finite and

   $\lim\limits_{x\to x_0-} f(x) \le f(x_0) \le \lim\limits_{x\to x_0+} f(x)$.
5. If f is monotonically increasing and continuous on an interval I then f^{-1} exist and is continuous and monotonically increasing.
6. Let f be a function which is continuous at c and $f(x) \neq 0$. Then there exists an interval $(c - \delta, c + \delta)$ throughout which $f(x)$ is of the same sign.
7. Let f be a continuous function on $[a, b]$. If $f(a)$ and $f(b)$ are of opposite sign, then there exists a point $c \in (a, b)$ such that $f(c) = 0$

SOLVED EXAMPLES

Concept-based

Straight Objective Type Questions

Example 1: Let $f(x) = \begin{cases} \dfrac{x - |x|}{x} & , x \neq 0 \\ 1 & , x = 0 \end{cases}$ then

(a) $\lim\limits_{x\to 0+} f(x) = 1$

(b) $\lim\limits_{x\to 0-} f(x) = 0$

(c) $\lim\limits_{x\to 0+} f(x) \neq \lim\limits_{x\to 0-} f(x)$

(d) $\lim\limits_{x\to 0+} f(x)$ does not exist

Ans. (c)

Solution: If $x > 0$, $|x| = x$, so

$$\lim_{x\to 0+} \frac{x - |x|}{x} = \lim_{x\to 0+} \frac{x - x}{x} = 0$$

for $x < 0$, $|x| = -x$, so

$$\lim_{x\to 0-} \frac{x - |x|}{x} = \lim_{x\to 0-} \frac{x + x}{x} = 2$$

Thus $\lim\limits_{x\to 0+} f(x) \neq \lim\limits_{x\to 0-} f(x)$

Example 2: Let $f(x) = \left[\dfrac{\sin x}{x}\right]$, $x \neq 0$, where [.] denotes the greatest integer function then $\lim\limits_{x\to 0} f(x)$

(a) does not exist
(b) is equal to 1
(c) is equal to 0
(d) $\lim\limits_{x\to 0+} f(x) = 1$

Ans. (c)

Solution: For $x \neq 0$ $\left|\dfrac{\sin x}{x}\right| < 1$. For $-1 < x < 0$, $\dfrac{\sin x}{x} > 0$, so $\dfrac{\sin x}{x}$ tends to 1 as $x \to 0$ but through values which are less than 1. Hence $\left[\dfrac{\sin x}{x}\right] = 0$ as x tends to 0.

Thus $\lim\limits_{x\to 0} f(x) = 0$.

Example 3: $\lim\limits_{x\to\infty} \dfrac{(x+1)^{10} + (x+2)^{10} + \cdots + (x+100)^{10}}{x^{10} + 10^{10}}$ is equal to

(a) 100
(b) 0
(c) 1
(d) 10

Ans. (a)

Solution: $f(x) = \dfrac{(x+1)^{10} + (x+2)^{10} + \cdots + (x+100)^{10}}{x^{10} + 10^{10}}$

$$= \frac{\left(1+\frac{1}{x}\right)^{10}+\left(1+\frac{2}{x}\right)^{10}+\cdots+\left(1+\frac{100}{x}\right)^{10}}{1+\left(\frac{10}{x}\right)^{10}}$$

As $\frac{1}{x} \to 0, \text{for } x \to \infty$ so $\lim\limits_{x\to\infty} f(x) = \frac{1+1\cdots+1-(100 \text{ times})}{1}$

$$= 100.$$

Example 4: $\lim\limits_{x\to 1}\left(\frac{1}{1-x}-\frac{3}{1-x^3}\right)$ is equal

(a) 1 (b) –1

(c) 2 (d) $-\frac{1}{2}$

Ans. (b)

Solution: For $x \neq 1, f(x) = \frac{1}{1-x} - \frac{3}{1-x^3}$

$$= \frac{1}{(1-x)}\left[1-\frac{3}{1+x+x^2}\right]$$

$$= \frac{1}{(1-x)} \cdot \frac{x^2+x-2}{\left(1+x+x^2\right)} = \frac{(x+2)(x-1)}{(1-x)\left(1+x+x^2\right)}$$

$$= -\frac{x+2}{1+x+x^2}$$

so $\lim\limits_{x\to 1} f(x) = -\lim\limits_{x\to 1}\frac{x+2}{1+x+x^2} = -1$.

Example 5: $\lim\limits_{x\to\pi}\frac{\sin 3x}{\sin 2x}$ is equal to

(a) $\frac{3}{2}$ (b) 0

(c) 1 (d) $-\frac{3}{2}$

Ans. (d)

Solution: $\lim\limits_{x\to\pi}\frac{\sin 3x}{\sin 2x} = \lim\limits_{u\to 0}\frac{\sin 3(\pi-u)}{\sin 2(\pi-u)}$ $(u = x - \pi)$

$$= \lim_{u\to 0}\frac{\sin 3u}{-\sin 2u} = -\frac{3}{2}\lim \frac{\sin 3u}{3u} \times \frac{2u}{\sin 2u}$$

$$= -\frac{3}{2}.$$

Example 6: If $f(x) = \begin{cases} mx^2+x+n & , \quad x<0 \\ nx+m & , \quad 0\le x\le 1 \\ 2nx^3+x^2-2x+m & , \quad x>1 \end{cases}$

and $\lim\limits_{x\to 0} f(x)$ and $\lim\limits_{x\to 1} f(x)$ exist then

(a) $m = 2, n = 1$ (b) $m = 0, n = 1$

(c) $m = 1, n = 2$ (d) $m = 1, n = 1$

Ans. (d)

Solution: $\lim\limits_{x\to 0+} f(x) = \lim\limits_{x\to 0+}(nx+m) = m$

$$\lim_{x\to 0-} f(x) = \lim_{x\to 0-}\left(mx^2+x+n\right) = n$$

Hence $m = n$.

Also $\lim\limits_{x\to 1-} f(x) = \lim\limits_{x\to 1-}(nx+m) = n+m$

and $\lim\limits_{x\to 1+} f(x) = \lim\limits_{x\to 1+}\left(2nx^3+x^2-2x+m\right)$

$$= 2n+1-2+m = 2n+m-1$$

Hence $n+m = 2n+m-1 \Rightarrow n = 1$ so $m = 1$

Example 7: If $f(x) = \begin{cases} -2\sin x & \text{if} \quad x \le -\frac{\pi}{2} \\ A\sin x + B & \text{if} \quad -\frac{\pi}{2} < x < \frac{\pi}{2} \\ \cos x & \text{if} \quad x \ge \frac{\pi}{2} \end{cases}$

is a continuous function then

(a) $A = 1, B = -1$ (b) $A = -1, B = 1$

(c) $A = 0, B = 2$ (d) $A = -2, B = 2$

Ans. (b)

Solution: $f\left(-\frac{\pi}{2}\right) = -2\sin\left(-\frac{\pi}{2}\right) = 2$

$$\lim_{x\to -\pi/2+} f(x) = \lim_{x\to -\pi/2}(A\sin x + B) = -A+B$$

so $2 = -A + B$ … (i)

Also $f\left(\frac{\pi}{2}\right) = \cos\frac{\pi}{2} = 0$

$$\lim_{x\to\frac{\pi}{2}-} f(x) = \lim_{x\to\pi/2-}(A\sin x + B) = A+B$$

Hence A + B = 0 (ii)

Solving (i) and (ii), we get $A = -1, B = 1$.

Example 8: The function $f(x) = \frac{x^2-1}{x^3-1}$ is not defined for $x = 1$. The value of $f(1)$ so that the function extended by this value is continuous is

(a) $\frac{2}{3}$ (b) $\frac{1}{3}$

(c) 1 (d) 0

Ans. (a)

Solution: For f to be continuous at $x = 1$,

$$f(1) = \lim_{x\to 1} f(x) = \lim_{x\to 1}\frac{x^2-1}{x^3-1}$$

$$= \lim_{x\to 1}\frac{(x-1)(x+1)}{(x-1)\left(x^2+x+1\right)}$$

$$= \lim_{x\to 1}\frac{x+1}{x^2+x+1} = \frac{2}{3}.$$

Example 9: Let $y = -\dfrac{2^{\frac{1}{x}}-1}{2^{\frac{1}{x}}+1}$, then

(a) $\lim\limits_{x\to 0} y = -1$ (b) $\lim\limits_{x\to 0} y = 1$

(c) $\lim\limits_{x\to 0+} y = -1$ (d) $\lim\limits_{x\to 0+} y = \lim\limits_{x\to 0-} y$

Ans. (c)

Solution: As $x \to 0+$, $\dfrac{1}{x} \to \infty$ so $2^{-\frac{1}{x}} \to 0$ Hence

$$\lim_{x\to 0+} f(x) = -\lim_{x\to 0+} \frac{2^{\frac{1}{x}}-1}{2^{\frac{1}{x}}+1} = -\lim_{x\to 0+} \frac{1-2^{-\frac{1}{x}}}{1+2^{-\frac{1}{x}}} = -1$$

As $x \to 0-, \dfrac{1}{x} \to -\infty$ so $2^{\frac{1}{x}} \to 0$

$$\lim_{x\to 0-} f(x) = -\lim_{x\to 0-} \frac{2^{\frac{1}{x}}-1}{2^{\frac{1}{x}}+1} = -(-1) = 1.$$

Example 10: The value of $\lim\limits_{x\to\infty} \dfrac{x^6}{6^x}$ is

(a) 1 (b) 0

(c) – 1 (d) not a finite number

Ans. (b)

Solution: $\lim\limits_{x\to\infty} \dfrac{x^6}{6^x}\left(\dfrac{\infty}{\infty}\right)$

$$= \lim_{x\to\infty} \frac{6x^5}{6^x(\log 6)}\left(\frac{\infty}{\infty}\right) \text{ (L' Hopital Rule)}$$

$$= \lim_{x\to\infty} \frac{6.5.4.3.2.1}{6^x(\log 6)^6} = 0.$$

LEVEL 1

Straight Objective Type Questions

Example 11: $\lim\limits_{x\to\infty}\left(\dfrac{x+1}{x+2}\right)^{2x+1}$ is

(a) e (b) e^{-2}

(c) e^{-1} (d) 1

Ans. (b)

Solution:

$$\lim_{x\to\infty}\left(\frac{x+1}{x+2}\right)^{2x+1} = \left[\lim_{x\to\infty}\left(1-\frac{1}{x+2}\right)^{-(x+2)}\right]^{-\frac{2x+1}{x+2}}$$

$$= \left[\lim_{x\to\infty}\left(1-\frac{1}{x+2}\right)^{-(x+2)}\right]^{-\frac{2+1/x}{1+2/x}} = e^{-2}$$

Example 12: $\lim\limits_{x\to 0} \dfrac{(\cos x)^{1/2}-(\cos x)^{1/3}}{\sin^2 x}$ is

(a) 1/6 (b) – 1/12

(c) 2/3 (d) 1/3

Ans. (b)

Solution: $\lim\limits_{x\to 0} \dfrac{(\cos x)^{1/2}-(\cos x)^{1/3}}{\sin^2 x}\left(\dfrac{0}{0}\text{ form}\right)$

$$= \lim_{x\to 0} \frac{-\frac{1}{2}(\cos x)^{-1/2}\sin x + \frac{1}{3}(\cos x)^{-2/3}\sin x}{2\sin x\cos x}$$

(using L'Hôpital Rule)

$$= \lim_{x\to 0} \frac{-\frac{1}{2}(\cos x)^{-1/2} + \frac{1}{3}(\cos x)^{-2/3}}{2\cos x}$$

$$= -\frac{1}{2}\left[\frac{1}{2}-\frac{1}{3}\right] = -\frac{1}{12}.$$

Example 13: $\lim\limits_{x\to 1} \dfrac{1+\log x - x}{1-2x+x^2}$ equals

(a) 1 (b) 0

(c) – 1 (d) – 1/2

Ans. (d)

Solution: $\lim\limits_{x\to 1} \dfrac{1+\log x - x}{1-2x+x^2} = \lim\limits_{x\to 1} \dfrac{1/x-1}{-2+2x}$

(using L'Hôpital Rule)

$$= \lim_{x\to 1} -\frac{1}{2}\frac{(1-x)}{x(1-x)} = -\frac{1}{2}\lim_{x\to 1}\frac{1}{x} = -\frac{1}{2}$$

Example 14: $\lim\limits_{x\to 0} \dfrac{\tan x - x}{x^2 \tan x}$ equals to

(a) 1/3 (b) 2/3

(c) 1/2 (d) 1

Ans. (a)

Solution: $\lim\limits_{x\to 0} \dfrac{\tan x - x}{x^2\tan x} = \lim\limits_{x\to 0} \dfrac{\sin x - x\cos x}{x^2 \sin x}\left(\dfrac{0}{0}\text{ form}\right)$

$$= \lim_{x\to 0} \frac{\cos x - \cos x + x\sin x}{2x\sin x + x^2\cos x}$$

(using L'Hôpital Rule)

$$= \lim_{x\to 0}\frac{\sin x}{2\sin x + x\cos x} = \lim_{x\to 0}\frac{(\sin x)/x}{(2(\sin x)/x) + \cos x} = \frac{1}{3}$$

Example 15: $\lim_{n\to\infty}\left[\frac{1}{1-n^4} + \frac{8}{1-n^4} + \cdots + \frac{n^3}{1-n^4}\right]$ is

(a) 1/4 (b) 1/8
(c) 1/2 (d) none of these

Ans. (d)

Solution: $\lim_{n\to\infty}\left[\frac{1}{1-n^4} + \frac{8}{1-n^4} + \cdots + \frac{n^3}{1-n^4}\right]$

$$= \lim_{n\to\infty}\frac{1}{1-n^4}\,[1^3 + 2^3 + \cdots + n^3]$$

$$= \lim_{n\to\infty}\frac{1}{4}\frac{(n(n+1))^2}{1-n^4} = \frac{1}{4}\lim_{n\to\infty}\frac{(1+1/n)^2}{1/n^4 - 1} = -\frac{1}{4}$$

Example 16: $\lim_{x\to\pi/3}\frac{2\sin(x-\pi/3)}{1-2\cos x}$ is

(a) $1/\sqrt{2}$ (b) $2/\sqrt{3}$
(c) 2/3 (d) 1/3

Ans. (b)

Solution: $\lim_{x\to\pi/3}\frac{2\sin(x-\pi/3)}{1-2\cos x}\left(\frac{0}{0}\text{ form}\right)$

$$= \lim_{x\to\pi/3}\frac{2\cos(x-\pi/3)}{2\sin x}$$

[using L'Hôpital Rule]

$= \cos 0/\sin(\pi/3) = 2/\sqrt{3}$

Example 17: $\lim_{x\to\pi/4}\frac{1-\cot^3 x}{2-\cot x-\cot^3 x}$ is

(a) 11/4 (b) 3/4
(c) 1/2 (d) none of these

Ans. (b)

Solution: $\lim_{x\to\pi/4}\frac{1-\cot^3 x}{2-\cot x-\cot^3 x}$

$$= \lim_{x\to\pi/4}\frac{(1-\cot x)\left(1+\cot x+\cot^2 x\right)}{(1-\cot x)\left(\cot^2 x+\cot x+2\right)}$$

$$= \lim_{x\to\pi/4}\frac{1+\cot x+\cot^2 x}{\cot^2 x+\cot x+2} = \frac{3}{4}$$

Example 18:

$$\lim_{x\to 1}\left[\left(\frac{4}{x^2-x^{-1}} - \frac{1-3x+x^2}{1-x^3}\right)^{-1} + 3\,\frac{x^4-1}{x^3-x^{-1}}\right] \text{ is}$$

(a) 3 (b) 2
(c) 4 (d) 28/3

Ans. (a)

Solution:

$$\lim_{x\to 1}\left[\left(\frac{4}{x^2-x^{-1}} - \frac{1-3x+x^2}{1-x^3}\right)^{-1} + 3\,\frac{x^4-1}{x^3-x^{-1}}\right]$$

$$= \lim_{x\to 1}\left[\left(\frac{4x}{x^3-1} - \frac{1-3x+x^2}{1-x^3}\right)^{-1} + \frac{3x\left(x^4-1\right)}{x^4-1}\right]$$

$$= \lim_{x\to 1}\left[\left(\frac{4x+1-3x+x^2}{x^3-1}\right)^{-1} + 3x\right]$$

$$= \lim_{x\to 1}[x - 1 + 3x] = 3$$

Example 19: $\lim_{x\to 3}\frac{\sqrt{1-\cos 2(x-3)}}{x-3}$

(a) $= \sqrt{2}$ (b) does not exist
(c) = 1 (d) $= -\sqrt{2}$

Ans. (b)

Solution: $1 - \cos 2(x-3) = 2\sin^2(x-3)$

ϕι $\sqrt{1-\cos 2(x-3)} = \sqrt{2}\,|\sin(x-3)|$

So, $\lim_{x\to 3+}\frac{\sqrt{1-\cos 2(x-3)}}{x-3} = \sqrt{2}\lim_{x\to 3+}\frac{\sin(x-3)}{x-3} = \sqrt{2}$

whereas

$$\lim_{x\to 3-}\frac{\sqrt{1-\cos 2(x-3)}}{x-3} = \sqrt{2}\lim_{x\to 3-}\frac{-\sin(x-3)}{x-3} = -\sqrt{2}$$

Example 20: Let $f : \mathbf{R} \to [0, \infty)$ be such that $\lim_{x\to 5} f(x)$ exists and $\lim_{x\to 5}\frac{(f(x))^2-9}{\sqrt{|x-5|}} = 0$

Then $\lim_{x\to 5} f(x)$ equals

(a) 0 (b) 1
(c) 2 (d) 3

Ans. (d)

Solution: As $\lim_{x\to 5}\frac{(f(x))^2-9}{\sqrt{|x-5|}} = 0$, so

$(f(x))^2 - 9 = K|x-5|^{\alpha}P(x)$, where $\alpha > 1/2$ and $P(x)$ is a function of x such that $\lim_{x\to 5} P(x)$ exist

ϕι $\lim_{x\to 5}(f(x))^2 = \lim_{x\to 5}\left[K|x-5|^{\alpha}P(x) + 9\right] = 9$

The only possible answer is $\lim_{x\to 5} f(x) = 3$

Example 21: If $f(x) = \begin{cases} \dfrac{\sin(1+[x])}{[x]} & \text{for } [x] \neq 0 \\ 0 & \text{for } [x] = 0 \end{cases}$ where $[x]$ denotes the greatest integer $\leq x$, then $\lim\limits_{x \to 0-} f(x)$ equals

(a) 1 (b) 0
(c) – 1 (d) none of these

Ans. (b)

Solution: For $-1 < x < 0$, $[x] = -1$, so

$$\lim_{x \to 0-} \frac{\sin(1+[x])}{[x]} = \frac{\sin 0}{-1} = 0.$$

Example 22: Let $f(x) = \begin{cases} x\left(\sin(1/x) + \sin\left(1/x^2\right)\right) & x \neq 0 \\ 0 & x = 0 \end{cases}$

then $\lim\limits_{x \to \infty} f(x)$ equals

(a) 0 (b) – 1/2
(c) 1 (d) none of these

Ans. (c)

Solution: $\lim\limits_{x \to \infty} f(x) = \lim\limits_{x \to \infty} \left[\dfrac{\sin(1/x)}{1/x} + \dfrac{1}{x} \cdot \dfrac{\sin\left(1/x^2\right)}{1/x^2}\right]$

$$= \left(\lim_{u \to 0} \frac{\sin u}{u} + \lim_{u \to 0} u \frac{\sin u^2}{u^2}\right)\left(u = \frac{1}{x}\right)$$

$$= 1 + 0.1 = 1.$$

Example 23: The value of

$$\lim_{n \to \infty} \left(\frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \cdots + \text{up to } n \text{ terms}\right) \text{ is}$$

(a) 1/4 (b) 1/2
(c) 1 (d) none of these

Ans. (b)

Solution:

$$L = \lim_{n \to \infty} \frac{1}{2}\left[\left(1 - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{5}\right) + \ldots + \left(\frac{1}{2n-1} - \frac{1}{2n+1}\right)\right]$$

$$= \lim_{n \to \infty} \frac{1}{2}\left[1 - \frac{1}{2n+1}\right] = \frac{1}{2}$$

Example 24: If $\lim\limits_{x \to 0} (1 + ax)^{b/x} = e^4$, where a and b are natural numbers then

(a) $a = 4, b = 2$ (b) $a = 8, b = 4$
(c) $a = 16, b = 8$ (d) none of these

Ans. (d)

Solution: $e^4 = \lim\limits_{x \to 0} (1 + ax)^{b/x}$

$$= \lim_{x \to 0} \left[(1 + ax)^{(1/ax)}\right]^{ab} = e^{ab}$$

$\Rightarrow$ $ab = 4$. But none of the values in (a), (b), (c) satisfy $ab = 4$.

Example 25: $\lim\limits_{x \to 0} \dfrac{a^x - 1}{\sqrt{a+x} - \sqrt{a}}$ is

(a) $2\sqrt{a}\ \log a$ (b) $\sqrt{a}\ \log a$
(c) $\log a$ (d) none of these

Ans. (a)

Solution: $= \lim\limits_{x \to 0} \dfrac{a^x - 1}{\sqrt{a+x} - \sqrt{a}}$

$$= \lim_{x \to 0} \frac{a^x \log a}{\frac{1}{2} \cdot \frac{1}{\sqrt{a+x}}} \left(\frac{0}{0} \text{ form}\right)$$

$$= \lim_{x \to 0} 2\, a^x \log a \left(\sqrt{a+x}\right) = 2\sqrt{a}\ \log a.$$

Example 26: Let $f(x) = 3x^{10} - 7x^8 + 5x^6 - 21x^3 + 3x^2 - 7$.

The value of $\lim\limits_{h \to 0} \dfrac{f(1-h) - f(1)}{h^3 + 3h}$ is

(a) 50/3 (b) 22/3
(c) 13 (d) none of these

Ans. (d)

Solution: $= \lim\limits_{h \to 0} \dfrac{f(1-h) - f(1)}{h^3 + 3h}$

$$= \lim_{h \to 0} \frac{f(1-h) - f(1)}{-h} \cdot \frac{-1}{h^2 + 3}$$

$$= f'(1)\,(-1/3) = 53/3.$$

Example 27: $\lim\limits_{x \to 0} \dfrac{e^{x^2} - \cos x}{x^2}$ is equal to

(a) 1/2 (b) 3/2
(c) 2/3 (d) 2

Ans. (b)

Solution:

$$\lim_{x \to 0} \frac{e^{x^2} - 1 + 1 - \cos x}{x^2} = \lim_{x \to 0}\left(\frac{e^{x^2} - 1}{x^2} + \frac{2\sin^2 x/2}{4(x/2)^2}\right)$$

$$= 1 + \frac{1}{2} = \frac{3}{2}$$

Example 28: Let $f(x) = \langle x \rangle^*$, where $\langle x \rangle^*$ is the distance from x to the integer nearest to x then $\lim\limits_{x \to 2} f(x)$ is

(a) 2 (b) 1
(c) 0 (d) none of these

Ans. (c)

◎ **Solution:** $\lim\limits_{x\to 2+} f(x) = \lim\limits_{h\to 0+} <2+h>^{*} = \lim\limits_{h\to 0+} h = 0$

and $\lim\limits_{x\to 2-} f(x) = \lim\limits_{h\to 0+} <2-h>^{*} = \lim\limits_{h\to 0+} h = 0.$

Hence $\lim\limits_{x\to 2} f(x) = 0.$

◉ **Example 29:** $\lim\limits_{x\to 0} \dfrac{(1-\cos 2x)(3+\cos x)}{x\tan 4x}$ is equal to

(a) 1/2 (b) 1
(c) 2 (d) – 1/4

Ans. (c)

◎ **Solution:** For $x \neq 0$, $\dfrac{(1-\cos 2x)(3+\cos x)}{x\tan 4x}$

$$= \frac{2\dfrac{\sin^2 x}{x^2}\times(3+\cos x)}{4\dfrac{\tan 4x}{4x}}$$

Therefore, the required limit $= \dfrac{2\times 1\times 4}{4\times 1} = 2$

◉ **Example 30:** $\lim\limits_{x\to 0} \dfrac{\sin(\pi\cos^2 x)}{x^2}$ is equal to

(a) $-\pi$ (b) π
(c) $\pi/2$ (d) 1

Ans. (b)

◎ **Solution:** $\lim\limits_{x\to 0} \dfrac{\sin(\pi\cos^2 x)}{x^2}\left(\dfrac{0}{0}\right)$

$$= \lim_{x\to 0} \frac{-\cos(\pi\cos^2 x)\,2\pi\cos x\sin x}{2x}$$

$$= -\pi \lim_{x\to 0}\cos(\pi\cos^2 x)\lim_{x\to 0}\frac{\sin x}{x}\lim_{x\to 0}\cos x$$

$$= \pi$$

◉ **Example 31:** Let $f(x) = \text{sgn}(\text{sgn}(\text{sgn}\, x))$. Then $\lim\limits_{x\to 0} f(x)$ is

(a) 1 (b) 2
(c) 0 (d) none of these

Ans. (d)

◎ **Solution:** By definition we have for $x \neq 0$, sgn (sgn x) = sgn $\left(\dfrac{x}{|x|}\right) = \dfrac{x/|x|}{|x|/|x|} = \dfrac{x}{|x|}$ = sgn x. Thus, sgn [sgn) (sgn x)] =

$$\text{sgn}\, x = \begin{cases} 1 & x>0 \\ 0 & x=0 \\ -1 & x<0 \end{cases}$$

Therefore, $\lim\limits_{x\to 0+} f(x) = 1$ but $\lim\limits_{x\to 0-} f(x) = -1$.

◉ **Example 32:** $\lim\limits_{x\to a-}\left(\dfrac{|x|^3}{a} - \left[\dfrac{x}{a}\right]^3\right)$ $(a > 0)$, where $[x]$ denotes the greatest integer less than or equal to x is

(a) $a^2 - 3$ (b) $a^2 - 1$
(c) a^2 (d) none of these

Ans. (c)

◎ **Solution:** For, $0 < x < a$, $\left[\dfrac{x}{a}\right] = 0$,

So $\lim\limits_{x\to a-}\left(\dfrac{|x|^3}{a} - \left[\dfrac{x}{a}\right]^3\right) = \dfrac{a^3}{a} = a^2$.

◉ **Example 33:** $\lim\limits_{x\to 0}\left\{\dfrac{1+\tan x}{1+\sin x}\right\}^{\text{cosec}\, x}$ is equal to

(a) e (b) e^{-1}
(c) 1 (d) none of these

Ans. (c)

◎ **Solution:** $\lim\limits_{x\to 0}\left\{\dfrac{1+\tan x}{1+\sin x}\right\}^{\text{cosec}\, x}$

$$= \lim_{x\to 0}\{1+\tan x\}^{\cot x\sec x}\left\{\frac{1}{1+\sin x}\right\}^{\text{cosec}\, x}.$$

$$= \lim_{x\to 0}\{1+\tan x\}^{\cot x\cdot\sec x}\cdot\frac{1}{(1+\sin x)^{\text{cosec}\, x}}$$

$$= e^1\cdot\frac{1}{e} = 1.$$

◉ **Example 34:** $\lim\limits_{n\to\infty}(6^n + 5^n)^{1/n}$ is equal to

(a) 6 (b) 5
(c) 5/6 (d) e

Ans. (a)

◎ **Solution:** $\lim\limits_{n\to\infty}(6^n+5^n)^{1/n} = 6\lim\limits_{n\to\infty}(1+(5/6)^n)^{1/n}$

$$= 6\lim_{n\to\infty}\left(1+(5/6)^n\right)^{\left[(6/5)^n.(1/n)(5/6)^n\right]}$$

$$= 6e^0 = 6.$$

◉ **Example 35:** If $f(x) = \left(\dfrac{x^2+5x+3}{x^2+x+2}\right)^x$ then $\lim\limits_{x\to\infty} f(x)$ is

(a) e^{-4} (b) e^3
(c) e^2 (d) e^4

Ans. (d)

◎ **Solution:** $\lim\limits_{x\to\infty} f(x) = \lim\limits_{x\to\infty}\left(\dfrac{x^2+5x+3}{x^2+x+2}\right)^x$

$$= \lim_{x\to\infty}\left(1+\frac{4x+1}{x^2+x+2}\right)^x$$

$$= \lim_{x\to\infty}\left[\left(1+\frac{4x+1}{x^2+x+2}\right)^{\frac{x^2+x+2}{4x+1}}\right]^{\alpha} \qquad (1)$$

where $\alpha = \dfrac{x(4x+1)}{x^2+x+2} = \dfrac{4+1/x}{1+1/x+2/x^2} \to 4$ as $x \to \infty$

$\therefore$ $\quad (1) \Rightarrow \lim\limits_{x\to\infty} f(x) = e^4.$

◉ **Example 36:** $\lim\limits_{x\to\infty}\left(\sqrt{x+\sqrt{x+\sqrt{x}}}-\sqrt{x}\right)$ is given by

(a) 0 (b) 1/2
(c) log 2 (d) none of these

Ans. (b)

◎ **Solution:** $\lim\limits_{x\to\infty}\left(\sqrt{x+\sqrt{x+\sqrt{x}}}-\sqrt{x}\right)$

$$= \lim_{x\to\infty}\frac{\sqrt{x+\sqrt{x}}}{\sqrt{x+\sqrt{x+\sqrt{x}}}+\sqrt{x}}$$

$$= \lim_{x\to\infty}\frac{\sqrt{1+x^{-1/2}}}{\sqrt{1+\sqrt{x^{-1}+x^{-3/2}}}+1} = \frac{1}{2}.$$

◉ **Example 37:** If $\lim\limits_{x\to -a}\dfrac{x^9+a^9}{x+a} = 9$, then the value of a is

(a) – 7 (b) – 1
(c) 7 (d) none of these

Ans. (b)

◎ **Solution:** $\lim\limits_{x\to -a}\dfrac{x^9+a^9}{x+a} = \lim\limits_{x\to -a}\dfrac{x^9-(-a)^9}{x-(-a)} = 9(-a)^8$

So $\quad 9(-a)^8 = 9 \Rightarrow a^8 = 1$

$\Rightarrow (a-1)(a+1)(a^2+1)(a^4+1) = 0$

$\Rightarrow \quad a = 1$ or -1.

◉ **Example 38:** Let $f(x) = [x] + [-x]$, where $[x]$ denotes the greatest integer not greater than x. Then for any integer m

(a) f is continuous at $x = m$
(b) $\lim\limits_{x\to m+} f(x)$ exists and is equal to $f(m)$
(c) $\lim\limits_{x\to m} f(x)$ exists but is not equal to $f(m)$
(d) f is differentiable at $x = m$

Ans. (c)

◎ **Solution:** For, $m-1 < x < m$, $[x] = m-1$ and $[-x] = -m$ and for $m < x < m+1$, $[x] = m$ and $[-x] = -m-1$. Thus

$\lim\limits_{x\to m} f(x) = m-1-m = -1$ and $\lim\limits_{x\to m+} f(x) = m-m-1 = -1$

and so $\lim\limits_{x\to m} f(x) = -1$. But $f(m) = [m] + [-m] = m - m = 0$.

Hence $\lim\limits_{x\to m} f(x)$ exists but is not equal to $f(m)$.

◉ **Example 39:** Let f be a continuous function on [1, 3]. If f takes only rational values for all x and $f(2) = 10$ then $f(1.5)$ is equal to

(a) 8 (b) $\dfrac{f(1)+f(3)}{3}$
(c) 20 (d) none of these

Ans. (d)

◎ **Solution:** Since f is continuous, so it must take all real values between $f(1)$ and $f(3)$. But since f takes only rational values so f must be a constant function. Hence $f(1.5) = f(2) = 10$.

◉ **Example 40:** Let $f(x) = \begin{cases} |x|\cos(1/x) + 9x^2 & x \neq 0 \\ k & x = 0 \end{cases}$

then f is continuous if the value k is

(a) 9 (b) 6
(c) 0 (d) none of these

Ans. (c)

◎ **Solution:** Since $0 \le ||x|\cos(1/x)| \le |x|$, so $\lim\limits_{x\to 0} |x|\cos 1/x = 0$. Hence

$$k = \lim_{x\to 0} f(x) = 0.$$

◉ **Example 41:** If $f(x) = \tan(\pi/4 - x)/\cot 2x$ for $x \neq \pi/4$. The value of $f(\pi/4)$ so that f is continuous at $x = \pi/4$ is

(a) 1/3 (b) 1/2
(c) 1/4 (d) 1/6

Ans. (b)

◎ **Solution:** For f to be continuous at $x = \pi/4$, we must have $f(\pi/4) = \lim\limits_{x\to\pi/4} f(x) = \lim\limits_{x\to\pi/4}[\tan(\pi/4 - x)/\cot 2x]$

$$= \lim_{x\to\pi/4}\left[\frac{1-\tan x}{1+\tan x}\cdot\frac{2\tan x}{1-\tan^2 x}\right] = \lim_{x\to\pi/4}\left[\frac{2\tan x}{(1+\tan x)^2}\right] = \frac{1}{2}.$$

◉ **Example 42:** Let a function f be defined by $f(x) = \dfrac{x-|x|}{x}$ for $x \neq 0$ and $f(0) = 2$. Then f is

(a) continuous nowhere
(b) continuous everywhere
(c) continuous for all x except $x = 1$
(d) continuous for all x except $x = 0$

Ans. (d)

◎ **Solution:** $f(x) = \begin{cases} 2 & \text{if } x < 0 \\ 0 & \text{if } x > 0 \\ 2 & x = 0 \end{cases}$

Thus $\lim\limits_{x\to 0-} f(x) = 2 \neq 0 = \lim\limits_{x\to 0+} f(x)$. Hence, f is continuous everywhere except at $x = 0$.

◉ **Example 43:** If $f(x)$ is a continuous function satisfying $f(x)f(1/x) = f(x) + f(1/x)$ and $f(1) > 0$ then $\lim\limits_{x\to 1} f(x)$ is equal to

(a) 2 (b) 1

(c) 3 (d) none of these

Ans. (a)

◎ **Solution:** Since f is continuous function so $\lim\limits_{x\to 1} f(x) = f(1)$.

Put $x = 1$ in the given equation we have $(f(1))^2 = 2f(1)$ so $f(1) = 0$ or 2. Since $f(1) > 0$ so $f(1) = 2$.

◉ **Example 44:** The function $f(x) = (x-1)^{1/(2-x)}$ is not defined at $x = 2$. The value of $f(2)$ so that f is continuous at $x = 2$ is

(a) 1 (b) e

(c) $1/e$ (d) $1/e^2$

Ans. (c)

◎ **Solution:** For f to be continuous at $x = 2$, $f(2) = \lim\limits_{x\to 2} (x-1)^{1/(2-x)} = \lim\limits_{x\to 2} (1+(x-2)^{-1/(x-2)} = e^{-1}$.

◉ **Example 45:** Let $f(x) = \dfrac{x + x^2 + \cdots + x^n - n}{x-1}$, $x \neq 1$, the value of $f(1)$ of that f is continuous is

(a) n (b) $\dfrac{n+1}{2}$

(c) $\dfrac{n(n+1)}{2}$ (d) $\dfrac{n(n-1)}{2}$

Ans. (c)

◎ **Solution:** $f(1) = \lim\limits_{x\to 1} \dfrac{x + x^2 + \cdots + x^n - n}{x-1} \left(\dfrac{0}{0}\text{ form}\right)$

$$= \lim_{x\to 1} \frac{1 + 2x + \cdots + n\,x^{n-1}}{1} = 1 + 2 + \ldots + n$$

$$= \frac{n(n+1)}{2}.$$

◉ **Example 46:** Let $y = \dfrac{1}{u^2 + u - 2}$ where $u = \dfrac{1}{x-1}$ then y is discontinuous only at $x =$

(a) 1, 2 (b) 1, – 2

(c) 1, 1/2, 2 (d) none of these

Ans. (c)

◎ **Solution:** $u = \phi(x) = \dfrac{1}{x-1}$ is discontinuous at $x = 1$, $y = f(u) = \dfrac{1}{u^2+u-2} = \dfrac{1}{(u+2)(u-1)}$ is discontinuous at $u = -2$, $u = 1$. If $u = -2$ then $-2 = \dfrac{1}{x-1}$ $\Rightarrow x = 1/2$. If $u = 1$ then $1 = \dfrac{1}{x-1}$ $\Rightarrow x = 2$. Hence the composite function is discontinuous only at $x = 1, 1/2, 2$.

◉ **Example 47:** Let $f(x) = [x]$ and $g(x) = \begin{cases} 0 & , x \in \mathbf{I} \\ x^2 & , x \in \mathbf{R} \sim \mathbf{I} \end{cases}$

Then

(a) g is continuous at $x = 1$

(b) f is continuous at $x = 2$

(c) $g \circ f$ is a continuous function

(d) $f \circ g$ is a continuous function

Ans. (c)

◎ **Solution:** f is not continuous at every $x \in \mathbf{I}$ and g is also not continuous at every $x \in \mathbf{I} \sim \{0\}$.

$$g \circ f(x) = g(f(x)) = g([x]) = 0, \text{ since } [x] \,\varepsilon\, \mathbf{I}$$

$$f \circ g(x) = f(g(x)) = \begin{cases} 0 & \text{if } x \in \mathbf{I} \\ [x^2] & , x \in \mathbf{R} \sim \mathbf{I} \end{cases}$$

Thus $g \circ f$ is a constant function and hence continuous but $f \circ g$ is not continuous at every $x \,\varepsilon\, \mathbf{I} \sim \{0\}$.

◉ **Example 48:** If a, b are chosen from {1, 2, 3, 4, 5, 6, 7} randomly with replacement. The probability that $\lim\limits_{x\to 0}\left(\dfrac{a^x + b^x}{2}\right)^{2/x} = 7$ is

(a) 1/7 (b) 2/49

(c) 4/7 (d) 4/49

Ans. (b)

◎ **Solution:** $\left(\dfrac{a^x + b^x}{2}\right)^{2/x}$

$$= a^2\left(1 + \frac{(b/a)^x - 1}{2}\right)^{\frac{2}{(b/a)^x - 1} \times \frac{(b/a)^x - 1}{x}}$$

So $\lim\limits_{x\to 0}\left(\dfrac{a^x + b^x}{2}\right)^{2/x}$

$$= a^2 \cdot \lim_{u\to 0} (1+u)^{1/u \cdot \lim\limits_{x\to 0} \frac{(b/a)^x - 1}{x}}$$

$$= a^2\, e^{\log b/a} = ab$$

Thus $ab = 7$.

The favourable outcomes are (1, 7) and (7, 1). Therefore, required probability is 2/49.

◉ **Example 49:** $\lim\limits_{x\to \pi/2} \dfrac{\cot x - \cos x}{(\pi - 2x)^3}$ equals:

(a) $\dfrac{1}{16}$ (b) $\dfrac{1}{8}$

(c) $\dfrac{1}{4}$ (d) $\dfrac{\pi}{2}$

Ans. (a)

◎ **Solution:** Put $x - \pi/2 = \theta$, so that

$$\lim_{x\to\pi/2}\frac{\cot x-\cos x}{(\pi-2x)^3}=\lim_{\theta\to 0}\frac{\cot(\pi/2+\theta)-\cos(\pi/2+\theta)}{(-2\theta)^3}$$

$$=\frac{1}{8}\lim_{\theta\to 0}\frac{\tan\theta-\sin\theta}{\theta^3}$$

$$=\frac{1}{8}\lim_{\theta\to 0}\frac{\sec^2\theta-\cos\theta}{3\theta^2}$$

$$=\frac{1}{24}\lim_{\theta\to 0}\frac{2\sec^2\theta\tan\theta+\sin\theta}{2\theta}\left(\frac{0}{0}\text{ form}\right)$$

$$=\frac{1}{24}\left(\frac{2+1}{2}\right)=\frac{1}{16}.$$

Example 50: If $f(x)=\dfrac{((a-n)nx-\tan x)\sin nx}{x^2}$, $x\neq 0$ and $\lim\limits_{x\to 0}f(x)=0$, n is a non-zero real number, then a is equal to

(a) 0 (b) $\dfrac{n}{n+1}$

(c) n (d) $n+(1/n)$

Ans. (d)

Solution: $\lim\limits_{x\to 0}f(x)=0$

$\Rightarrow$ $\lim\limits_{x\to 0}\dfrac{\sin nx}{nx}\times(n)\left[(a-n)n-\dfrac{\tan x}{x}\right]=0$

$\Rightarrow$ $n((a-n)\,n-1)=0$

$\Rightarrow$ $(a-n)\,n-1=0\ \Rightarrow\ a=n+\dfrac{1}{n}$.

Example 51: The function $f(x)=[x]^n-[x^n]$, $n\geq 2$ (where $[y]$ is the greatest integer less than or equal to y), is discontinuous at all points of

(a) **I** (b) **I** ~ {0, 1}

(c) **I** ~ {0} (d) **I** ~ {1}.

Ans. (d)

Solution: $f(x)=0$ for $x\in\mathbf{I}$

If $0<x<1$, then $0<x^n<1$, so

$[x]=0$ and $[x^n]=0$

$\Rightarrow$ $f(x)=0$ for $0<x<1$

If $1<x<2^{1/n}$ then $1<x^n<2\ \Rightarrow\ [x]=1$

and $[x^n]=1$

Thus $f(x)=[x]^n-[x^n]=0$ if $1<x<2^{1/n}$

So $f(x)=0$ if $0\leq x<2^{1/n}$

Therefore, f is continuous at $x=1$

To the left of any integral value $m\neq 1$ but close to m, $f(x)\neq 0$ but to the right of m and close to m, $f(x)=0$. Hence f is discontinuous for all $m\in\mathbf{I}$ ~ {1}.

Example 52: The value of

$$\lim_{x\to 0}\frac{e^{nx}-\left(1+nx+\dfrac{n^2}{2}x^2\right)}{x^3}\ (n>0)\text{ is}$$

(a) $\dfrac{n^2}{6}$ (b) $\dfrac{n^3}{3}$

(c) $\dfrac{n^3}{6}$ (d) 1/6

Ans. (c)

Solution: Using series expansion of e^{nx}, the required limit is equal to

$$\lim_{x\to 0}\frac{\dfrac{n^3}{6}x^3+\dfrac{n^4}{24}x^4+\cdots}{x^3}=\frac{n^3}{6}.$$

Example 53: Let $f(x)=\dfrac{\left(e^{nx}-1\right)^{2n}}{\sin^n(x/a)(\log(1+(x/a)))^n}$ for $x\neq 0$.

If $f(0)=16^n$ and f is a continuous function, then the value of a is

(a) 16 (b) 2

(c) 8 (d) 4

Ans. (d)

Solution: $\lim\limits_{x\to 0}f(x)=$

$$\lim_{x\to 0}\left(\frac{e^x-1}{x}\right)^{2n}\times\frac{(x/a)^n}{\sin^n(x/a)}\times\frac{(x/a)^n}{(\log(1+(x/a)))^n}\cdot a^{2n}$$

$$=a^{2n}$$

Since $f(0)=\lim\limits_{x\to 0}f(x)$ so $a^{2n}=16^n=4^{2n}$

Thus $a=4$.

Example 54: Let $f(x)=\begin{cases}x+a & ;\ x<0\\ |x-1| & ;\ x\geq 0\end{cases}$ and

$$g(x)=\begin{cases}x+1 & ;\ \text{if } x<0\\ (x-1)^2+b & ;\ x\geq 0\end{cases}$$

If gof is continuous ($a>0$) then

(a) $a=2, b=0$ (b) $a=2, b=1$

(c) $a=1, b=0$ (d) $a=1, b=1$

Ans. (c)

Solution:

$$(gof)\,(x)=\begin{cases}x+a+1 & ;\quad x<-a\\ (x+a-1)^2+b & ;\quad -a\leq x<0\\ x^2+b & ;\quad 0\leq x<1\\ (x-2)^2+b & ;\quad x\geq 1\end{cases}$$

gof is continuous except possibly at $x=-a, 0, 1$.

$$\lim_{x\to -a-}f(x)=-a+a+1=1,\ gof(-a)=1+b$$

Therefore, $b + 1 = 1 \Rightarrow b = 0.$

$$\lim_{x \to 0-} f(x) = (a-1)^2 + b$$

$$= (a-1)^2,\ gof(0) = b = 0,$$

So $(a-1)^2 = 0 \Rightarrow a = 1.$

◉ **Example 55:** If $f : \mathbf{R} \to \mathbf{R}$ is function defined by $f(x) = [x]^3 \cos\left(\frac{2x-1}{2}\right)\pi$, where $[x]$ denotes the greatest integer function, then f is:

(a) discontinuous only at $x = 0$
(b) discontinuous only at non-zero integral value of x.
(c) continuous only at $x = 0$
(d) continuous for every real x.

Ans. (d)

◎ **Solution:** For $n \in \mathbf{I}$, we have $[x] = n$, for $n \le x < n + 1$,

Thus $f(x) = n^3 \cos\left(\frac{2x-1}{2}\right)\pi$, for $n \le x < n + 1$, Since $[x]$ is continuous for $x \notin I$ and $\cos\left(\frac{2x-1}{2}\right)\pi$ is a continuous. So f is continuous at all $x \notin I$. For $x = n \in \mathbf{I}$,

$$\lim_{x \to n+} f(x) = \lim_{x \to n+} n^3 \cos\left(\frac{2x-1}{2}\right)\pi = 0$$

$$\lim_{x \to n-} f(x) = \lim_{x \to n-} (n-1)^3 \cos\left(\frac{2x-1}{2}\right)\pi = 0$$

Also $f(n) = 0$. So f is continuous on $\mathbf{R}$.

◉ **Example 56:** If $\lim_{x \to 0} (1 + x \log(1 + b^2))^{1/x} = 2b\sin^2\theta$, $b > 0$ and $\theta \in [-\pi, \pi]$, then the value of θ is

(a) $\pm\frac{\pi}{4}$ (b) $\pm\frac{\pi}{3}$
(c) $\pm\frac{\pi}{6}$ (d) $\pm\frac{\pi}{2}$

Ans. (d)

◎ **Solution:** $\lim_{x \to 0} (1 + x \log(1 + b^2))^{1/x}$

$$= \lim_{x \to 0} (1 + x \log(1 + b^2))^{\frac{1}{x \log(1+b^2)} \times \log(1+b^2)}$$

$$= e^{\log(1 + \mathrm{b}^2)} = 1 + b^2.$$

Thus,

$$1 + b^2 = 2b \sin^2\theta$$

$$\Rightarrow \quad \sin^2\theta = \frac{1+b^2}{2b} \ge 1$$

$$\Rightarrow \quad \sin^2\theta = 1 \Rightarrow \sin\theta = \pm 1 \quad \text{or} \quad \theta = \pm \pi/2.$$

◉ **Example 57:** Let $f : \mathbf{R} \to [0, \infty]$ be such that $\lim_{x \to 3} f(x)$ exists and $\lim_{\mathrm{x} \to 3} \frac{(f(x))^2 - 4}{\sqrt{|x-3|}} = 1$

Then $\lim_{x \to 3} f(x)$ equals

(a) 0 (b) 1
(c) 2 (d) 3

Ans. (c)

◎ **Solution:** Since, $\lim_{x \to 3} \frac{(f(x))^2 - 4}{\sqrt{|x-3|}} = 1$ So for $\in = 1$ there is $\delta > 0$ such that

$$0 < \frac{(f(x)^2 - 9)}{\sqrt{|x-5|}} < 2 \text{ whenever } 0 < |x - 3| < \delta$$

$$\Rightarrow 0 < f(x) - 2 < 2\frac{\sqrt{|x-3|}}{f(x)+2} \text{ whenever } 0 < |x - 3| < \delta$$

Since the range of f is $[0, \infty]$ So $\lim_{x \to 3} (f(x) + 2) \ne 0$ and exists. Thus

$$0 \le \lim_{x \to 3} (f(x) - 2) \le 0 \Rightarrow \lim_{x \to 3} f(x) = 2.$$

◉ **Example 58:** The value of $\lim_{x \to 0}\left(\left[\frac{11x}{\sin x}\right] + \left[\frac{21\sin x}{x}\right]\right)$, where $[x]$ is the greatest integer less than or equal to x is

(a) 32 (b) 31
(c) 11 (d) 21

Ans. (b)

◎ **Solution:** Since $x > \sin x$, for $x > 0$ and $\lim_{x \to 0+} \frac{x}{\sin x} = 1$ so $\frac{11x}{\sin x} \to 11$ as $x \to 0+$ but $\frac{11x}{\sin x} > 11$. Thus

$\left[\frac{11x}{\sin x}\right] = 11$ for value $x \to 0+$. Similarly

$\frac{21\sin x}{x} \to 21$ as $x \to 0+$ but $20 \le \frac{21\sin x}{x} < 21$

$\left[\frac{21\sin x}{x}\right] = 20$. Hence

$$\lim_{x \to 0+}\left(\left[\frac{11x}{\sin x}\right] + \left[\frac{21\sin x}{x}\right]\right) = 31$$

Similarly $x < \sin x$ for $x < 0$, so $\left[\frac{11x}{\sin x}\right] = 11$ as $x \to 0-$ and $\left[21\frac{\sin x}{x}\right] = 20$ as $x \to 0-$. Thus

$$\lim_{x \to 0-}\left(\left[\frac{11x}{\sin x}\right] + \left[\frac{21\sin x}{x}\right]\right) = 31$$

◉ **Example 59:** If $\lim_{x \to 0} \frac{x^n - \sin x^n}{x - \sin^n x}$ is nonzero and finite, then n in equal to

(a) 1 (b) 4
(c) 2 (d) 3

Ans. (a)

◎ **Solution:** $\lim_{x \to 0} \frac{x^n - \sin x^n}{x - \sin^n x}\left(\frac{0}{0}\right)$

$$= \lim_{x\to 0} \frac{nx^{n-1}\left(1-\cos x^n\right)}{1-n\sin^{n-1} x\cos x} \quad \text{(L Hopital Rule)}$$

$$= \frac{0}{1} = 0, \text{ if } n > 1$$

For $n = 0$, $\lim_{x\to 0} \frac{x^n - \sin x^n}{x - \sin^n x} = \lim_{x\to 0} \frac{1-\sin 1}{x-1} = \sin 1 - 1$

For $n = 1$, $\lim_{x\to 0} \frac{x^n - \sin x^n}{x - \sin^n x} = \lim_{x\to 0} \frac{x - \sin x}{x - \sin x} = 1$

Example 60: $\lim_{n\to\infty} \sum_{k=1}^{n} \tan^{-1}\left(\frac{1}{2k^2}\right)$ is

(a) $\pi/8$ (b) $\pi/2$

(c) $\pi/4$ (d) $\pi/3$

Ans. (c)

Solution: $\tan^{-1}\left(\frac{1}{2k^2}\right) = \tan^{-1} \frac{2}{1+(2k-1)(2k+1)}$

$$= \tan^{-1} \frac{(2k+1)-(2k-1)}{1+(2k-1)(2k+1)}$$

$$= \tan^{-1}(2k+1) - \tan^{-1}(2k-1)$$

$$\sum_{k=1}^{n} \tan^{-1}\left(\frac{1}{2k^2}\right) = \tan^{-1}(2n+1) - \tan^{-1}(2n-1) + \tan^{-1}(2n-1) - \tan^{-1}(2n-3) + \ldots + \tan^{-1} 3 - \tan^{-1} 1$$

$$= \tan^{-1}(2n+1) - \tan^{-1} 1$$

$$= \tan^{-1}(2n+1) - \frac{\pi}{4}$$

$$\lim_{n\to\infty} \sum_{k=1}^{n} \tan^{-1}\left(\frac{1}{2k^2}\right) = \tan^{-1}\infty - \frac{\pi}{4} = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}$$

Example 61: If f is a continuous function and $x^3 - \left(\sqrt{5}+1\right)x^2 + \left(\sqrt{5}-2+f(x)\right)x + 2\sqrt{5} - \sqrt{5}\, f(x) = 0$ satisfies for $x \in \mathbf{R}$ then $f\left(\sqrt{5}\right)$ is equal to

(a) $2-\sqrt{5}$ (b) $5+\sqrt{5}$

(c) $3-\sqrt{5}$ (d) $\sqrt{5}-3$

Ans. (d)

Solution: For $x \neq \sqrt{5}$,

$$f(x) = -\frac{x^3 - \left(\sqrt{5}+1\right)x^2 + \left(\sqrt{5}-2\right)x + 2\sqrt{5}}{x-\sqrt{5}}$$

$$= -\frac{(x+1)(x-2)\left(x-\sqrt{5}\right)}{x-\sqrt{5}}$$

$$= -(x+1)(x-2)$$

$$f\left(\sqrt{5}\right) = \lim_{x\to\sqrt{5}} f(x) = -\left(1+\sqrt{5}\right)\left(\sqrt{5}-2\right)$$

$$= -\left(3-\sqrt{5}\right) = \sqrt{5}-3$$

Example 62: If $x = u$ is *a* point of discontinuity of $f(x) = \lim_{n\to\infty} \cos^{2n} x$, then the value of $\cos u$ is

(a) 0 (b) 1/2

(c) $(-1)^n$ (d) 1

Ans. (c)

Solution: $f(x) = \lim_{n\to\infty} \left(\cos^2 x\right)^n$

$$= \begin{cases} 0, & 0 \le \cos^2 x < 1 \\ 1, & \cos^2 x = 1 \end{cases}$$

$$= \begin{cases} 0, & 0 \neq n\pi \\ 1, & x = n\pi \end{cases}$$

Hence $f(x)$ is discontinuous when $u = n\pi$, $n \in \mathbf{I}$

So $\cos u = \cos n\pi = (-1)^n$.

Assertion-Reason Type Questions

Example 63: Let $f(x) = \frac{\sqrt{x^2+1} - \sqrt[3]{x^2+1}}{\sqrt[4]{x^4+1} - \sqrt[5]{x^4+1}}$

Statement-1: $\lim_{x\to\infty} f(x) = 1$

Statement-2: $\lim_{x\to\infty} \frac{1}{x^n} = 0$ for $n > 0$.

Ans. (a)

Solution: $f(x) = \frac{x\left(1+1/x^2\right)^{1/2} - x^{2/3}\left(1+1/x^2\right)^{1/3}}{x\left(1+1/x^4\right)^{1/4} - x^{4/5}\left(1+1/x^4\right)^{1/5}}$

$$= \frac{\left(1+\frac{1}{2}\frac{1}{x^2}+0\left(\frac{1}{x^2}\right)\right) - \frac{1}{x^{1/3}}\left(1+\frac{1}{3x^2}+0\left(\frac{1}{x^2}\right)\right)}{\left(1+\frac{1}{4}\frac{1}{x^4}+0\left(\frac{1}{x^4}\right)\right) - \frac{1}{x^{1/5}}\left(1+\frac{1}{5x^4}+0\left(\frac{1}{x^4}\right)\right)}$$

Since $\lim_{x\to\infty} \frac{1}{x^n} = 0$ for all $n > 0$, so $\lim_{x\to\infty} f(x) = \frac{1-0.1}{1-0.1} = 1$.

Example 64: Let $f(x) = \frac{1}{1-x} - \frac{3}{1-x^3}$, $x \neq 1$

Statement-1: The value of $f(1)$ so that f is a continuous function is 1

Statement-2: $g(x) = \dfrac{x+2}{1+x+x^2}$ is a continuous function

Ans. (d)

Solution: For $x \neq 1, f(x) = \dfrac{1}{1-x}\left[1 - \dfrac{3}{1+x+x^2}\right]$

$$= \frac{(x-1)(x+2)}{(1-x)\left(1+x+x^2\right)} = -\frac{x+2}{1+x+x^2}$$

So, $\quad f(1) = \lim\limits_{x\to 1} f(x) = -\lim\limits_{x\to 1} \dfrac{x+2}{1+x+x^2} = -1.$

Example 65: Let $f(x) = \dfrac{1 - \cos x\sqrt{\cos 2x}}{x^2}$, $x \neq 0$

Statement-1: The value of $f(0)$ so that f is a continuous function is 3/2.

Statement-2: For an even function defined near a point a, $\lim\limits_{x\to a+} f(x) = \lim\limits_{x\to a} f(x)$

Ans. (b)

Solution: $\lim\limits_{x\to 0} f(x) = \lim\limits_{x\to 0} \dfrac{\sin x\sqrt{\cos 2x} + \dfrac{\cos x}{\sqrt{\cos 2x}}\sin 2x}{2x}$

$$= \frac{1}{2}\lim_{x\to 0}\frac{\sin x}{x}\lim_{x\to 0}\sqrt{\cos 2x} + \lim_{x\to 0}\frac{\sin 2x}{2x}\lim_{x\to 0}\frac{\cos x}{\sqrt{\cos^2 x}}$$

$$= \frac{1}{2} + 1 = \frac{3}{2}.$$

Statement-2 is also true since $f(x) = f(-x)$.

Example 66:

Statement-1: $\lim\limits_{x\to a}\left(\sin\dfrac{x-a}{2}\tan\dfrac{\pi x}{2a}\right) = \dfrac{a}{\pi}$, $a \neq 0$

Statement-2: Trigonometric functions are continuous on their domain of definition.

Ans. (d)

Solution: $\lim\limits_{x\to a}\left(\sin\dfrac{x-a}{2}\tan\dfrac{\pi}{2}\dfrac{x}{a}\right)$

$$= \lim_{x\to a}\sin\frac{x-a}{2}\cot\frac{\pi}{2}\left(1-\frac{x}{a}\right)$$

$$= \lim_{x\to a}\frac{\sin\dfrac{x-a}{2}}{\dfrac{x-a}{2}} \times \frac{\dfrac{x-a}{2}}{\dfrac{\pi}{2}\dfrac{a-x}{a}} \times \frac{\dfrac{\pi}{2}\left(1-\dfrac{x}{a}\right)}{\sin\dfrac{\pi}{2}\left(1-\dfrac{x}{a}\right)} \times \cos\frac{\pi}{2}\left(1-\frac{x}{a}\right)$$

$$= 1 \times -\frac{a}{\pi} \times 1 \times 1 = -\frac{a}{\pi}$$

Statement 2 is clearly true.

Example 67: Let $f(x) = \dfrac{\sqrt{1+\sin x} - \sqrt{1-\sin x}}{\tan x}$, $x \neq 0$ and

$$g(x) = \left(1 + \frac{1}{x}\right)^{\frac{x+1}{x}}$$

Statement-1: $\lim\limits_{x\to 0} f(x) = \lim\limits_{x\to\infty} g(x)$

Statement-2: Both the limits are equal to 1.

Ans. (a)

Solution: $\lim\limits_{x\to 0} f(x)$

$$= \lim_{x\to 0}\frac{1+\sin x - 1 + \sin x}{\tan x} \times \frac{1}{\sqrt{1+\sin x} + \sqrt{1-\sin x}}$$

$$= \lim_{x\to 0} 2\cos x \times \frac{1}{\sqrt{1+\sin x} + \sqrt{1-\sin x}}$$

$$= 2 \times 1 \times \frac{1}{1+1} = 1.$$

$$\lim_{x\to\infty} g(x) = \lim_{x\to\infty}\left(1 + \frac{1}{x}\right)^{x\times\left(\frac{1}{x}+\frac{1}{x^2}\right)} = e^0 = 1$$

Example 68: Define F(x) as the product of two real functions $f_1(x) = x$, $x \in \mathbf{R}$, and $f_2(x) = \begin{cases} \sin 1/x & ; \quad \text{if } x \neq 0 \\ 0 & ; \quad \text{if } x = 0 \end{cases}$ as follows:

$$\mathrm{F}(x) = \begin{cases} f_1(x)\, f_2(x) & ; \quad x \neq 0 \\ 0 & ; \quad x = 0 \end{cases}$$

Statement-1: F(x) is continuous on **R**

Statement-2: $f_1(x)$ and $f_2(x)$ are continuous on **R**.

Ans. (c)

Solution: Since $|x \sin 1/x| \leq |x|$ so $\lim\limits_{x\to 0} \mathrm{F}(x) = 0 = \mathrm{F}(0)$. Thus F is a continuous function. Since $\lim\limits_{x\to 0}\sin 1/x$ doesn't exist so f_2 is not continuous at $x = 0$.

Example 69:

Statement-1: $\lim\limits_{x\to 0}\left[\dfrac{\tan^{-1} x}{x}\right] = 0$, where $[x]$ represents greatest integer $\leq x$.

Statement-2: $\dfrac{\tan^{-1} x}{x} < 1$ for all $x \neq 0$.

Ans. (a)

Solution: Let $f(x) = \tan^{-1} x - x$

$f'(x) = \dfrac{1}{1+x^2} - 1 = \dfrac{-x^2}{1+x^2} < 0$. Hence f is decreasing function so for $x > 0$, $\tan^{-1} x < x$ and for $x < 0$, $f(x) > f(0) = 0$

ϕι $\tan^{-1} x > x$ ϕι $\dfrac{\tan^{-1} x}{x} < 1$ $(x < 0)$

Thus $\lim_{x \to 0+} \left[\frac{\tan^{-1} x}{x}\right] = 0$ and

$$\lim_{x \to 0-} \left[\frac{\tan^{-1} x}{x}\right] = 0$$

Example 70:

Statement-1: $f(x) = \text{sgn}(x^2 - 5x + 6)$ is continuous for all x

Statement-2: $ax^2 + bx + c = 0$ has no real roots if $b^2 - 4ac < 0$

Ans. (d)

Solution: $f(x) = \text{sgn}\,(x - 2)\,(x - 3)$. Hence f is not continuous at $x = 2$ and $x = 3$

Thus statement 1 is not true but statement 2 is true.

LEVEL 2

Straight Objective Type Questions

Example 71: The value of $\lim_{x \to \alpha} \frac{1 - \cos(ax^2 + bx + c)}{(x - \alpha)^2}$ where α and β are the roots of $ax^2 + bx + c = 0$ is

(a) $(a - b)^2$ (b) $\frac{(\alpha - \beta)^2}{2}$

(c) $\frac{1}{2}a^2(\alpha - \beta)^2$ (d) none of these

Ans. (c)

Solution: $\lim_{x \to \alpha} \frac{1 - \cos\left(ax^2 + bx + c\right)}{(x - \alpha)^2} \left(\frac{0}{0} \text{ form}\right)$

$$= \lim_{x \to \alpha} \frac{(2ax + b)\sin\left(ax^2 + bx + c\right)}{2(x - \alpha)}$$

[using L' Hôpital Rule]

$$= \lim_{x \to \alpha} \frac{(2ax + b)\sin[a(x - \alpha)(x - \beta)]}{2(x - \alpha)}$$

$$= \lim_{x \to \alpha} \frac{(2ax + b)\sin[a(x - \alpha)(x - \beta)]}{2a(x - \alpha)(x - \beta)}\, a\,(x - \beta)$$

$$= \frac{a^2}{2}\left(2\alpha + \frac{b}{a}\right)(\alpha - \beta)$$

$$= \frac{a^2}{2}(2\alpha - \alpha - \beta)(\alpha - \beta)$$

$$= \frac{a^2(\alpha - \beta)^2}{2}.$$

Example 72: The integer n for which $\lim_{x \to 0} \frac{(\cos x - 1)(\cos x - e^x)}{x^n}$ is a finite non-zero number is

(a) 1 (b) 2

(c) 3 (d) 4

Ans. (c)

Solution: $(\cos x - 1)\,(\cos x - e^x)$

$$= \left(\left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) - 1\right)\left[\left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) - \left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} \cdots\right)\right]$$

$$= x^2\left(-\frac{1}{2} + \frac{x^2}{4!} \cdots\right)\left(-x - x^2 - \frac{x^3}{3!} \cdots\right)$$

$$= x^3\left(-\frac{1}{2} + \frac{x^2}{4!} \cdots\right)\left(-1 - x - \frac{x^2}{3!} \cdots\right)$$

$$\Rightarrow \frac{(\cos x - 1)\left(\cos x - e^x\right)}{x^3} = \left(\begin{array}{l}\frac{1}{2} + \text{terms containing } x \\ \text{and higher powers of } x\end{array}\right)$$

$\lim_{x \to 0} \frac{(\cos x - 1)\left(\cos x - e^x\right)}{x^3} = \frac{1}{2}$. So $n = 3$.

In case $n = 1, 2, 4$, the limit is zero or does not exist.

Example 73: Let $f(x) = \lim_{n \to \infty} \frac{x^{2n} - 1}{x^{2n} + 1}$, then

(a) $f(x) = 1$ for $|x| = 1$

(b) $f(x) = \begin{cases} 1 & \text{for } |x| > 1 \\ -1 & \text{for } |x| < 1 \end{cases}$

(c) $f(x) = \begin{cases} 1 & \text{for } |x| > 1 \\ -1 & \text{for } |x| \le 1 \end{cases}$

(d) f is not defined for any value of x

Ans. (b)

Solution: For $|x| < 1$, $x^{2n} \to 0$ as $n \to \infty$ and for $|x| > 1$, $\frac{1}{x^{2n}} \to 0$ as $n \to \infty$. For $|x| = 1$ we have $x^2 = 1$. Thus

$$\frac{x^{2n} - 1}{x^{2n} + 1} = \begin{cases} 0, & |x| = 1 \\ \frac{1 - x^{-2n}}{1 + x^{-2n}}, & |x| > 1 \\ \frac{x^{2n} - 1}{x^{2n} + 1}, & |x| < 1 \end{cases}$$

Hence $$f(x)=\begin{cases} 0, & |x|=1 \\ 1, & |x|>1 \\ -1, & |x|<1 \end{cases}$$

Example 74: If $\lim\limits_{x\to a}\dfrac{a^x-x^a}{x^x-a^a}=-1$, then the value of a is

(a) 1 (b) 0

(c) e (d) none of these

Ans. (a)

Solution: $\lim\limits_{x\to a}\dfrac{a^x-x^a}{x^x-a^a}\quad\left(\dfrac{0}{0}\text{form}\right)$

$$=\lim_{x\to a}\frac{a^x\log a-ax^{a-1}}{x^x(1+\log x)}$$

(using L'Hôpital Rule) (1)

Now the numerator tends to a^a (log a – 1) and denominator tends to a^a(1 + log a). If the limit of denominator is 0 then 1 + log a = 0 so $a = e^{-1}$ in this case $a^a(\log a-1)\neq 0$ so the limit in (1) doesn't exist. Thus, the last limit is equal to

$$\frac{a^a(\log a-1)}{a^a(\log a+1)}=\frac{\log a-1}{\log a+1}=-1 \text{ if } 2\log a=0\Rightarrow a=1.$$

Example 75: $\lim\limits_{x\to 0}\left(\dfrac{e^x+e^{-x}-2}{x^2}\right)^{1/x^2}$ is

(a) $e^{1/2}$ (b) $e^{1/4}$

(c) $e^{1/3}$ (d) $e^{1/12}$

Ans. (d)

Solution: For $x\neq 0$, let $u=\dfrac{e^x+e^{-x}-2}{x^2}$

$$=\frac{1}{x^2}\left[\left(1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\cdots\right)+\left(1-x+\frac{x^2}{2!}-\frac{x^3}{3!}\cdots\right)-2\right]$$

$$=\frac{2}{x^2}\left[\frac{x^2}{2!}+\frac{x^4}{4!}+\cdots\right]=\left[1+\frac{x^2}{12}+\frac{2x^4}{6!}+\cdots\right]$$

$$\therefore\qquad u^{1/x^2}=\left[1+\frac{x^2}{12}+\cdots\right]^{\frac{1}{x^2}}$$

$$=\left[1+\left(\frac{x^2}{12}+\frac{x^4}{360}-\cdots\right)\right]^{\frac{1}{(x^2/12+x^4/360+\cdots)}\left(\frac{1}{12}+\frac{x^2}{360}+\cdots\right)}$$

$$\lim_{x\to 0}u^{1/x^2}=\lim_{y\to 0}(1+y)^{\frac{1}{y}.\lim\limits_{x\to 0}\left(\frac{1}{12}+\frac{x^2}{360}+\ldots\right)}\quad\left(y=\frac{x^2}{12}+\frac{x^4}{360}+\cdots\right)$$

$$=e^{1/12}$$

Example 76: If $\lim\limits_{x\to\infty}\left(\dfrac{x^2+1}{x+1}-ax-b\right)=0$

then

(a) $a = 1, b = -2$ (b) $a = 1, b = -1$

(c) $a = -1, b = 1$ (d) $a = 2, b = -2$

Ans. (b)

Solution:

$$=\lim_{x\to\infty}\left(\frac{x^2+1}{x+1}-ax-b\right)$$

$$=\lim_{x\to\infty}\left(\frac{(x^2+1)-(ax+b)(x+1)}{(x+1)}\right)$$

$$=\lim_{x\to\infty}\left(\frac{(1-a)x^2-(a+b)x-b+1}{x+1}\right)$$

This limit does not exist unless 1 – a = 0. In case a = 1, the last limit is equal to

$$\lim_{x\to\infty}\frac{-(1+b)x-b+1}{x+1}=\lim_{x\to\infty}\frac{-(1+b)-b/x+1/x}{1+1/x}$$

$$=-(1+b)$$

Thus $1 + b = 0 \Rightarrow b = -1$.

Example 77: Let $f(x) = g(x)\,\dfrac{e^{1/x}-e^{-1/x}}{e^{1/x}+e^{-1/x}}$, where g is a continuous function then $\lim\limits_{x\to 0}f(x)$ exist if

(a) $g(x) = x + 2$

(b) $g(x) = x^2 + 4$

(c) $g(x) = xh(x)$, $h(x)$ is a polynomial

(d) $g(x)$ is a constant function

Ans. (c)

Solution: $\lim\limits_{x\to 0+}\dfrac{e^{1/x}-e^{-1/x}}{e^{1/x}+e^{-1/x}}=\lim\limits_{x\to 0+}\dfrac{1-e^{-2/x}}{1+e^{-2/x}}=1$

$$\lim_{x\to 0-}\frac{e^{1/x}-e^{-1/x}}{e^{1/x}+e^{-1/x}}=\lim_{x\to 0-}\frac{e^{2/x}-1}{e^{2/x}+1}=-1$$

Hence $\lim\limits_{x\to 0}f(x)$ exists if $g(x) = xh(x)$ where $h(x)$ is a continuous function. If $g(x) = a$ $(a\neq 0)$ then $\lim\limits_{x\to 0+}f(x)=a$ and $\lim\limits_{x\to 0-}f(x)=-a$. Thus $\lim\limits_{x\to 0}f(x)$ does not exist if $f(x) = x + 2$ or $x^2 + 4$ or is a constant function.

Example 78: The value of $f(0)$, so that the function,

$$f(x)=\frac{\sqrt{a^2-ax+x^2}-\sqrt{a^2+ax+x^2}}{\sqrt{a+x}-\sqrt{a-x}},\ a>0$$

becomes continuous for all x in $[-a, a]$, is given by

(a) $a\sqrt{a}$ (b) $\sqrt{a}$

(c) $-\sqrt{a}$ (d) $-a\sqrt{a}$

Ans. (c)

Solution: Note that f is continuous for all x except possibly at $x = 0$. In order that f becomes continuous at $x = 0$, we must have

$$f(0) = \lim_{x\to 0} f(x)$$

Rationalizing the numerator and denominator, we have

$$f(0) = \lim_{x\to 0} \frac{-2ax\left[\sqrt{a+x}+\sqrt{a-x}\right]}{2x\left[\sqrt{a^2-ax+x^2}+\sqrt{a^2+ax+x^2}\right]} = -\sqrt{a}.$$

Example 79: If $f(x) = \dfrac{2-(256-7x)^{1/8}}{(5x+32)^{1/5}-2}$ $(x \neq 0)$; then for f to be continuous on $[-1, 1]$, $f(0)$ is equal to

(a) -1 (b) 1

(c) 2^6 (d) none of these

Ans. (d)

Solution: f is continuous everywhere except possibly at $x = 0$. For f to be continuous everywhere,

$$f(0) = \lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{2-(256-7x)^{1/8}}{(5x+32)^{1/5}-2}$$

$$= \lim_{x\to 0} \frac{1-\left(1-\dfrac{7x}{256}\right)^{1/8}}{\left(1+\dfrac{5x}{32}\right)^{1/5}-1} = \lim_{x\to 0} \frac{1-\left[1-\dfrac{1}{8}\cdot\dfrac{7x}{256}+0\left(x^2\right)\right]}{\left[1+\dfrac{1}{5}\cdot\dfrac{5x}{32}+0\left(x^2\right)\right]-1}$$

$$= \lim_{x\to 0} \frac{\left[\dfrac{1}{8}\cdot\dfrac{7}{256}-0(x)\right]}{\dfrac{1}{32}+0(x)} = \frac{1}{8}\cdot\frac{7}{256}\times\frac{32}{1} = \frac{7}{64}.$$

Example 80: Let $f(x) = \dfrac{x(1+a\cos x)-b\sin x}{x^3}$, $x \neq 0$ and $f(0) = 1$. The value of a and b so that f is a continuous function are

(a) 5/2, 3/2 (b) 5/2, –3/2

(c) –5/2, –3/2 (d) none of these

Ans. (c)

Solution: Note that f is continuous everywhere except possibly at $x = 0$. For f to be continuous at $x = 0$,

$$1 = f(0) = \lim_{x\to 0} \frac{x(1+a\cos x)-b\sin x}{x^3}\left(\frac{0}{0}\text{ form}\right)$$

$$= \lim_{x\to 0} \frac{(1+a\cos x)-xa\sin x-b\cos x}{3x^2}$$

$$= \lim_{x\to 0} \frac{1+(a-b)\cos x-xa\sin x}{3x^2}$$

This limit will exist only if $1 + (a - b) = 0$. In this case limit is equal to

$$= \lim_{x\to 0} \frac{-(a-b)\sin x-ax\cos x-a\sin x}{6x}$$

(using L'Hôpital Rule)

$$= \frac{1}{6}\lim_{x\to 0}\left[(b-2a)\frac{\sin x}{x}-a\cos x\right]$$

$$= \frac{1}{6}[b-3a] \Rightarrow b-3a = 6$$

Solving $a - b = -1$ and $b - 3a = 6$, we get $b = -3/2$ and $a = -5/2$.

Example 81: $f(x) = \begin{cases} (3/x^2)\sin 2x^2 & \text{if } x < 0 \\ \dfrac{x^2+2x+c}{1-3x^2} & \text{if } x \geq 0, x \neq \dfrac{1}{\sqrt{3}} \\ 0 & x = 1/\sqrt{3} \end{cases}$

then in order that f be continuous at $x = 0$, the value of c is

(a) 2 (b) 4

(c) 6 (d) 8

Ans. (c)

Solution:

$$\lim_{x\to 0-} f(x) = \lim_{x\to 0-} \frac{3}{x^2}\sin 2x^2 = 6\lim_{x\to 0}\frac{\sin 2x^2}{2x^2} = 6$$

$$\lim_{x\to 0+} f(x) = \lim_{x\to 0+} \frac{x^2+2x+c}{1-3x^2} = \frac{c}{1} = c$$

Hence for f to be continuous $c = 6$.

Example 82: The function $f(x) = (\sin 2x)^{\tan^2 2x}$ is not defined at $x = \pi/4$. The value of $f(\pi/4)$ so that f is continuous at $x = \pi/4$ is

(a) $\sqrt{e}$ (b) 1

(c) 2 (d) none of these

Ans. (d)

Solution: For f to be continuous at $x = \pi/4$,

$$f(\pi/4) = \lim_{x\to\pi/4} f(x) = \lim_{x\to\pi/4} (1-\cos^2 2x)^{(1/2)\tan^2 2x}$$

$$= \lim_{x\to\pi/4}\left\{(1-\cos^2 2x)^{-(1/\cos^2 2x)}\right\}^{-(\sin^2 2x)/2} = \frac{1}{\sqrt{e}}.$$

Example83: Let $f(x) = \dfrac{\log\left(1+x+x^2\right)+\log\left(1-x+x^2\right)}{\sec x-\cos x}$, $x \neq 0$. Then the value of $f(0)$ so that f is continuous at $x = 0$ is

(a) 1 (b) 0

(c) 2 (d) none of these

Ans. (a)

◎ **Solution:** For f to be continuous at $x = 0$,

$$f(0) = \lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{\log\left(1+x+x^2\right)+\log\left(1-x+x^2\right)}{\sec x - \cos x}$$

$$= \lim_{x\to 0} \frac{\log\left(\left(1+x^2\right)^2 - x^2\right)}{1-\cos^2 x}\cdot\cos x$$

$$= \lim_{x\to 0} \frac{\log\left(1+\left(x^2+x^4\right)\right)}{\sin^2 x}\cdot\cos x$$

$$= \lim_{x\to 0} \frac{\log\left(1+\left(x^2+x^4\right)\right)}{x^2+x^4}\times\frac{x^2}{\sin^2 x}\times\left(1+x^2\right)\cos x = 1.$$

● **Example 84:** The value of k ($k > 0$) for which the function

$$f(x) = \frac{(e^x-1)^4}{\sin(x^2/k^2)\log\{1+(x^2/2)\}}, \qquad x \neq 0; f(0) = 8$$

may be continuous function is

(a) 1	(b) 4
(c) 2	(d) 3

Ans. (c)

◎ **Solution:** We have $\lim_{x\to 0} f(x) =$

$$\lim_{x\to 0}\left(\frac{e^x-1}{x}\right)^4\times\frac{x^2/k^2}{\sin\left(x^2/k^2\right)}\times\frac{x^2/2}{\log\left(1+x^2/2\right)}\times 2k^2$$

$= 2k^2$

So $\quad 2k^2 = 8 \Rightarrow k = \pm 2.$

● **Example 85:** The function $f(x) = [\log(1+ax) - \log(1-bx)]/x$ is not defined at $x = 0$. The value, which should be assigned to f at $x = 0$ so that it is continuous at $x = 0$ is

(a) $a - b$	(b) $a + b$
(c) $\log a + \log b$	(d) none of these.

Ans. (b)

◎ **Solution** $\quad f(0) = \lim_{x\to 0} f(x) =$

$$\lim_{x\to 0}\left[\frac{\log(1+ax)}{x} - \frac{\log(1-bx)}{x}\right]$$

$$= \lim_{x\to 0}\frac{a\log(1+ax)}{ax} - \frac{(-b)\log(1-bx)}{-bx} = a+b.$$

● **Example 86:** Let $f(x) = \dfrac{\log\left(1+x^2\right)}{x^4-26x^2+25}$. Then

(a) f is continuous on [6, 10]
(b) f is continuous on [– 2, 2]
(c) f is continuous on [– 6, 6]
(d) f is continuous on [1, 7]

Ans. (a)

◎ **Solution:** $f(x) = \dfrac{\log\left(1+x^2\right)}{\left(x^2-25\right)\left(x^2-1\right)}$

$$= \frac{\log\left(1+x^2\right)}{(x-5)(x+5)(x-1)(x+1)}$$

Since $\log(1+x^2)$ is continuous on $(-\infty, \infty)$, so f is continuous on $\mathbf{R} \sim \{-5, -1, 1, 5\}$ which clearly contains the interval [6, 10].

● **Example 87:** Let $f(x) = \dfrac{\sin\left(\pi\cos^2 x\right)}{x^2}$, $x \neq 0$. The value of $f(0)$ so that f is a continuous function is

(a) $-\pi$	(b) π
(c) $\pi/2$	(d) 1

Ans. (b)

◎ **Solution:** $f(0) = \lim_{x\to 0}\dfrac{\sin\left(\pi\cos^2 x\right)}{x^2}$

$$= \lim_{x\to 0}\frac{\sin\left(\pi\left(1-\sin^2 x\right)\right)}{x^2}$$

$$= \lim_{x\to 0}\frac{\sin\left(\pi\sin^2 x\right)}{x^2}$$

$$= \lim_{x\to 0}\frac{\sin\left(\pi\sin^2 x\right)}{\pi\sin^2 x}\cdot\frac{\pi\sin^2 x}{x^2}$$

$$= 1\cdot\pi\cdot 1 = \pi.$$

● **Example 88:** Let $f(x) = \begin{cases}\dfrac{e^{\alpha x}-e^x-x}{x^2} & x \neq 0\\ 3/2 & x = 0\end{cases}$

The value of α so that f is a continuous function is

(a) 1	(b) 0
(c) 4	(d) 2

Ans. (d)

◎ **Solution:** $\dfrac{3}{2} = \lim_{x\to 0} f(x) = \lim_{x\to 0}\dfrac{e^{\alpha x}-e^x-x}{x^2}\left(\dfrac{0}{0}\text{form}\right)$

$$= \lim_{x\to 0}\frac{\alpha e^{\alpha x}-e^x-1}{2x}$$

For the last limit to exist, we must have
$\lim_{x\to 0}(\alpha e^{\alpha x} - e^x - 1) = 0$

$\therefore\ \alpha - 1 - 1 = 0 \Rightarrow \alpha = 2$. In this case, the last limit is equal to

$$\lim_{x\to 0}\frac{\alpha^2 e^{\alpha x}-e^x}{2} = \frac{\alpha^2-1}{2} = \frac{3}{2}.$$

Example 89: Let f be a continuous function on **R** such that $f(1/2^n) = (\sin e^n)\ e^{-n^2} + \dfrac{2n^2}{n^2+1}$. Then the value of $f(0)$ is

(a) 1 (b) 1/2
(c) 2 (d) none of these

Ans. (c)

Solution: As f is continuous so $f(0) = \lim\limits_{x\to 0} f(x) = \lim\limits_{n\to\infty} f(x_n)$ for any sequence x_n such that $\lim\limits_{n\to\infty} x_n = 0$.

Thus

$$f(0) = \lim_{n\to\infty} f\left(1/2^n\right) = \lim_{n\to\infty}\left(\left(\sin e^n\right)e^{-n^2} + \frac{2n^2}{n^2+1}\right)$$

$$= \lim_{n\to\infty}\left(\left(\sin e^n\right)e^{-n^2} + \frac{2}{1+1/n^2}\right) = 0 + 2 = 2.$$

Example 90: Let $f(x) = \lim\limits_{n\to\infty} \dfrac{x}{1+(2\sin x)^{2n}}$ then f is discontinuous at

(a) π (b) $\pi/3$
(c) $\pi/4$ (d) $\pi/6$

Ans. (d)

Solution:

$$f(x) = \begin{cases} x & \text{if } \ |\sin x| < 1/2 \text{ i.e} -\dfrac{\pi}{6} + n\pi < x < \dfrac{\pi}{6} + n\pi \\ \dfrac{x}{2} & \text{if } \ |\sin x| = \dfrac{1}{2} \text{ i.e. } x = \pm\dfrac{\pi}{6} + n\pi \\ 0 & \text{if } \ |\sin x| > \dfrac{1}{2} \text{ i.e } \dfrac{\pi}{6} + n\pi < x < \dfrac{5\pi}{6} + n\pi \end{cases}$$

Thus points of discontinuities of f are of the form $x = \pm\dfrac{\pi}{6} + n\pi$. In particular, f is discontinuous at $x = \pi/6$.

Alternatively since the choices are in $[0, \pi]$ so one may look at the graph of $\sin x$ and decide about the point of discontinuity.

Example 91: Let f be a non-zero continuous function satisfying $f(x + y) = f(x) f(y)$ for all $x, y \in$ **R**. If $f(2) = 9$ then $f(3)$ is

(a) 1 (b) 27
(c) 9 (d) none of these

Ans. (b)

Solution: Any non-zero continuous function satisfying the given functional equation is of the form a^x for some $a > 0$. Since $f(2) = 9$ so $a^2 = 9$ i.e., $a = 3$. Thus $f(x) = 3^x$ and so $f(3) = 3^3 = 27$.

Example 92: Let f be a function on [0, 1] defined by $f(x) = (1/2)^n$, $(1/2)^{n+1} \le x < (1/2)^n$, $n = 0, 1, 2, \ldots$ Then

(a) f is a continuous function
(b) f is continuous except $x = 1/2$
(c) f is continuous except for finitely many points
(d) The set of points where f is not continuous is infinite.

Ans. (d)

Solution: $\lim\limits_{x\to(1/2)^n-} f(x) = \left(\dfrac{1}{2}\right)^n$ whereas

$\lim\limits_{x\to(1/2)^n+} f(x) = (1/2)^{n-1}$ as $f(x) = (1/2)^{n-1}$ for $(1/2)^n \le x < (1/2)^{n-1}$. So f is discontinuous at 1/2, $(1/2)^2$…. Thus f has infinitely many discontinuities.

Example 93: If $f(x) = \begin{cases} \dfrac{\sin(a+1)x + \sin x}{x} & , x < 0 \\ c & , x = 0 \\ \dfrac{\sqrt{x+bx^2} - \sqrt{x}}{bx^{3/2}} & , x > 0 \end{cases}$

is continuous at $x = 0$, then

(a) $a = -3/2$, $b = 0$, $c = 1/2$
(b) $a = -3/2$, $b = 1$, $c = 1/2$
(c) $a = -3/2$, b ε **R**, $c = -1/2$
(d) none of these

Ans. (c)

Solution: $\lim\limits_{x\to 0-} f(x) = \lim\limits_{x\to 0} \dfrac{\sin(a+1)x + \sin x}{x}$

$$= \lim_{x\to 0}\left[(a+1)\frac{\sin(a+1)x}{(a+1)x} + \frac{\sin x}{x}x^2\right] = a + 2$$

Also $\lim\limits_{x\to 0+} f(x) = \lim\limits_{x\to 0+} \dfrac{\sqrt{x+bx^2} - \sqrt{x}}{bx^{3/2}}$

$$= \lim_{x\to 0} \frac{\sqrt{1+bx} - 1}{bx} = \left(\frac{0}{0}\text{form}\right)$$

$$= \lim_{x\to 0} \frac{b}{2\sqrt{1+bx}} \cdot \frac{1}{b}\ \frac{1}{2}$$

Thus we must have $a + 2 = c = 1/2$.
So $a = -3/2$, $c = 1/2$ and b is any real number.

Example 94: If $f(x) = \begin{cases} \dfrac{72^x - 9^x - 8^x + 1}{\sqrt{2} - \sqrt{1+\cos x}}, & x \ne 0 \\ K \log 2 \log 3, & x = 0 \end{cases}$

is a continuous function then K is equal to

(a) $\sqrt{2}$ (b) 24
(c) $18\sqrt{3}$ (d) $24\sqrt{2}$

Ans. (d)

◎ **Solution:** $K \log 2 \log 3 = f(0) = \lim_{x\to 0} f(x)$

$$= \lim_{x\to 0} \frac{72^x - 9^x - 8^x + 1}{\sqrt{2} - \sqrt{1+\cos x}}$$

$$= \lim_{x\to 0} \frac{(9^x-1)(8^x-1)}{x^2} \frac{x^2}{\sqrt{2}\,(1-\cos x/2)}$$

$$= \lim_{x\to 0} \frac{9^x-1}{x}\cdot\frac{8^x-1}{x}\,\frac{16(x/4)^2}{\sqrt{2}\cdot 2\sin^2 x/4}$$

$$= \frac{16}{2\sqrt{2}} \log 9 \log 8 = \frac{8}{\sqrt{2}}\, 6 \log 3 \log 2$$

$$= 24\sqrt{2}\, \log 3 \log 2$$

Thus $K = 24\sqrt{2}$.

◉ **Example 95:** Let f be a function defined on **R** by $f(x) = [x] + \sqrt{x-[x]}$ then

(a) f is not continuous at every $x \in$ **I**
(b) f is not continuous at every $x \in$ **R** ~ **I**
(c) f is a continuous function
(d) none of these

Ans. (b)

◎ **Solution:** $f(x) = n + \sqrt{x-n}$, $n \le x < n+1$

If $x_0 = K \in$ **I** then $\lim_{x\to K+} f(x)$

$$= \lim_{x\to K+} K + \sqrt{x-K} = K$$

and $\lim_{x\to K-} f(x) = \lim_{x\to K-} (K-1) + \sqrt{x-(K-1)}$

$$= -1 + 1 = 0$$

Thus, f is not continuous at every $x_0 = K \in$ **I**. If $x_0 \in$ **R** ~ **I** then $[x]$ is continuous at x_0 which in turn gives that f is continuous at every $x_0 \in$ **R** ~ **I**.

◉ **Example 96:** The function f : **R** ~ $\{0\} \to$ **R** given by $f(x) = \dfrac{\tan x - x}{x - \sin x}$ can be made continuous at $x = 0$ by defining $f(0)$ as

(a) 1 (b) 0
(c) 2 (d) 4

Ans. (c)

◎ **Solution:** We must define $f(0) = \lim_{x\to 0} f(x)$

Let $u(x) = \tan x - x$, $v(x) = x - \sin x$ so $u(0) = v(0) = 0$.
Now $u'(x) = \sec x^2 - 1$, $v'(x) = 1 - \cos x$ so $u'(0) = v'(0) = 0$
Again $u''(x) = 2\sec^2 x \tan x$, $v''(x) = \sin x$ and $u''(0) = v''(0) = 0$
Next $u''(x) = 2\sec^4 x + 4\sec^3 x \tan^2 x$, $v''(x) = \cos x$, so $u'''(0) = 2$, $v'''(0) = 1$

Hence $\lim_{x\to 0} f(x) = \lim_{x\to 0} \dfrac{u(x)}{v(x)} = \lim_{x\to 0} \dfrac{u'''(x)}{v'''(x)} = \dfrac{2}{1} = 2.$

◉ **Example 97:** For $x \ne 1$, f is defined by $f(x) = \dfrac{1}{\log x} - \dfrac{1}{x-1}$

The value of $f(1)$, so that f is a continuous function is

(a) 1 (b) $\frac{1}{2}$
(c) 0 (d) 2

Ans. (b)

◎ **Solution:** $f(x) = \dfrac{x-1-\log x}{(\log x)(x-1)} = \dfrac{u(x)}{v(x)}$

$u(1) = 0$, $v(1) = 0$

$u'(x) = 1 - \dfrac{1}{x}$, $v'(x) = \log x + \dfrac{x-1}{x}$ but $u'(1) = v'(1) = 0$

$$\frac{u'(x)}{v'(x)} = \frac{\dfrac{x-1}{x}}{\dfrac{x\log x + (x-1)}{x}} = \frac{x-1}{x\log x + (x-1)} = \frac{r(x)}{s(x)}$$

$r(1) = s(1) = 0$ and

$$\frac{r'(x)}{s'(x)} = \frac{1}{1 + \log x + 1}$$

so $\lim_{x\to 1} f(x) = \lim_{x\to 1} \dfrac{r'(x)}{s'(x)} = \lim_{x\to 1} \dfrac{1}{2 + \log x} = \dfrac{1}{2}$

◉ **Example 98:** The number of points where

$$f(x) = \begin{cases} [\cos \pi x] & , \quad 0 \le x \le 1 \\ |5x-2|[x-2] & , \quad 1 < x \le 2 \end{cases}$$

($[x]$ is the greatest integer less than or equal to x) is discontinuous is

(a) 2 (b) 4
(c) 3 (d) 1

Ans. (b)

◎ **Solution:** f is discontinuous possibly at $x = 1$ and points of discontinuities of $[\cos \pi x]$, $0 \le x \le 1$ and $|5x-2|[x-2]$, $1 < x \le 2$.

$\lim_{x\to 1-} f(x) = \lim_{x\to 1-} [\cos \pi x] = -1$ (As for $x \to 1-$, $\pi x \to \pi -$ so $\cos \pi x > -1$)

$\lim_{x\to 1+} f(x) = \lim_{x\to 1+} |5x-2|\,[x-2] = -\lim_{x\to 1+} |5x-2| = -3$

Hence f is discontinuous at $x = 1$.

For $0 \le x \le 1$, $[\cos \pi x] = \begin{cases} 1 & , \quad x = 0 \\ 0 & , \quad 0 < x \le 1/2 \\ -1 & , \quad 1/2 < x \le 1 \end{cases}$

so $[\cos \pi x]$ is discontinuous at $x = 0, 1/2$

For $1 < x \le 2$, $|5x-2|\,[x-2] = (5x-2)\,[x-2]$

$$= \begin{cases} -(5x-2) & , \quad 1 < x < 2 \\ 0 & , \quad x = 2 \end{cases}$$

This function is discontinuous at 2.
Thus f is discontinuous at 0, 1/2, 1, 2.

Example 99: If $f(x) = \begin{cases} x^2 + Ax + 5 & x \in \mathbf{Q} \\ 1 + x & x \in \mathbf{R} \sim \mathbf{Q} \end{cases}$ is continuous at exactly two points, then the possible values of A are in

(a) $(1, \infty)$ (b) $(-3, \infty)$
(c) $(5, \infty) \cup (-\infty, -3)$ (d) $(-\infty, \infty)$

Ans. (c)

Solution: For f to be continuous, $x^2 + Ax + 5 = 1 + x$ should have real roots

ϕι $x^2 + (A - 1)x + 4 = 0$
i.e. $(A - 1)^2 - 16 \le 0$
ϕι $A - 1 \ge 4$ or $A - 1 \le -4$
ϕι $A \ge 5$ or $A \le -3$
ϕι $A \in [5, \infty) \cup (-\infty, -3]$

Example 100: $\lim\limits_{x\to 1} \dfrac{n\,x^{n+1} - n\,x^n + 1}{(e^x - e^2)\sin \pi x}$ is equal to

(a) $\dfrac{n(n+1)}{e^2 - e}$ (b) $\dfrac{n}{(e^2 - e)\pi}$

(c) $\dfrac{n}{(e - e^2)\pi}$ (d) $\dfrac{n^2(n+1)}{(e^2 - e)\pi}$

Solution: $\lim\limits_{x\to 1} \dfrac{n\,x^{n+1} - n\,x^n + 1}{(e^x - e^2)\sin \pi x}\left(\dfrac{0}{0}\right)$

$$= \lim_{x\to 1} \frac{n(n+1)\,x^n - n^2\,x^n + 1}{e^x \sin \pi\,x + (e^x - e^2)\pi \cos \pi x}$$

$$= \frac{n}{(e^2 - e)\pi}.$$

EXERCISE

Concept-based Straight Objective Type Questions

1. $\lim\limits_{x\to\infty} \dfrac{1}{n^2}\,(1 + 2 + \cdots + n)$ is equal to

   (a) 0 (b) 1
   (c) $\dfrac{1}{2}$ (d) $\dfrac{1}{4}$

2. $\lim\limits_{x\to\infty}\left(\dfrac{1}{1.2} + \dfrac{1}{2.3} + \cdots \dfrac{1}{(n-1)n}\right)$ is equal to

   (a) 0 (b) $\dfrac{1}{2}$
   (c) $\dfrac{1}{3}$ (d) 1

3. $\lim\limits_{x\to 1} \dfrac{x^m - 1}{x^n - 1}$ is equal to (m and n are positive integers)

   (a) $\dfrac{m}{n}$ (b) 1
   (c) 0 (d) $\dfrac{m-1}{n-1}$

4. $\lim\limits_{\alpha\to 0} \dfrac{\sin(\alpha^n)}{(\sin \alpha)^m}$ (m, $n \in \mathbf{I}^+$) is equal to

   (a) 1 if $m > n$ (b) 0 if $n > m$
   (c) 1 if $> m$ (d) 1 if $m = n$

5. $\lim\limits_{x\to\infty}\left(1 + \dfrac{k}{x}\right)^{mx}$ is equal to

   (a) m^k (b) e^m
   (c) e^{mk} (d) $e^{m/k}$

6. Let $f(x) = \begin{cases} a|x^2 - x - 2|, & x < 2 \\ b & , x = 2 \\ \dfrac{x - [x]}{x - 2} & , x > 2 \end{cases}$

   If f is continuous at $x = 2$ then
   (a) $a = 1, b = 1$ (b) $a = 1, b = 2$
   (c) $a = 2, b = 1$ (d) $a = 2, b = 2$

7. Let $f(x) = \dfrac{2x^5 - 8x^2 + 11}{x^4 + 4x^3 + 8x^2 + 8x + 4}$. Then

   $A = \{x : f$ is continuous at $x\}$ is equal to
   (a) $\mathbf{R}$ (b) $\mathbf{R} \sim \{0\}$
   (c) $\mathbf{R} \sim \{-1\}$ (d) $\mathbf{R} \sim \{-1, -2\}$

8. Let $f(x) = \begin{cases} ax - b & , \quad x \le 1 \\ 3x & , \quad 1 < x < 2 \\ bx^2 - a & , \quad x \ge 2 \end{cases}$

   If f is continuous function then (a, b) is equal to
   (a) (1, 2) (b) (1, 3)
   (c) (3, 6) (d) (6, 3)

9. If $f(x) = \begin{cases} \cos^{-1}(\cot x) & , \quad x < \dfrac{\pi}{2} \\ a(\pi[x] - 1) & , \quad x \ge \dfrac{\pi}{2} \end{cases}$

The value of a for f to be continuous at $x = \frac{\pi}{2}$ is

(a) $\frac{\pi}{2(\pi-1)}$ (b) $\pi - 1$

(c) $\frac{\pi}{\pi+1}$ (d) $\frac{\pi}{\pi-1}$

10. Let $f(x) = \begin{cases} \frac{\sin 4x}{\log(1+3x)} &, x \neq 0 \\ A+1 &, x = 0 \end{cases}$

The value of A for f to be continuous at $x = 0$ is

(a) $\frac{2}{3}$ (b) $\frac{1}{3}$

(c) 1 (d) $\frac{3}{4}$

LEVEL 1

Straight Objective Type Questions

11. The value of $\lim_{x\to\infty} x\left(\tan^{-1}\frac{x+1}{x+2} - \tan^{-1}\frac{x}{x+2}\right)$ is

(a) 1 (b) 0

(c) 1/2 (d) 1/4

12. The value of $\lim_{x\to 0}\left(1+\tan^2\sqrt{x}\right)^{1/2x}$

(a) e (b) $e^{1/2}$

(c) $e^{1/4}$ (d) $e^{-1/2}$

13. If $f(x) = \frac{\sin(a+x)-\sin(a-x)}{\tan(a+x)-\tan(a-x)}$, $x \neq 0$ then $\lim_{x\to 0} f(x)$ is

(a) $\cos a$ (b) $\frac{1}{2}\cos a$

(c) $\cos^2 a$ (d) none of these

14. $\lim_{x\to\pi/6}\frac{\sin(x-\pi/6)}{\sqrt{3}/2-\cos x}$ is equal to

(a) 2 (b) 1

(c) – 1 (d) $\sqrt{3}/2$

15. $\lim_{x\to\pi/2}\frac{\cos x}{\sqrt[3]{(1-\sin x)^2}}$ is equal to

(a) 1 (b) 2

(c) 21/3 (d) none of these

16. If $x^2 + 2x^3 \leq x + f(x) \leq x^5 - 2x^3$ for value of x near 0, then $\lim_{x\to 0}\frac{f(x)}{x}$ is

(a) – 1 (b) 0

(c) 1 (d) none of these

17. If $f(x) = \frac{\sin^{-1}([x]+x)}{[x]}$, $[x] \neq 0$

$= 0, [x] = 0$

where $[x]$ denotes the greatest integer less than or equal to x, then $\lim_{x\to 0} f(x)$ is

(a) 1 (b) – 1

(c) 0 (d) none of these

18. The function $f(x) = [x]\cos\frac{2x-1}{2}\pi$, where [ ] denotes the greatest integer function is discontinuous at

(a) all x (b) all integer points

(c) no x (d) x which is not integer

19. Let $f(y) = \sin\frac{y-a}{2}\tan\frac{\pi y}{2a}$, $y \neq a$. The value of $f(a)$ so that f is a continuous function is

(a) π/a (b) $-a/\pi$

(c) $\pi/2a$ (d) none of these

20. Let $f(x) = (1 + \sin x)^{\operatorname{cosec} x}$, the value of $f(0)$ so that f is a continuous function is

(a) e (b) $e^{1/2}$

(c) e^2 (d) 1

21. Let $f(x) = \begin{cases} x+1 &, x \leq 1 \\ 3-ax^2 &, x > 1 \end{cases}$

The value of a so that f is continuous is

(a) 1/2 (b) 1

(c) 2 (d) 3

22. Let $f(x) = [x^2 + 1]$, ($[x]$ is the greatest integer less than or equal to x). Then f is continuous

(a) on [1, 3]

(b) for all x in [1, 3] except four points

(c) for all x in [1, 3] except seven points

(d) for all x in [1, 3] except eight points

23. The function $y = \sqrt{\frac{1}{2}-\cos^2 x}$ is not continuous at

(a) $x = \pi/4$ (b) $x = 3\pi/4$

(c) $x = 5\pi/4$ (d) none of these

24. The number of points at which the function $f(x) = 1/(x - [x])$ is not continuous is

(a) 1 (b) 2

(c) 3 (d) none of these

25. Let $f(x) = x$, $x \in \mathbf{Q}$; $f(x) = 1 - x$, $x \in \mathbf{R} \sim \mathbf{Q}$ then f is continuous only at $x =$
(a) 1/2 (b) 1
(c) 0 (d) 2

26. $\lim\limits_{x\to 0} \dfrac{x\tan 2x - 2x\tan x}{(1-\cos 2x)^2}$ is
(a) 2 (b) – 2
(c) 1/2 (d) – 1/2

27. Let $f(x) = \dfrac{\sqrt{1-\cos 2(x-2)}}{x-2}$, $x \neq 2$. The $\lim\limits_{x\to 2} f(x)$
(a) exists and is equal to $\sqrt{2}$
(b) does not exist because $\lim\limits_{x\to 2+} f(x)$ doesn't exist
(c) equal to 1
(d) doesn't exist because $\lim\limits_{x\to 2+} f(x) \neq \lim\limits_{x\to 2-} f(x)$

28. The value of $f(0)$ so that the function $f(x) = \dfrac{\sqrt{1+x} - \sqrt[3]{1+x}}{x}$ becomes continuous is equal to
(a) 1/6 (b) 1/4
(c) 1/3 (d) 3

29. The set of all points of continuity of *fo fo f*, where $f(x) = \operatorname{sgn} x$ is
(a) $\mathbf{R} \sim \{0\}$ (b) $\mathbf{R} \sim \{1, 0, 1\}$
(c) $\mathbf{R} \sim \{-1, 1\}$ (d) none of these

30. The set of all points of discontinuity of $f(x) = \dfrac{x-1}{x^3+6x^2+11x+6}$
(a) ϕ (b) $\{-1\}$
(c) $\{-1, -2, -3\}$ (d) $\{1, 2, 3\}$

31. The number of continuous functions on $\mathbf{R}$ which satisfy $(f(x))^2 = x^2$ for $x \in \mathbf{R}$ is
(a) 2 (b) 4
(c) 1 (d) infinitely many

32. The value of $\lim\limits_{x\to 0} \dfrac{\sqrt{x^2+1}-1}{\sqrt{x^2+16}-4}$ is
(a) 3 (b) 4
(c) 1 (d) 2

33. The value of $\lim\limits_{x\to a} \dfrac{\sqrt{x-b}-\sqrt{a-b}}{x^2-a^2}$ $(a > b)$ is
(a) $\dfrac{1}{4a}$ (b) $\dfrac{1}{a\sqrt{a-b}}$
(c) $\dfrac{1}{2a\sqrt{a-b}}$ (d) $\dfrac{1}{4a\sqrt{a-b}}$

34. The value of $\lim\limits_{x\to\infty} \left(\sqrt{x^2+1}-\sqrt{x^2-1}\right)$ is
(a) – 1 (b) 1
(c) 0 (d) none of these

35. The value of $\lim\limits_{x\to\infty} x^{3/2}\left(\sqrt{x^3+1}-\sqrt{x^3-1}\right)$ is
(a) 1 (b) – 1
(c) 0 (d) none of these

36. The value of $f(1)$ so that $f(x) = (e^x - e)/(x - 1)$ is continuous at $x = 1$ is
(a) e^{-1} (b) e^2
(c) $e^{1/2}$ (d) e

37. The function $f(x) = a[x + 1] + b[x - 1]$, $(a \neq 0, b \neq 0)$ where $[x]$ is the greatest integer function is continuous at $x = 1$ if
(a) $a = 2b$ (b) $a = b$
(c) $a + b = 0$ (d) $a + 2b = 0$

38. Let $f(x) = [2x^3 - 6]$, where $[x]$ is the greatest integer less than or equal to x. Then the number of points in (1,2) where f is discontinuous is
(a) 5 (b) 7
(c) 13 (d) 12

39. Let f be defined on $\mathbf{R}$ by $f(x) = \lim\limits_{n\to\infty}\left[\sin\left(\dfrac{\pi x}{2}\right)\right]^{2n}$ then
(a) f is continuous on [0, 2]
(b) f is continuous on $\mathbf{R} \sim \{2n, n \in I\}$
(c) f is continuous on $\mathbf{R} \sim \{(2n + 1), n \in \mathbf{I}\}$
(d) $\lim\limits_{x\to 0+} f(x) = 1$

40. If $f(x) = (1/2)x - 1$, then on the interval $[0, \pi]$,
(a) $\tan f(x)$ and $\dfrac{1}{f(x)}$ are both continuous
(b) $\tan f(x)$ and $\dfrac{1}{f(x)}$ are both discontinuous
(c) $\tan f(x)$ and $f^{-1}(x)$ are both continuous
(d) $\tan(f(x))$ is continuous but $\dfrac{1}{f(x)}$ is not

41. If $\lim\limits_{x\to 0}[\cot(\pi/4+x)]^{1/x} = Ae^2$ then the value of A is
(a) e^2 (b) e^{-4}
(c) e (d) e^3

42. Let $f(x) = \dfrac{[1/2+x]-[1/2]}{x}$, $-1 \le x \le 2$ and $f(0) = 0$ ($[x]$ is greatest integer less than or equal to x) then
(a) f is not continuous at $x = 0$
(b) f is a continuous function on [–1/2, 1/2]
(c) f is continuous on [– 1, 0]
(d) f is continuous on [0, 2]

43. Let f and g functions such that $f + g$ is a continuous function then
(a) f and g are continuous function
(b) f or g is a continuous function
(c) f may be discontinuous but g is continuous
(d) both f and g may be discontinuous

44. $\lim\limits_{x\to 0} \dfrac{(1+x^2)^{1/3}-(1-2x)^{1/4}}{x+x^2}$ is

(a) 2 (b) 1/2

(c) 3/2 (d) cannot be determined

45. The set of all points for which $f(x) = |x|\ |x-1| + 1/[x+1]$ ($[x]$ is the greatest integer function) is continuous is

(a) **R** (b) **R** ~ **I**

(c) **R** ~ ($I \cup [-1, 0)$) (d) none of these

46. Let $f(x) = \begin{cases} \left(\left(e^{[x]} - e^{\{x\}}\right)e^{-x} + A\right) & , \quad x < 0 \\ \dfrac{2\sin\{x\}}{\tan\{x\}} & , \quad x > 0 \\ 2 & , \quad x = 0 \end{cases}$

The value of A so that f is continuous at $x = 0$ is ($[x]$ is greatest integer function and $\{x\}$ is the fractional part of x) is

(a) e^{-1} (b) $3 - e^{-1}$

(c) $2 - e^{-1}$ (d) 2

47. If $\lim\limits_{x\to 0}\left(\dfrac{\sin 2x}{x^3} + a + \dfrac{b}{x^2}\right) = 0$ then the value of $3a + b$ is

(a) 2 (b) – 2

(c) – 1 (d) 0

48. For continuous functions f and g on R, let $f(a) = 4$, $f'(a) = 6$, $g(a) = 2$, $g'(a) = 1$. Then the value of

$$\lim_{x\to a} \frac{\sqrt{f(x)\,g(a)} - \sqrt{g(x)\,f(a)}}{(x-a)\left(\sqrt{f(x)\,g(a)} + \sqrt{g(x)\,f(a)}\right)}$$

(a) 0 (b) 3

(c) 1/4 (d) 2/3

49. Let $f(x) = \begin{cases} \dfrac{\sqrt{1+ax} - \sqrt{1-ax}}{x} & , -1 \le x < 0 \\ \dfrac{2x+1}{x-2} & , 0 \le x \le 1 \end{cases}$

The value of a so f is continuous on [– 1, 1] is

(a) 1/2 (b) –1/2

(c) 1 (d) – 1

Assertion-Reason Type Questions

50. Let $f(x) = \dfrac{\sqrt[n]{x} - 1}{\sqrt[m]{x} - 1}$, $x \ne 1$, and $g(x) = \dfrac{\sin mx}{\sin nx}$, $x \ne 0$ and $n \ne m$.

Statement-1: $\lim\limits_{x\to 1} f(x) = \lim\limits_{x\to 0} g(x)$

Statement-2: Both the limits are equal to $\dfrac{n}{m}$

51. Let $f(x) = \dfrac{\cos x - \sin x}{\cos 2x}$, $x \ne \dfrac{\pi}{4}$.

Statement-1: The value of $f\left(\dfrac{\pi}{4}\right)$ so that f is a continuous is $\dfrac{1}{\sqrt{2}}$

Statement-2: $f(x) = \dfrac{1}{\sqrt{2}} \dfrac{1}{\sin\left(x + \dfrac{\pi}{4}\right)}$

52. Let $f(x) = \dfrac{(x+1)^{10} + (x+2)^{10} \cdots + (x+50)^{10}}{x^{10} + 10^{10}}$

Statement-1: $\lim\limits_{x\to\infty} f(x) = 10$

Statement-2: $f(x) =$

$$\sum_{r=1}^{10} \sum_{\alpha=1}^{50} {}^{10}C_r x^{r-10} \alpha^{10-r} \left(1 + \left(\frac{10}{x}\right)^{10}\right)^{-1}$$

53. Let $f(x) = x$ if x is rational and $f(x) = 1 - x$ if x is irrational

Statement-1: f is discontinuous on [0, 1]

Statement-2: f satisfies the intermediate value property.

54. Let f be a continuous function satisfying $f\left(\dfrac{x+y}{2}\right) = \dfrac{f(x) + f(y)}{2}$, $f(0) = 0$, $f(1) = 1$

Statement-1: There is only one function satisfying the above conditions.

Statement-2: A continuous function satisfying $f(x + y) = f(x) + f(y)$ is of the form $f(x) = \alpha x$.

55. **Statement-1:** $\lim\limits_{x\to 0} \cos^{-1}\{x\}$ does not exist, $\{x\}$being the fractional part of x

Statement-2: $\{x\}$ is discontinuous

56. **Statement-1:** The functions $|x^2 + e^x - \log x|$, $x^2 + e^x - \log x$ are continuous functions

Statement-2: Continuity of $|f|$ implies the continuity of f

57. **Statement-1:** If $|f(x)| \le |x|$ for all $x \in$ **R** then $|f|$ is continuous at $x = 0$

Statement-2: If f is continuous then $|f|$ is also continuous

58. **Statement-1:** $f(x) = \cos x + 2[x]$ is discontinuous at $x = 0$, where $[x]$ denotes the greatest integer $\le x$.

Statement-2: If $u(x)$ is continuous and $v(x)$ is discontinuous at $x = a$ then $u(x) + v(x)$ is discontinuous at $x = a$

59. **Statement-1:** $f(x) = \{\sin x\} - \{\cos x\}$ is discontinuous at $x = \pi/2$, $\{x\}$ is the fractional part of x.

Statement-2: Sum of two discontinuous function is a discontinuous function

60. **Statement-1:** $\lim\limits_{x\to 0} [x]^2 \left\{\dfrac{e^{1/x}-1}{e^{1/x}+1}\right\}$ does not exist

Statement-2: $\lim\limits_{x\to 0+} \left\{\dfrac{e^{1/x}-1}{e^{1/x}+1}\right\} = \lim\limits_{x\to 0+} [x]^2 \left\{\dfrac{e^{1/x}-1}{e^{1/x}+1}\right\}$

LEVEL 2

Straight Objective Type Questions

61. If α and β are the roots of $ax^2 + bx + c = 0$, $c \neq 0$ then

$$\lim_{x\to 1/\alpha} \sqrt{\frac{1-\cos\left(cx^2+bx+a\right)}{2(1-\alpha x)^2}} \text{ is}$$

(a) $c(a - b)$ (b) $\dfrac{c}{2\alpha}\left(\dfrac{1}{\alpha}-\dfrac{1}{\beta}\right)$

(c) $\dfrac{1}{\beta}\left(\dfrac{1}{\alpha}-\dfrac{1}{\beta}\right)$ (d) $\left|\left(\dfrac{1}{\alpha}-\dfrac{1}{\beta}\right)\dfrac{c}{2\alpha}\right|$

62. Let f be a continuous function satisfying $f(x)\, f(y) = f(x) + f(y) + f(xy) - 2$ for all $x, y \in \mathbf{R}$ and $f(2) = 5$ then $\lim\limits_{x\to 4} f(x)$ is

(a) 5 (b) 17

(c) – 5 (d) 21

63. The value of $\lim\limits_{x\to\infty} \dfrac{e^{1/x}-e^{-1/x}}{e^{1/x}+e^{-1/x}} \tan(1/x)$ is

(a) 1 (b) 0

(c) – 1 (d) none of these

64. Let f be a continuous function satisfying $f(x + y) = f(x) + f(y)$ for all $x, y \in \mathbf{R}$ and $f(1) = 5$ then $\lim\limits_{x\to 4} f(x)$ is equal to

(a) 4 (b) 80

(c) 0 (d) none of these

65. Let $f(x) = e^x \operatorname{sgn}(x + [x])$, where sgn is the signum function and $[x]$ is the greatest integer function. Then

(a) $\lim\limits_{x\to 0+} f(x) = 0$ (b) $\lim\limits_{x\to 0+} f(x) = -1$

(c) $\lim\limits_{x\to 0+} f(x) = 1$ (d) $\lim\limits_{x\to 0-} f(x) = 1$

66. The value of $\lim\limits_{x\to -4} \dfrac{\tan \pi x}{x+4} + \lim\limits_{x\to\infty} (1 + 1/x^2)^x$ is

(a) greater than 3 (b) less than 2

(c) equal to 0 (d) equal to 1

67. The value of $\lim\limits_{x\to 0}\left(\dfrac{\sin x}{x}\right)^{\frac{\sin x}{x-\sin x}}$ is

(a) e (b) 1

(c) e^2 (d) $1/e$

68. $\lim\limits_{x\to 0} \dfrac{(\sin x-\tan x)^2+(1-\cos 2x)^4+x^5}{7\tan^7 x+\sin^6 x+2\sin^5 x}$ is equal to

(a) 0 (b) 1

(c) 1/2 (d) 2

69. Let $f(x) = x - 1$ and $g(x) = 1/x$. Then the set of points where go*f og* is continuous is

(a) $\mathbf{R} \sim \{0\}$ (b) $\mathbf{R} \sim \{1\}$

(c) $(-\infty, \infty)$ (d) $(-\infty, \infty) \sim \{0, 1\}$

70. Let $f(x) = \lim\limits_{n\to\infty} \dfrac{\left[x^2\right]+\left[(2x)^2\right]+\cdots+\left[(nx)^2\right]}{n^3}$ then the set of all points of continuity of f ([x] denotes the greatest integer function)

(a) $(-\infty, \infty) \sim \{0\}$ (b) $(-\infty, \infty) \sim \mathbf{I}$

(c) $(-\infty, \infty)$ (d) $(-\infty, \infty) \sim \{0, 1\}$

71. Let $f(x) = \begin{cases} 1 & x \text{ is rational} \\ 0 & x \text{ is irrational} \end{cases}$, then

(a) f is discontinuous for every real x

(b) f is continuous on $\mathbf{R}$

(c) f is continuous at the points where x is rational

(d) f is continuous at the points where x is irrational.

72. Let f: $\mathbf{R} \to \mathbf{R}$ be defined by

$$f(x) = \begin{cases} x, & x \text{ irrational} \\ 1-x, & x \text{ is rational} \end{cases}$$

then f is

(a) discontinuous at $x = 1/2$
(b) continuous at $x = 1/2$
(c) continuous everywhere
(d) discontinuous everywhere

73. Let f: $\mathbf{R} \to \mathbf{R}$ be any function. Define g: $\mathbf{R} \to \mathbf{R}$ by $g(x) = |f(x)|$ for all x. Then g is
(a) one-one if f is one-one
(b) discontinuous if f is discontinuous
(c) continuous if f is continuous
(d) onto if f is onto

74. Let f be a function defined on $\mathbf{R}$ by

$$f(x) = \lim_{n\to\infty} \frac{\log(3+x) - x^{2n}\sin x}{1+x^{2n}} \text{ then}$$

(a) f is continuous on $\mathbf{R}$
(b) f is continuous on $\mathbf{R} \sim \{-1, 1\}$
(c) f is continuous on $\mathbf{R} \sim \{0\}$
(d) none of these

75. If $f(x) = \left(\dfrac{x^2+5x+3}{x^2+x+2}\right)^x$, then $\lim\limits_{x\to\infty} f(x)$ is

(a) e^4	(b) e^3
(c) e^2	(d) 2^4

76. Let $f(x)$ be defined for all $x > 0$ and be continuous. Let $f(x)$ satisfy $f\left(\dfrac{x}{y}\right) = f(x) - f(y)$ for all x, y and $f(e) = 1$, then
(a) f is bounded
(b) $f(1/x) \to 0$ as $x \to 0$
(c) $x f(x) \to 1$ as $x \to 0$
(d) $f(x) = \log x$

77. Given the function $f(x) = 1/(1-x)$, the numbers of discontinuities of $f^{3n} = f \circ f \ldots of$ ($3n$ times) is

(a) 1	(b) 2
(c) 3	(d) infinite

78. If $f(x) = \dfrac{1+\sin x - \cos x}{1-\sin x - \cos x}$, $x \neq 0$. The value of $f(0)$ so that f is a continuous function is

(a) 1	(b) -2
(c) -1	(d) 2

79. If $f(x) = \begin{cases} ax+1 & , x \le \pi/2 \\ \sin x + b & , x > \pi/2 \end{cases}$ is continuous then

(a) $a = 1, b = 0$	(b) $a = b\dfrac{\pi}{2} + 1$
(c) $b = a\dfrac{\pi}{2}$	(d) $a = b = \pi/2$

80. Let $f(x) = \begin{cases} \dfrac{x^3+x^2-16x+20}{(x-2)^2} & , \text{if } x \neq 2 \\ K & , \text{if } x = 2 \end{cases}$

then the value of K so that f is a continuous function is

(a) 5	(b) 7
(c) 6	(d) 4

81. If $f(x) = \begin{cases} \dfrac{2^{x+2}-16}{4^x-16} & , \text{if } x \neq 2 \\ A & , \text{if } x = 2 \end{cases}$

then the value of A so that f is continuous is

(a) 1/2	(b) 1
(c) 2	(d) e

82. If the function $f(x) = \dfrac{\cos^2 x - \sin^2 x - 1}{\sqrt{x^2+1}-1}$ is continuous at $x = 0$ then $f(0)$ is equal to

(a) -2	(b) -1
(c) 0	(d) -4

83. If a and b are positive integers then

(a) $\lim\limits_{x\to 0+} \dfrac{x}{a}\left[\dfrac{b}{x}\right] = \dfrac{a}{b}$	(b) $\lim\limits_{x\to 0+} \dfrac{x}{a}\left[\dfrac{b}{x}\right] = ab$
(c) $\lim\limits_{x\to 0+} \dfrac{a}{x}\left[\dfrac{x}{b}\right] = \dfrac{b}{a}$	(d) $\lim\limits_{x\to 0+} \dfrac{x}{a}\left[\dfrac{b}{x}\right] = \dfrac{b}{a}$

84. Let $f(x) = \dfrac{\tan\left[e^2\right]x^2 - \tan\left[-e^2\right]x^2}{\sin^2 x}$ $x \neq 0$. Then the value of $f(0)$ so that f is a continuous function is

(a) 15	(b) 10
(c) 7	(d) 8

85. The value of $f(0)$ so that the function $f(x) = \dfrac{\cos ax - \cos bx}{x^2}$, $x \neq 0$ is continuous is given by

(a) $a - b$	(b) $a^2 - b^2$
(c) $\dfrac{b^2-a^2}{2}$	(d) $\dfrac{a^2+b^2}{2}$

Previous Years' AIEEE/JEE Main Questions

1. f is defined on $[-5, 5]$ as $f(x) = \begin{cases} x \text{ if } x \text{ is rational} \\ -x \text{ if } x \text{ is irrational} \end{cases}$
   - (a) $f(x)$ is continuous at every x, except $x = 0$
   - (b) $f(x)$ is discontinuous at every x, except $x = 0$
   - (c) $f(x)$ is continuous everywhere
   - (d) $f(x)$ is discontinuous everywhere **[2002]**

2. $\lim\limits_{x \to 0} \dfrac{\sqrt{1-\cos 2x}}{\sqrt{2}x}$ is
   - (a) 1 (b) -1
   - (c) 0 (d) does not exist **[2002]**

3. $\lim\limits_{x \to \infty} \left(\dfrac{x^2+5x+3}{x^2+x+3}\right)^x$
   - (a) e^4 (b) e^2
   - (c) e^3 (d) e **[2003]**

4. If $\lim\limits_{x \to 0} \dfrac{\log(3+x)-\log(3-x)}{x} = k$, the value of k is
   - (a) $-\dfrac{1}{3}$ (b) $\dfrac{2}{3}$
   - (c) $-\dfrac{2}{3}$ (d) 0 **[2003]**

5. $\lim\limits_{x \to \frac{\pi}{2}} \dfrac{\left(1-\tan\dfrac{x}{2}\right)(1-\sin x)}{\left(1+\tan\dfrac{x}{2}\right)(\pi-2x)^3}$ is
   - (a) 0 (b) $\dfrac{1}{32}$
   - (c) ∞ (d) $\dfrac{1}{8}$ **[2003]**

6. If $\lim\limits_{x \to \infty} \left(1+\dfrac{a}{x}+\dfrac{b}{x^2}\right)^{2x} = e^2$, then the values of a and b are
   - (a) $a \in \mathbf{R}, b = 2$ (b) $a = 1, b \in \mathbf{R}$
   - (c) $a \in \mathbf{R}, b \in \mathbf{R}$ (d) $a = 1$ and $b = 2$ **[2004]**

7. Let $f(x) = \dfrac{1-\tan x}{4x-\pi}, x \neq \dfrac{\pi}{4}, x \in \left[0, \dfrac{\pi}{4}\right]$. If $f(x)$ is continuous in $\left[0, \dfrac{\pi}{2}\right]$ then $f\left(\dfrac{\pi}{4}\right)$ is
   - (a) $-\dfrac{1}{2}$ (b) $\dfrac{1}{2}$
   - (c) 1 (d) -1 **[2004]**

8. Let α and β be the distinct roots of $ax^2 + bx + c = 0$, then $\lim\limits_{x \to \alpha} \dfrac{1-\cos(ax^2+bx+c)}{(x-\alpha)^2}$ is equal to
   - (a) $-\dfrac{a^2}{2}(\alpha-\beta)^2$ (b) $\dfrac{1}{2}(\alpha-\beta)^2$
   - (c) $\dfrac{a^2}{2}(\alpha-\beta)^2$ (d) 0 **[2005]**

9. The function $f : \mathbf{R} \sim \{0\} \to \mathbf{R}$ given by $f(x) = \dfrac{1}{x} - \dfrac{2}{e^{2x}-1}$ can be made continuous at $x = 0$ by defining $f(0)$ as
   - (a) 2 (b) -1
   - (c) 0 (d) 1 **[2007]**

10. Let f: $R \to R$ be a positive increasing function with $\lim\limits_{x\to\infty} \dfrac{f(3x)}{f(x)} = 1$. Then $\lim\limits_{x\to\infty} \dfrac{f(2x)}{f(x)}$
    - (a) 3/2 (b) 3
    - (c) 1 (d) 2/3 **[2010]**

11. The values of p and q for which function

$$f(x) = \begin{cases} \dfrac{\sin(p+1)x+\sin x}{x} & , x < 0 \\ q & , x = 0 \\ \dfrac{\sqrt{x+x^2}-\sqrt{x}}{x^{3/2}} & , x > 0 \end{cases}$$

is continuous for all x in $\mathbf{R}$, are:
   - (a) $p = \dfrac{1}{2}, \ q = \dfrac{3}{2}$ (b) $p = \dfrac{1}{2}, \ q = -\dfrac{3}{2}$
   - (c) $p = \dfrac{5}{2}, \ q = \dfrac{1}{2}$ (d) $p = -\dfrac{3}{2}, \ q = \dfrac{1}{2}$

[2011]

12. Let $f : \mathbf{R} \to [0, \infty)$ be such that $\lim\limits_{x\to5} f(x)$ exists and $\lim\limits_{x\to5} \dfrac{(f(x))^2-9}{\sqrt{|x-5|}} = 0$. Then $\lim\limits_{x\to5} f(x)$ equals.
    - (a) 0 (b) 1
    - (c) 2 (d) 3 **[2011]**

13. Define F(x) as the product of two real functions $f_1(x)$ $= x$, $x \in \mathbf{R}$, and $f_2(x) = \begin{cases} \sin 1/x & , x \neq 0 \\ 0 & , x = 0 \end{cases}$ as follows:

$$F(x) = \begin{cases} f_1(x).f_2(x) & \text{, if } x \neq 0 \\ 0 & \text{, if } x = 0 \end{cases}$$

Statement-1: F(x) is continuous on **R**.
Statement-2: $f_1(x)$ and $f_2(x)$ are continuous on **R**. **[2011]**

14. $\lim\limits_{x \to 2} \dfrac{\sqrt{1 - \cos 2(x-2)}}{x - 2}$

(a) equals $\dfrac{1}{\sqrt{2}}$ (b) does not exist
(c) equals $\sqrt{2}$ (d) equals $-\sqrt{2}$ **[2011]**

15. If f: **R** → **R** is function defined by $f(x) = [x] \cos \dfrac{2x-1}{2}\pi$ whose $[x]$ denotes the greatest integer function, then f is:
(a) discontinuous only at $x = 0$.
(b) discontinuous only at non-zero integral value of x.
(c) continuous only at $x = 0$.
(d) continuous for every real x. **[2012]**

16. $\lim\limits_{x \to 0} \dfrac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x}$ is equal to
(a) 1/2 (b) 1
(c) 2 (d) – 1/4 **[2013]**

17. If the function

$$f(x) = \begin{cases} \dfrac{\sqrt{2 + \cos x} - 1}{(\pi - x)^2} & , \quad x \neq \pi \\ k & , \quad x = \pi \end{cases}$$

is continuous at $x = \pi$ then k equals
(a) 2 (b) 1/4
(c) 1/2 (d) 0 **[2014, online]**

18. $\lim\limits_{x \to 0} \dfrac{\sin(\pi \cos^2 x)}{x^2}$ is equal to
(a) $\pi/2$ (b) 1
(c) $-\pi$ (d) π **[2014]**

19. If $f(x)$ is continuous and $f\left(\dfrac{9}{2}\right) = \dfrac{2}{9}$, then $\lim\limits_{x \to 0} f\left(\dfrac{1 - \cos 3x}{x^2}\right)$ is equal to

(a) $\dfrac{9}{2}$ (b) $\dfrac{2}{9}$
(c) 0 (d) $\dfrac{8}{9}$ **[2014, online]**

20. If $\lim\limits_{x \to 2} \dfrac{\tan(x-2)\{x^2 + (k-2)x - 2x\}}{x^2 - 4x + 4} = 5$, then k is equal to
(a) 0 (b) 1
(c) 2 (d) 3 **[2014, online]**

21. If $\lim\limits_{x \to \infty} \dfrac{e^{x^2} - \cos x}{\sin^2 x}$ is equal to

(a) 3 (b) $\dfrac{3}{2}$
(c) $\dfrac{5}{4}$ (d) 2 **[2015]**

22. If $\lim\limits_{x \to 0} \dfrac{(1 - \cos 2x)(3 + \cos x)}{x \tan 4x}$ is equal to
(a) 4 (b) 3
(c) 2 (d) $\dfrac{1}{2}$ **[2015]**

23. Let k be a non-zero real number. If

$$f(x) = \begin{cases} \dfrac{(e^x - 1)^2}{\sin\left(\dfrac{x}{k}\right)\log\left(1 + \dfrac{x}{4}\right)} & , x \neq 0 \\ 12 & , x = 0 \end{cases}$$

is a continuous function, then the value of k is
(a) 1 (b) 2
(c) 3 (d) 4 **[2015]**

24. Let $p = \lim\limits_{x \to 0+} \left(1 + \tan^2 \sqrt{x}\right)^{\frac{1}{2x}}$, then $\log p$ is equal to
(a) 2 (b) 1
(c) $\dfrac{1}{2}$ (d) $\dfrac{1}{4}$. **[2016]**

25. If $\lim\limits_{x \to \infty} \left(1 + \dfrac{a}{x} - \dfrac{4}{x^2}\right)^{2x} = e^3$. Then a is equal to

(a) 2 (b) $\dfrac{3}{2}$
(c) $\dfrac{1}{2}$ (d) $\dfrac{2}{3}$ **[2016, online]**

26. Let $a, b \in \mathbf{R}(a \neq 0)$. If the function f defined as

$$f(x) = \begin{cases} \dfrac{2x^2}{a}, & 0 \le x < 1 \\ a, & 1 \le x < \sqrt{2} \\ \dfrac{2b^2 - 4b}{x^3} & \sqrt{2} \le x < \infty \end{cases}$$

is continuous in the interval $[a, \infty)$, then an ordered pair (a, b) is
(a) $\left(-\sqrt{2}, 1 - \sqrt{3}\right)$ (b) $\left(\sqrt{2}, -1 + \sqrt{3}\right)$

(c) $\left(\sqrt{2}, 1-\sqrt{3}\right)$ (d) $\left(-\sqrt{2}, 1+\sqrt{3}\right)$

[2016, online]

27. $L = \lim\limits_{x\to 0} \dfrac{(1-\cos 2x)^2}{2x\tan x - x\tan 2x}$ is

(a) 2 (b) $-\dfrac{1}{2}$

(c) –2 (d) $\dfrac{1}{2}$ **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. If $\lim\limits_{x\to c}\left(\dfrac{f(x)}{g(x)}\right)$ exists, then

(a) $\lim\limits_{x\to c} f(x)$ exist

(b) neither $\lim\limits_{x\to c} f(x)$ nor $\lim\limits_{x\to c} g(x)$ may exist

(c) $\lim\limits_{x\to c} g(x)$ exist

(d) both $\lim\limits_{x\to c} f(x)$ and $\lim\limits_{x\to c} g(x)$ must exist **[2006]**

2. Let $f : (-\infty, \infty) \to (-\infty, \infty)$ be such that $f(.)$ is continuous at 0 and let

$$f\left(\frac{x+y}{2}\right) = \frac{f(x)+f(y)}{2} \text{ for } x, y \in (-\infty, \infty)$$

Statement-1: $f(.)$ is continuous at every point on $(-\infty, \infty)$

Statement-2: $2f(x+h) + f(0) = 2f(x) + f(2h)$ for $x, h \in (-\infty, \infty)$ **[2008]**

3. **Statement-1:** $\lim\limits_{x\to 1} \sin\dfrac{\pi}{4}\left(\dfrac{x|x|-1}{|x|-1}\right)$ exists

Statement-2: $\lim\limits_{x\to 1} \tan\dfrac{\pi}{4}\left(\dfrac{x|x|-1}{|x|-1}\right)$ exists **[2009]**

4. Let $f : \mathbf{R} \to \left(\dfrac{-1}{2}, \dfrac{1}{2}\right)$ be an odd function such that $\lim\limits_{x\to 0} f(x)$ exists. Then, $\lim\limits_{x\to 0} \dfrac{1}{2f(x)-1}$ equals

(a) 0 (b) $\dfrac{1}{2}$

(c) 2 (d) – 1 **[2010]**

5. The values of α and β such that

$$\lim_{x\to\infty}\left[\frac{x^2+1}{x-1} - \alpha x - 2\beta\right] = \frac{3}{2} \text{ are}$$

(a) $\alpha = -1, \beta = \dfrac{3}{4}$ (b) $\alpha = 1, \beta = -\dfrac{1}{4}$

(c) $\alpha = -1, \beta = \dfrac{5}{4}$ (d) $\alpha = 1, \beta = \dfrac{-3}{4}$ **[2011]**

6. Let $f(x) = |x| + [x-1]$, where [.] is greatest integer function, then $f(x)$ is

(a) continuous at $x = 0$ as well as at $x = 1$

(b) continuous at $x = 0$ but not at $x = 1$

(c) continuous at $x = 1$ but not at $x = 0$

(d) neither continuous at $x = 0$ or nor at $x = 1$ **[2012]**

7. If for some real number a, $\lim\limits_{x\to 0} \dfrac{\sin 2x + a\sin x}{x^3}$ exists, then the limit is equal to

(a) – 2 (b) – 1

(c) 1 (d) 2 **[2013]**

8. If $f(x) = \begin{vmatrix} \sin x & \cos x & \tan x \\ x^3 & x^2 & x \\ 2x & 1 & 1 \end{vmatrix}$, then $\lim\limits_{x\to 0} \dfrac{f(x)}{x^2}$ is

(a) 1 (b) – 1

(c) 0 (d) 2 **[2015]**

9. Let $f(x) = [x]$ where $[x]$ be the greatest integer less than or equal to x.

$$g(x) = \begin{cases} 0, & x \in \mathbf{Z} \\ x^2, & x \in \mathbf{R}-\mathbf{Z} \end{cases}$$

z is the set of integers, $\phi(x) = fog(x)$ and $\psi(x) = gof(x)$. Then on the set $\mathbf{R}-\mathbf{Z}$.

(a) both ϕ and ψ are continuous

(b) neither ϕ nor ψ is continuous.

(c) ϕ is continuous and ψ is not continuous.

(d) ψ is continuous and ϕ is not continuous **[2015]**

10. $\lim_{x\to 1}((1-x)+[x-1]+|1-x|)$, where $[x]$ denotes the greatest integer less than or equal to x
    (a) is equal to 0 (b) is equal to 1
    (c) does not exist (d) is equal to –1

[2016]

Hints and Solutions

Concept-based

1. $\frac{1}{n^2}\ (1+2\cdots+n)=\frac{n(n+1)}{2n^2}=\frac{1}{2}\left(1+\frac{1}{n}\right)$

so $\lim_{n\to\infty}\frac{1}{n^2}\ (1+2+\cdots+n)=\frac{1}{2}$

2. $\frac{1}{1.2}+\frac{1}{2.3}+\cdots+\frac{1}{(n-1)n}=\sum_{k=2}^{n}\frac{1}{(k-1)k}$

$$=\sum_{k=2}^{n}\left[\frac{1}{k-1}-\frac{1}{k}\right]=1-\frac{1}{n}$$

so $\lim_{n\to\infty}\left[\frac{1}{1.2}+\frac{1}{2.3}+\cdots+\frac{1}{(n-1)n}\right]=1$

3. $\lim_{x\to 1}\frac{x^m-1}{x^n-1}=\lim_{x\to 1}\frac{mx^{m-1}}{nx^{n-1}}=\frac{m}{n}$

4. If $n>m$, then $\frac{\sin\alpha^n}{(\sin\alpha)^m}=\frac{\sin\alpha^n}{\alpha^n}\cdot\frac{\alpha^n}{\alpha^m}\left(\frac{\alpha}{\sin\alpha}\right)^m$

$$=\frac{\sin\alpha^n}{\alpha^n}\cdot\alpha^{n-m}\left(\frac{\alpha}{\sin\alpha}\right)^m$$

$\Rightarrow \lim_{\alpha\to 0}\frac{\sin\alpha^n}{(\sin\alpha)^m}=0$

5. $\lim_{x\to\infty}\left(1+\frac{k}{x}\right)^{mx}=\lim_{k\to\infty}\left(1+\frac{k}{x}\right)^{\frac{x}{k}\cdot mk}=e^{mk}$

6. $\frac{x-[x]}{x-2}=1$ for $2<x<3$

So $b=\lim_{x\to 2+}f(x)=1$. For $1<x<2$, $\frac{a|x^2-x-2|}{-(x^2-x-2)}$

$=\frac{a|x-2||x+1|}{-(x-2)(x+1)}=\frac{-a(x-2)(x+1)}{-(x-2)(x+1)}=a$

For f to be continuous $a = b = 1$

7. $x^4 + 4x^3 + 8x^2 + 8x + 4 = (x^2 + 2x + 2)^2$ and $x^2 + x + 2 = (x + 1)^2 + 1$ so $x^4 + 4x^3 + 8x^2 + 8x + 4 \neq 0$ for any x. Hence f is a continuous function

8. $f(1) = a - b$ and $\lim\limits_{x\to 1} 3x = 3$ so for f to be continuous $a - b = 3$. Also $f(2) = 4b - a$, so $\lim\limits_{x\to 2-} f(x) = \lim\limits_{x\to 2-} 3x = 6$. Thus $4b - a = 6$ solving, we have $a = 6$, $b = 3$.

9. $f(\pi/2) = a\left(\pi\left[\dfrac{\pi}{2}\right] - 1\right) = a\,(\pi - 1)$

$$\lim_{x\to\pi/2-} f(x) = \lim_{x\to\pi/2-} \cos^{-1}(\cot x) = \frac{\pi}{2}$$

$\phi\iota\ a\,(\pi - 1) = \dfrac{\pi}{2}$.

10. For $x \neq 0$, $\dfrac{\sin 4x}{\log(1+3x)} = \dfrac{\sin 4x}{4x} \times \dfrac{4}{3} \times \dfrac{3x}{\log(1+3x)}$

so $A + 1 = \lim\limits_{x\to 0} \dfrac{\sin 4x}{\log(1+3x)} = \dfrac{4}{3} \Rightarrow A = \dfrac{1}{3}$

Level 1

11. $x\left(\tan^{-1}\dfrac{x+1}{x+2} - \tan^{-1}\dfrac{x}{x+2}\right)$

$$= x\tan^{1}\frac{\frac{x+1}{x+2}\quad\frac{x}{x+2}}{1+\frac{x(x+1)}{(x+2)^2}}$$

$$= x\tan^{-1}\frac{x+2}{2x^2+5x+4}$$

$$= x\left(\tan^{-1}\frac{\frac{1}{x}+\frac{2}{x^2}}{2+\frac{5}{x}+\frac{4}{x^2}}\right)$$

$$= \frac{\tan^{-1}u}{u}\cdot\frac{1+\frac{2}{x}}{2+\frac{5}{x}+\frac{4}{x^2}},\quad u = \frac{\frac{1}{x}+\frac{2}{x^2}}{2+\frac{5}{x}+\frac{4}{x^2}}$$

$$\to \frac{1}{2} \text{ as } x \to \infty.$$

12. $\left(1+\tan^2\sqrt{x}\right)^{\frac{1}{2x}} = \left(1+\tan^2\sqrt{x}\right)^{\left(\frac{1}{\tan^2\sqrt{x}}\right)\cdot\left(\frac{\tan\sqrt{x}}{\sqrt{x}}\right)^2\frac{1}{2}}$

$$\to e^{1/2} \text{ as } x \to 0$$

13. $f(x) = \dfrac{-2\cos a\cos x\cos(a+x)\cos(a-x)}{\sin 2x}$ so $\lim\limits_{x\to 0} f(x)$ does not exist.

14. Required limit $= \lim\limits_{x\to\frac{\pi}{6}} \dfrac{\cos\left(x-\frac{\pi}{6}\right)}{\sin x} = 2$.

15. The limit does not exist.

16. $x + 2x^2 - 1 \le \dfrac{f(x)}{x} \le x^4 - 2x^2 - 1$ so $\lim\limits_{x\to 0}\dfrac{f(x)}{x} = -1$

(Sandwich Theorem)

17. $\lim\limits_{x\to 0-} f(x) = \lim\limits_{x\to 0-}\dfrac{\sin^{-1}(x-1)}{-1} = \dfrac{\pi}{2}$.

$\lim\limits_{x\to 0+} f(x) = 0$.

18. If $x \in n \in \mathbf{I}$, $f(n) = n\cos\dfrac{2n-1}{2}\pi = 0$.

$$\lim_{x\to n+} f(x) = \lim_{x\to n+} n\cos\frac{2x-1}{2}\pi = 0 = \lim_{x\to n-} f(x)$$

If $x \notin \mathbf{I}$, then $[u]$ is a continuous at x and $\cos\dfrac{2u-1}{2}\pi$ is also continuous. Hence f is a continuous function.

19. $f(a) = \lim\limits_{y\to a}\sin\dfrac{(y-a)}{2}\tan\dfrac{\pi}{2}\dfrac{y}{a}$

$$= \lim_{y\to a}\frac{\sin\frac{y-a}{2}}{\cot\frac{\pi}{2}\frac{y}{a}}\left(\frac{0}{0}\text{ form}\right)$$

$$= \lim_{y\to a}\frac{\left(\frac{1}{2}\right)\cos\frac{y-a}{2}}{\left(-\frac{\pi}{2a}\right)\operatorname{cosec}^2\frac{\pi}{2}\frac{y}{a}} = -\frac{a}{\pi}.$$

20. $f(0) = \lim\limits_{x\to 0}(1+\sin x)^{\frac{1}{\sin x}} = e$

21. $2 = f(1) = \lim\limits_{x\to 1+}(3 - ax^2) = 3 - a \Rightarrow a = 1$.

22. f is discontinuous at x for which $x^2 + 1 \in \mathbf{I}$. For $x \in (1, 3)$ we have $x^2 + 1 \in (2, 10)$ so there are seven values. f is clearly continuous from right at 1 but discontinuous from left at 3.

23. $u = \sqrt{x}$, $v = \left(\dfrac{1}{2}\right) - \cos^2 x$ are continuous for $x > 0$.

24. f is not defined for $x \in \mathbf{I}$.

25. $f\left(\frac{1}{2}\right) = \lim\limits_{x \to \frac{1}{2}+} f(x) = \lim\limits_{x \to \frac{1}{2}-} f(x)$ so f is continuous only at $x = \frac{1}{2}$.

26. $\dfrac{x \tan 2x - 2x \tan x}{(1 - \cos 2x)^2}$

$$= \frac{1}{4} x \left[\frac{2 \tan x}{1 - \tan^2 x} - 2 \tan x\right] \frac{1}{\sin^4 x}$$

$$= \frac{1}{4} \frac{2x \tan^3 x}{1 - \tan^2 x} \frac{1}{\sin^4 x} = \frac{1}{2} \frac{\left(\frac{\tan x}{x}\right)^3}{1 - \tan^2 x} \cdot \frac{1}{\left(\frac{(\sin x)}{x}\right)^4}$$

So the required limit = $\frac{1}{2} \cdot \frac{1}{1 - 0} \cdot \frac{1}{1} = \frac{1}{2}$

27. $f(x) = \dfrac{\sqrt{2}\,|\sin(x-2)|}{(x-2)}$ so $\lim\limits_{x \to 2+} f(x) = 1$

and $\lim\limits_{x \to 2-} f(x) = -1$.

28. $f(x) = \frac{1}{x}\left[(1+x)^{1/2} - (1+x)^{1/3}\right]$

$$= \frac{1}{x}\left[\left(1 + \left(\frac{1}{2}\right)x + 0(x^2)\right) - \left(1 + \left(\frac{1}{3}\right)x + 0(x^2)\right)^2\right]$$

$$= \frac{1}{x}\left[\left(\frac{1}{6}\right)x + 0(x^2)\right] = \frac{1}{6} + 0(x) \cdot$$

$\lim\limits_{x \to 0} f(x) = \frac{1}{6}$.

29. $x = 0$ is the only discontinuity of f. $f \circ f(x) = f(x)$, $f \circ f \circ f(x) = f(x)$ so $f \circ f \circ f$ is continuous on **R** ~ {0}.

30. $x^3 + 6x^2 + 11x + 6 = (x + 1)(x + 2)(x + 3)$. Thus, f is discontinuous at $x = -1, -2, -3$.

31. $f(x) = x$, $f(x) = -x$, $f(x) = \begin{cases} x\ , & x \ge 0 \\ -x\ , & x < 0 \end{cases}$

$f(x) = \begin{cases} -x\ , & x \ge 0 \\ x\ , & x < 0 \end{cases}$.

32. $\dfrac{\sqrt{x^2+1} - 1}{\sqrt{x^2+16} - 4} = \dfrac{x^2\left(\sqrt{x^2+16} + 14\right)}{x^2\left(\sqrt{x^2+1} + 1\right)}$, for $x \ne 0$

So the required limit = $\frac{4+4}{1+1}$ = 4.

33. $\dfrac{\sqrt{x-b} - \sqrt{a-b}}{x^2 - a^2}$

$$= \frac{(x-b) - (a-b)}{(x-a)(x+a)} \frac{1}{\sqrt{x-b} + \sqrt{a-b}}$$

$$= \frac{1}{(x+a)\left(\sqrt{x-b} + \sqrt{x-a}\right)}$$

Required limit = $\dfrac{1}{2a.2\sqrt{a-b}} = \dfrac{1}{4a\sqrt{a-b}}$.

34. $\sqrt{x^2+1} - \sqrt{x^2-1} = \dfrac{2}{\sqrt{x^2+1} + \sqrt{x^2-1}}$

$$= \frac{2/x}{\sqrt{1 + \frac{1}{x^3}} + \sqrt{1 - \frac{1}{x^3}}} \to 0 \text{ as } x \to \infty$$

35. $x^{\frac{3}{2}}\left(\sqrt{x^3+1} - \sqrt{x^3-1}\right) = \dfrac{2x^{\frac{3}{2}}}{\sqrt{x^3+1} + \sqrt{x^3-1}}$

$$= \frac{2}{\sqrt{1 + \frac{1}{x^3}} + \sqrt{1 - \frac{1}{x^3}}} \to \frac{2}{1+1} = 1 \text{ as } x \to \infty$$

36. $f(x) = \dfrac{e\left(e^{x-1} - 1\right)}{x - 1}$ so $f(1) = e$.

37. $f(1) = 2a$, $\lim\limits_{x \to 1-} f(x) = a - b$ so $a + b = 0$ for f to be continuous at $x = 1$.

38. For $x \in (1, 2)$, $2 < 2x^3 < 16 \Rightarrow -4 < 2x^3 - 6 < 10$, $2x^3 - 6 = -3, -2, -1, 0, 1, 2, \ldots 9$. So there are 13 points at which the function f is discontinuous.

39. $f(x) = \begin{cases} 0 \text{ if } \left|\sin \frac{\pi}{2} x\right| < 1 \\ 1 \text{ if } \left|\sin \frac{\pi}{2} x\right| = 1 \end{cases}$.

$\left|\sin \frac{\pi}{2} x\right| = 1 \Rightarrow x = (2n + 1)$. So f is continuous on **R** ~ $\{(2n + 1) : n \in \mathbf{I}\}$.

40. $f(x) = \tan\left(\left(\frac{1}{2}\right)x - 1\right)$. For $x \in [0, \pi]$, $\left(\frac{1}{2}\right)x - 1 \in \left[-1, \frac{\pi}{2} - 1\right]$ so f is continuous $[0, \pi]$ but $\dfrac{1}{f(x)} = \dfrac{2}{x-2}$ which is not continuous at $x = 2 \in [0, \pi]$

41. $Ae^2 = \lim\limits_{x\to 0}\left(\dfrac{\cot x-1}{\cot x+1}\right)^{\frac{1}{x}}$

$$= \lim_{x\to 0}\left(1-\frac{2}{\cot x+1}\right)^{-\frac{\cot x+1}{2}\times\frac{-2\tan x}{1+\tan x}} = e^{-2}$$

42. $$f(x) = \begin{cases} -\dfrac{1}{x} & -1 \le x < -\dfrac{1}{2} \\ 0 & -\dfrac{1}{2} \le x < \dfrac{1}{2} \\ \dfrac{1}{x} & \dfrac{1}{2} \le x < \dfrac{3}{2} \\ \dfrac{2}{x} & \dfrac{3}{2} \le x \le 2 \end{cases}$$

43. Take $g = -f$, f any discontinuous function.

44. $$\frac{(1+x^2)^{\frac{1}{3}}-(1-2x)^{\frac{1}{4}}}{x+x^2}$$

$$= \frac{1+\frac{1}{3}x^2+0(x^4)-1+\frac{1}{2}x+0(x^2)}{x(x+1)}$$

$$= \frac{\frac{1}{2}+\text{terms containing } x}{x+1}$$

so the required limit is $\dfrac{1}{2}$.

45. Modulus function is continuous, $[x]$ is continuous on $\mathbf{R} \sim \mathbf{I}$ and $[x+1] = 0$ for $-1 \le x < 0$. So f is continuous on $\mathbf{R} \sim (\mathbf{I} \cup (-1, 0))$.

46. $f(0) = 2$ and $\lim\limits_{x\to 0-} f(x) = \lim\limits_{x\to\infty}\left(e^{[x]}-e^{\{x\}}\right)e^{-x}+\text{A})$
$= (e^{-1}-1) + \text{A}$

47. Required limit $= \lim\limits_{x\to 0}\dfrac{\sin 2x+ax^3+bx}{x^3}\left(\dfrac{0}{0}\right)$

$$= \lim_{x\to 0}\frac{2\cos 2x+3ax^2+b}{3x^2}$$

If this limit exists then, we must have b + 2 = 0
In this case the last limit is equal to
$\lim\limits_{x\to 0}\dfrac{-4\sin 2x+6ax}{6x^2} = -\dfrac{4}{3}+a$, so a $= \dfrac{4}{3}$.

48. Rationalize the numerator and apply $\dfrac{0}{0}$ form

49. $f(0) = -\dfrac{1}{2}$ and $\lim\limits_{x\to 0-} f(x) = a$

50. Use L' Hopital rule to calculate $\lim\limits_{x\to 1} f(x)$, the value of this limit is $\dfrac{m}{n}$. Also $\lim\limits_{x\to 0}\dfrac{\sin mx}{\sin nx} =$
$\lim\limits_{x\to 0}\dfrac{\sin mx}{mx}\times\dfrac{mx}{nx}\times\dfrac{nx}{\sin nx} = \dfrac{m}{n}$.

51. $f(x) = \dfrac{\cos x-\sin x}{\cos^2 x-\sin^2 x}$

$$= \frac{1}{\cos x+\sin x} = \frac{1}{\sqrt{2}}\times\frac{1}{\sin\left(x+\frac{\pi}{4}\right)}$$

52. $$f(x) = \frac{\left(1+\frac{1}{x}\right)^{10}+\left(1+\frac{2}{x}\right)^{10}+\cdots+\left(1+\frac{50}{x}\right)^{10}}{1+\left(\frac{10}{x}\right)^{10}}$$

so $\lim\limits_{x\to\infty} f(x) = \dfrac{1+\cdots+1}{1}$ (50 times) = 50.

53. f is discontinuous at every point of [0, 1] except at $x = 1/2$. Also f is a one-to-one mapping of [0, 1] onto [0, 1] and hence satisfies the intermediate value property.

54. $f\left(\dfrac{x}{2}\right) = f\left(\dfrac{x+0}{2}\right) = \dfrac{f(x)+f(0)}{2} = \dfrac{f(x)}{2}$

$\dfrac{f(x)+f(y)}{2} = f\left(\dfrac{x+y}{2}\right) = \dfrac{f(x+y)}{2}$

$\Rightarrow\ f(x)+f(y) = f(x+y)$
Using statement-2 we get $f(x) = \alpha x$ but $f(1) = 1$, so $f(x) = x$ is the only function satisfying the given conditions.

55. $\lim\limits_{x\to 0+}\cos^{-1}\{x\} = \cos^{-1} 0 = \dfrac{\pi}{2}$

$\lim\limits_{x\to 0-}\cos^{-1}\{x\} = \cos^{-1} = 0$

(Look at the graph of $\{x\}$)
$\{x\}$ is discontinuous at $x = n$, $n \in \mathbf{I}$
For $x \notin \mathbf{I}$ $\{x\}$ is continuous

56. $g(x) = x^2 + e^x - \log x$ is a continuous function and $u(x) = |x|$ is also continuous so $uog(x) = |x^2 + e^x - \log x|$ is a continuous function. However continuity of $|f|$ does not imply the continuity of f, e.g.
$f(x) = \begin{cases} 2 & x \ge 0 \\ -2 & x < 0 \end{cases}$ is not continuous at $x = 0$ but
$|f|(x) = 2$ for all x is continuous.

57. $|f(x)| \le |x|$ for all $x \in \mathbf{R} \Rightarrow 0 \le |f(0)| \le 0$
so $|f(0)| = 0$. Also

$0 \le \lim\limits_{x\to 0} |f|\,(x) \le \lim\limits_{x\to 0} |x| = 0$ i.e $\lim\limits_{x\to 0} |f|(x) = 0$

so $|f|$ is continuous. The statement-2 is also true but is not a correct explanation.

58. cos x is a continuous function and $[x]$ is discontinuous at $x = n \in \mathbf{I}$. By statement-2 $\cos x + 2[x]$ is discontinuous at $x = 0$. Statement-2 is true for if $u(x) + v(x)$ is continuous at $x = a$ then $v(x) = u(x) + v(x) - u(x)$ is continuous at $x = a$ which is a contradiction.

59. $\lim\limits_{x\to\pi/2+} f(x) = 0 - 0 = 0$

$\lim\limits_{x\to\pi/2-} f(x) = 1 - 0 = 1$

f is discontinuous at $x = \pi/2$. But sum of two discontinuous need not be discontinuous e.g.

$$f(x) = \begin{cases} 1 & , \ x \ge 0 \\ -1 & , \ x < 0 \end{cases} \quad g(x) = \begin{cases} -1 & , \ x \ge 0 \\ 1 & , \ x < 0 \end{cases}$$

$f(x) + g(x) = 0$ for all x.

60. $\lim\limits_{x\to 0+} [x]^2 \left(\dfrac{e^{1/x}-1}{e^{1/x}+1}\right) = \lim\limits_{x\to 0+} [x]^2 \left(\dfrac{1-e^{-1/x}}{1+e^{-1/x}}\right)$

$= 0 \times 1 = 0$

$\lim\limits_{x\to 0-} [x]^2 \left(\dfrac{e^{1/x}-1}{e^{1/x}+1}\right) = (-1)^2 \times (-1) = -1.$

$\lim\limits_{x\to 0+} \left(\dfrac{e^{1/x}-1}{e^{1/x}+1}\right) = 1.$

Level 2

61. If α, β are the roots of $ax^2 + bx + c = 0$ then $1/\alpha$, $1/\beta$ will be the roots of $cx^2 + bx + a = 0$.

Thus $\lim\limits_{x\to 1/a} \sqrt{\dfrac{1-\cos\left(cx^2+bx+a\right)}{2(1-\alpha x)^2}}$

$$= \lim_{x\to 1/a} \frac{\left|\sin\dfrac{cx^2+bx+a}{2}\right|}{|\alpha||1/\alpha - x|}$$

$$= \lim_{x\to 1/a} \frac{\left|\sin\dfrac{c}{2}(x-1/\alpha)(x-1/\beta)\right|}{|\alpha|\dfrac{|c|}{2}|x-1/\alpha||x-1/\beta} \times \frac{|c|}{2}|x-1/\beta|$$

$$= \left|\frac{c}{2\alpha}\left(\frac{1}{\alpha}-\frac{1}{\beta}\right)\right|.$$

62. $\lim\limits_{x\to 4} f(x) = f(4)$ as f is continuous. Putting $x = y = 2$ in the given functional equation, we have $(f(2))^2 = 2f(2) + f(4) - 2 \Rightarrow 25 - 10 + 2 = f(4)$. Therefore, $f(4) = 17$.

63. $\lim\limits_{x\to\infty} \dfrac{e^{1/x}-e^{-1/x}}{e^{1/x}+e^{-1/x}} \tan(1/x) = \lim\limits_{x\to\infty} \dfrac{1-e^{-2/x}}{1+e^{-2/x}} \tan 1/x$

$= 0.$

64. $f(2) = f(1 + 1) = f(1) + f(1) = 10$

$f(4) = f(2 + 2) = f(2) + f(2) = 20$

Therefore, $\lim\limits_{x\to 4} f(x) = f(4) = 20$.

65. $\lim\limits_{x\to 0+} f(x) = \lim\limits_{x\to 0+} e^x (x + [x]) = 1.0 = 0.$

66. $\lim\limits_{x\to -4} \dfrac{\tan \pi x}{x+4} = \lim\limits_{x\to -4} \dfrac{\pi \sec^2 \pi x}{1}\left(\dfrac{0}{0} \text{ form}\right).$

$= \lim\limits_{x\to\infty} \left(1+1/x^2\right)^x = \lim\limits_{x\to\infty} \left(1+1/x^2\right)^{x^2.1/x} = e^0 = 1$

So the sum of the two given limits is equal to $\pi + 1 > 3$.

67. $\lim\limits_{x\to 0} \left(\dfrac{\sin x}{x}\right)^{\frac{\sin x}{x-\sin x}}$

$= \lim\limits_{x\to 0} \left(1+\left(-1+\dfrac{\sin x}{x}\right)\right)^{\frac{x}{\sin x - x}\times -\frac{\sin x}{x}}$

$= \lim\limits_{u\to 0} (1+u)^{\frac{1}{u}\times \lim\limits_{u\to 0}\left(-\frac{\sin x}{x}\right)}$

$= e^{-1}.$

68. $\lim\limits_{x\to 0} \dfrac{(\sin x - \tan x)^2 + (1-\cos 2x)^4 + x^5}{7\tan^7 x + \sin^6 x + 2\sin^5 x}$

$$= \lim_{x\to 0} \frac{\sin^2 x\left(\dfrac{1-\cos^2 x}{\cos^2 x}\right)^2 + 16\sin^8 x + x^5}{7\dfrac{\sin^7 x}{\cos^7 x} + \sin^6 x + 2\sin^5 x}$$

$$= \lim_{x\to 0} \frac{\left(\dfrac{\sin x}{x}\right)^5 \sin x.\sec^4 x + 16\left(\dfrac{\sin x}{x}\right)^5 \sin^3 x + 1}{7\left(\dfrac{\sin x}{x}\right)^5 \sin^2 x \sec^7 x + \left(\dfrac{\sin x}{x}\right)^5 \sin x + 2\left(\dfrac{\sin x}{x}\right)^5}$$

$$= \frac{1\times 0\times 1 + 16\times 1\times 0 + 1}{7\times 1\times 0\times 1 + 1\times 0 + 2\times 1} = \frac{1}{2}.$$

69. g is not continuous at $x = 0$. $fog\ (x) = f(1/x)$ $= \dfrac{1-x}{x}$. $gofog\ (x) = g\left(\dfrac{1-x}{x}\right) = \dfrac{x}{1-x}$ which is not continuous at $x = 1$. Hence $gofog$ is.

continuous except for $x = 0, 1$ i.e $(-\infty, \infty) \sim \{0, 1\}$

70. $k^2 x^2 - 1 \le [(kx)^2] \le k^2 x^2$ for all k, so

$x^2 (1^2 + 2^2 + \cdots + n^2) - 1 \le [x^2] + [(2x)^2] + \cdots + [(nx)^2]$

$\le x^2 (1^2 + 2^2 \cdots + n^2)$

$$\Rightarrow \frac{x^2 n(n+1)(2n+1)}{6n^3} - \frac{1}{n^3}$$

$$\le \frac{\left[x^2\right] + \left[(2x)^2\right] \cdots + \left[(nx)^2\right]}{n^3}$$

$$\le \frac{x^2 n(n+1)(2n+1)}{6n^3}$$

$$\Rightarrow \lim_{n\to\infty}\left(\frac{x^2(1+1/n)(2+1/n)}{6} - \frac{1}{3}\right)$$

$$\le \lim_{n\to\infty}\frac{[x^2]+[(2x)^2]+\cdots+[(nx)^2]}{n^3}$$

$$\le \lim_{n\to\infty}\frac{x^2(1+1/n)(2+1/n)}{6}$$

$\Rightarrow \dfrac{x^2}{6} \le f(x) \le \dfrac{x^2}{6}$ so $f(x) = \dfrac{x^2}{3}$ which is continuous on $(-\infty, \infty)$

71. If $x \in Q$ (the set of rational numbers) then we can find a sequence of irrational numbers x_n converging to x. But $f(x_n) = 0$ and $f(x) = 1$. So f is discontinuous at every rational number. Similarly, if x is irrational number.

72. $\lim\limits_{x\to 1/2} f(x) = \dfrac{1}{2} = f\left(\dfrac{1}{2}\right)$. So f is continuous at $x = \dfrac{1}{2}$. f is discontinuous at every other point

73. Let $f(x) = x$ in (a), $g(x) = |x|$ is not one-one.

Take in (b), $f(x) = \begin{cases} 1 \text{ if } x \ge 0 \\ -1 \text{ if } x < 0 \end{cases}$ then $g(x) = 1$ for all x so g is continuous but not f. If f is continuous then g is composition of two continuous functions so is continuous. Take $f(x) = x$ in (d), f is onto but $g : \mathbf{R} \to \mathbf{R}$ given by $g(x) = |x|$ is not onto.

74. If $|x| < 1$ then $x^{2n} \to 0$ as $n \to \infty$ and if $|x| > 1$ then $1/x^{2n} \to 0$ as $n \to \infty$. So,

$$f(x) = \begin{cases} \log(3+x) & \text{for } -1 < x < 1 \\ -\sin x & \text{for } x > 1 \; or \; x < -1 \\ \frac{1}{2}[\log{(3 + \mathrm{x})} - \sin \mathrm{x}] & \text{for x} = 1, -1 \end{cases}$$

$\lim\limits_{x\to 1+} f(x) = -\sin 1$, $\lim\limits_{x\to 1-} f(x) = \log 4$.

$\lim\limits_{x\to -1+} f(x) = \log 2$, $\lim\limits_{x\to 1-} f(x) = \sin 1$

so f is continuous on $\mathbf{R} \sim \{-1, 1\}$.

75. $f(x) = \left(1 + \dfrac{4x+1}{x^2+x+2}\right)^{\frac{x^2+x+2}{4x+1} \times \frac{(4x+1)}{x^2+x+1}}$

$$= (1+u)^{\frac{1}{u} \times \frac{4+1/x}{1+1/x+2/x^2}}, \; u = \frac{4x+1}{x^2+x+2}$$

Since $u \to 0$ as $x \to \infty$ so $\lim\limits_{x\to\infty} f(x) = e^4$.

76. $f(x) = \log x$ satisfy this functional equation.

f is clearly not bounded $f(1/x) = -\log x \to \infty$ as $x \to 0+$, $x \log x \to -\infty$ as $x \to 0+$.

77. The point $x = 1$, is a discontinuity of the function f. If $x \ne 1$, then $u(x) = f(f(x)) = \dfrac{x-1}{x}$ Hence $x = 0$ is a point of discontinuity of u. If $x \ne 0$, $x \ne 1$ then $fofof(x) = x$. Hence $y(x) = f^{3n}(x) = x$ is continuous everywhere except $x = 0, 1$.

78. $f(0) = \lim\limits_{x\to 0}\dfrac{1-\cos x+\sin x}{1-\cos x-\sin x}$

$$= \lim_{x\to 0}\frac{2\sin x/2(\sin x/2+\cos x/2)}{2\sin x/2(\sin x/2-\cos x/2)}$$

$$= \lim_{x\to 0}\frac{\sin x/2+\cos x/2}{\sin x/2-\cos x/2} = -1.$$

79. If f is continuous then $\lim\limits_{x\to \pi/2+} f(x) = f(\pi/2) = \lim\limits_{x\to \pi/2-} f(x)$

so $a\dfrac{\pi}{2} + 1 = 1 + b \Rightarrow a\dfrac{\pi}{2} = b$.

80. $x^3 + x^2 - 16x + 20 = (x-2)^2 (x+5)$. Hence $\lim\limits_{x\to 2} f(x) = 7 = K$.

81. For $x \ne 2$, $f(x) = \dfrac{16\left(2^{x-2}-1\right)}{16\left(4^{x-2}-1\right)}$

$$= \frac{2^{x-2}-1}{x-2} \times \frac{x-2}{4^{x-2}-1}$$

So $\lim\limits_{x\to 2} f(x) = \dfrac{\log 2}{\log 4} = \dfrac{1}{2}$.

82. For $x \neq 0$, $f(x) = \dfrac{-2\sin^2 x}{x^2+1-1} \times \left(\sqrt{x^2+1}+1\right)$

$= 2\dfrac{\sin^2 x}{x^2} \times \left(\sqrt{x^2+1}+1\right)$

Thus $\lim\limits_{x\to 0} f(x)$ = – 2 × 1 × 2 = – 4.

83. $\lim\limits_{x\to 0}\dfrac{x}{a}\left[\dfrac{b}{x}\right] = \lim\limits_{x\to 0}\dfrac{x}{a}\left[\dfrac{b}{x}-\left\{\dfrac{b}{x}\right\}\right]$

($\{x\}$ is the fractional part of x)

$= \lim\limits_{x\to 0}\left(\dfrac{b}{a}-\dfrac{b}{a}\dfrac{\{b/x\}}{b/x}\right)$

$= \dfrac{b}{a} - \dfrac{b}{a}\lim\limits_{y\to\infty}\dfrac{\{y\}}{y}$

$= \dfrac{b}{a}$.

Since $0 \le \{y\} < 1$ so $\dfrac{\{y\}}{y} \le \dfrac{1}{y}$ for $y > 0$

Hence $\lim\limits_{y\to\infty}\dfrac{\{y\}}{y} = 0$.

84. Since $7 < e^2 < 8$ so $[e^2] = 7$ and $[-e^2] = -8$, so

$f(0) = \lim\limits_{x\to 0}\dfrac{\tan 7x^2 - \tan(-8)x^2}{\sin^2 x}$

$= \lim\limits_{x\to 0}\left(7\dfrac{\tan 7x^2}{7x^2}\times\dfrac{x^2}{\sin^2 x}+8.\dfrac{\tan 8x^2}{8x^2}\times\dfrac{x^2}{\sin^2 x}\right)$

= 7 + 8 = 15.

85. $f(0) = \lim\limits_{x\to 0} f(x) = \lim\limits_{x\to 0}\dfrac{\cos ax - \cos bx}{x^2}$

$= \lim\limits_{x\to 0}\dfrac{-a\sin ax + b\sin bx}{2x}\left(\dfrac{0}{0}\right)$

$= \lim\limits_{x\to 0}\dfrac{-a^2\cos ax + b^2\cos bx}{2}$

$= \dfrac{b^2-a^2}{2}$.

Previous Years' AIEEE/JEE Main Questions

1. $f(0) = 0 = \lim\limits_{x\to 0} f(x)$, so f is continuous at $x = 0$. If $x_0 \in Q$ then $\lim\limits_{x\to x_0} f(x)$ does not exist similarly if x_0 is irrational.

2. $\lim\limits_{x\to 0}\dfrac{\sqrt{1-\cos 2x}}{\sqrt{2}x} = \lim\limits_{x\to 0}\dfrac{|\sin x|}{\sqrt{2}x}$ which doesn't exist as $\lim\limits_{x\to 0+}\dfrac{|\sin x|}{\sqrt{2}x} = \dfrac{1}{\sqrt{2}}$ and $\lim\limits_{x\to 0-}\dfrac{|\sin x|}{\sqrt{2}x} = -\dfrac{1}{\sqrt{2}}$.

3. $\lim\limits_{x\to\infty}\left(\dfrac{x^2+5x+3}{x^2+x+3}\right)^x = \lim\limits_{x\to\infty}\left(1+\dfrac{4x}{x^2+x+3}\right)^x$

$= \lim\limits_{x\to\infty}\left(1+\dfrac{4x}{x^2+x+3}\right)^{\frac{x^2+x+3}{4x}\times\frac{4x^2}{x^2+x+3}}$

$= \lim\limits_{x\to\infty}\left(1+\dfrac{4x}{x^2+x+3}\right)^{\frac{x^2+x+3}{4x}\times\frac{4}{1+1/x+3/x^2}}$

$= e^4$.

4. $\lim\limits_{x\to 0}\dfrac{\log(3+x)-\log(3-x)}{x} = \lim\limits_{x\to 0}\dfrac{1}{x}\left[\log\dfrac{3+x}{3-x}\right]$

$= \lim\limits_{x\to 0}\dfrac{1}{x}\left[\log\left(1+\dfrac{2x}{3-x}\right)\right]$

$= \lim\limits_{x\to 0}\dfrac{\log\left(1+\dfrac{2x}{3-x}\right)}{\dfrac{2x}{3-x}}\times\dfrac{2x}{x(3-x)}$

$= 1\times\dfrac{2}{3} = \dfrac{2}{3}$.

5. $\lim\limits_{x\to\pi/2}\dfrac{1-\tan\dfrac{x}{2}}{1+\tan\dfrac{x}{2}}\,\dfrac{1-\sin x}{(\pi-2x)^3}$

$= \dfrac{1}{8}\lim\limits_{x\to\pi/2}\dfrac{\tan\left(\dfrac{\pi}{4}-\dfrac{x}{2}\right)(1-\sin x)}{(\pi/2-x)^3}$

$= \dfrac{1}{8}\lim\limits_{u\to 0}\dfrac{\left(\tan\dfrac{1}{2}u\right)(1-\sin(\pi/2-u)}{u^3}$

$= \dfrac{1}{8}\lim\limits_{u\to 0}\dfrac{1}{2}\dfrac{\tan u/2}{u/2}\times\dfrac{1-\cos u}{u^2}$

$= \dfrac{1}{16}\lim\limits_{u\to 0}\dfrac{\tan u/2}{u/2}\,\dfrac{2\sin^2 u/2}{4(u/2)^2}$

$= \dfrac{1}{32}$.

6. We have $\lim\limits_{x\to\infty}\left(1+\dfrac{a}{x}+\dfrac{b}{x^2}\right)^{2x} = e^{2a}$

$\therefore\ e^{2a} = e^2$

Thus, $a = 1$ and b may be any real number.

7. We have $\lim\limits_{x\to\pi/4} f(x) = \lim\limits_{x\to\pi/4} \dfrac{1-\tan x}{4x-\pi/4}$

$$= \lim_{x\to\pi/4} \frac{-\sec^2 x}{4}$$

$$= \frac{-(\sqrt{2})^2}{4} = -\frac{1}{2}.$$

8. $\lim\limits_{x\to\alpha} \dfrac{1-\cos(ax^2+bx+c)}{(x-\alpha)^2}$

$$= \lim_{x\to\alpha} \frac{\sin(ax^2+bx+c)(2ax+b)}{2(x-\alpha)} \quad \text{[L$'$ Hospital Rule]}$$

$$= \lim_{x\to\alpha} \frac{\cos(ax^2+bx+c)(2ax+b)^2+\sin(ax^2+bx+c)(2a)}{2}$$

$$= \frac{\cos(a\alpha^2+b\alpha+c)(2a\alpha+b)^2+\sin(a\alpha^2+b\alpha+c)(2a)}{2}$$

$$= \frac{\cos(0)\left(2\alpha+\dfrac{b}{a}\right)^2 a^2+\sin(0)(2a)}{2}$$

$$= \frac{a^2}{2}(2\alpha-\alpha-\beta)^2 \qquad \left[\because -\frac{b}{a} = \alpha+\beta\right]$$

$$= \frac{1}{2}a^2(\alpha-\beta)^2$$

9. $f(0) = \lim\limits_{x\to 0} f(x)$

$$= \lim_{x\to 0}\left(\frac{1}{x}-\frac{2}{e^{2x}-1}\right)$$

$$= \lim_{x\to 0} \frac{e^{2x}-1-2x}{x(e^{2x}-1)}\left(\frac{0}{0}\text{form}\right)$$

$$= \lim_{x\to 0} \frac{2e^{2x}-2}{e^{2x}-1+2xe^{2x}}\left(\frac{0}{0}\text{form}\right)$$

$$= \lim_{x\to 0} \frac{4e^{2x}}{4e^{2x}(1+x)} = 1.$$

10. As f is an increasing function, and

$x < 2x < 3x\ \forall\ x > 0$,

we get

$f(x) < f(2x) < f(3x)\ \forall\ x > 0$

$$\Rightarrow 1 < \frac{f(2x)}{f(x)} < \frac{f(3x)}{f(x)} \qquad [\because f(x) > 0]$$

Since $\lim\limits_{x\to\infty} 1 = 1$ and

$\lim\limits_{x\to\infty} \dfrac{f(3x)}{f(x)} = 1$ (given), by the Sandwich theorem, we get

$$1 \le \lim_{x\to\infty} \frac{f(2x)}{f(x)} \le 1 \Rightarrow \lim_{x\to\infty} \frac{f(2x)}{f(x)} = 1.$$

11. f is continuous at all points except possibly at $x = 0$

$$\lim_{x\to 0-} f(x) = \lim_{x\to 0-} \frac{\sin(p+1)x+\sin x}{x}$$

$$= (p+1)\lim_{x\to 0-} \frac{\sin(p+1)x}{(p+1)x} + \lim_{x\to 0-} \frac{\sin x}{x}$$

$$= (p+1) + 1 = p + 2$$

$$\lim_{x\to 0+} f(x) = \lim_{x\to 0+} \frac{\sqrt{x+x^2}-\sqrt{x}}{x^{3/2}} = \lim_{x\to 0+} \frac{\sqrt{1+x}-1}{x}$$

$$= \lim_{x\to 0+} \frac{\left(\sqrt{x+1}-1\right)\left(\sqrt{x+1}+1\right)}{x\left(\sqrt{x+1}+1\right)}$$

$$= \lim_{x\to 0+} \frac{x+1-1}{x}\cdot\frac{1}{\sqrt{x+1}+1} = \frac{1}{2}$$

For continuity at $x = 0$, we must have $p + 2 = 1/2$ $= q \Rightarrow p = -3/2$, $q = 1/2$.

12. As $\lim\limits_{x\to 5} \dfrac{(f(x))^2-9}{\sqrt{|x-5|}} = 0$,

we have

$(f(x))^2 - 9 = k|x-5|^{\alpha}P(x)$

where $\alpha > 1/2$ and $P(x)$ is some function of x.

$$= \lim_{x\to 5} f(x)^2 = \lim_{x\to 5}\,[9 + k\,|x-5|^{\alpha}P(x)]$$

$$= 9 + 0 = 9$$

Thus, only possible answer is $\lim\limits_{x\to 5} f(x) = 3$.

13. f_2 is not continuous at $x = 0$, as $\lim\limits_{x\to 0}\sin\left(\dfrac{1}{x}\right)$ does not exist. $\therefore$ Statement –2 is false.

$$F(x) = \begin{cases} x\sin 1/x, & x \ne 0 \\ 0, & x = 0 \end{cases}$$

$\lim\limits_{x\to 0} F(x) = 0$ so F is continuous on **R**.

14. $1 - \cos(2(x-2)) = 2\sin^2(x-2)$

$$\Rightarrow \sqrt{1-\cos(2(x-2))} = \sqrt{2}\,|\sin(x-2)|$$

Now, $\lim\limits_{x\to 2-} \dfrac{\sqrt{1-\cos(2(x-2))}}{x-2}$

$$= \lim_{x\to 2-} \frac{-\sqrt{2}\sin(x-2)}{x-2}$$

$$= -\sqrt{2}$$

and $\lim\limits_{x\to 2+} \dfrac{\sqrt{1-\cos(2(x-2))}}{x-2}$

$$= \lim_{x\to 2+} \frac{\sqrt{2}\sin(x-2)}{x-2} = \sqrt{2}$$

As $\lim\limits_{x\to 2-} \dfrac{\sqrt{1-\cos(2(x-2))}}{x-2}$

$$\ne \lim_{x\to 2+} \frac{\sqrt{1-\cos(2(x-2))}}{x-2}$$

we get $\lim\limits_{x\to 2} \dfrac{\sqrt{1-\cos(2(x-2))}}{x-2}$ does not exist.

15. $f(x) = [x]\cos\left(\dfrac{2x-1}{2}\right)\pi$

Let n be any integer, then $[x] = n$. For $n \le x < n+1$.

Thus,

$f(x) = n\cos\left(\dfrac{2x-1}{2}\right)\pi$ for $n \le x < n+1$.

$$= \begin{cases} -\cos\left(\dfrac{2x-1}{2}\right)\pi & \text{for} -1 \le x < 0 \\ 0 & \text{for}\, 0 \le x < 1 \\ \cos\left(\dfrac{2x-1}{2}\right)\pi & \text{for}\, 1 \le x < 2 \\ 2\cos\left(\dfrac{2x-1}{2}\right)\pi & \text{for}\, 2 \le x < 3 \end{cases}$$

Note that f is continuous at all points except possibly at …, –3, –2, 0, 1, …

We check the continuity at $x = n \in I$.

$$\lim_{x\to n-} f(x) = \lim_{x\to n-} (n-1)\cos\left(\frac{2x-1}{2}\right)\pi = 0$$

and $\lim\limits_{x\to n+} f(x) = \lim\limits_{x\to n+} n\cos\left(\dfrac{2x-1}{2}\right)\pi = 0$

Thus, f is continuous at each $x \in$ **R**.

16. $\lim\limits_{x\to 0} \dfrac{(1-\cos 2x)(3+\cos x)}{x\tan 4x}$

$$= \lim_{x\to 0} \frac{(2\sin^2 x)(3+\cos x)}{x\tan 4x}$$

$$= \frac{2}{4}\lim_{x\to 0}\left(\frac{\sin x}{x}\right)^2 \frac{4x}{\tan 4x}(3+\cos x)$$

$$= \frac{1}{2}\,(1^2)\,(1)\,(4) = 2$$

17. As f is continuous at $x = \pi$,

$$k = \lim_{x\to\pi} \frac{\sqrt{2+\cos x}-1}{(\pi - x)^2}$$

Put $\pi - x = \theta$, so that

$$k = \lim_{\theta\to 0} \frac{\sqrt{2+\cos(\pi-\theta)}-1}{\theta^2}$$

$$= \lim_{\theta\to 0} \frac{\sqrt{2-\cos\theta}-1}{\theta^2}$$

$$= \lim_{\theta\to 0} \frac{(\sqrt{2-\cos\theta}-1)(\sqrt{2-\cos\theta}+1)}{\theta^2(\sqrt{2-\cos\theta}+1)}$$

$$= \lim_{\theta\to 0} \frac{2-\cos\theta-1}{\theta^2}\cdot\frac{1}{\sqrt{2-\cos\theta+1}}$$

$$= \lim_{\theta\to 0} \frac{(1-\cos\theta)(1+\cos\theta)}{\theta^2}\,\frac{1}{1+\cos\theta}\cdot\frac{1}{\sqrt{2-\cos\theta+1}}$$

$$= 1\left(\frac{1}{2}\right)\left(\frac{1}{1+1}\right) = \frac{1}{4}$$

18. $\lim\limits_{x\to 0} \dfrac{\sin(\pi\cos^2 x)}{x^2} = \lim\limits_{x\to 0} \dfrac{\sin(\pi - \pi\sin^2 x)}{x^2}$

$$= \lim_{x\to 0} \frac{\sin(\pi\sin^2 x)}{\pi\sin^2 x}\times\frac{\pi\sin^2 x}{x^2}$$

$$= \pi.$$

19. As f is continuous

$$\lim_{x\to 0} f\left(\frac{1-\cos 3x}{x^2}\right) = f\left(\lim_{x\to 0}\frac{1-\cos 3x}{x^2}\right)$$

$$= f\left(\lim_{x\to 0} 9\left(\frac{\sin 3x}{3x}\right)^2 \frac{1}{1+\cos 3x}\right)$$

$$= f\left(\frac{9}{2}\right) = \frac{2}{9}$$

20. $\lim\limits_{x\to 2} \dfrac{\tan(x-2)(x-2)(x+k)}{(x-2)^2} = 5$

$$\Rightarrow \lim_{x\to 2} \frac{\tan(x-2)}{(x-2)}(x + k) = (1)(2 + k) = 5$$

$$\Rightarrow k = 3$$

21. $\lim\limits_{x\to 0} \dfrac{e^{x^2} - \cos x}{\sin^2 x}$

$$= \lim_{x\to 0} \frac{(e^{x^2} - 1)(1 - \cos x)}{\sin^2 x}$$

$$= \lim_{x\to 0} \left[\frac{(e^{x^2} - 1)/x^2}{(\sin x/x)^2} + \frac{1}{1+\cos x}\right]$$

$$= \frac{1}{1} + \frac{1}{2} = \frac{3}{2}.$$

22. Same as Q. 16.

23. $\lim\limits_{x\to 0} f(x) = \lim\limits_{x\to 0} 4k\left(\dfrac{e^x - 1}{x}\right)^2 \left(\dfrac{x/k}{\sin(x/k)}\right)\left(\dfrac{x/4}{\log(1+x/4)}\right)$

$= (4k)\ (1)\ (1) = 4k$

As f is continuous at $x = 0$,

$12 = f(0) = \lim\limits_{x\to 0} f(x) = 4k \Rightarrow k = 3.$

24. $\log p = \lim\limits_{x\to 0+} \log\left(1 + \tan^2\sqrt{x}\right)^{\frac{1}{2x}}$

$$= \lim_{x\to 0+} \frac{\log\left(1+\tan^2\sqrt{x}\right)}{2x}$$

$$= \frac{1}{2}\lim_{x\to 0+} \frac{\log\left(1+\tan^2\sqrt{x}\right)}{\tan^2\sqrt{x}} \times \left(\frac{\tan\sqrt{x}}{\sqrt{x}}\right)^2$$

$$= \frac{1}{2}\cdot 1\cdot 1 = \frac{1}{2}.$$

25. $e^3 = \lim\limits_{x\to\infty} 4k\left(1 + \dfrac{a}{x} - \dfrac{4}{x^2}\right)^{2x}$

$$= \lim_{x\to\infty}\left(1 + \frac{ax-4}{x^2}\right)^{2x}$$

$$= \lim_{x\to\infty}\left[\left(1 + \frac{ax-4}{x^2}\right)^{\frac{x^2}{ax-4}}\right]^{\left(a-\frac{4}{x}\right)(2)}$$

$$= e^{2a}$$

$$\Rightarrow 2a = 3 \Rightarrow a = \frac{3}{2}.$$

26. f is continuous on all points except possibly at $x = 1$ and $x = \sqrt{2}$.

$$\therefore \lim_{x\to 1-} f(x) = \lim_{x\to 1-} \frac{2x^2}{a} = \frac{2}{a}$$

$\lim\limits_{x\to 1+} f(x) = \lim\limits_{x\to 1+} a = a$. By continuity of f at $x = 1$, we have $a = \dfrac{2}{a} \Rightarrow a = \pm\sqrt{2}$.

Also $\lim\limits_{x\to\sqrt{2}-} f(x) = a$ and $\lim\limits_{x\to\sqrt{2}+} f(x)$

$$= \lim_{x\to\sqrt{2}+} \frac{2b^2 - 4b}{x^3} = \frac{2b^2 - 4b}{2\sqrt{2}} = \frac{b^2 - 2b}{\sqrt{2}}$$

Thus $a = \dfrac{b^2 - 2b}{\sqrt{2}}$.

If $a = \sqrt{2}$, then $b^2 - 2b = 2 \Rightarrow b = 1 \pm \sqrt{3}$,

If $a = -\sqrt{2}$ then $b^2 - 2b = -\sqrt{2} \Rightarrow (b - 1)^2 = 1 - \sqrt{2} < 0$, not possible

Thus $(a, b) = (\sqrt{2}, 1-\sqrt{3})$.

27. $L = \lim\limits_{x\to 0} \dfrac{4\sin^4 x}{x\left(2\tan x - \dfrac{2\tan x}{1+\tan^2 x}\right)}$

$$= \lim_{x\to 0} \frac{2\sin^4 x(1+\tan^2 x)}{x.\tan x\tan^2 x}$$

$$= 2\lim_{x\to 0} \frac{\sin x}{x}(1+\tan^2 x)\cos^2 x$$

$= 2.\ 1.\ (1 + 0).1 = 2.$

Previous Years' B-Architecture Entrance Examination Questions

1. Take $f(x) = g(x) = \dfrac{1}{x}$ and $c = 0$.

2. $2f\,(x + h) + f(0) = 2f\left(\dfrac{2x+2h}{2}\right) + f(0)$

$$= 2\,\frac{f(2x) + f(2h)}{2} + f(0)$$

$= f(2x) + f(0) + f(2h)$

$$= 2f\left(\frac{2x+0}{2}\right) + f(2h)$$

$= 2f(x) + f(2h)$

Taking limit on both the sides as $h \to 0$, we have

$$2\lim_{h\to 0} f(x+h) + f(0) = 2f(x) + \lim_{h\to 0} f(2h)$$

$= 2f(x) + f(0)$ (f is continuous at 0)

$\Rightarrow \lim\limits_{h\to 0} f(x+h) = f(x)$

$\Rightarrow f$ is continuous at every point.

3. $$\lim_{x\to 1} \sin\frac{\pi}{4}\left(\frac{x\,|x|-1}{|x|-1}\right) = \lim_{x\to 1} \sin\frac{\pi}{4}\left(\frac{x^2-1}{x-1}\right)$$

$$= \sin\frac{\pi}{4}(1+1) = 1.$$

$$\lim_{x\to 1} \tan\frac{\pi}{4}\left(\frac{x\,|x|-1}{|x|-1}\right) = \lim_{x\to 1} \tan\frac{\pi}{4}\left(\frac{x^2-1}{x-1}\right)$$

$= \lim\limits_{x\to 1} \tan\frac{\pi}{4}(x+1)$, which does not exist.

4. $$\lim_{x\to 0} f(x) = \lim_{x\to 0+} f(x) = -\lim_{x\to 0+} f(-x) = -\lim_{x\to 0-} f(x)$$

$$= -\lim_{x\to 0} f(x)$$

Hence $\lim\limits_{x\to 0} f(x) = 0$.

Thus $$\lim_{x\to 0} \frac{1}{2f(x)-1} = \frac{1}{\lim\limits_{x\to 1}(2f(x)-1)} = -1.$$

5. $$\lim_{x\to\infty}\left[\frac{x^2+1}{x-1} - \alpha x - 2\beta\right]$$

$$= \lim_{x\to\infty} \frac{x^2(1-\alpha) - (2\beta-\alpha)x + 1 + 2\beta}{x-1}$$

Since the last exists so $1 - \alpha = 0 \Rightarrow \alpha = 1$. In this case the last limit is equal to

$$\lim_{x\to\infty} \frac{-(2\beta-\alpha) + \dfrac{1+2\beta}{x}}{1-\dfrac{1}{x}} = -(2\beta - \alpha) = \frac{3}{2}$$

$$\Rightarrow -2\beta = \frac{3}{2} - 1 = \frac{1}{2} \Rightarrow \beta = -\frac{1}{4}.$$

6. $[x]$ is not continuous at $x \in I$ and $|x|$ is a continuous function so $|x| + [x - 1]$ is neither continuous at $x = 0$ nor at $x = 1$.

7. $$\lim_{x\to 0} \frac{\sin 2x + a\sin x}{x^3} = \lim_{x\to 0} \frac{2\cos 2x + a\cos x}{3x^2} \left(\frac{0}{0} \text{ form}\right)$$

The last limits will exist if $a = -2$. In this case the last limit is equal to

$$\lim_{x\to 0} \frac{-4\sin 2x + 2\sin x}{6x} = \lim_{x\to 0}\left[-\frac{4}{3}\frac{\sin 2x}{2x} + \frac{1}{3}\frac{\sin x}{x}\right]$$

$$= -\frac{4}{3} + \frac{1}{3} = -1.$$

8. For $x \neq 0$,

$$\frac{f(x)}{x^2} = \begin{vmatrix} \dfrac{\sin x}{x} & \cos x & \tan x \\ x & x & 1 \\ 2 & 1 & 1 \end{vmatrix}$$

$$\Rightarrow \lim_{x\to 0} \frac{f(x)}{x^2} = \begin{vmatrix} 1 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 1 & 1 \end{vmatrix} = 1$$

9. f is continuous on $\mathbf{R} \sim \mathbf{Z}$ and g is continuous on $\mathbf{R} \sim \mathbf{Z}$ so $\phi(x) = fog(x)$ is continuous on $\mathbf{R} \sim \mathbf{Z}$.

Next, $\psi(x) = (gof)(x) = g(f(x)) = g([x]) = 0 \ \forall\ x \in \mathbf{R}$.
$\Rightarrow \psi$ is continuous on $\mathbf{R}$ in particular on $\mathbf{R} \sim \mathbf{Z}$.

10. For $0 < x < 1$, $-1 < x - 1 < 0$, so

$F(x) = (1 - x) + (-1) + (1 - x) = 1 - 2x$

$\Rightarrow \lim\limits_{x\to 1-} f(x) = 1 - 2.(1) = -1.$

For $1 < x < 2$, $0 < x - 1 < 1$, so

$f(x) = (1 - x) + 0 + (x - 1) = 0$

$\Rightarrow \lim\limits_{x\to 1+} f(x) = 0$. Thus $\lim\limits_{x\to 1} f(x)$ does not exist.

CHAPTER TEN

Differentiability and Differentiation

DIFFERENTIABILITY

Let f be a real-valued function defined on an open interval containing a point x_0.
then f is said to be *differentiable* at x_0 if

$$\lim_{\Delta x \to 0} \frac{f(x_0+\Delta x)-f(x_0)}{\Delta x}$$

exists. If this limit exists we call it the derivative of $f(x)$ at x_0 and denote it by $f'(x_0)$ or by

$$\left.\frac{dy}{dx}\right|_{x=x_0}$$

If this limit does not exist, we say that f is not *differentiable* at $x = x_0$.

Equivalently $\lim\limits_{x\to x_0} \dfrac{f(x)-f(x_0)}{x-x_0}$ exists. Graphically the graph of f has a non vertical tangent line at $x = x_0$.

Using one-sided limits, we define the *right-hand derivative*, denoted by $f'(x_0+)$, at $x = x_0$ as

$$\lim_{\Delta x \to 0+} \frac{f(x_0+\Delta x)-f(x_0)}{\Delta x}$$

and the *left-hand derivative*, denoted by $f'(x_0-)$, at $x = x_0$ as

$$\lim_{\Delta x \to 0-} \frac{f(x_0+\Delta x)-f(x_0)}{\Delta x}$$

Thus, a function $f(x)$ is derivable at $x = x_0$ if $f'(x_0+) = f'(x_0-)$.

Every differentiable function is continuous but the converse may not be true. That is, a continuous function need not be differentiable. e.g.

Illustration 1

$f(x) = |x|$ at $x = 0$,

$$f'(0+) = \lim_{\Delta x\to 0+} \frac{f(0+\Delta x)-f(0)}{\Delta x}$$

$$= \lim_{\Delta x\to 0+} \frac{|\Delta x|}{\Delta x} = 1$$

$$f'(0-) = \lim_{\Delta x\to 0-} \frac{|\Delta x|}{\Delta x} = \lim_{\Delta x\to 0-} \frac{-\Delta x}{\Delta x}$$

(as $\Delta x \to 0-$, we have $\Delta x < 0$)

$$= -1$$

Thus f is not differentiable at $x = 0$.

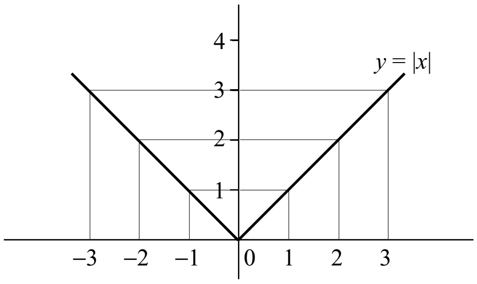

Fig. 10.1

The *absolute value* function is not differentiable at $x = 0$. Clearly f is a continuous function. Similarly if $f(x) = |x - a|$, then f is not differentiable at $x = a$, $f'(a+) = 1$ and $f'(a-) = -1$.

Geometrically, we interpret

$$f'(x) = \lim_{h\to 0} \frac{f(x+h)-f(x)}{h}$$

as the slope of the graph at the point $(x, f(x))$. The line through $(x, f(x))$ which has this slope is called the tangent line at $(x, f(x))$. Thus, if there is no tangent line at a certain point or has a vertical tangent line, the function is not differentiable at that point. In other words, a function is not differentiable at a corner point of a curve, i.e., a point where the curve suddenly changes direction (Fig. 10.2).

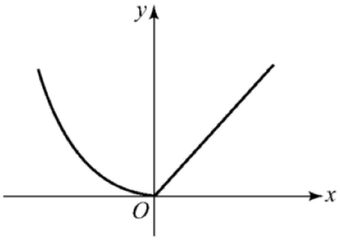

Fig. 10.2

DIFFERENTIABILITY ON AN INTERVAL

A function $f(x)$, defined on $[a, b]$, is said to be differentiable on $[a, b]$ if it is differentiable at every c $\in$ (a, b) and both

$$\lim_{h \to 0+} \frac{f(a+h)-f(a)}{h} \text{ and } \lim_{h \to 0-} \frac{f(b+h)-f(b)}{h}$$

exist.

Continuously Differentiable

A function f is said to be continuously differentiable if the derivative $f'(x)$ exists and is itself a continuous function. e.g.

Illustration 2

$$f(x) = \begin{cases} x^2 \sin \dfrac{1}{x} & , x \neq 0 \\ 0 & , x = 0 \end{cases}$$

$$\lim_{h\to 0} \frac{f(0+h)-f(0)}{h} = \lim_{h\to 0} \frac{h^2 \sin \frac{1}{h}}{h} = \lim_{h\to 0} h \sin \frac{1}{h} = 0 .$$

For $x \neq 0$ $f'(x) = 2x \sin \dfrac{1}{x} - \cos \dfrac{1}{x}$

Since $\lim\limits_{x\to 0} f'(x)$ does not exist. So f is differentiable but not continuously differentiable. All polynomials are continuously differentiable.

HIGHER ORDER DIFFERENTIATION

Let $y = f(x)$ be a differentiable function such that $z = f'(x)$ is also differentiable. Then the second derivative of $y = f(x)$ is denoted by $y_2(x)$, $f''(x)$ or $\mathrm{d}^2y/\mathrm{d}x^2$, and is defined by

$$\frac{\mathrm{d}^2 y}{\mathrm{d}x^2} = \frac{\mathrm{d}}{\mathrm{d}x}\left(\frac{\mathrm{d}y}{\mathrm{d}x}\right)\left(= \frac{dz}{dx}\right)$$

Similarly, we can define

$$\frac{\mathrm{d}^3 y}{\mathrm{d}x^3} = \frac{\mathrm{d}}{\mathrm{d}x}\left(\frac{\mathrm{d}^2 y}{\mathrm{d}x^2}\right) = f'''(x) \text{ and } f^{(\mathrm{iv})}(x) = \frac{\mathrm{d}^4 y}{\mathrm{d}x^4}$$

or, in general, $\dfrac{\mathrm{d}^n y}{\mathrm{d}x^n} = \dfrac{\mathrm{d}}{\mathrm{d}x}\left(\dfrac{\mathrm{d}^{n-1} y}{\mathrm{d}x^{n-1}}\right)$ for any $n \in \mathbf{N}$, $n > 1$.

Many functions, like polynomial, trigonometric, exponential and logarithmic functions, are differentiable at each point of their domain.

SOME FORMULAE OF DIFFERENTIATION

Let $f(x)$ and $g(x)$ be differentiable functions and $\alpha \in \mathbf{R}$.

1. *Sum and Difference Rule*

   $$\frac{\mathrm{d}}{\mathrm{d}x}(f(x) \pm g(x)) = \frac{\mathrm{d}}{\mathrm{d}x}(f(x)) \pm \frac{\mathrm{d}}{\mathrm{d}x}(g(x))$$

2. *Scalar Multiple Rule*

   $$\frac{\mathrm{d}}{\mathrm{d}x}(\alpha f(x)) = \alpha \frac{\mathrm{d}}{\mathrm{d}x} f(x)$$

3. *Product rule.*

   $$\frac{\mathrm{d}}{\mathrm{d}x}(f(x)g(x)) = g(x)\frac{\mathrm{d}}{\mathrm{d}x}(f(x)) + f(x)\frac{\mathrm{d}}{\mathrm{d}x}(g(x))$$

4. *Quotient rule*

   $$\frac{\mathrm{d}}{\mathrm{d}x}\left(\frac{f(x)}{g(x)}\right) = \frac{g(x)\dfrac{\mathrm{d}}{\mathrm{d}x}(f(x)) - f(x)\dfrac{\mathrm{d}}{\mathrm{d}x}(g(x))}{(g(x))^2}$$

   provided g $(x) \neq 0$

5. *Chain rule* If $y = h(u)$ and $u = f(x)$, then

   $$\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{\mathrm{d}y}{\mathrm{d}u}\frac{\mathrm{d}u}{\mathrm{d}x}$$

6. *Test of constancy* If at all points of a certain interval, $f'(x) = 0$, then the function $f(x)$ has a constant value within this interval.

DIFFERENTIATION OF SOME ELEMENTARY FUNCTIONS

1. The trigonometric functions have the following derivatives:

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(\sin x) = \cos x$ $\dfrac{\mathrm{d}}{\mathrm{d}x}(\cos x) = -\sin x$

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(\tan x) = \sec^2 x$ $\dfrac{\mathrm{d}}{\mathrm{d}x}(\cot x) = -\operatorname{cosec}^2 x$

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(\sec x) = \sec x \tan x$

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(\operatorname{cosec} x) = -\operatorname{cosec} x \cot x$

2. If $f(x)$ is a differentiable function

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(x^n) = nx^{n-1}$ and in general

   $$\frac{\mathrm{d}}{\mathrm{d}x}(f(x)^n) = n(f(x))^{n-1} f'(x)$$

3. If $f(x)$ is a differentiable function

   $\dfrac{\mathrm{d}}{\mathrm{d}x}(\log x) = \dfrac{1}{x}$ and in general

   $$\frac{\mathrm{d}}{\mathrm{d}x}(\log f(x))) = \frac{1}{f(x)} f'(x)$$

4. $\dfrac{d}{dx}(a^x) = a^x \log a$. In particular,

$$\frac{d}{dx}(e^x) = e^x \quad \text{and} \quad \frac{d}{dx}(e^{f(x)}) = e^{f(x)} f'(x)$$

5. $\dfrac{d}{dx}(\sin^{-1}x) = -\dfrac{d}{dx}(\cos^{-1}x) = \dfrac{1}{\sqrt{1-x^2}}$ for $-1 < x < 1$.

At the points $x = \pm 1$, $\sin^{-1} x$ and $\cos^{-1} x$ are not differentiable.

6. $\dfrac{d}{dx}(\tan^{-1} x) = -\dfrac{d}{dx}(\cot^{-1} x) = \dfrac{1}{1+x^2}$, for $x \in \mathbf{R}$

7. $\dfrac{d}{dx}(\sec^{-1}x) = -\dfrac{d}{dx}(\operatorname{cosec}^{-1}x) = \dfrac{1}{|x|\sqrt{x^2-1}}$ for $|x| > 1$.

DIFFERENTIATION OF IMPLICIT FUNCTIONS

To find dy/dx when a differentiable function $y = y(x)$ satisfies the equation $F(x, y) = 0$, we differentiate F with respect to x, considering y as a function of x, and solve the resulting equation to obtain for dy/dx.

Illustration 3

To find $\dfrac{dy}{dx}$ if y satisfies $x^3 + y^3 - 3\,axy = 0$.

Differentiating w.r.t. x, we have

$$3x^2 + 3y^2\frac{dy}{dx} - 3a\left[x\frac{dy}{dx} + y\right] = 0$$

$$\Rightarrow \quad [3y^2 - 3ax]\frac{dy}{dx} = 3ay - 3x^2$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{ay - x^2}{y^2 - ax}$$

DIFFERENTIATION OF FUNCTIONS REPRESENTED PARAMETRICALLY

Let there be given two functions $x = \varphi(t)$ and $y = \psi(t)$, where $t \in (\alpha, \beta)$. If the function $x = \varphi(t)$ has an inverse, $t = \varphi^{-1}(x)$ on the interval (α, β), then the new function defined by $y(x) = \psi(\varphi^{-1}(x))$ is said to represent y parametrically. We find its derivative by using the relation

$$\frac{dy}{dx} = \frac{dy}{dt}.\frac{dt}{dx} \quad \text{and} \quad \frac{d^2y}{dx^2} = \frac{d}{dt}\left(\frac{dy}{dx}\right)\frac{dt}{dx}$$

Illustration 4

$$x = e^t \sin t,\ y = e^t \cos t$$

To find $\dfrac{dy}{dx}$, we compute first $\dfrac{dx}{dt}$ and $\dfrac{dy}{dt}$.

$$\frac{dx}{dt} = e^t \cos t + e^t \sin t = e^t(\sin t + \cos t)$$

$$\frac{dy}{dt} = -e^t \sin t + e^t \cos t = e^t(\cos t - \sin t)$$

So, $$\frac{dy}{dx} = \frac{dy}{dt}\cdot\frac{dt}{dx} = \frac{\cos t - \sin t}{\cos t + \sin t}.$$

LOGARITHMIC DIFFERENTIATION

The process of taking logarithms of both sides and then differentiating them is called logarithmic differentiation. It is useful in the following cases:

1. If the given function consists of three or more factors which are functions of x.
2. If the given function is of the form $(f(x))^{h(x)}$
3. If the given function is of the form $h_1(x)h_2(x)/h_3(x)h_4(x)$.

If $h(x) = (f_2(x))^{f_1(x)} f_3(x)$, then take logarithum of both the sides. The right hand side will be take the form

$$f_1(x)\log f_2(x) + \log f_3(x)$$

The last expression can be differentiated easily.

Illustration 5

$$y = (\sin x)^{\cos x}$$

Taking logarithum of both the sides, we have

$$\log y = \cos x \log \sin x$$

Differentiating, we get

$$\frac{1}{y}\frac{dy}{dx} = \cos x\frac{d}{dx}(\log\sin x) + (\log\sin x)\frac{d}{dx}\cos x$$

$$= \cos x\frac{\cos x}{\sin x} - (\log\sin x)\sin x$$

$$\Rightarrow \quad \frac{dy}{dx} = (\sin x)^{\cos x}\left[\frac{\cos^2 x}{\sin x} - (\log\sin x)\sin x\right]$$

Illustration 6

$$y = \sqrt[3]{\frac{x(x^2+1)}{(x^2-1)^2}}$$

Taking logarithum, we obtain

$$\log y = \frac{1}{3}\left[\log x + \log(x^2+1) - 2\log(x^2-1)\right]$$

Differentiating, we get

$$\frac{1}{y}\frac{dy}{dx} = \frac{1}{3}\left[\frac{1}{x} + \frac{2x}{x^2+1} - \frac{4x}{x^2-1}\right]$$

$$\Rightarrow \quad \frac{dy}{dx} = \sqrt[3]{\frac{x(x^2+1)}{(x^2-1)^2}} \times \frac{1}{3}\left[\frac{1}{x} + \frac{2x}{x^2+1} - \frac{4x}{x^2-1}\right]$$

LEIBNITZ THEOREM AND *n*th DERIVATIVES

Let $f(x)$ and $g(x)$ be functions both possessing derivatives up to nth order. Then,

$$\frac{d^n}{dx^n}(f(x)\,g(x)) = f^n(x)\,g(x) + {}^nC_1 f^{n-1}(x)\,g^1(x) + {}^nC_2 f^{n-2}(x)\,g^2(x) + \dots + {}^nC_r f^{n-r}(x)\,g^r(x) + \dots + {}^nC_n f(x)\,g^n(x).$$

where for any $k > 1$, $f^k(x) = \frac{d^k}{dx^k}(f(x))$ i.e. kth derivative of $f(x)$

$$\frac{d^n}{dx^n}(x^n) = n!;\quad \frac{d}{dx}\left(\frac{1}{x}\right) = \frac{(-1)^n\, n!}{x^{n+1}};$$

$$\frac{d^n}{dx^n}(\sin x) = \sin\left(x + n\frac{\pi}{2}\right),$$

$$\frac{d^n}{dx^n}(\cos x) = \cos\left(x + n\frac{\pi}{2}\right);$$

$$\frac{d^n}{dx^n}(e^{mn}) = m^n e^{mx}.$$

SOLVED EXAMPLES

Concept-based
Straight Objective Type Questions

Example 1: If $x = k(t - \sin t)$, $y = k(1 - \cos t)$ $(k \neq 0)$ then

$$\frac{d^2y}{dx^2} \text{ at } t = \frac{\pi}{2}$$

(a) $-\frac{1}{k}$ (b) $\frac{1}{2k}$

(c) $\frac{1}{k^2}$ (d) $2k$

Ans. (a)

Solution:

$$\frac{dx}{dt} = k(1 - \cos t),\quad \frac{dy}{dt} = k\sin t$$

so
$$\frac{dy}{dx} = \frac{k\sin t}{k(1-\cos t)} = \frac{2\sin\frac{t}{2}\cos\frac{t}{2}}{2\sin^2\frac{t}{2}} = \cot\frac{t}{2}$$

$$\frac{d^2y}{dx^2} = \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d}{dt}\left(\frac{dy}{dx}\right)\frac{dt}{dx}$$

$$= \frac{1}{2}\left(-\text{cosec}^2\left(\frac{t}{2}\right)\right)\frac{1}{k\left(2\sin^2\left(\frac{t}{2}\right)\right)}$$

$$= -\frac{1}{4k}\text{cosec}^4\frac{t}{2}$$

$$\left.\frac{d^2y}{dx^2}\right|_{t=\pi/2} = -\frac{1}{4k}(\sqrt{2})^4 = -\frac{1}{k}$$

Example 2: If $x = 2t + 3t^2$, $y = t^2 + 2t^3$ then $y'^2 + 2y'^3$ $\left(y' = \frac{dy}{dx}\right)$ is equal to

(a) $2y$ (b) y^2

(c) y (d) $3y + 2$

Ans. (c)

Solution: $\frac{dx}{dt} = 2 + 6t$, $\frac{dy}{dt} = 2t + 6t^2$

So that $$y' = \frac{dy}{dx} = \frac{2t+6t^2}{2+6t} = t$$

$$y'^2 + 2\,y'^3 = t^2 + 2t^3 = y$$

Example 3: If function $y = \frac{x-3}{x+4}$ satisfies the relationship $Ay'^2 = (y - 1)y''$ then A is equal to

(a) 1 (b) 3

(c) 4 (d) 2

Ans. (d)

Solution: $y = 1 - \frac{7}{x+4}$

$$\Rightarrow\quad y' = \frac{7}{(x+4)^2} \text{ and } y'' = -\frac{14}{(x+4)^3}$$

Therefore, the L.H.S. $= A\,y'^2 = \frac{49A}{(x+4)^4}$

and R.H.S. $= (y-1)y'' = \left(\frac{x-3-x-4}{x+4}\right)\left(-\frac{14}{(x+4)^3}\right)$

$$= \frac{98}{(x+4)^4}$$

Hence $A = 2$

Example 4: Let $f(x) = \left|x - \left(\frac{\pi}{2}\right)\right|^3 + \sin^2 x$, then $f''\left(\frac{\pi}{2}\right)$

(a) does not exist (b) is equal to 2

(c) is equal to –2 (d) is equal to 0

Ans. (c)

Solution: $f(x) = \begin{cases} \left(x - \frac{\pi}{2}\right)^3 + \sin^2 x & \text{if } x \geq \frac{\pi}{2} \\ -\left(x - \frac{\pi}{2}\right)^3 + \sin^2 x & \text{if } x < \frac{\pi}{2} \end{cases}$

Let $u(x) = \begin{cases} \left(x - \frac{\pi}{2}\right)^3 & x \geq \frac{\pi}{2} \\ -\left(x - \frac{\pi}{2}\right)^3 & x < \frac{\pi}{2} \end{cases}$

$$u'\left(\frac{\pi}{2}+\right) = \lim_{h\to 0+} \frac{\left(\frac{\pi}{2} + h - \frac{\pi}{2}\right)^3 - 0}{h}$$

$$= \lim_{h\to 0+} \frac{h^3}{h} = \lim_{h\to 0+} h^2 = 0$$

$$u'\left(\frac{\pi}{2}-\right) = \lim_{h\to 0-} \frac{-\left(\frac{\pi}{2} + h - \frac{\pi}{2}\right)^3}{h} = 0$$

$$u'(x) = \begin{cases} 3\left(x - \frac{\pi}{2}\right)^2, & x \geq \frac{\pi}{2} \\ -3\left(x - \frac{\pi}{2}\right)^2, & x < \frac{\pi}{2} \end{cases}$$

$$u''(x) = \begin{cases} 6\left(x - \frac{\pi}{2}\right), & x > \frac{\pi}{2} \\ -6\left(x - \frac{\pi}{2}\right), & x < \frac{\pi}{2} \end{cases}$$

$$u''\left(\frac{\pi}{2}+\right) = \lim \frac{3\left(h + \frac{\pi}{2} - \frac{\pi}{2}\right)^2 - 0}{h} = 0$$

If $v(x) = \sin^2 x$, then $v'(x) = 2 \sin x \cos x = \sin 2x$

so $v''(x) = 2\cos 2x$ and $v''\left(\frac{\pi}{2}\right) = -2$

Hence $f''\left(\frac{\pi}{2}\right) = 0 - 2 = -2$

Example 5: If $(x - a)^2 + (y - b)^2 = c^2$, for some $c > 0$, then the value of $\frac{\left(1 + y'^2\right)^{3/2}}{y''}$ is equal to

(a) $\frac{a-b}{a+b}$ (b) $\frac{c+a}{c-a}$

(c) 1 (d) $-c$

Ans. (d)

Solution: $2(x - a) + 2(y - b)\,\frac{dy}{dx} = 0$ (i)

$$\Rightarrow \quad y' = \frac{dy}{dx} = -\frac{x-a}{y-b}$$

Differentiating (i) again, we get

$$1 + (y - b)\, y'' + y'^2 = 0$$

$$\Rightarrow \quad y'' = -\frac{1 + y'^2}{(y-b)}$$

So, $$\frac{(1 + y'^2)^{3/2}}{y''} = \frac{\left(1 + \left(\frac{x-a}{y-b}\right)^2\right)^{1/2} \left(1 + y'^2\right)}{-\frac{\left(1 + y'^2\right)}{y-b}}$$

$$= -(y-b)\frac{\left((y-b)^2 + (x-a)^2\right)^{1/2}}{(y-b)}$$

$$= -c$$

Example 6: If $y = \sin(n \sin^{-1} x)$ satisfies $(1 - x^2)y'' - xy' + Ay = 0$ then A is equal to

(a) 1 (b) 2

(c) n^2 (d) n

Ans. (c)

Solution: $y' = \cos\left(n \sin^{-1} x\right) \frac{n}{\sqrt{1 - x^2}}$

Squaring both the sides, we have

$$(1 - x^2)\, y'^2 = n^2 \cos^2 (n \sin^{-1} x)$$

$$= n^2 [1 - \sin^2 (n \sin^{-1} x)]$$

$$= n^2 [1 - y^2]$$

Differentiating again

$$-2xy'^2 + (1 - x^2)\, 2y'y'' = -n^2\, 2yy'$$

$$\Rightarrow \quad (1 - x^2)\, y'' - xy' = -n^2 y$$

Hence $A = n^2$

Example 7: If $y = (x^2 + 1)^{\sin x}$, then $y'(0)$ is equal to

(a) 0 (b) 1

(c) 2 (d) – 1

Ans. (a)

Solution: Using logarithmic differentiation, we have

$$\log y = \sin x\, (\log(x^2 + 1))$$

$$\Rightarrow \quad \frac{1}{y}\frac{dy}{dx} = \cos x\, (\log(x^2 + 1)) + \frac{(\sin x)(2x)}{x^2 + 1}$$

$$\Rightarrow \quad \frac{dy}{dx} = (x^2 + 1)^{\sin x} \left[\frac{2x \sin x}{x^2 + 1} + \cos x \left(\log(x^2 + 1)\right)\right]$$

So, $\left.\dfrac{dy}{dx}\right|_{x=0} = 1\,[0 + |\log|]$

$= 0$

Example 8: If $x\sqrt{1+y} + y\sqrt{1+x} = 0$, for $-1 < x < 1$ then $\dfrac{dy}{dx}$ at $x = 0$ is

(a) 1 (b) –1

(c) 0 (d) 2

Ans. (b)

Solution: Differentiating the given relation implies

$$x\frac{1}{2\sqrt{1+y}}\frac{dy}{dx} + \sqrt{1+y} + \frac{dy}{dx}\sqrt{1+x} + \frac{y}{2\sqrt{1+x}} = 0$$

$$\Rightarrow \left(\frac{x}{2\sqrt{1+y}} + \sqrt{1+x}\right)\frac{dy}{dx} = -\left(\sqrt{1+y} + \frac{y}{2\sqrt{1+x}}\right)$$

Since $y(0) = 0$ So putting these values, we have

$$(0+\sqrt{1})\left.\frac{dy}{dx}\right|_{x=0} = -(\sqrt{1}+0)$$

$$\Rightarrow \left.\frac{dy}{dx}\right|_{x=0} = -1$$

Example 9: If $y = \sin\left(e^{x^2+3x-2}\right)$ then $\left.\dfrac{dy}{dx}\right|_{x=1}$ is equal to

(a) $5e^2 \cos e^2$ (b) $3e^2 \cos e^2$

(c) $e^2 \cos e^2$ (d) $\cos e^2$

Ans. (a)

Solution:

$$\frac{dy}{dx} = \cos\left(e^{x^2+3x-2}\right)\frac{d}{dx}\left(e^{x^2+3x-2}\right)$$

$$= \cos\left(e^{x^2+3x-2}\right)e^{x^2+3x-2}\frac{d}{dx}(x^2+3x-2)$$

$$= \cos\left(e^{x^2+3x-2}\right)e^{x^2+3x-2}(2x+3)$$

$$\left.\frac{dy}{dx}\right|_{x=1} = 5e^2 \cos(e^2)$$

Example 10: If $x = e^{\sin^{-1} y}$ then $\left.\dfrac{dy}{dx}\right|_{x=1}$

(a) –1 (b) 2

(c) 1/2 (d) 1

Ans. (d)

Solution: $x = e^{\sin^{-1} y} \Rightarrow \log x = \sin^{-1} y$

$\Rightarrow \quad y = \sin(\log x)$

$$\frac{dy}{dx} = \cos(\log x)\frac{1}{x},$$

so $\left.\dfrac{dy}{dx}\right|_{x=1} = \cos(\log 1) = \cos 0 = 1$

LEVEL 1

Straight Objective Type Questions

Example 11: If $f'(3) = 2$, then $\displaystyle\lim_{h\to 0}\frac{f(3+h^2)-f(3-h^2)}{2h^2}$ is

(a) 1 (b) 2

(c) 3 (d) 1/2

Ans. (b)

Solution: $\displaystyle\lim_{l-0}\frac{f(3+h^2)-f(3-h^2)}{2h^2}$

$$= \frac{1}{2}\lim_{h\to 0}\frac{f(3+h^2)-f(3)}{h^2} - \frac{1}{2}\lim_{h\to 0}\frac{f(3-h^2)-f(3)}{h^2}$$

$$= \frac{1}{2}[f'(3)+f'(3)] = 2.$$

Example 12: The set of all points where the function $f(x) = \sqrt{1-e^{-x^2}}$ is differentiable is

(a) $(0, \infty)$ (b) $(-\infty, \infty)$

(c) $(-\infty, \infty) \sim \{0\}$ (d) none of these.

Ans. (c)

Solution: For $x \neq 0, f'(x) = \dfrac{1}{2}\dfrac{1}{\sqrt{1-e^{-x^2}}}[-(-2x)e^{-x^2}]$

$$= \frac{x\,e^{-x^2}}{\sqrt{1-e^{-x^2}}}$$

Also $\displaystyle f'(0+) = \lim_{h\to 0+}\frac{f(h)-f(0)}{h}$

$$= \lim_{h \to 0+} \left(\frac{e^{-h^2} - 1}{-h^2} \right)^{1/2} = 1$$

and $$f'(0-) = -\lim_{h \to 0-} \left(\frac{e^{-h^2} - 1}{-h^2} \right)^{1/2} = -1.$$

Hence the set of all points of differentiability is $(-\infty, \infty) \sim \{0\}$.

◉ **Example 13:** If $f(x) = |\log_{10} x|$ then at $x = 1$

(a) f is not continuous
(b) f is continuous but not differentiable
(c) f is differentiable
(d) the derivative is 1.

Ans. (b)

◎ **Solution:** Since $g(x) = |x|$ is continuous but not differentiable at $x = 0$, so f is continuous but not differentiable for $\log_{10} x = 0$ i.e. for $x = 1$.

◉ **Example 14:** $f(x) = \begin{cases} |x-4| & \text{for } x \ge 1 \\ x^3/2 - x^2 + 3x + 1/2 & \text{for } x < 1, \end{cases}$ then

(a) $f(x)$ is continuous at $x = 1$ and at $x = 4$
(b) $f(x)$ is differentiable at $x = 4$
(c) $f(x)$ is continuous and differentiable at $x = 1$
(d) $f(x)$ is only continuous at $x = 1$.

Ans. (a)

◎ **Solution:** Since $g(x) = |x|$ is a continuous function and $\lim\limits_{x \to 1+} f(x) = 3 = \lim\limits_{x \to 1-} f(x)$ so f is a continuous function. In particular f is continuous at $x = 1$ and $x = 4$. f is clearly not differentiable at $x = 4$. Since $g(x) = |x|$ is not differentiable at $x = 0$. Now

$$f'(1+) = \lim_{h \to 0+} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \to 0+} \frac{|-3+h| - 3}{h} = -1,$$

$$f'(1-) = \lim_{h \to 0-} \frac{(1/2)(1+h)^3 - (1+h)^2 + 3(1+h) + 1/2 - 3}{h}$$

$$= \lim_{h \to 0-} \frac{(1/2)\left(h^3 + 3h^2 + 3h\right) - \left(h^2 + 2h\right) + 3h}{h}$$

$$= \frac{5}{2}.$$

Hence f is not differentiable at $x = 1$.

◉ **Example 15:** If $f(x) = |x - a| + |x + b|$, $x \in \mathbf{R}$, $b > a > 0$. Then

(a) $f'(a+) = 1$ (b) $f'(a+) = 0$
(c) $f'(-b+) = 0$ (d) $f'(-b+) = 1$

Ans. (c)

◎ **Solution:** $f'(a+) = \lim\limits_{h \to 0+} \dfrac{f(a+h) - f(a)}{h}$

$$= \lim_{h \to 0+} \frac{|h| + |a+b+h| - |a+b|}{h}$$

$$= \lim_{h \to 0+} \frac{h + a + b + h - (a+b)}{h} \text{ as } h > 0, a+b > 0$$

$$= 2$$

$$f'(-b+) = \lim_{h \to 0+} \frac{f(-b+h) - f(-b)}{h}$$

$$= \lim_{h \to 0+} \frac{|-b+h-a| + |h| - |-b-a|}{h}$$

$$= \lim_{h \to 0+} \frac{|a+b-h| + |h| - |a+b|}{h}$$

$$= \lim_{h \to 0+} \frac{a+b-h+h-(a+b)}{h} = 0.$$

◉ **Example 16:** The set of all points where the function $f(x) = 2x|x|$ is differentiable is

(a) $(-\infty, \infty)$ (b) $(-\infty, 0) \cup (0, \infty)$
(c) $(0, \infty)$ (d) $[0, \infty)$

Ans. (a)

◎ **Solution:** $f(x) = \begin{cases} 2x^2, & x \ge 0 \\ -2x^2, & x < 0 \end{cases}$

Since x^2 and $-x^2$ are differentiable functions, $f(x)$ is differentiable except possible at $x = 0$

Now $$f'(0+) = \lim_{h \to 0+} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0+} \frac{f(h)}{h}$$

$$= \lim_{h \to 0+} \frac{2h^2}{h} = 0$$

and $$f'(0-) = \lim_{h \to 0-} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0-} \frac{f(h)}{h}$$

$$= \lim_{h \to 0-} \frac{-2h^2}{h} = 0.$$

Hence f is differentiable everywhere.

◉ **Example 17:** The function $f(x) = \sin^{-1}(\tan x)$ is not differentiable at

(a) $x = 0$ (b) $x = -\pi/6$
(c) $x = \pi/6$ (d) $x = \pi/4$

Ans. (d)

◎ **Solution:** The function $f(x) = \sin^{-1}(\tan x)$ $(-\pi/4 \le x < \pi/4)$ is not differentiable for those x for which $\tan x = 1$ or -1. This happens if $x = \pi/4$ or $-\pi/4$.

◉ **Example 18:** Let $[\cdot]$ denote the greatest integer function and $f(x) = [\tan^2 x]$. Then

(a) $\lim_{x\to 0} f(x)$ does not exist
(b) $f(x)$ is continuous at $x = 0$
(c) $f(x)$ is not differentiable at $x = 0$
(d) $f'(0) = 1$.

Ans. (b)

◎ **Solution:** For $0 < x < \pi/4$, $0 < \tan^2 x < 1 \Rightarrow [\tan^2 x] = 0$ for $0 < x < \pi/4$. As $\tan^2 x$ is an even function, so $\lim_{x\to 0+} f(x) = \lim_{x\to 0+} f(x) = 0$. So f is continuous at $x = 0$. Now

$$\lim_{h\to 0}\frac{f(0+h)-f(0)}{h} = \lim_{h\to 0}\frac{f(h)-(0)}{h} = \lim_{h\to 0}\frac{0}{h} = 0.$$

Hence f is differentiable at $x = 0$ and $f'(0) = 0$.

◉ **Example 19:** If $f(x)$ differentiable everywhere then

(a) $|f(x)|$ is differentiable everywhere
(b) $|f|^2$ is differentiable everywhere
(c) $f\,|f|$ is not differentiable at some point
(d) none of these

Ans. (b)

◎ **Solution:** If f is differentiable then $|f|^2(x) = f(x)^2$ which is differentiable. For $f(x) = x$, (a) and (c) do not hold.

◉ **Example 20:** Suppose f is differentiable at $x = 1$ and $\lim_{h\to 0}\frac{1}{h}f(1+h) = 5$ then

(a) $f'(1) = 4$ (b) $f'(1) = 3$
(c) $f'(1) = 6$ (d) none of these

Ans. (d)

◎ **Solution:** Since f is differentiable so it is continuous also. Thus

$$f(1) = \lim_{h\to 0} f(1+h) = \lim_{h\to 0} h\frac{f(1+h)}{h} = (0)(5) = 0$$

Hence $$f'(1) = \lim_{h\to 0}\frac{f(1+h)-f(1)}{h} = \lim_{h\to 0}\frac{f(1+h)}{h} = 5.$$

◉ **Example 21:** If $f(a) = a^2$, $\phi(a) = b^2$ $(a > 0, b > 0)$ and $f'(a) = 3\,\phi'(a)$ then $\lim_{x\to a}\frac{\sqrt{f(x)}-a}{\sqrt{\phi(x)}-b}$ is

(a) b^2/a^2 (b) b/a
(c) $2b/a$ (d) none of these

Ans. (d)

◎ **Solution:** $$\lim_{x\to a}\frac{\sqrt{f(x)}-a}{\sqrt{\phi(x)}-b}$$

$$= \lim_{x\to a}\frac{f(x)-a^2}{\phi(x)-b^2}\times\frac{\sqrt{\phi(x)}+b}{\sqrt{f(x)}+a}$$

$$= \lim_{x\to a}\frac{f(x)-f(a)}{\phi(x)-\phi(a)}\times\frac{\sqrt{\phi(x)}+b}{\sqrt{f(x)}+a}$$

$$= \frac{f'(a)}{\phi'(a)}\times\frac{\sqrt{\phi(a)}+b}{\sqrt{f(a)}+a} = \frac{3b}{a}.$$

◉ **Example 22:** Let f and g be differentiable function satisfying $g'(a) = 2$, $g(a) = b$ and $g = f^{-1}$ then $f'(b)$ is equal to

(a) 1/2 (b) 2
(c) 2/3 (d) none of these

Ans. (a)

◎ **Solution:** Since $g = f^{-1}$ so $f \circ g\,(x) = x$. Therefore, $f'(g(x))\,g'(x) = 1$. Thus, $f'(g(a))\,g'(a) = 1$

$\Rightarrow \quad f'(b)2 = 1 \quad \Rightarrow \quad f'(b) = 1/2.$

◉ **Example 23:** Let $f(x) = |x - a|\,\varphi(x)$, where φ is a continuous function and $\varphi(a) \neq 0$. Then

(a) $f'(a+) = \varphi'(a)$
(b) f is differentiable at $x = a$
(c) $f'(a+) = \varphi'(a)$
(d) $f'(a-) = -\varphi(a)$

Ans. (d)

◎ **Solution:** $$f'(a+) = \lim_{h\to 0+}\frac{|a+h-a|\,\varphi(a+h)-0}{h}$$

$$= \lim_{h\to 0+}\frac{|h|\,\varphi(a+h)}{h}$$

$$= \lim_{h\to 0+}\varphi(a+h) = \varphi(a)$$

Similarly $f'(a-) = -\varphi(a)$.

◉ **Example 24:** If $f'(c)$ exists and non-zero then $\lim_{h\to 0}\frac{f(c+h)+f(c-h)-2f(c)}{h}$ is equal to

(a) $f'(c)$ (b) 0
(c) $2f'(c)$ (d) none of these

Ans. (b)

◎ **Solution:** $$\lim_{h\to 0}\frac{f(c+h)+f(c-h)-2f(c)}{h}$$

$$= \lim_{h\to 0}\frac{f(c+h)-f(c)}{h}+\frac{f(c-h)-f(c)}{h}$$

$$= f'(c) - \lim_{h\to 0}\frac{f(c-h)-f(c)}{-h}$$

$$= f'(c) - f'(c) = 0$$

◉ **Example 25:** Let $f: \mathbf{R}\to\mathbf{R}$ be any function. Define $g: \mathbf{R}\to\mathbf{R}$ by $g(x) = |f(x)|$ for all x. Then g is

(a) g may be bounded even if f is unbounded
(b) one-one if f is one
(c) continuous if f is continuous
(d) differentiable if f is differentiable

Ans. (c)

◎ **Solution:** Take $f(x) = x$. Since g: $\mathbf{R}\to\mathbf{R}$ given by $g(x) = |x|$ is not one-one so (b) is violated. Also g is not differentiable at $x = 0$. Let $u(x) = |x|$ then u is continuous function and $g(x) = u(f(x)) = u \circ f(x)$. Hence g is continuous if f is continuous. It is easy to see g is bounded if and only if f is bounded.

◉ **Example 26:** The function $f(x) = (x^2 - 1)\,|x^2 - 3x + 2| + \cos|x|$ is not differentiable at

(a) -1 (b) 0
(c) 1 (d) 2

Ans. (d)

◎ **Solution:** $f(x) = (x + 1)(x - 1)\,|x - 1|\,|x - 2| + \cos x$, because

$$\cos|x| = \begin{cases} \cos x, & \text{if } x \ge 0 \\ \cos(-x), & \text{if } x < 0 \end{cases} = \cos x.$$

Since $h(x) = x|x|$ is differentiable at $x = 0$, so $(x-1)\,|x-1|$ is differentiable at $x = 1$. Also $f(x)$ is not differentiable at $x = 2$.

◉ **Example 27:** Let $f : \mathbf{R} \to \mathbf{R}$ and $g : \mathbf{R} \to \mathbf{R}$ be defined by $g(x) = xf(x)$ then

(a) g is a differentiable function
(b) g is differentiable at 0 if f is continuous at 0
(c) g is one-one if f is one-one
(d) none of these

Ans. (b)

◎ **Solution:** Take $f(x) = \operatorname{sgn} x$ then $g(x) = |x|$, hence g need not be differentiable. Take $f(x) = x$, then $g(x) = x^2$ which is not one-one.

Let f be continuous at 0, then for $h \neq 0$.

$$\frac{g(0+h) - g(0)}{h} = \frac{hf(h)}{h} = f(h). \text{ Therefore, } g'(0) = f(0).$$

◉ **Example 28:** If $y = \tan^{-1}\left(\dfrac{\sqrt{1+x^2} - 1}{x}\right)$, then $y'(0)$ is

(a) 1/2 (b) 0
(c) 1 (d) doesn't exist.

Ans. (a)

◎ **Solution:** Putting $x = \tan\theta$, we get

$$\frac{\sqrt{1+x^2} - 1}{x} = \frac{\sec\theta - 1}{\tan\theta} = \frac{1 - \cos\theta}{\sin\theta} = \tan\left(\frac{\theta}{2}\right)$$

Hence $y = \dfrac{1}{2}\tan^{-1} x$ so $y'(x) = \dfrac{1}{2(1+x^2)}$ and thus $y'(0) = 1/2$.

◉ **Example 29:** If $f'(x) = g(x)$ and $g'(x) = -f(x)$ for all x and $f(2) = 4 = f'(2)$ then $(f(24))^2 + (g(24))^2$ is

(a) 32 (b) 24
(c) 64 (d) 48

Ans. (a)

◎ **Solution:** $\dfrac{d}{dx}\left((f(x))^2 + (g(x))^2\right) = 2[f(x)f'(x) + g(x)g'(x)] = 2[f(x)g(x) - g(x)f(x)] = 0.$

Hence $(f(x))^2 + (g(x))^2$ is constant. Thus $(f(24))^2 + (g(24))^2 = (f(2))^2 + (g(2))^2 = 16 + 16 = 32.$

◉ **Example 30:** If $f(x) = \log_{x^2}(\log x)$ then $f'(x)$ at $x = e$ is

(a) 0 (b) 1
(c) e^{-1} (d) $(2e)^{-1}$.

Ans. (d)

◎ **Solution:** $f(x) = \dfrac{\log(\log x)}{\log x^2} = \dfrac{1}{2}\dfrac{\log(\log x)}{\log x}$

$$\text{Therefore } f'(x) = \frac{1}{2}\,\frac{\log x \cdot \dfrac{1}{x\log x} - \dfrac{1}{x}\log(\log x)}{(\log x)^2}$$

and thus $f'(e) = \dfrac{1}{2}\left[\dfrac{1}{e} - 0\right] = (2e)^{-1}$.

◉ **Example 31:** If $x = 2\sin t - \sin 2t$, $y = 2\cos t - \cos 2t$, then the value of $\dfrac{d^2y}{dx^2}$ at $t = \dfrac{\pi}{2}$ is

(a) 2 (b) $-1/2$
(c) $-3/4$ (d) $-3/2$.

Ans. (b)

◎ **Solution:** $\dfrac{dx}{dt} = 2\cos t - 2\cos 2t = 2\,[2\sin(3t/2)\sin t/2]$

and $\dfrac{dy}{dt} = -2\sin t + 2\sin 2t = 2\left[\sin\dfrac{3t}{2}\cos\dfrac{t}{2}\right].$

Hence $\dfrac{dy}{dx} = \cot(t/2)$ and $\left(\dfrac{d^2y}{dx^2}\right) = -\dfrac{1}{2}\operatorname{cosec}^2(t/2) \times \dfrac{dt}{dx}$

Therefore, $\dfrac{d^2y}{dx^2} = -\dfrac{1}{2}\operatorname{cosec}^2(t/2)\,x \times \dfrac{1}{4\sin(3t/2)\sin(t/2)}$

and $\left.\dfrac{d^2y}{dx^2}\right|_{t=\pi/2} = \left(-\dfrac{1}{2}\right) \times \left(\sqrt{2}\right)^2 \times \dfrac{1}{4 \times (1/2)} = -\dfrac{1}{2}$.

◉ **Example 32:** Let $f(x) = \sin x$, $g(x) = x^2$ and $h(x) = \log x$. If $F(x) = h(f(g(x)))$, then $F''(x)$ is

(a) $2\operatorname{cosec}^3 x$
(b) $2\cot x^2 - 4x^2\operatorname{cosec}^2 x^2$
(c) $2x\cot x^2$
(d) $-2\operatorname{cosec}^2 x$.

Ans (b)

◎ **Solution:** $F(x) = h(f(g(x))) = h(f(x^2)) = h(\sin x^2) = \log\sin x^2$.

Hence $F'(x) = 2x\cot x^2$. and $F''(x) = 2\cot x^2 - 4x^2\operatorname{cosec}^2 x^2$.

Example 33: Let $y = e^{2x}$. Then $\left(\frac{d^2y}{dx^2}\right)\left(\frac{d^2x}{dy^2}\right)$ is

(a) 1　　(b) e^{-2x}

(c) $2\,e^{-2x}$　　(d) $-2e^{-2x}$.

Ans. (d)

Solution: $\frac{dy}{dx} = 2e^{2x}$ and $\frac{d^2y}{dx^2} = 4e^{2x}$. Also $x = \frac{1}{2}\log y$,

$$\text{so}\qquad \frac{dx}{dy} = \frac{1}{2y} \text{ and } \frac{d^2x}{dy^2} = -\frac{1}{2y^2} = -\frac{1}{2}e^{-4x}.$$

$$\text{Hence}\quad \left(\frac{d^2y}{dx^2}\right)\left(\frac{d^2x}{dy^2}\right) = -2e^{-2x}.$$

Example 34: Let $f(x + y) = f(x)f(y)$ for all x and y. If $f(5) = 2$ and $f'(0) = 3$ then $f'(5)$ is equal to

(a) 5　　(b) 8

(c) 0　　(d) none of these

Ans. (d)

Solution: Putting $x = 0$, $y = 5$ in the given equation, we get

$$f(0 + 5) = f(0)f(5) \Rightarrow f(5)\,[f(1) - 0] = 0 \Rightarrow f(0) = 1$$

$$f'(5) = \lim_{h\to 0}\frac{f(5+h) - f(5)}{h} = \lim_{h\to 0}\frac{f(5)(f(h)-1)}{h}$$

$$= f'(5)\lim_{h\to 0}\frac{f(h) - f(0)}{h} = (2)(3) = 6.$$

Example 35: If $f''(x)$ is continuous at $x = 0$ and $f''(0) = 4$, then the value of

$$\lim_{x\to 0}\frac{2f(x) - 3f(2x) + f(4x)}{x^2} \text{ is}$$

(a) 4　　(b) 8

(c) 12　　(d) none of these

Ans. (c)

Solution: Required limit

$$= \lim_{x\to 0}\frac{2f'(x) - 6f'(2x) + 4f'(4x)}{2x}\left(\frac{0}{0}\text{ form}\right)$$

$$= \lim_{x\to 0}\frac{2f''(x) - 12f''(2x) + 16f''(4x)}{2}$$

$$= 3f''(0) = 12.$$

Example 36: The solution set of $f'(x) > g'(x)$ where $f(x) = (1/2)\,5^{2x+1}$ and $g(x) = 5^x + 4x\log 5$ is

(a) $(1, \infty)$　　(b) $(0, 1)$

(c) $[0, \infty)$　　(d) $(0, \infty)$

Ans. (d)

Solution: $f'(x) = (1/2)\,5^{2x+1}(\log 5)(2) = \log 5\cdot(5^{2x+1})$ also $g'(x) = 5^x\log 5 + 4\log 5$.

So
$$\begin{aligned}\{x : f'(x) > g'(x)\} &= \{x : \log 5\cdot 5^{2x+1} > \log 5\,5^x + 4\log 5\}\\ &= \{x : 5^{2x+1} > 5^x + 4\}\\ &= \{t = 5^x : 5t^2 - t - 4 > 0\}\\ &= \{t = 5^x : (5t + 4)(t - 1) > 0\}\\ &= \{t = 5^x : t > 1 \text{ or } t < -4/5\}\\ &= \{t = 5^x : t > 1\} = (0, \infty).\end{aligned}$$

Example 37: The values of a and b such that the function f defined as

$$f(x) = \begin{cases} ax^2 - b, & |x| < 1\\ -1/|x|, & |x| \ge 1\end{cases} \text{ is differentiable are}$$

(a) $a = 1, b = -1$

(b) $a = 1/2, b = 1/2$

(c) $a = 1/2, b = 3/2$

(d) none of these

Ans. (c)

Solution: Since every differentiable function is continuous, so we must have

$$\lim_{x\to 1-} f(x) = f(1) \quad\Rightarrow\quad a - b = -1.$$

For f to be differentiable, $f'(1-) = f'(1+)$

$$\Rightarrow\quad \lim_{h\to 0-}\left[\frac{a(1+h)^2 - b + 1}{h}\right] = \lim_{h\to 0+}\left[\frac{-1/|1+h| + 1}{h}\right]$$

$$\Rightarrow\quad \lim_{h\to 0-}\left[\frac{a(2h+h^2)}{h}\right] = \lim_{h\to 0+}\frac{h}{h(1+h)} \quad (\text{as } a - b = -1)$$

$\Rightarrow\quad 2a = 1$. Hence $a = 1/2$ and $b = 3/2$.

Example 38: For a whole number n, if $f(x) = x^{n-1}\sin(1/x)$, $x \ne 0$ and $f(0) = 0$ then in order that f is differentiable at all x, the value of n can be

(a) 1　　(b) 2

(c) 3　　(d) 0

Ans. (c)

Solution: f is clearly differentiable except possibly $x = 0$.

$$f'(0) = \lim_{h\to 0}\frac{h^{n-1}\sin(1/h)}{h}$$

$$= \lim_{h\to 0} h^{n-2}\sin(1/h)$$

The last limit exists and is equal to 0 only if $n - 2 \ge 1$, i.e. $n \ge 3$. [Using Sandwich Theorem]

Example 39: $\frac{d}{dx}(\log\,(ax)^x)$, where a is a constant is equal to

(a) 1　　(b) $\log ax$

(c) $1/a$　　(d) $\log(ax) + 1$

Ans. (d)

◎ **Solution:** $\frac{d}{dx}(\log (ax)^x) = \frac{d}{dx}(x \log ax) = \log ax + 1.$

◉ **Example 40:** If $\cos^{-1}\left(\frac{x^2 - y^2}{x^2 + y^2}\right) = \log a$ then $\frac{dy}{dx}$ is equal to

(a) y/x (b) x/y

(c) x^2/y^2 (d) y^2/x^2

Ans. (a)

◎ **Solution:** $\cos^{-1}\left(\frac{x^2 - y^2}{x^2 + y^2}\right) = \log\ a \Rightarrow \frac{x^2 - y^2}{x^2 + y^2} = \cos$ $\log a = A$ (say)

Putting $u = y/x$ and applying componendo and dividendo, we have

$$(y/x)^2 = u^2 = (1 - A)/(1 + A)$$

$$\Rightarrow y/x = \sqrt{(1-A)/(1+A)}$$

$$\Rightarrow \quad x\, dy/dx - y = 0$$

$$\Rightarrow dy/dx = y/x$$

◉ **Example 41:** If $(\sin x)(\cos y) = 1/2$ then d^2y/dx^2 at $(\pi/4, \pi/4)$ is equal to

(a) -4 (b) -2

(c) -6 (d) 0

Ans. (a)

◎ **Solution:** Differentiating the given equation, we have $\cos x \cos y - \sin x \sin y\, dy/dx = 0$. Putting $x = y = \pi/4$, we have $\left.\frac{dy}{dx}\right|_{(\pi/4,\, \pi/4)} = 1$. Differentiating again, we get $-\sin x \cos y - \cos x \sin y\, dy/dx - \cos x \sin y\, dy/dx - \sin x \sin y\, (dy/dx)^2 - \sin x \sin y\, d^2y/dx^2 = 0$. Putting $x = y = \pi/4$, we have

$$\left.\frac{d^2 y}{dx^2}\right|_{(\pi/4, \pi/4)} = -4.$$

◉ **Example 42:** The set onto which the derivative of the function $f(x) = x(\log x - 1)$ maps the ray $[1, \infty)$ is

(a) $[1, \infty)$ (b) $(0, \infty)$

(c) $[0, \infty)$ (d) none of these

Ans. (c)

◎ **Solution:** $f'(x) = \log x - 1 + x\left(\frac{1}{x}\right) = \log x$

Since $\log x$ is an increasing function so f' maps $[1, \infty)$ onto $[0, \infty)$.

◉ **Example 43:** Let $f(x)$ be a function satisfying $f(x + y) = f(x) f(y)$ for all $x, y \in \mathbf{R}$ and $f(x) = 1 + x\, g(x)$ where $\lim_{x \to 0} g(x) = 1$ then $f'(x)$ is equal to

(a) $g'(x)$ (b) $g(x)$

(c) $f(x)$ (d) none of these

Ans. (c)

◎ **Solution:** $f'(x)$

$$= \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{f(x)f(h) - f(x)}{h}$$

$$= f(x) \lim_{h \to 0} \frac{f(h) - 1}{h} = f(x) \lim_{h \to 0} \frac{1 + hg(h) - 1}{h}$$

$$= f(x) \lim_{h \to 0} g(h) = f(x)$$

◉ **Example 44:** Let $g = f^{-1}$ and $f'(x) = \frac{1}{1 + x^4}$ then $g'(x)$ is equal to

(a) $(1 + (g(x)^4)^{-1}$ (b) $(1 + (f(x))^4)^{-1}$

(c) $1 + (f(x))^4$ (d) $1 + (g(x))^4$

Ans. (d)

◎ **Solution:** Since $g(f(x)) = x$ so $g'(f(x)) f'(x) = 1$ $\Rightarrow g'(f(x)) = 1 + x^4$. Putting $u = f(x)$ so that $g(u) = x$, we have $g'(u)$

$$= 1 + (g(u))^4.$$

◉ **Example 45:** Suppose for a differentiable function f, $f(0) = 0, f(1) = 1$ and $f'(0) = 4 = f'(1)$. If $g(x) = f(e^x)\, e^{f(x)}$ then $g'(0)$ is equal to

(a) 4 (b) 8

(c) 2 (d) none of these

Ans. (b)

◎ **Solution:** $g'(x) = f'(e^x)\, e^x\, e^{f(x)} + f(e^x)\, e^{f(x)} f'(x)$, so $g'(0) = f'(1)\, e^{f(0)} + f(1)\, e^{f(0)} f'(0) = f'(1) + f'(0) = 8$

◉ **Example 46:** If the function f is differentiable and strictly increasing in a neighbourhood of 0, then $\lim_{x \to 0} \frac{f(x^5) - f(x)}{f(x) - f(0)}$ is equal to

(a) -1 (b) 0

(c) 1 (d) $5/2$

Ans. (a)

◎ **Solution:** $\frac{f(x^5) - f(x)}{f(x) - f(0)}$

$$= \frac{f(x^5) - f(0) - (f(x) - f(0))}{f(x) - f(0)}$$

$$= \frac{f(x^5) - f(0)}{f(x) - f(0)} - 1$$

$$= \frac{\frac{f(x^5) - f(0)}{x^5 - 0} \times x^5}{\frac{f(x) - f(0)}{x - 0} \times x} - 1$$

So $$\lim_{x \to 0} \frac{f(x^5) - f(x)}{f(x) - f(0)} = \lim_{x \to 0} x^4 \times \frac{f'(0)}{f'(0)} - 1$$

$$= 0 - 1 = -1\ .\ (f'(0) > 0)$$

Example 47: Let $f(x) = ||x-1|-1|$, then all the points where $f(x)$ is not differentiable is (are)

(a) 1 (b) 1, 2
(c) ± 1 (d) 0, 1, 2

Ans. (d)

Solution: $f(x) = \begin{cases} |x-1|-1 & \text{if } |x-1| \ge 1 \\ 1-|x-1| & \text{if } |x-1| < 1 \end{cases}$

$$= \begin{cases} -x & x \le 0 \\ x & 0 < x \le 1 \\ 2-x & 1 < x < 2 \\ x-2 & x \ge 2 \end{cases}$$

f is not differentiable at 0, 1, 2 as these are corner points on the graph.

Example 48: $\dfrac{d^2x}{dy^2}$ equals

(a) $\left(\dfrac{d^2y}{dx^2}\right)^{-1}$ (b) $-\left(\dfrac{d^2y}{dx^2}\right)^{-1}\left(\dfrac{dy}{dx}\right)^{-3}$
(c) $\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-2}$ (d) $-\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-3}$

Ans. (d)

Solution: $\dfrac{dx}{dy} = \dfrac{1}{dy/dx}$

$$\Rightarrow \quad \frac{d^2x}{dy^2} = \frac{d}{dy}\left(\frac{1}{dy/dx}\right) = \frac{d}{dx}\left(\frac{1}{dy/dx}\right)\frac{dx}{dy}$$

$$-\frac{d}{dx}\left(\frac{dy}{dx}\right)\left(\frac{dy}{dx}\right)^{-2}\left(\frac{dy}{dx}\right)^{-1}$$

$$= -\frac{d^2y}{dx^2}\left(\frac{dy}{dx}\right)^{-3}$$

Example 49: If $x^2 + y^2 = t + \dfrac{1}{t}$ and $x^4 + y^4 = t^2 + \dfrac{1}{t^2}$ $(xy > 0)$ then $\dfrac{d^2y}{dx^2}$ is equal

(a) $1/x^3$ (b) $2/x^3$
(c) $2\sqrt{2}/x^3$ (d) $2\sqrt{2}/x^4$

Ans. (b)

Solution: $(x^2 + y^2)^2 = \left(t+\dfrac{1}{t}\right)^2 = t^2 + \dfrac{1}{t^2} + 2 = x^4 + y^4 + 2$

$$\Rightarrow \quad 2x^2y^2 = 2 \quad \Rightarrow \quad x^2y^2 = 1 \quad \Rightarrow \quad xy = 1$$

$$\Rightarrow \quad x\frac{dy}{dx} + y = 0 \quad \Rightarrow \frac{dy}{dx} = -\frac{y}{x} = -\frac{1}{x^2}$$

$$\Rightarrow \quad \frac{d^2y}{dx^2} = \frac{2}{x^3}.$$

Example 50: If $2f(\sin x) + f(\cos x) = x$ for all $x \in$ **R** then $y = f(x)$ satisfies

(a) $(1 - x^2)\, y'' - xy' = 0$
(b) $x^2 y'' - (1 - x^2)y' = 0$
(c) $(1 + x^2)\, y'' + xy' = 0$
(d) $(1 - x^2)\, y'' + xy' = 0$

Ans. (a)

Solution: Replacing x by $\pi/2 - x$ in the given equation, we get

$$2f(\cos x) + f(\sin x) = \pi/2 - x$$

Solving this equation with the given equation, we obtain

$$f(\cos x) = \pi/3 - x \Rightarrow y = f(x) = \pi/3 - \cos^{-1}x$$

$$\Rightarrow \quad y' = \frac{1}{\sqrt{1-x^2}} \quad \Rightarrow \quad y'^2(1 - x^2) = 1$$

Differentiating again we have

$$2\,y'\,y''(1 - x^2) - 2x\,y'^2 = 0$$

$$\Rightarrow \quad (1 - x^2)\,y'' - xy' = 0.$$

Example 51: Let $f(x) = (1 + \sin x)\,(2 + \sin^2 x) \ldots + (n + \sin^n x)$ then $f'(0)$ is equal to

(a) 1 (b) $n!$
(c) $n!/2$ (d) n

Ans. (b)

Solution: $\log f(x) = \displaystyle\sum_{k=1}^{n} \log\left(k + \sin^k x\right)$

$$\Rightarrow \quad \frac{f'(x)}{f(x)} = \sum_{k=1}^{n} \frac{k \sin^{k-1} x \cos x}{k + \sin^k x}$$

$f'(0) = f(0) \,.\, 1$ (If $k = 1$, then at $x = 0$ the corresponding term in summation is 1 otherwise it is 0)

$$f'(0) = 1.\,2.\,\ldots n = n! \text{ as } f(0) = n!$$

Example 52: Let f_α be a function defined by $f_\alpha(x) = \begin{cases} x^\alpha \sin 1/x & , x \ne 0 \\ 0 & , x = 0 \end{cases}$

A value of α so that f_α is differentiable on **R** and f'_α is differentiable on **R** is

(a) 2 (b) 5/2
(c) 7/2 (d) 1

Ans. (c)

Solution: For $x \ne 0$

$$f'_\alpha(x) = x^{\alpha-2} \sin 1/x + \alpha x^{\alpha-1} \sin 1/x$$

$$\frac{f_\alpha(x) - f_\alpha(0)}{x - 0} = x^{\alpha-1} \sin 1/x$$

$$\lim_{x \to 0} \frac{f_\alpha(x) - f_\alpha(0)}{x - 0} \text{ exists and is equal 0 if } \alpha > 1$$

For $x \ne 0$, $f''_\alpha(x) = (\alpha - 2)\, x^{\alpha-3} \sin 1/x - x^{\alpha-4} \cos 1/x + \alpha(\alpha - 1)\, x^{\alpha-2} \sin 1/x - \alpha\, x^{\alpha-3} \cos 1/x$

$$\lim_{x\to 0}\frac{f'_\alpha(x)-f'_\alpha(0)}{x-0} = \lim_{x\to 0}\left(x^{\alpha-3}\sin 1/x+\alpha x^{\alpha-2}\sin 1/x\right)$$

The last limit exists if $\alpha > 3$ So $\alpha = 7/2$.

◉ **Example 53:** If function $f(x)$ is differentiable at $x = a$ then $\lim_{x\to a}\frac{x^2 f(a)-a^2 f(x)}{x-a}$ is.

(a) $-a^2 f'(a)$

(b) $af(a) - a^2 f'(a)$

(c) $2af(a) - a^2 f'(a)$

(d) $2af(a) + a^2 f'(a)$

Ans. (c)

◎ **Solution:** For $x \neq a$, $\frac{x^2 f(a)-a^2 f(x)}{x-a}$

$$= \frac{(x^2-a^2)f(a)+a^2(f(a)-f(x))}{x-a}$$

$$= (x+a)f(a) - a^2\frac{f(x)-f(a)}{x-a}$$

Therefore, $\lim_{x\to a}\frac{x^2 f(a)-a^2 f(x)}{x-a} = 2af(a) - a^2 f'(a)$.

◉ **Example 54:** Let f: $(0, 1) \to \mathbf{R}$ be defined by $f(x) = \frac{b-x}{1-bx}$ where b is a constant such that $0 < b < 1$. Then

(a) f is not invertible on (0,1)

(b) $f \neq f^{-1}$ on (0, 1) and $f'(b) = \frac{1}{f'(0)}$

(c) $f = f^{-1}$ on (0, 1) and $f'(b) = \frac{1}{f'(0)}$

(d) f^{-1} is differentiable on (0, 1).

Ans. (a)

◎ **Solution:** As $f(0)$ and hence $f'(0)$ are not defined so (*b*) and (*c*) are not possible. Note that $0 < bx < 1$, for $0 < x < 1$. Thus $f(x) > 0$, for $0 < x < b$, $f(b) = 0$ and $f(x) < 0$, for $b < x < 1$. For $y_1, y_2 \in (0, 1)$

$$f(y_1) = f(y_2) \Rightarrow \frac{b-y_1}{1-by_1} = \frac{b-y_2}{1-by_2}$$

$$\Rightarrow \quad b - y_1 - b^2y_2 + by_1y_2 = b - b^2y^1 - y_2 + by_1y_2$$

$$\Rightarrow \quad (y_2 - y_1)(1 - b^2) = 0$$

Since $0 < b < 1$ so $y_2 = y_1$

Thus f is one – one, but f is not onto. The pre-image of any $y \in (1, \infty)$ is $\frac{b-y}{1-by}$ but $\frac{b-y}{1-by} \in (0,1)$ if $0 < b < 1/y$.

◉ **Example 55:** If $y = \operatorname{cosec}(\cot^{-1}x)$, then $\frac{dy}{dx}$ at $x = 1$ is equal to

(a) $\frac{1}{\sqrt{2}}$ (b) 1

(c) $-\sqrt{2}$ (d) $-\frac{1}{\sqrt{2}}$

Ans. (a)

◎ **Solution:**

$$\frac{dy}{dx} = -\operatorname{cosec}(\cot^{-1}x)\cot(\cot^{-1}x)\frac{d}{dx}(\cot^{-1}x)$$

$$= \operatorname{cosec}(\cot^{-1}x)\times\frac{1}{1+x^2}$$

$$\left.\frac{dy}{dx}\right|_{x=1} = \operatorname{cosec}\frac{\pi}{4}\times\frac{1}{2} = \sqrt{2}\times\frac{1}{2} = \frac{1}{\sqrt{2}}.$$

◉ **Example 56:** Let $f(x) = \begin{cases}\frac{1}{|x|} & \text{if } |x|>2\\ A+Bx^2 & \text{if } |x|\le 2\end{cases}$

then $f(x)$ is differentiable at $x = -2$ for:

(a) $A = \frac{3}{4},\ B = -\frac{1}{16}$

(b) $A = -\frac{1}{4},\ B = \frac{1}{16}$

(c) $A = \frac{1}{4},\ B = -\frac{1}{16}$

(d) $A = \frac{3}{4},\ B = \frac{1}{16}$

Ans. (a)

◎ **Solution:** $f(x) = \begin{cases}-\frac{1}{x}, & x<-2\\ A+Bx^2, & -2\le x\le 2\\ \frac{1}{x}, & x>2\end{cases}$

$$f'(-2+) = \lim_{h\to 0+}\frac{f(-2+h)-f(-2)}{h}$$

$$= \lim_{h\to 0+}\frac{A+B(-2+h)^2-(A+4B)}{h}$$

$$= B\lim_{h\to 0+}\frac{(4+h^2-4h)-4}{h}$$

$$= B\lim_{h\to 0+}(h-4) = -4B$$

$$f'(2-) = \lim_{h\to 0-}\frac{f(-2+h)-f(-2)}{h}$$

$$= \lim_{h\to 0-}\frac{-\frac{1}{-2+h}-(A+4B)}{h}$$

$$= -\lim_{h\to 0-}\frac{1+(A+4B)(-2)+(A+4B)h}{(-2+h)h}$$

The last limit exists if $1 + (-2)(A + 4B) = 0$ (i)

In case (i) is satisfied then the last limit is equal to

$$-\lim_{h\to 0-}\frac{A+4B}{(-2+h)} = \frac{1}{2}(A+4B) = \frac{1}{4}$$

Hence $B = -\frac{1}{16}$. Putting this value in (i)

$$1+(-2)\left(A-\frac{1}{4}\right) = 0 \Rightarrow A = \frac{3}{4}$$

Example 57: If $f''(x) = -f(x)$, $h(x) = f'(x)$ and $F(x) = (f(x/2))^2 + (h(x/2))^2$. Given that $F(2) = 4$, the value $F(1)$ is

(a) 2 (b) 4

(c) 1 (d) 0

Ans. (b)

Solution: $h'(x) = f''(x) = -f(x)$.

$$F'(x) = 2f\left(\frac{x}{2}\right)f'\left(\frac{x}{2}\right)\frac{1}{2} + 2h\left(\frac{x}{2}\right)h'\left(\frac{x}{2}\right)\frac{1}{2}$$

$$= f\left(\frac{x}{2}\right)f'\left(\frac{x}{2}\right) + f'\left(\frac{x}{2}\right)\left(-f\left(\frac{x}{2}\right)\right) = 0$$

Hence F is constant function. Therefore, $F(1) = F(2) = 4$.

Example 58: Let f be a differentiable function such that $8f(x) + 6f(1/x) - x = 5$ $(x \neq 0)$ and $y = x^2 f(x)$, then $\frac{dy}{dx}$ at $x = 1$ is

(a) $\frac{15}{14}$ (b) $\frac{17}{14}$

(c) $\frac{19}{14}$ (d) $-\frac{17}{14}$

Ans. (c)

Solution: Differentiating the given expression, we get

$$8f'(x) + 6f'\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right) - 1 = 0$$

$\Rightarrow$ $8f'(1) + 6f'(1)(-1) = 1$

$\Rightarrow$ $f'(1) = 1/2$

Also $\frac{dy}{dx} = 2xf(x) + x^2 f'(x)$

so, $\left.\frac{dy}{dx}\right|_{x=1} = 2f(1) + f'(1)$

Putting $x = 1$ in the given equation, we obtain

$8f(1) + 6f(1) - 1 = 5$

$\Rightarrow$ $14f(1) = 6$

$\Rightarrow$ $f(1) = \frac{3}{7}$

Hence $\left.\frac{dy}{dx}\right|_{x=1} = 2,\frac{3}{7} + \frac{1}{2} = \frac{19}{14}$

Example 59: Let $f(x) = \begin{cases} Ax & , x < 1 \\ Ax^2 + Bx + 4 & , x \geq 1 \end{cases}$

If f is differentiable for all x, then

(a) $A = 2, B = -2$ (b) $A = -4, B = 4$

(c) $A = 1, B = -1$ (d) $A = 4, B = -4$

Ans. (d)

Solution:

$$f'(1+) = \lim_{h\to 0+}\frac{f(1+h)-f(1)}{h}$$

$$= \lim_{h\to 0+}\frac{A(1+h)^2 + B(1+h) + 4 - (A+B+4)}{h}$$

$$= \lim_{h\to 0+}\frac{A(h^2+2h)+Bh}{h} = 2A + B$$

$$f'(1-) = \lim_{h\to 0-}\frac{f(1+h)-f(1)}{h}$$

$$= \lim_{h\to 0-}\frac{A(1+h)-(A+B+4)}{h}$$

$$= \lim_{h\to 0-}\frac{Ah-(B+4)}{h}$$

The last limit exist if $B + 4 = 0 \Rightarrow B = -4$. In this case, the last limit is equal to A.

Hence $A = 2A + B \Rightarrow A = 4$

Example 60: A twice differentiable function $f : \mathbf{R} \to \mathbf{R}$ satisfies $\sin x \cos y\,(f(2x + 2y) - f(2x - 2y)) = \cos x \sin y\,(f(2x + 2y) + f(2x - 2y))$ for all $x, y \in \mathbf{R}$ then

(a) $f''(x) = f(x) = 0$ (b) $4f''(x) + f(x) = 0$

(c) $f''(x) + f(x) = 0$ (d) $4f''(x) - f(x) = 0$

Ans. (b)

Solution:

$f(2x + 2y)(\sin x \cos y - \cos x \sin y)$

$= f(2x - 2y)[\sin x \cos y + \cos x \sin y]$

$\Rightarrow$ $f(2x + 2y)\sin(x - y) = f(2x - 2y)\sin(x + y)$

$$\Rightarrow \frac{f(2(x+y))}{\sin(x+y)} = \frac{f(2x-2y)}{\sin(x-y)}$$

Putting $2(x + y) = u$, $2(x - y) = v$

$$\Rightarrow \frac{f(u)}{\sin\frac{u}{2}} = \frac{f(v)}{\sin\frac{v}{2}} = k \text{ for all } u, v \in \mathbf{R}$$

$$\Rightarrow f(u) = k\sin\frac{u}{2}$$

$$\Rightarrow f'(u) = \frac{k}{2}\cos\frac{u}{2} \text{ and } f''(u) = \frac{-k}{4}\sin\frac{u}{2}$$

$$\text{so } 4f''(u) = -k\sin\frac{u}{2} = -f(u)$$

$$\Rightarrow 4f''(u) + f(u) = 0$$

Assertion-Reason Type Questions

Example 61: Let $y = \sqrt{2x - x^2}$, $0 \le x \le 2$

Statement-1: y satisfies $y^3\, y'' + 1 = 0$
Statement-1: y is a differentiable function of x on [0, 2]

Ans. (c)

Solution: $y' = \frac{1}{2}\,\frac{2 - 2x}{\sqrt{2x - x^2}} = \frac{1 - x}{y}$ for $x \ne 0, 2$

$\Rightarrow$ $yy' = 1 - x$. Differentiating again, we have

$$\Rightarrow \quad y'^2 + yy'' = -1 \quad \Rightarrow \quad y^3 y'' = -y^2 - (yy')^2$$
$$= -y^2 - (1 - x)^2$$
$$= -(2x - x^2) - (1 + x^2 - 2x) = -1$$

y is not differentiable at $x = 0, 2$.

Example 62: Let $x = \log t$, $y = t^2 - 1$

Statement-1: $\frac{d^2y}{dx^2}$ at $x = 0$ is 4

Statement-1: $\frac{d^2y}{dx^2} = 4t^2$

Ans. (a)

Solution: $\frac{dx}{dt} = \frac{1}{t}, \frac{dy}{dt} = 2t$ so $\frac{dy}{dx} = 2t^2$

$$\Rightarrow \quad \frac{d^2y}{dx^2} = \frac{d}{dt}\left(\frac{dy}{dx}\right)\frac{dt}{dx} = 4t\ .\ t = 4t^2$$

If $x = 0$ then $t = 1$ so $\frac{d^2y}{dx^2}$ at $x = 0$ is 4.

Example 63: If $e^y + xy = e$ then

Statement-1: $y''(0) = 1/e^2$
Statement-2: $y'(0) = -1$

Ans. (c)

Solution: $e^y\, y' + xy' + y = 0$ (1)

$\Rightarrow$ $e^y\, y'' + e^y\, y'^2 + y' + xy'' + y' = 0$ (2)

For $x = 0$, $e^{y(0)} + 0.y(0) = e \Rightarrow y(0) = 1$

Putting $x = 0$ in (1) $e^y(0)\, y'^{(0)} + y(0) = 0 \Rightarrow y'(0) = -1/e$

Putting $x = 0$ in (2) $e^{y(0)}\, y''(0) + e^{y(0)}\, (y'(0))^2 + 2y'(0) = 0$

$$\Rightarrow \quad ey''(0) + e\ .\ \frac{1}{e^2} - \frac{2}{e} = 0$$

$\Rightarrow$ $y''(0) = 1/e^2$.

Example 64: Let $x = t^3 + 1$, $y = t^2 + t + 1$

Statement-1: $\frac{dy}{dx}$ at (1, 1) is 1

Statement-2: $\frac{dt}{dx}$ is not defined at $x = 1$.

Ans. (d)

Solution: $\frac{dx}{dt} = 3t^2, \frac{dy}{dt} = 2t + 1$

$$\frac{dy}{dx} = \frac{2t + 1}{3t^2}.\ \text{If } x = 1, \text{ then } t = 0$$

$\frac{dt}{dx}$ is not defined at $t = 0$ and also $\frac{dy}{dx}$ is not defined at $t = 0$.

Example 65: If $y = \log\cos\left(\tan^{-1}\frac{e^x - e^{-x}}{2}\right)$

Statement-1: $y'(0) = 0$

Statement-2: $y'(x) = -\frac{e^x - e^{-x}}{1 + x^2}$

Ans. (c)

Solution: $y'(x)$

$$= -\frac{\sin\left(\tan^{-1}\frac{e^x - e^{-x}}{2}\right)}{\cos\left(\tan^{-1}\frac{e^x - e^{-x}}{2}\right)} \times \frac{1}{1 + \left(\frac{e^x - e^{-x}}{2}\right)^2} \times \frac{e^x + e^{-x}}{2}$$

$$= -\tan\left(\tan^{-1}\frac{e^x - e^{-x}}{2}\right)\frac{2}{\left(e^x + e^{-x}\right)^2} \times \left(e^x + e^{-x}\right)$$

$$= -\frac{e^x - e^{-x}}{e^x + e^{-x}}$$

$y'(0) = 0$.

Example 66: Consider the function

$f(x) = |x - 2| + |x - 5|$, x ε **R**

Statement 1. $f'(4) = 0$

Statement 2. f is continuous on [2, 5], differentiable on (2, 5) and $f(2) = f(5)$.

Ans. (b)

Solution: $f(x) = \begin{cases} 7 - 2x & if\ x \le 2 \\ 3 & if\ 2 \le x \le 5 \\ 2x - 7 & if\ x > 5 \end{cases}$

$f'(4) = 0$ as f is a constant function on (2, 5). Also f is continuous on [2, 5] and differentiable on (2, 5) and $f(2) = f(5)$ = 0 but this is not correct explanation of statement-1.

Example 67: Statement 1 : $f(x) = (\sin \pi x)(x-2)^{1/3}$ is differentiable at $x = 2$.

Statement 2: Pointwise product of two differentiable functions in differentiable.

Ans. (b)

Solution:

$$f'(2+) = \lim_{h\to 0+} \frac{f(2+h)-f(2)}{h}$$

$$= \lim_{h\to 0+} \frac{(\sin \pi(2+h))(2+h-2)^{1/3}}{h}$$

$$= \pi \lim_{h\to 0+} \frac{(\sin \pi h)(h)^{1/3}}{\pi h}$$

(h is small but positive)

$$= \pi.1.0 = 0$$

$$f'(2-) = \lim_{h\to 0-} \frac{\sin \pi(2+h)(2+h-2)^{1/3}}{h}$$

$$= \pi \lim_{h\to 0-} \frac{(-\sin \pi h)(h)^{1/3}}{\pi h}$$

(h is small and negative)

$$= -\pi \times 1 \times 0 = 0$$

Hence f is differentiable at $x = 2$. Statement 2 is also correct but since $(x-2)^{1/3}$ is not differentiable at $x = 2$, so statement 2 does not imply Statement 1.

Example 68: Suppose that f is a differentiable function and satisfies $f(x) + f(x-4) = 0$ for all $x \in \mathbf{R}$. If $f'(x) = u$ then $f'(x+800) = u$.

Statement 2: f satisfies $f(x) = f(x+8)$

Ans. (a)

Solution: Replacing x by $x + 4$ in the given equation of statement 1, we have

$$f(x+4) + f(x) = 0 \qquad \ldots\text{(i)}$$

Again replacing x by $x + 4$

$$f(x+8) + f(x+4) = 0$$

$$\Rightarrow \quad f(x+8) - f(x) = 0 \text{ using (i)}$$

so $\quad f(x) = f(x+8)$, for all $x \in \mathbf{R}$

$$f'(x+800) = \lim_{h\to 0} \frac{f(x+800+h)-f(x+800)}{h}$$

$$= \lim_{h\to 0} \frac{f(x+h)-f(x)}{h} = f'(x)$$

Example 69: Suppose that a differentiable function f satisfies $f(x+y^5) = f(x) + f(y^5)$, $x, y \in \mathbf{R}$.

Statement 1: If $f'(9) = 8$ then $f'(-9) = 8$

Statement 2: f is an odd function.

Ans. (a)

Solution: Putting $x = y = 0$ in the given equation, we have $f(0) = f(0) + f(0) \Rightarrow f(0) = 0$

Putting $y = -x^{1/5}$, we have $0 = f(0) = f(x + y^5)$

$$= f(x) + f(y^5)$$

$$= f(x) + f(-x)$$

Hence f is an odd function.

$$f'(-9) = \lim_{h\to 0} \frac{f(-9+h)-f(-9)}{h}$$

$$= \lim_{h\to 0} \frac{-f(9-h)+f(9)}{h}$$

$$= \lim_{h\to 0} \frac{f(9-h)-f(9)}{-h} = f'(9).$$

Example 70: Let $f(x) = \log\left(x+\sqrt{x^2+1}\right) + x^3 + \sin^5 x$

Statement 1: f' is an even function

Statement 2: f is an odd function

Ans. (a)

Solution: $f(-x) = \log(-x+\sqrt{x^2+1}) + (-x^3) + (-\sin^5 x)$

$$= \log\left(\frac{-x^2+x^2+1}{x+\sqrt{x^2+1}}\right) + (-x^3) + (-\sin^5 x)$$

$$= \log \frac{1}{x+\sqrt{x^2+1}} - x^3 - \sin^5 x$$

$$= -f(x)$$

Hence f is an odd function. Morever f is a differentiable function so f' is even.

LEVEL 2

Straight Objective Type Questions

Example 71: If $f(x) = p\,|\sin x| + qe^{|x|} + r|x|^3$ and if $f(x)$ is differentiable at $x = 0$, then

(a) $q + r = 0, p \in \mathbf{R}$ (b) $p + q = 0; r \in \mathbf{R}$

(c) $q = 0; r = 0; p \in \mathbf{R}$ (d) $r = 0; p = 0; q \in \mathbf{R}$

Ans. (b)

Solution: For $-\pi/2 < x \le 0$, $f(x) = -p \sin x + qe^{-x} - rx^3$, so

$$f'(0-) = \lim_{x\to 0-} \frac{f(x)-f(0)}{x-0}$$

$$= \lim_{x\to 0-}\left[-\frac{p\sin x}{x} - q\left(\frac{e^{-x}-1}{-x}\right) - rx^2\right]$$

$$= -p - q.$$

For $0 < x < \pi/2, f(x) = p\sin x + q\,e^x + rx^3$,

$$f'(0+) = \lim_{x\to 0+}\frac{f(x)-f(0)}{x-0}$$

$$= \lim_{x\to 0+}\left[\frac{p\sin x}{x} + q\left(\frac{e^{x}-1}{x}\right) - rx^2\right]$$

$$= p + q.$$

For f to be differentiable at $x = 0$, we must have

$$p + q = -p - q \Rightarrow p + q = 0.$$

Example 72: Let $h(x) = \min\{x, x^2\}$ for $x \in \mathbf{R}$. Then which of the following is not correct

(a) h is continuous for all x

(b) h is differentiable for all x

(c) $h'(x) = 1$ for all $x > 1$

(d) h is not *a* differentiable function at atleast two points

Ans. (b)

Solution: $h(x) = \begin{cases} x, & x \ge 1 \\ x^2, & 0 \le x < 1 \\ x, & x < 0 \end{cases}$

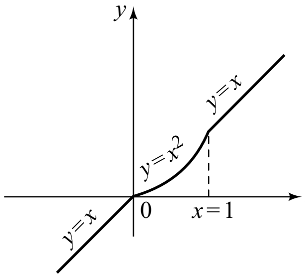

Fig. 10.3

From the graph it is clear that h is continuous. Also h is differentiable except possibly at $x = 0$ and 1.

$$h'(x) = \begin{cases} 1, & x > 1 \\ 2x, & 0 < x < 1 \\ 1 & x < 0 \end{cases}$$

For $x = 1$, $h'(1+) = \lim_{t\to 0+}\frac{h(1+t)-h(1)}{t}$

$$= \lim_{t\to 0+}\frac{1+t-1}{t} = 1$$

but $\quad h'(1-) = \lim_{t\to 0+}\frac{h(1-t)-h(1)}{t} = \lim_{t\to 0+}\frac{(1-t)^2-1}{t}$

$$= -2$$

So h is not differentiable at 1. Similarly $h'(0+) = 0$ but $h'(0-) = 1$

Example 73: Let $f(x) = \begin{cases} \dfrac{\sin|x^2-5x+6|}{x^2-5x+6} & x \ne 2, 3 \\ 1 & x = 2 \text{ or } 3 \end{cases}$

the set of all points where f is differentiable is

(a) $(-\infty, \infty)$

(b) $(-\infty, \infty) \sim \{2\}$

(c) $(-\infty, \infty) \sim \{3\}$

(d) $(-\infty, \infty) \sim \{2, 3\}$.

Ans. (d)

Solution: The function is clearly differentiable except possibly at $x = 2, 3$.

$$f'(2+) = \lim_{h\to 0+}\frac{f(2+h)-f(2)}{h}$$

$$= \lim_{h\to 0+}\frac{\sin h(1-h) + h(1-h)}{h^2(-1+h)}$$

$$= -\lim_{h\to 0+}\left(\frac{\sin h(1-h)}{h(1-h)} + 1\right)\frac{1}{h}$$

The last limit doesn'*t* exist. If this limit then $\lim_{h\to 0+}\frac{1}{h}$ exist, which is not true.

Thus f is not differentiable at $x = 2$. Similarly f is not differentiable at $x = 3$. Hence the set of all points where f is differentiable is $(-\infty, \infty) \sim \{2, 3\}$.

Example 74: If $f(x) = x\cdot\dfrac{(a^{1/x} - a^{-1/x})}{a^{1/x} + a^{-1/x}}$, $x \ne 0$ $(a > 0)$, $f(0) = 0$ then

(a) f is differentiable at $x = 0$

(b) f is not differentiable at $x = 0$

(c) f is not continuous at $x = 0$

(d) none of these.

Ans. (b)

Solution: $\lim_{x\to 0+} f(x) = \lim_{x\to 0+}\dfrac{x\left(a^{1/x} - a^{-1/x}\right)}{a^{1/x} + a^{-1/x}}$

$$= \lim_{x\to 0+}\frac{x\left(1 - a^{-2/x}\right)}{1 + a^{-2/x}}$$

also $\quad \lim_{x\to 0-} f(x) = \lim_{x\to 0-}\dfrac{x\left(a^{2/x} - 1\right)}{a^{2/x} - 1} = 0.$

So f is continuous at $x = 0$.

$$f'(0+) = \lim_{x\to 0+}\frac{h\left(a^{1/h} - a^{-1/h}\right)}{h\left(a^{1/h} + a^{-1/h}\right)}$$

$$= \lim_{x\to 0+}\frac{1 - a^{-2/h}}{1 + a^{-2/h}} = 1$$

Similarly $f'(0-) = -1$. Hence, f is not differentiable at $x = 0$.

Example 75: Suppose that f is a differentiable function with the property that $f(x + y) = f(x) + f(y) + xy$ and $\lim\limits_{h\to 0}\frac{1}{h}f(h) = 3$ then

(a) f is a linear function
(b) $f(x) = 3x + x^2$
(c) $f(x) = 3x + x^2/2$
(d) none of these.

Ans. (c)

Solution: $$f'(x) = \lim_{h\to 0}\frac{f(x+h)-f(x)}{h}$$
$$= \lim_{h\to 0}\frac{f(x)+f(h)+xh-f(x)}{h}$$
$$= \lim_{h\to 0}\frac{1}{h}f(h)+x = 3 + x$$

Hence $f(x) = 3x + x^2/2 + C$. Putting $x = y = 0$ in the given equation, we have $f(0) = f(0 + 0) = f(0) + f(0) + 0 \Rightarrow f(0) = 0$. Thus $C = 0$ and $f(x) = 3x + x^2/2$.

Example 76: Let $f(x) = \begin{cases} x^2, & if\ x \le x_0 \\ ax+b, & x > x_0 \end{cases}$

If f is differentiable at x_0 then

(a) $a = x_0, b = -x_0$ (b) $a = 2x_0, b = -x_0^2$
(c) $a = 2x_0, b = x_0^2$ (d) none of these

Ans. (b)

Solution: Since f is differentiable so it is continuous also, therefore
$$x_0^2 = f(x_0) = \lim_{x\to x_0+} f(x) = ax_0 + b$$

Also $$\lim_{h\to 0+}\frac{f(x_0+h)-f(x_0)}{h}$$
$$= \lim_{h\to 0+}\frac{a(x_0+h)+b-x_0^2}{h}$$
$$= \lim_{h\to 0+}\frac{x_0^2+ah-x_0^2}{h} = a$$
$$(\text{since } x_0^2 = ax_0 + b)$$

Thus $$a = f'(x_0-) = \lim_{h\to 0+}\frac{(x_0+h)^2-x_0^2}{h} = 2x_0$$

Hence $$x_0^2 = 2x_0^2 + b \quad\Rightarrow\quad b = -x_0^2$$

Example 77: Let $f(x)$ be *a* polynomial of degree two which is positive for all $x \in \mathbf{R}$. If $g(x) = f(x) + f'(x) + f''(x) + xf'''(x) + x^2 f^{\text{IV}}(x)$, then for any real x

(a) $g(x) < 0$ (b) $g(x) > 0$
(c) $g(x) = 0$ (d) $g(x) \ge 0$

Ans. (b)

Solution: Let $f(x) = ax^2 + bx + c$. As $f(x) > 0$ for all $x \in \mathbf{R}$, we must have, $a > 0$ and $b^2 - 4ac < 0$.

Now $$g(x) = ax^2 + bx + c + (2ax + b) + 2a + x.0 + x^2.0$$
$$= ax^2 + (b + 2a)x + b + c + 2a$$

Discriminant of $g(x) = (b + 2a)^2 - 4a(b + c + 2a)$
$$= -4a^2 + (b^2 - 4ac) < 0$$

Thus $g(x) > 0$ for all $x \in \mathbf{R}$.

Example 78: The left-hand derivative of $f(x) = [x]\sin \pi x$ at $x = k$, k is an integer is

(a) $(-1)^k (k-1)\pi$ (b) $(-1)^{k-1}(k-1)\pi$
(c) $(-1)^k k\pi$ (d) $(-1)^{k-1} k\pi$

Ans. (a)

Solution: Clearly $f(k) = 0$, so the left-hand derivative is equal to $\lim\limits_{h\to 0-}\frac{f(k+h)}{h}$
$$= \lim_{h\to 0-}\frac{[k+h]\sin(k+h)\pi}{h}$$
$$= \lim_{h\to 0-}\frac{(k-1)\sin(k\pi+h\pi)}{h}$$
$$= \lim_{h\to 0-}\frac{(k-1)(-1)^k\sin h\pi}{h} \qquad (\text{since } h < 0)$$
$$= (k-1)(-1)^k\pi.$$

Example 79: If $y = \tan^{-1}\left(\frac{\log ex^{-2}}{\log ex^2}\right) + \tan^{-1}\left(\frac{3+2\log x}{1-6\log x}\right)$ then $\frac{d^2y}{dx^2}$ is

(a) 2 (b) 1
(c) 0 (d) x

Ans. (c)

Solution: $$y = \tan^{-1}\left(\frac{\log e - 2\log x}{\log e + 2\log x}\right) + \tan^{-1}\left(\frac{3+2\log x}{1-6\log x}\right)$$
$$= \tan^{-1}\left(\frac{1-2\log x}{1+2\log x}\right) + \tan^{-1}\left(\frac{3+2\log x}{1-6\log x}\right)$$
$$= \frac{\pi}{4} - \tan^{-1}(2\log x) + \tan^{-1}3 + \tan^{-1}(2\log x)$$
$$= \frac{\pi}{4} + \tan^{-1}3$$

Thus $$\frac{dy}{dx} = 0 \quad\Rightarrow\quad \frac{d^2y}{dx^2} = 0.$$

Example 80: If $f(x) = x^{1/x}$ then $f''(e)$ is equal to

(a) $e^{1/(e-3)}$ (b) $e^{1/e}$
(c) $e^{1/(e-2)}$ (d) none of these

Ans. (d)

◎ **Solution:** $\log f(x) = \frac{1}{x}\log x$. Differentiating both sides we have

$$\frac{f'(x)}{f(x)} = \frac{1}{x^2} - \frac{\log x}{x^2}$$

$$\Rightarrow \qquad f'(x) = f(x)\,\frac{1-\log x}{x^2}$$

Differentiating again both the sides, we have

$$f''(x) = f'(x)\,\frac{1-\log x}{x^2} + f(x)\left[\frac{x^2(-1/x) - (1-\log x)\,2x}{x^4}\right]$$

thus $f''(e) = -\frac{f(e)}{e^3} = -e^{(1/e)-3}$.

◉ **Example 81:** If $y^2 = P(x)$ is a polynomial of degree 3, then $\frac{d}{dx}\left(y^3\frac{d^2y}{dx^2}\right)$ is equal to

(a) $P(x) + P''(x)$ (b) $P(x)\,P''(x)$

(c) $P(x)\,P'''(x)$ (d) *a* constant.

Ans. (c)

◎ **Solution:** From $y^2 = P(x)$, we have $2yy_1 = P'(x)$ i.e. $2y_1 = P'(x)/y$

$$\Rightarrow \quad 2y_2 = \frac{yP''(x) - P'(x)y_1}{y^2} = \frac{yP''(x) - P'(x)P'(x)/2y}{y^2}$$

$$= \frac{2y^2P''(x) - (P'(x))^2}{2y^3}$$

$$\Rightarrow \qquad 2y_2\,y^3 = \frac{1}{2}\,[2\,P(x)\,P''(x) - (P'(x))^2]$$

$$\Rightarrow 2\frac{d}{dx}\left(y^3\frac{d^2y}{dx^2}\right) = \frac{1}{2}\,[2\{P'(x)\,P''(x) + P(x)\,P'''(x)\} - 2P'(x)\,P''(x)]$$

$$= \frac{1}{2}\,2P(x)\,P'''(x) = P(x)\,P'''(x).$$

◉ **Example 82:** If $f(x) = (1+x)^n$, then the value of $f(0) + f'(0) + \frac{1}{2!}f''(0) + \cdots + \frac{1}{n!}f^n(0)$ is

(a) n (b) $2n$

(c) 2^{n-1} (d) none of these

Ans. (b)

◎ **Solution:** $f(0) = 1, f'(x) = n(1+x)^{n-1}$,

$f''(x) = n\,(n-1)\,(1+x)^{n-2} \cdots f^n(x) = n(n-1)\cdots 1\,(1+x)^{n-n}$.

So $\qquad f'(0) = n, f''(0) = n\,(n-1), \ldots f^n(0) = n!$.

∴ the given expression is equals to

$$1 + n + \frac{n(n-1)}{2!} + \cdots \frac{n!}{n!} = 2^n.$$

◉ **Example 83:** If $f(x) = x^2 + \frac{x^2}{(1+x^2)} + \frac{x^2}{(1+x^2)^2} + \ldots + \frac{x^2}{(1+x^2)^n} + \ldots$ then at $x = 0$

(a) $f(x)$ has no limit

(b) $f(x)$ is discontinuous

(c) $f(x)$ is continuous but not differentiable

(d) $f(x)$ is differentiable

Ans. (b)

◎ **Solution:** For $x = 0, f(0) = 0$ and for $x \neq 0$,

$$f(x) = x^2\left[1 + \frac{1}{1+x^2} + \frac{1}{(1+x^2)^2} + \ldots\right]$$

$$= x^2\,\frac{1}{1 - 1/(1+x^2)} = \frac{x^2(1+x^2)}{x^2} = 1 + x^2,$$

Thus, $\lim_{x\to 0} f(x) = 1$, Hence f is not continuous at $x = 0$, so f is also not differentiable at $x = 0$.

◉ **Example 84:** Let $f(x) = \begin{cases}\int_0^x \{1 + |1-t|\}\,dt & \text{if } x > 2\\ 5x - 7 & \text{if } x \le 2,\end{cases}$ then

(a) f is not continuous at $x = 2$

(b) f is continuous but not differentiable at $x = 2$

(c) f is differentiable everywhere

(d) $f'(2+)$ doesn'*t* exist

Ans. (b)

◎ **Solution:** For $x > 2$,

$$\int_0^x \{1 + |1-t|\}dt = \int_0^1 \{1 + |1-t|\}dt + \int_1^x \{1 + |1-t|\}dt$$

$$= \int_0^1 (2-t)dt + \int_1^x t\,dt = 1 + \frac{x^2}{2}.$$

Thus,. $$f(x) = \begin{cases} 1 + x^2/2, & x > 2\\ 5x - 7, & x \le 2\end{cases}$$

$$\lim_{x\to 2+} f(x) = 1 + 4/2 = 3 = f(2) = \lim_{x\to 2-} f(x)$$

$$f'(2+) = \lim_{h\to 0+}\frac{1 + (1/2)(2+h)^2 - 3}{h}$$

$$= \lim_{h\to 0+}\frac{(1/2)h^2 + 2h}{h} = 2,$$

$$f'(2-) = \lim_{h\to 0-}\frac{5(2+h) - 7 - 3}{h} = 5$$

Hence f is continuous but not differentiable at $x = 2$.

Example 85: Let $f(x) = \underset{k=1}{\pi} (\cos (2k-1)x + \mathrm{i} \sin (2k-1) x)$ then $(\operatorname{Re} f(x))'' + \mathrm{i}\, (\operatorname{Im} f(x))''$ is equal to

(a) $n^2 f(x)$ (b) $-n^4 f(x)$
(c) $-n^2 f(x)$ (d) $n^4 f(x)$

Ans. (b)

Solution: $f(x) = \prod\limits_{k=1}^{n} (\cos (2k-1)x + i \sin (2k-1)x)$

$$= \cos \sum_{k=1}^{n} (2k-1)\, x + i \sin \sum_{k=1}^{n} (2k-1)\, x$$

$= \cos n^2x + \mathrm{i} \sin n^2x$ (Using De Movire's Theorem)

$\therefore$ $(\operatorname{Re} f(x))'' = -n^4 \cos n^2x$ and

$\operatorname{Im} f(x)'' = -n^4 \sin n^2x$. Thus

$(\operatorname{Re} f(x))'' + i\, (\operatorname{Im} f(x))'' = -n^4 [\cos n^2x + i \sin n^2x] = -n^4 f(x)$.

Example 86: Let $f(x)$ be defined for all $x > 0$ and be continuous. Let $f(x)$ satisfy $f(x/y) = f(x) - f(y)$ for all x, y and $f(e) = 1$. Then which of the following may be true

(a) $f(x)$ is bounded
(b) $f(1/x) \to 0$ as $x \to \infty +$
(c) $x f(x) \to 1$ as $x \to 0 +$
(d) $f'(x) = 1/x$

Ans. (d)

Solution: A function satisfying the given functional equation is $f(x) = \log x$. Clearly $f(x)$ is not bounded and $f(1/x) = -\log x \not\to 0$ as $x \to \infty$. Also $x f(x) = x \log x \not\to 1$ as $x \to 0$. But $f'(x) = 1/x$.

In fact, it can be shown that any continuous function satisfying the given functional equation is of the form $k \log x$, for some $k > 0$. Since $f(e) = 1$ so $k = 1$.

Example 87: If $x = \cos \theta$, $y = \sin^3 \theta$, then $\left(\dfrac{\mathrm{d}y}{\mathrm{d}x}\right)^2 + y \dfrac{\mathrm{d}^2 y}{\mathrm{d}x^2}$ at $\theta = \pi/2$ is

(a) 1 (b) 2
(c) -2 (d) -3

Ans. (d)

Solution: $\dfrac{\mathrm{d}x}{\mathrm{d}\theta} = -\sin \theta$, $\dfrac{\mathrm{d}y}{\mathrm{d}\theta} = 3 \sin^2 \theta \cos \theta \Rightarrow$ $\dfrac{\mathrm{d}y}{\mathrm{d}x} = -3 \sin \theta \cos \theta$. Differentiating again, we have $\dfrac{\mathrm{d}^2 y}{\mathrm{d}x^2} = -3 \cos {}^2\theta \dfrac{\mathrm{d}\theta}{\mathrm{d}x} = \dfrac{3 \cos 2\theta}{\sin\theta}$.

$$\left(\frac{\mathrm{d}y}{\mathrm{d}x}\right)^2 + y \frac{\mathrm{d}^2 y}{\mathrm{d}x^2} = 9 \sin^2 \theta \cos^2 \theta + \sin^3 \theta \frac{3 \cos 2\theta}{\sin\theta}$$

$$= 9 \sin^2 \theta \cos^2 \theta + 3 \sin^2 \theta \cos 2\theta$$

So the value of the expression on L.H.S. at $\theta = \pi/2$ is -3.

Example 88: If $y = \tan^{-1} \dfrac{1}{1 + x + x^2} + \tan^{-1} \dfrac{1}{x^2 + 3x + 3} + \tan^{-1} \dfrac{1}{x^2 + 5x + 7} + \ldots$ + upto n terms, then $y'(0)$ is equal to

(a) $-1/(n^2 + 1)$ (b) $-n^2/(n^2 + 1)$
(c) $n^2/(n^2 + 1)$ (d) none of these

Ans. (b)

Solution: $y = \tan^{-1} \dfrac{1}{1 + x + x^2} + \tan^{-1} \dfrac{1}{x^2 + 3x + 3} + \ldots$ + upto n terms

$$= \tan^{-1} \frac{(x+1) - x}{1 + x(x+1)} + \tan^{-1} \frac{(x+2) - (x+1)}{1 + (x+1)(x+2)} + \ldots n \text{ terms}$$

$= \tan^{-1} (x + 1) - \tan^{-1} x + \tan^{-1} (x + 2) - \tan^{-1} (x + 1) + \ldots$
$+ \tan^{-1} (x + n) - \tan^{-1} (x + (n - 1))$
$= \tan^{-1} (x + n) - \tan^{-1} x$.

$$y'(x) = \frac{1}{1 + (x+n)^2} - \frac{1}{1 + x^2}$$

$$\Rightarrow \quad y'(0) = \frac{1}{1 + n^2} - 1 = -\frac{n^2}{1 + n^2}.$$

Example 89: If $f(x) = \sqrt{x + 2\sqrt{2x - 4}} + \sqrt{x - 2\sqrt{2x - 4}}$ then

(a) f is differentiable at all points of its domain except $x = 4$
(b) f is differentiable on $(2, \infty)$
(c) f is differentiable on $(-\infty, \infty)$
(d) $f'(x) = 0$ for all $x \in [2, 6)$

Ans. (a)

Solution: The domain of f is $[2, \infty)$. Put $t = \sqrt{2x - 4}$

$$f(x) = \sqrt{t^2/2 + 2 + 2t} + \sqrt{t^2/2 + 2 - 2t}$$

$$= \frac{1}{\sqrt{2}} (t + 2) + \frac{1}{\sqrt{2}} |t - 2| = \begin{cases} \dfrac{1}{\sqrt{2}} \times 4 & \text{if } t < 2 \\ \sqrt{2} t & \text{if } t \geq 2 \end{cases}$$

$$= \begin{cases} 2\sqrt{2} & \text{if } x \in (2, 4) \\ 2\sqrt{x - 2} & \text{if } x \in (4, \infty) \end{cases}$$

$$\text{Hence } f'(x) = \begin{cases} 0 & \text{if } x \in (2, 4) \\ \dfrac{1}{\sqrt{x - 2}} & \text{if } x \in (4, \infty) \end{cases}$$

and $f'(4)$ does not exist.

◉ **Example 90:** If $y = \sec^{-1}\left(\dfrac{x+1}{x-1}\right) + \sin^{-1}\left(\dfrac{x-1}{x+1}\right)$, $x \in [0, \infty) \sim \{1\}$ then $\dfrac{dy}{dx}$ is equal to

(a) 1 (b) $\dfrac{x-1}{x+1}$

(c) 0 (d) $\dfrac{x+1}{x-1}$

Ans. (c)

◎ **Solution:** $y = \cos^{-1}\dfrac{x-1}{x+1} + \sin^{-1}\dfrac{x-1}{x+1}$, since $-1 \le \dfrac{x-1}{x+1} \le 1$

$$\therefore \qquad y = \frac{\pi}{2}. \text{ So } \frac{dy}{dx} = 0$$

◉ **Example 91:** The least value of n so that $y_n = y_{n+1}$ where $y = x^2 + e^x$ is

(a) 4 (b) 3

(c) 5 (d) 2

Ans. (b)

◎ **Solution:** $y' = 2x + e^x$, $y'' = 2 + e^x$, $y''' = e^x$, $y^{iv} = e^x$. Thus $n = 3$.

◉ **Example 92:** If $y = \cos^{-1}\dfrac{9-x^2}{9+x^2}$ then $y'(-1)$ is equal to

(a) – 3/5 (b) 3/5

(c) 2/7 (d) 3/8

Ans. (a)

◎ **Solution:** $\cos^{-1}\dfrac{9-x^2}{9+x^2} = \cos^{-1}\dfrac{1-(x/3)^2}{1+(x/3)^2} = 2\tan^{-1}\dfrac{x}{3}$, if $0 \le x < \infty$ and is equal to $-2\tan^{-1} x/3$ if $-\infty < x \le 0$. Hence

$$y'(x) = \begin{cases} \dfrac{2}{1+(x/3)^2}.\dfrac{1}{3} & \text{if } 0 < x < \infty \\ -\dfrac{2}{1+(x/3)^2}.\dfrac{1}{3} & \text{if } -\infty < x < 0 \end{cases}$$

Hence $y'(-1) = -3/5$.

◉ **Example 93:** If $y = (x^2 + 1)^{\sin x}$, then $y'(0)$ is equal to

(a) 1/2 (b) e^2

(c) 0 (d) 3/2

Ans. (c)

◎ **Solution:** $\log y = \sin x \log(x^2 + 1)$.

Differentiating we get $\dfrac{y'}{y} = (\sin x)\dfrac{2x}{x^2+1} + \cos x \log(x^2 + 1)$ so $y'(0) = y(0).0 = 0$.

◉ **Example 94:** If $f(x) = x^n + 4$ then the value of $f(1) + \dfrac{f'(1)}{1!} + \dfrac{f''(1)}{2!} + \ldots + \dfrac{f^n(1)}{n!}$ is

(a) 2^{n-1}

(b) $2^n + 4$

(c) $1 + \dfrac{1}{1!} + \dfrac{1}{2!} + \ldots + \dfrac{1}{n!}$

(d) none of these

Ans. (b)

◎ **Solution:** $f(1) = 5, f'(x) = nx^{n-1}$ so $f'(1) = n$ $f''(1) = n(n-1), \ldots, f^n(1) = 1.2 \ldots n$. Thus

$$f(1) + \frac{f'(1)}{1!} + \ldots + \frac{f^n(1)}{n!}$$

$$= 5 + \frac{n}{1} + \frac{n(n-1)}{2!} + \ldots + \frac{n!}{n!} = (1+1)^n + 4 = 2^n + 4.$$

◉ **Example 95:** Let a function $y = y(x)$ be defined parametrically by $x = 2t - |t|$, $y = t^2 + t|t|$. Then $y'(x)$, $x > 0$

(a) 0 (b) $4x$

(c) $2x$ (d) does not exist

Ans. (b)

◎ **Solution:** $x = 2t - |t| = \begin{cases} t, & t \ge 0 \\ 3t, & t < 0 \end{cases}$, so $t = \begin{cases} x, & x \ge 0 \\ x/3, & x < 0 \end{cases}$

Therefore, we can express $y = t^2 + t|t| = \begin{cases} 2t^2, & t \ge 0 \\ 0 & t < 0 \end{cases}$

$$= \begin{cases} 2x^2, & x \ge 0 \\ 0 & x < 0 \end{cases}. \text{ Hence } y'(x) = \begin{cases} 4x, & x > 0 \\ 0, & x < 0 \end{cases}$$

Note that we cannot find $\dfrac{dx}{dt}$ as the derivative does not exist at $t = 0$.

◉ **Example 96:** $\dfrac{d^2x}{dy^2}$ equals

(a) $\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-3}$ (b) $\left(\dfrac{d^2y}{dx^2}\right)^{-1}$

(c) $\left(\dfrac{d^2y}{dx^2}\right)^{-1}\left(\dfrac{dy}{dx}\right)^{-3}$ (d) $\left(\dfrac{d^2y}{dx^2}\right)\left(\dfrac{dy}{dx}\right)^{-2}$

Ans (a)

◎ **Solution:** $\dfrac{d^2x}{d^2y} = \dfrac{d}{dy}\left(\dfrac{dx}{dy}\right) = \dfrac{d}{dx}\left(\dfrac{dx}{dy}\right)\dfrac{dx}{dy}$

$$= \frac{d}{dx}\left(\frac{1}{dy/dx}\right)\frac{dx}{dy}$$

$$= (-1)\left(\frac{dy}{dx}\right)^{-2}\frac{d^2y}{dx^2}\left(\frac{dy}{dx}\right)^{-1}$$

$$= -\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-3}.$$

◉ **Example 97:** Let $y = f(x) = \log(1+\sin x)^2, x \neq (2n+1)\dfrac{\pi}{2}$, $n \in \mathbf{I}$ then $f''(x) + 2e^{-y/2}$ is equal to

(a) 0 (b) $\dfrac{1}{1+\sin x}$

(c) $\dfrac{1}{(1+\sin x)^2}$ (d) $-\dfrac{1}{1+\sin x}$

Ans. (a)

◎ **Solution:** $y = 2\log(1+\sin x)$

$$y' = \frac{2\cos x}{1+\sin x}$$

$$\Rightarrow \quad y'' = 2\frac{-(1+\sin x)\sin x - \cos^2 x}{(1+\sin x)^2}$$

$$= -2\frac{1+\sin x}{(1+\sin x)^2} = -\frac{2}{1+\sin x}$$

$$f''(x) + 2e^{-y/2} = f''(x) + 2e^{-\log(1+\sin x)}$$

$$= f''(x) + \frac{2}{1+\sin x} = 0.$$

◉ **Example 98:** Let $f(x) = x + \cot x$ and f is the inverse of g, then $g'(x)$ is equal to

(a) $\dfrac{x}{x-g(x)}$ (b) $\dfrac{1}{(x-g(x))^2}$

(c) $-\dfrac{1}{(x-g(x))^2}$ (d) $\dfrac{x}{(x-g(x))^2}$

Ans. (c)

◎ **Solution:** $f(g(x)) = x$

$\Rightarrow \quad g(x) + \cot g(x) = x$

Differentiating both sides, we get

$g'(x) - (\operatorname{cosec}^2 g(x))\, g'(x) = 1$

$$\Rightarrow \quad g'(x) = \frac{1}{1-\operatorname{cosec}^2 g(x)}$$

$$= \frac{1}{1-(1+\cot^2 g(x))} = -\frac{1}{(x-g(x))^2}$$

◉ **Example 99:** If $f(x) = \begin{cases} xe^{-\left\{\frac{1}{|x|}+\frac{1}{x}\right\}} &, x \neq 0 \\ 0 &, x = 0 \end{cases}$ then f is

(a) discontinuous everywhere

(b) continuously differentiable at $x = 0$

(c) differentiable everywhere

(d) continuous but not differentiable

Ans. (d)

◎ **Solution:** $f(x) = \begin{cases} x & x < 0 \\ xe^{-\frac{2}{x}} & x > 0 \\ 0 & x = 0 \end{cases}$

f is clearly a continuous function

$$f'(x) = \begin{cases} 1 &, x < 0 \\ e^{-\frac{2}{x}} + \frac{2}{x}e^{-\frac{2}{x}} &, x > 0 \end{cases}$$

$$\lim_{h\to 0^-} \frac{f(0+h)-f(0)}{h} = \lim_{h\to 0^-} \frac{h}{h} = 1$$

$$\lim_{h\to 0^+} \frac{f(0+h)-f(0)}{h} = \lim_{h\to 0^+} \frac{he^{-\frac{2}{h}}}{h} = \lim_{h\to 0^+} e^{-\frac{2}{h}} = 0$$

f is not differentiable at $x = 0$.

◉ **Example 100:** Let f and g be twice differentiable functions such that $\text{fog}(x) = x^3$ and $g(1) = 2$, $g'(1) = 1$, $g''(1) = 4$ then $f''(2)$ is equal to

(a) 0 (b) 2

(c) 4 (d) -6

Ans. (d)

◎ **Solution:** Since $f(g(x)) = x^3$, differentiating both the sides, we get

$$f'(g(x))\, g'(x) = 3x^2$$

$$\Rightarrow \quad f''(g(x))\,(g'(x))^2 + f'(g(x))\, g''(x) = 6x$$

$$\Rightarrow \quad f''(g(x))\,(g'(x))^2 + \frac{3x^2}{g'(x)}\, g''(x) = 6x$$

Putting $x = 1$, we have

$$f''(2)\, 1^2 + \frac{3}{1}\, 4 = 6$$

$$\Rightarrow \quad f''(2) = -6.$$

EXERCISE

Concept-based Straight Objective Type Questions

1. If $f(t) = \dfrac{t^2-5t-1}{t^3}$ then $f'\left(\dfrac{1}{a}\right)$ is given by

(a) $3a^4 + 10a^3 + a^2$ (b) $3a^4 + 10a^3 - a^2$

(c) $a^4 + 5a^3 - a^2$ (d) $a^4 + 5a^2 - a$

2. If $y = \dfrac{1}{\sqrt[3]{2x-1}} + \dfrac{1}{\sqrt[4]{(x^2+2)^3}}$ then $y'(0)$ is given by

(a) $\dfrac{1}{3}$ (b) $\dfrac{2}{3}$

(c) $-\frac{2}{3}$ (d) $-\frac{1}{3}$

3. Let $f(x) = |\log x|$ then
   (a) $f'(1+) = -1$ (b) $f'(1+) = f'(1-)$
   (c) $f'(1-) = 1$ (d) $f'(1+) = 1$

4. For $f(x) = \sin^{-1}\frac{2x}{1+x^2}$, if $A = \{x \in \text{dom } f : f$ is not differentiable at $x\}$ then number of points in A is
   (a) 0 (b) 1
   (c) 2 (d) 3

5. Let $y = \sqrt{1-\sqrt{1-x^2}}$. The set of all points of non differentiability of y is
   (a) $\{0, 1\}$ (b) $\{1, -1\}$
   (c) $\{0, -1\}$ (d) $\{0, -1, 1\}$

6. If $y = \log_2 (\log_3(\log_5 x))$ then $y'(125)$ is equal to
   (a) $\frac{1}{375 \log 2}$ (b) $\frac{1}{125 \log 2 \log 3 \log 5}$
   (c) $\frac{1}{375 \log 3 \log 3}$ (d) $\frac{1}{375 \log 2 \log 3 \log 5}$

7. If $x = \frac{t+1}{t}$, $y = \frac{t-1}{t}$ then $\frac{d^2y}{dx^2}$ at $t = 1$
   (a) 0 (b) 1
   (c) -1 (d) $\frac{1}{\sqrt{2}}$

8. If $x = 3 \cos t$, $y = 4 \sin t$ then $\frac{dy}{dx}$ at $\left(3/\sqrt{2}, 2\sqrt{2}\right)$ is equal to
   (a) $\frac{1}{3}$ (b) $\frac{2}{3}$
   (c) $-\frac{2}{3}$ (d) $-\frac{4}{3}$

9. If $x^4 + y^4 = x^2y^2$ then $\frac{dy}{dx}$ is given by
   (a) $\frac{x}{y}\cdot\frac{y^2-x^2}{2y^2-x^2}$ (b) $\frac{y}{x}\cdot\frac{y^2-2x^2}{y^2-x^2}$
   (c) $\frac{x}{y}\cdot\frac{y^2-2x^2}{2y^2-x^2}$ (d) $\frac{y}{x}\cdot\frac{y^2-2x^2}{2y^2-x^2}$

10. Let $f(x) = |x^2 - 4|x| + 3|$, then $A = \{x : f$ is not differentiable at $x\}$ is equal to
    (a) $\{-1, 1, -3, 3\}$ (b) $\{1, 3\}$
    (c) $\{1, -1\}$ (d) $\{3, -3\}$

LEVEL 1

Straight Objective Type Questions

11. The function
$$f(x) = \begin{cases} x^4 + x^2 - x + 2, & \text{for } x \le 1 \\ 3x^3 - x^2 + x, & \text{for } x > 1 \end{cases}$$
is
    (a) continuous everywhere
    (b) differentiable everywhere
    (c) differentiable at $x = 1$
    (d) such that f' exists everywhere but f'' is not continuous at $x = 1$.

12. If
$$f(x) = \begin{cases} x\sin(1/x), & \text{for } x \ne 0 \\ 0, & \text{for } x = 0 \end{cases}$$
then
    (a) f is a continuous function
    (b) $f'(0+)$ exists but $f'(0-)$ does not exist
    (c) $f'(0+) = f'(0-)$
    (d) $f'(0-)$ exists but $f'(0+)$ does not exist.

13. If $y = \log_{e^x}(x-2)^2$ for $x \ne 0, 2$, then $y'(3)$ is equal to
    (a) 1/3 (b) 2/3
    (c) 4/3 (d) none of these

14. The function f defined by
$$f(x) = \begin{cases} \frac{\sin x^2}{x}, & \text{for } x \ne 0 \\ 0, & \text{for } x = 0 \end{cases}$$
is
    (a) continuous and derivable at $x = 0$
    (b) neither continuous nor derivable at $x = 0$
    (c) continuous but not derivable at $x = 0$
    (d) none of these.

15. The derivative of $\tan^{-1}\left(\frac{\sqrt{1+x^2}-1}{x}\right)$ w.r.t. $\tan^{-1}\left(\frac{2x\sqrt{1-x^2}}{1-2x^2}\right)$ at $x = 0$ is
    (a) 1/4 (b) 1/8
    (c) 1/2 (d) 1

16. Let $f(x) = x^n$, n being a non-negative integer. The value of n for which the equality $f'(a + b) = f'(a) + f'(b)$ is valid for all $a, b > 0$ is
    (a) 3 (b) 1
    (c) 2 (d) none of these

17. The function $f(x) = |x^3|$ is
    (a) differentiable everywhere
    (b) continuous but not differentiable at $x = 0$
    (c) not a continuous function
    (d) a function with range $(0, \infty)$
18. The set of all points of differentiability of the function $f(x) = e^{-|x|}$ is
    (a) $(0, \infty)$ (b) $(-\infty, \infty)$
    (c) $[0, \infty)$ (d) $(-\infty, \infty) \sim \{0\}$
19. If $x = \log t$ and $y = t^2 - 1$, then $y''(1)$ at $t = 1$ is
    (a) 2 (b) 4
    (c) 3 (d) none of these
20. For a differentiable function f on $\mathbf{R}$ there is an x_0 with
    $$f'(x_0) = \frac{1}{2}[f'(0) + f'(1)]$$
    (a) only if f is constant
    (b) only if f is increasing
    (c) if f is decreasing
    (d) if f is continuously differentiable
21. Let f be defined by $f(x) = |x - 2| + |x| + |x + 2|$ for $x \in \mathbf{R}$ then
    (a) $f'(-2+)$ doesn't exist
    (b) $f'(2-)$ doesn't exist
    (c) $f'(2+) = 3$
    (d) $f'(0+) = 2$
22. Let f be defined on $\mathbf{R}$ by $f(x) = x^4 \sin(1/x)$, if $x \neq 0$ and $f(0) = 0$ then
    (a) $f'(0)$ doesn't exist
    (b) $f'(2-)$ doesn't exist
    (c) f'' is not continous at $x = 0$
    (d) $f''(0)$ exist but f'' is not continuous at $x = 0$
23. If $x^y = e^{x-y}$ then
    (a) $\dfrac{dy}{dx}$ doesn't exist at $x = 1$
    (b) $\dfrac{dy}{dx} = 0$ when $x = 1$
    (c) $\dfrac{dy}{dx} = \dfrac{1}{2}$ when $x = e$
    (d) none of these
24. If f is one-one and satisfies $f'(x) = \sqrt{1-(f(x))^2}$ then $(f^{-1})'(x)$
    (a) is equal to $\dfrac{1}{\sqrt{1-x^2}}$
    (b) may not exist for every $x \in \mathbf{R}$
    (c) may not be known explicitly
    (d) is equal to $\sin^{-1}(f(x))$
25. The function $y = \sin^{-1} x$ satisfies
    (a) $(1 - x^2)\, y'' = xy''$ (b) $(1 - x^2)\, y'' = xy'$
    (c) $(1 - x^2)\, y'' = x^2y'$ (d) $(1 - x^2)\, y' = 2xy'$
26. Let f be a one-one function satisfying $f'(x) = f(x)$ then $(f^{-1})''(x)$ is equal to
    (a) $-1/x^3$ (b) $-1/x^2$
    (c) $f(x)$ (d) $f^{-1}(x)$
27. If $y = \cos^{-1}(x^{-1})$ then $y'(-2)$ is equal to
    (a) $\dfrac{1}{2\sqrt{3}}$ (b) $-\dfrac{1}{2\sqrt{3}}$
    (c) $\dfrac{1}{2\sqrt{5}}$ (d) $-\dfrac{1}{2\sqrt{5}}$
28. If $x = \sin^{-1}(t^2 - 1)$, $y = \cos^{-1}(2t)$ then $\dfrac{dy}{dx}$ at $t = 0$ is
    (a) $-\sqrt{2}$ (b) $-\dfrac{1}{\sqrt{2}}$
    (c) $\sqrt{2}$ (d) $\dfrac{1}{\sqrt{2}}$
29. If $\tan^{-1} y - y + x = 0$ then $\dfrac{d^2y}{dx^2}$ is equal to
    (a) $\dfrac{-2(1+y^2)}{y^5}$ (b) $\dfrac{1+y^2}{y^5}$
    (c) $\dfrac{2(1+y^2)}{y^4}$ (d) $\dfrac{2(1+y^2)}{y^5}$
30. If $F(x) = \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix}$ then $F'(x)$ is equal to
    (a) $6x^3$ (b) $x^3 + 6x^2$
    (c) $3x$ (d) $6x^2$
31. If $y = \dfrac{\sin^2 x}{1+\cot x} + \dfrac{\cos^2 x}{1+\tan x}$ then $y'(x)$ is equal to
    (a) $\cos 2x$ (b) $-\cos 2x$
    (c) $2\cos^2 x$ (d) $\cos^3 x$
32. If $z(t) = \sqrt{t^3+1}$, then $z'(2)$ is equal to
    (a) 1/2 (b) – 1
    (c) 2 (d) – 1
33. If $y = \cos^{-1}\left(\dfrac{4\cos x - 5\sin x}{\sqrt{41}}\right)$, then $\dfrac{dy}{dx}$ is equal to
    (a) 0 (b) 1
    (c) – 1 (d) none of these
34. If $y = \log\cos\left(\tan^{-1}\dfrac{e^x - e^{-x}}{2}\right)$ then $y'(0)$ is equal to
    (a) $e + e^{-1}$ (b) $e - e^{-1}$
    (c) $\dfrac{e+e^{-1}}{2}$ (d) none of these

35. If the function $y = \log \frac{1}{1+x}$ satisfies the relation $xy' + 1 = f(y)$ then $f(y)$ is equal to

(a) y (b) $y^2 + 1$
(c) e^y (d) e^{-y}

36. If $y = \frac{\sin^{-1} x}{\sqrt{1-x^2}}$ satisfies the relation $(1 - x^2)y' - xy = k$ then the value of k is

(a) 1 (b) 0
(c) –1 (d) 2

37. If $x \sin y = \sin(y + a)$ and $\frac{dy}{dx} = \frac{A}{1+x^2-2x\cos a}$ then the value of A is

(a) 2 (b) $\cos a$
(c) $\sin a$ (d) none of these

38. If $f(x) = \cot^{-1} \frac{3x-x^3}{1-3x^2}$ and $g(x) = \sin^{-1} \frac{1-x^2}{1+x^2}$ then $\lim\limits_{x\to t} \frac{f(x)-f(t)}{g(x)-g(t)}$ is

(a) $\frac{3}{2(1+t^2)}$ (b) $\frac{-5}{2(1+t^2)}$
(c) $\frac{5}{2}$ (d) $\frac{3}{2}$

39. Let f be a function defined for every x, such that $f'' = -f$, $f(0) = 0$, $f'(0) = 1$ then $f(x)$ is equal to

(a) $\tan x$ (b) $e^x - 1$
(c) $\sin x$ (d) $2 \sin x$

40. If $y = \sin^{-1}(\cos x)$ and $y'(x)$ is identically equal to $g(x)$ on $\mathbf{R} \sim \{kp, k \in \mathbf{I}\}$ then $g(x)$ is equal to

(a) $|\sin x|$ (b) $-\operatorname{sgn}(\sin x)$
(c) $\operatorname{sgn}(\sin x)$ (d) none of these

41. If $f(x) = \cos(x^2 - 4[x])$ for $0 < x < 1$, where $[x]$ denotes the greatest integer $\le$ x, then $f'\left(\sqrt{\pi}/2\right)$ is equal

(a) $-\sqrt{\frac{\pi}{2}}$ (b) $\sqrt{\frac{\pi}{2}}$
(c) 0 (d) $\frac{\sqrt{\pi}}{4}$

42. If $x = a \cos 2t$, $y = b \sin^2 t$ then $\frac{d^2y}{dx^2}$ is equal to

(a) $\frac{a}{b} \cos 2t$ (b) 0
(c) 1 (d) $\frac{b}{a} \sin 2t$

43. If $f(x) = \tan^{-1} \sqrt{(1+\sin x)/(1-\sin x)}$, $0 \le x < \pi/2$, then $f'(\pi/6)$ is

(a) – 1/4 (b) – 1/2
(c) 1/4 (d) 1/2

44. If $2^x + 2^y = 2^{x+y}$, then the value of $\frac{dy}{dx}$ at $x = y = 1$ is

(a) 0 (b) – 1
(c) 1 (d) 2

45. If $t = \sin^{-1} 2^s$ then $\frac{ds}{dt}$ is equal to

(a) $\frac{\log 2}{\sqrt{1-t^2}}$ (b) $\frac{\sin t}{\log 2}$
(c) $\frac{\cot t}{\log 2}$ (d) none of these

46. Let (x, y) be any point on the unit circle with centre at the origin, then

(a) $yy'' - 2(y')^2 + 1 = 0$
(b) $yy'' + y'^2 + 1 = 0$
(c) $yy'' + y'^2 - 1 = 0$
(d) $yy'' + 2y'^2 + 1 = 0$

47. Let $f(x) = \log \sin x^2$, $0 < x < \pi/2$ then $f''\left(\sqrt{\pi}/2\right)$ is equal to

(a) 2π (b) $2(1 + \pi)$
(c) $2(1 - \pi)$ (d) $4(1 - \pi)$

48. Let $g(x)$ be the inverse of $f(x)$ and $f'(x) = \frac{1}{1+x^5}$ then $\frac{d^2}{dx^2}(g(x))$ is equal to

(a) $\frac{1}{1+(g(x))^5}$ (b) $5(g(x))^4 (1 + (g(x))^5$
(c) $\frac{g'(x)}{1+(g(x))^5}$ (d) $\frac{5(g'(x))^4}{1+(g(x))^5}$

49. The derivative of $f(\tan x)$ with respect to $g(\sec x)$ at $x = \frac{\pi}{4}$, where $f'(1) = 2$ and $g'\left(\sqrt{2}\right) = 4$, is:

(a) $1/\sqrt{2}$ (b) $\sqrt{2}$
(c) 1 (d) 0

50. If $y = \left(\log_{\cos x} \sin x\right) \left(\log_{nx} \cos x\right) + \sin^{-1} \frac{2x}{1+x^2}$, then $\frac{dy}{dx}$ at $x = \frac{\pi}{2}$ is equal to:

(a) $\frac{8}{\left(4+\pi^2\right)}$ (b) 0
(c) $-\frac{8}{\left(4+\pi^2\right)}$ (d) 1

51. If $y = \sin^{-1}\left(\dfrac{5x + 12\sqrt{1 - x^2}}{13}\right)$, then $\dfrac{dy}{dx}$ is equal to:

(a) $-\dfrac{1}{\sqrt{1 - x^2}}$ (b) $\dfrac{1}{\sqrt{1 - x^2}}$

(c) $\dfrac{3}{\sqrt{1 - x^2}}$ (d) $\dfrac{x}{\sqrt{1 - x^2}}$

52. Let f: $(-1, 1) \to \mathbf{R}$ be a differentiable function with $f(0) = -1$ and $f'(0) = 1$. Let $g(x) = [f(2f(x) + 2)]^2$. Then $g'(0) =$

(a) 0 (b) -2

(c) 4 (d) -4

53. Let y be an implicit function of x defined by $x^{2x} - 2x^x \cot y - 1 = 0$. Then $y'(1)$ equals

(a) log 2 (b) $-$ log 2

(c) -1 (d) 1

54. Let $f(x) = \begin{cases} (x - 1)\sin\dfrac{1}{x - 1} & if \;\; x \neq 1 \\ 0 & if \;\; x = 1 \end{cases}$

Then which one of the following is true

(a) f is neither differentiable at $x = 0$ nor at $x = 1$

(b) f is differentiable at $x = 0$ and at $x = 1$

(c) f is differentiable at $x = 0$ but not at $x = 1$

(d) f is differentiable at $x = 1$ but not at $x = 0$.

Assertion-Reason Type Questions

55. Let $y = \dfrac{1}{3}\log\dfrac{x + 1}{\sqrt{x^2 - x + 1}} + \dfrac{1}{\sqrt{3}}\tan^{-1}\dfrac{2x - 1}{\sqrt{3}}$

Statement-1: $\dfrac{dy}{dx}$ at $x = 0$ is 1

Statement-2: $\dfrac{dy}{dx} = \dfrac{2}{x^3 + 2}$

56. Let $y = \log\dfrac{1}{1 + x}$

Statement-1: $y'(1) = -1/2$

Statement-2: $xy' + 1 = e^y$.

57. Suppose that $\cos(xy) = x$

Statement-1: $\dfrac{dy}{dx} = \dfrac{1 + y\sin(xy)}{x\sin(xy)}$

Statement-2: $\dfrac{dy}{dx} < 0$ for $x, y > 0$ such that $0 < xy < \pi$.

58. Suppose that $x = t - t^4$, $y = t^2 - t^3$

Statement-1: $\dfrac{dy}{dx}$ at (0, 0) is equal to $\dfrac{1}{3}$ or 0

Statement-2: $\dfrac{dy}{dx} = \dfrac{2t - 3t^2}{1 - 4t^3}$.

59. If $y = \sin(3\sin^{-1} x)$

Statement-1: $y''(0) = 0$

Statement-2: $y'(0) = 3$.

60. **Statement-1:** Let $f : \mathbf{R} \to \mathbf{R}$ be a real valued function satisfying $|f(x) - f(y)| \le A|x - y|^{\alpha}$, for some constant A and $\alpha > 1$, for every $x, y \in \mathbf{R}$ then f is constant function.

Statement-2: $f'(x) = 0$ for all $x \in \mathbf{R}$ then f is a constant function.

61. Suppose that $y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x)$, $\pi/2 < x < \pi$

Statement-1: $\dfrac{d^2y}{dx^2} = 0$

Statement-2: y is a linear function of x.

62. Let f is a twice differentiable function satisfying $f'(x) = f(1 - x)$ for $x \in \mathbf{R}$. $f(\pi/2) = 1$

Statement-1: $f(x) = \left(-\dfrac{\cos 1}{1 + \sin 1}\right)\cos x + \sin x$

Statement-2: f satisfies $f''(x) - f(x) = 0$.

LEVEL 2

Straight Objective Type Questions

63. Let $f(x)$ be defined by

$$f(x) = \begin{cases} \sin 2x & \text{if } 0 < x \le \pi/6 \\ ax + b & \text{if } \pi/6 < x \le 1 \end{cases}$$

The values of a and b such that f and f' are continuous, are

(a) $a = 1, b = 1/\sqrt{2} + \pi/6$

(b) $a = 1/\sqrt{2}, b = 1/\sqrt{2}$

(c) $a = 1, b = \sqrt{3}/2 - \pi/6$

(d) none of these

64. Let
$$f(x) = \begin{cases} 1/|x| & \text{for } |x| \ge 1 \\ ax^2 + b & \text{for } |x| < 1 \end{cases}$$
The coefficients a and b so that f is continuous and differentiable at any point, are equal to
(a) $a = -1/2, b = 3/2$ (b) $a = 1/2, b = -3/2$
(c) $a = 1, b = -1$ (d) none of these.

65. For a real number y, let $[y]$ denote the greatest integer less than or equal to y. Then
$$f(x) = \frac{\tan(\pi[x - \pi])}{1 + [x]^2}$$
is
(a) discontinuous at some x
(b) continuous at all x, but the derivative $f'(x)$ does not exist for some x
(c) $f'(x)$ exists for all x but the second derivative $f''(x)$ does not exist
(d) $f'(x)$ exists for all x.

66. If
$$f(x) = \begin{cases} (\cos x)^{1/\sin x} & \text{for } x \ne 0 \\ k & \text{for } x = 0 \end{cases}$$
the value of k, so that f is differentiable at $x = 0$ is
(a) 0 (b) 1
(c) 1/2 (d) none of these.

67. If $y = \sin^{-1}\left(\dfrac{\sin\alpha \sin x}{1 - \cos\alpha \sin x}\right)$, then $y'(0)$ is
(a) 1 (b) $2\tan\alpha$
(c) $(1/2)\tan\alpha$ (d) $\sin\alpha$.

68. The set of all points of differentiability of the function
$$f(x) = \frac{\sqrt{x+1} - 1}{\sqrt{x}}$$
for $x \ne 0$ and $f(0) = 0$ is
(a) $(-\infty, \infty)$ (b) $[0, \infty)$
(c) $(0, \infty)$ (d) $(-\infty, \infty) \sim \{0\}$.

69. If $x = \sin^{-1} t$ and $y = \log(1 - t^2)$; then $\left.\dfrac{d^2y}{dx^2}\right|_{t=1/2}$ is
(a) $-8/3$ (b) $8/3$
(c) $3/4$ (d) $-3/4$

70. If $y^2 + x^2 = R^2$ and $k = 1/R$, then k is equal to
(a) $\dfrac{|y''|}{\sqrt{1 + y'^2}}$ (b) $\dfrac{|y''|}{\sqrt{(1 + y'^2)^3}}$
(c) $\dfrac{2|y''|}{\sqrt{1 + y'^2}}$ (d) $\dfrac{|y''|}{2\sqrt{(1 + y'^2)^3}}$.

71. Let $f : \mathbf{R} \to \mathbf{R}$. Then f is differentiable on $\mathbf{R}$ if
(a) $|f(x) - f(y)| \le k(x - y)$ for all $x, y \in \mathbf{R}$ and some $k > 0$
(b) $|f(x) - f(y)| \le k|x - y|^{1/2}$ for all $x, y \in \mathbf{R}$ and some $k > 0$
(c) $|f(x) - f(y)| \le k(x - y)^2$ for all $x, y \in \mathbf{R}$ and some $k > 0$
(d) f^2 is differentiable on $\mathbf{R}$

72. $f : \mathbf{R} \to \mathbf{R}$ be such that $|f(x) - f(y)| \le |x - y|^3$ for all $x, y \in \mathbf{R}$ then the value of $f'(x)$ is
(a) $f(x)$
(b) constant possibly different from zero
(c) $(f(x))^2$
(d) 0

73. Let f be the function on [0, 1] given by $f(x) = x\sin\dfrac{\pi}{x}$ for $x \ne 0$ and $f(0) = 0$. Then f is
(a) discontinuous but bounded
(b) differentiable
(c) continuous but not bounded
(d) continuous and bounded

74. Let $f(x) = \dfrac{|x|\left(3e^{1/|x|} + 4\right)}{2 - e^{1/|x|}}$, $x \ne 0$ and $f(0) = 0$ then
(a) f is not continuous
(b) f is continuous but not differentiable at $x = 0$
(c) $f'(0)$ exist
(d) $f'(0+) = 2$

75. Let $f(x) = \begin{cases} x^2 - 1, & x \le 1 \\ k(x - 1), & x > 1 \end{cases}$ then
(a) f is continuous for only finitely many values of k
(b) f is discontinuous at $x = 1$
(c) f is differentiable only when $k = 2$
(d) there are infinitely many values of k for which f is differentiable

76. Let f be a function defined on $[0, \infty)$ by
$$f(x) = \begin{cases} 0 & x = 0 \\ (x + a/\sqrt{2})(1/\sqrt{2}) & 0 < x \le a \\ (x/2 + a)(1/\sqrt{2}) & x \ge a \end{cases}$$
then
(a) $f'(x)$ is discontinuous at $x = 0, a$
(b) f is a continuous function
(c) f is discontinuous at $x = a$
(d) none of these

77. The number of times the function $y = (x^2 + 1)^{80}$ to be differentiated to result in a polynomial of degree 50 is
(a) 70 (b) 80
(c) 110 (d) 30

78. The derivative of the function $y = \sin^{-1}\left(\dfrac{2x}{1 + x^2}\right)$ doesn't exist for
(a) all values of x for which $|x| < 1$
(b) $x = -1, 1$

(c) all values of x for which $|x| > 1$
(d) none of these

79. If $0 < \alpha < 1$ and f is defined as

$$f(x) = \begin{cases} x^{\alpha} & \text{if } x > 0 \\ 0 & \text{if } x = 0 \end{cases} \quad \text{then}$$

(a) f is differentiable at $x = 0$
(b) f is not continuous
(c) f is not differentiable at $x = 0$
(d) f is bounded

80. Let $f(x) = \begin{cases} x^2 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$

then
(a) f is continuous on **R**
(b) f is differentiable on **R** ~ **Q**
(c) f is differentiable only at one point
(d) f is continuous at infinitely many points of **R**

81. A value of k such that $f(x) = x^k$ is $(n - 1)$ times differentiable at 0 but not n- times differentiable at 0 is

(a) $\dfrac{2n-3}{3}$ (b) $\dfrac{3n-2}{3}$
(c) $\dfrac{4n-3}{3}$ (d) none of these

82. The domain of the derivative of the function

$$f(x) = \begin{cases} \tan^{-1} x & \text{if } |x| \le 1 \\ \dfrac{1}{2}(|x| - 1) & \text{if } |x| > 1 \end{cases} \quad \text{is}$$

(a) **R** ~ {0} (b) **R** ~ {1}
(c) **R** ~ {– 1} (d) **R** ~ {– 1, 1}

83. The derivative of $\sin^{-1}\left(\dfrac{1-x^{2n}}{1+x^{2n}}\right)$ with respect to x^{2n} is

(a) $-\dfrac{1}{x^n + x^{3n}}$ (b) $\dfrac{1}{x^n + x^{3n}}$
(c) $\dfrac{1}{x^n + x^{2n}}$ (d) $-\dfrac{1}{x^n + x^{2n}}$

84. If $\sqrt{1-x^6} + \sqrt{1-y^6} = a(x^3 - y^3)$ and $\dfrac{dy}{dx} = f(x, y)\sqrt{\dfrac{1-y^6}{1-x^6}}$ then the value of $f(x, y)$ is

(a) y/x (b) y^2/x^2
(c) $2y^2/x^2$ (d) x^2/y^2

85. If $f(x) = x^2 + \tan x$ and f is inverse of g, then $g'(x)$ is equal to

(a) $\dfrac{1}{2+[g(x)-x]^2}$ (b) $\dfrac{1}{2g(x)+(g(x)-x)^2}$
(c) $\dfrac{1}{2g(x)-(g(x)-x)^2}$
(d) $\dfrac{1}{2g(x)+1+(x-(g(x))^2)^2}$

86. Number of points of non-differentiability of $f(x) = \sin \pi(x - [x])$ in $(-\pi/2, \pi/2)$, where [.] denotes greatest integer function is

(a) 4 (b) 5
(c) 3 (d) 2

87. Suppose that f is differentiable function with the property $f(x + y) = f(x) + f(y) + x^2y^2$ and $\lim\limits_{x\to 0} \dfrac{f(x)}{x} = 100$ then $f'(x)$ is equal to

(a) 100 (b) 20
(c) 30 (d) none of these

Previous Years' AIEEE/JEE Main Questions

1. $f(x)$ and $g(x)$ are two differential function on [0, 2] such that $f''(x) - g''(x) = 0$, $f'(1) = 2g'(1) = 4$, $f(2) = 3g(2) = 9$ then $f(x) - g(x)$ at $x = \dfrac{3}{2}$ is

(a) 0 (b) 2
(c) 10 (d) 5 **[2002]**

2. If $f(1) = 1, f'(1) = 2$ then $\lim\limits_{x \to 1} \dfrac{\sqrt{f(x)} - 1}{\sqrt{x} - 1}$ is

(a) 2 (b) 4
(c) 1 (d) $\dfrac{1}{2}$ **[2002]**

3. If $y = \left(x + \sqrt{1+x^2}\right)^n$, then $(1+x^2)\dfrac{d^2y}{dx^2} + x\dfrac{dy}{dx}$ is

(a) n^2y (b) $-n^2y$
(c) $-y$ (d) $2x^2y$ **[2002]**

4. If $f(x) = x^n$, then the value of

$$f(1) - \frac{f'(1)}{1!} + \frac{f''(1)}{2!} - \frac{f'''(1)}{3!} + \cdots + \frac{(-1)^n f^n(1)}{n!} \text{ is}$$

(a) 2^{n-1} (b) 0
(c) 1 (d) 2^n **[2003]**

5. If $f(x) = \begin{cases} x\, e^{-\left(\frac{1}{|x|} + \frac{1}{x}\right)} & , x \neq 0 \\ 0 & , x = 0 \end{cases}$ then $f(x)$ is

(a) continuous for all x, but not differentially at $x = 0$
(b) neither differential nor continuous at $x = 0$
(c) discontinuous everywhere
(d) continuous as well as differentiable for all x. **[2003]**

6. Let $f(a) = g(a) = k$ and their nth derivatives $f^n(a)$, $g^n(a)$ exist and are not equal for some n. Further if

$$\lim_{x \to a} \frac{f(a)g(x) - f(a) - g(a)f(x) + g(a)}{g(x) - f(x)} = 4 \text{ then}$$

the value of k is

(a) 2 (b) 1
(c) 0 (d) 4 **[2003]**

7. If $x = e^{y + e^{y + \ldots\infty}},$ $x > 0$, then $\frac{dy}{dx}$ is

(a) $\frac{1-x}{x}$ (b) $\frac{1}{x}$
(c) $\frac{x}{1+x}$ (d) $\frac{1+x}{x}$ **[2004]**

8. If f is a real valued differentiable function satisfying $|f(x) - f(y)| \leq (x - y)^2$, $x, y \in \mathbf{R}$ and $f(0) = 0$, then $f(1)$ equals

(a) 2 (b) 1
(c) – 1 (d) 0 **[2005]**

9. Suppose $f(x)$ is differentiable at $x = 1$ and $\lim_{h \to 0} \frac{1}{h} f(1 + h) = 5$, then $f'(1)$ equals

(a) 5 (b) 6
(c) 3 (d) 4 **[2005]**

10. The set of points where $f(x) = \frac{x}{1 + |x|}$ is differentiable is

(a) $(0, \infty)$
(b) $(-\infty, 0) \cup (0, \infty)$
(c) $(-\infty, -1) \cup (-1, \infty)$
(d) $(-\infty, \infty)$ **[2006]**

11. If $x^m y^n = (x + y)^{m+n}$, then $\frac{dy}{dx}$ is

(a) $\frac{x}{y}$ (b) $\frac{y}{x}$
(c) $\frac{x+y}{xy}$ (d) xy **[2006]**

12. Let $f : \mathbf{R} \to \mathbf{R}$ be a function defined by $f(x) = \min\{x + 1, |x| + 1\}$. Then which of the following is true.

(a) $f(x) \geq 1$ for $x \in \mathbf{R}$
(b) $f(x)$ is not differentiable at $x = 1$
(c) $f(x)$ is differentiable everywhere
(d) $f(x)$ is not differentiable at $x = 0$ **[2007]**

13. Let $f(x) = \begin{cases} (x-1)\sin\left(\frac{1}{x-1}\right), & \text{if } x \neq 1 \\ 0 & \text{if } x = 1 \end{cases}$

Then which one of the following is true

(a) f is neither differentiable at $x = 0$ nor at $x = 1$
(b) f is differentiable at $x = 0$ and at $x = 1$
(c) f is differentiable at $x = 0$ but not at $x = 1$
(d) f is differentiable at $x = 1$ but not at $x = 0$ **[2008]**

14. Let y be an implicit function of x defined by $x^{2x} - 2x^x \cot y - 1 = 0$. Then $y'(1)$ equals

(a) log 2 (b) – log 2
(c) – 1 (d) 1 **[2009]**

15. Let $f : (-1, 1) \to \mathbf{R}$ be a differentiable function with $f(0) = -1$ and $f'(0) = 1$. Let $g(x) = [f(2f(x) + 2)]^2$.

Then $g'(0) =$

(a) 0 (b) – 2
(c) 4 (d) – 4 **[2010]**

16. $\frac{d^2x}{dy^2}$ equals

(a) $-\left(\frac{d^2y}{dx^2}\right)^{-1}\left(\frac{dy}{dx}\right)^{-3}$ (b) $\left(\frac{d^2y}{dx^2}\right)^{-1}$
(c) $-\left(\frac{d^2y}{dx^2}\right)^{-1}\left(\frac{dy}{dx}\right)^{-3}$ (d) $-\left(\frac{d^2y}{dx^2}\right)\left(\frac{dy}{dx}\right)^{-2}$

[2011]

17. If function $f(x)$ is differentiable at $x = a$ than $\lim_{x \to a} \frac{x^2 f(a) - a^2 f(x)}{x - a}$ is

(a) $-a^2 f'(a)$ (b) $a^2 f'(a)$
(c) $2a f(a) - a^2 f'(a)$ (d) $2a f(a) + a^2 f'(a)$

[2011]

18. Consider the function , $f(x) = |x - 2| + |x - 5|$, $x \in \mathbf{R}$

Statement 1: $f'(4) = 0$

Statement 2: f is continuous is [2,5], differentiable in (2,5)and $f(2) = f(5)$ **[2012]**

19. Let f be a differentiable function such that $8f(x) + 6f\left(\frac{1}{x}\right) - x = 5$ $(x \neq 0)$ and $y = x^2 f(x)$, then $\frac{dy}{dx}$ at $x = -1$ is

    (a) $\frac{15}{14}$ (b) $-\frac{15}{14}$

    (c) $-\frac{1}{14}$ (d) $\frac{1}{14}$ **[2013, online]**

20. For $a > 0$, $t \in \left(0, \frac{\pi}{2}\right)$, let $x = \sqrt{a^{\sin^{-1} t}}$, $y = \sqrt{a^{\cos^{-1} t}}$. Then $1 + \left(\frac{dy}{dx}\right)^2$ equals

    (a) $\frac{x^2}{y^2}$ (b) $\frac{y^2}{x^2}$

    (c) $\frac{x^2 + y^2}{y^2}$ (d) $\frac{x^2 + y^2}{x^2}$ **[2013, online]**

21. If $y = \sec(\tan^{-1} x)$, then $\left.\frac{dy}{dx}\right|_{x=1}$ is equal to

    (a) $\frac{1}{2}$ (b) 1

    (c) $\sqrt{2}$ (d) $\frac{1}{\sqrt{2}}$ **[2013]**

22. Let $f(x) = \frac{x^2 - x}{x^2 + 2x}$, $x \neq 0, -2$. Then $\frac{d}{dx}(f^{-1}(x))$ (wherever defined) is equal to

    (a) $\frac{-1}{(1-x)^2}$ (b) $\frac{3}{(1-x)^2}$

    (c) $\frac{1}{(1-x)^2}$ (d) $\frac{-3}{(1-x)^2}$ **[2013, online]**

23. If g is the inverse of a function f and $f'(x) = \frac{1}{1+x^5}$, then $g'(x)$ is equal to

    (a) $1 + x^5$ (b) $5x^4$

    (c) $\frac{1}{1+(g(x))^5}$ (d) $1 + (g(x))^5$ **[2014]**

24. Let $f(x) = x|x|$, $g(x) = \sin x$ and $h(x) = go\,f(x)$. Then

    (a) $h(x)$ is not differentiable at $x = 0$

    (b) $h(x)$ is differentiable at $x = 0$, but $h'(x)$ is not continuous at $x = 0$

    (c) $h'(x)$ continuous at $x = 0$ but it is not differentiable at $x = 0$

    (d) $h'(x)$ is differentiable at $x = 0$

    [2014, online]

25. If $f(x) = x^2 - x + 5$, $x > \frac{1}{2}$, and $g(x)$ is its inverse function, then $g'(7)$ equals

    (a) $-\frac{1}{3}$ (b) $\frac{1}{13}$

    (c) $\frac{1}{3}$ (d) $-\frac{1}{13}$ **[2014, online]**

26. Let $f : \mathbf{R} \to \mathbf{R}$ be function such that $|f(x)| \leq x^2$ for all $x \in \mathbf{R}$. Than at $x = 0$, f is

    (a) continuous but not differentiable

    (b) continuous as well as differentiable

    (c) neither continuous nor differentiable

    (d) differentiable but not continuous **[2014, online]**

27. If $y = e^{nx}$, then $\left(\frac{d^2y}{dx^2}\right)\frac{d^2x}{dy^2}$ is equal to

    (a) ne^{nx} (b) ne^{-nx}

    (c) 1 (d) $-ne^{-nx}$ **[2014]**

28. If the function $g(x) = \begin{cases} k\sqrt{x+1}, & 0 \leq x \leq 3 \\ mx + 2, & 3 < x \leq 5 \end{cases}$ is differentiable, then the value of $k + m$ is:

    (a) 2 (b) $\frac{16}{5}$

    (c) $\frac{10}{3}$ (d) 4 **[2015]**

29. For $x \in \mathbf{R}$, $f(x) = |\log 2 - \sin x|$ and $g(x) = f(f(x))$, then

    (a) g is not differentiable at $x = 0$

    (b) $g'(0) = \cos(\log 2)$

    (c) $g'(0) = -\cos(\log 2)$

    (d) g is differentiable at $x = 0$ and $g'(0) = -\sin(\log 2)$ **[2016]**

30. If $f(x)$ is differentiability function in the internal $(0, \infty)$ such that $f(1) = 1$ and $\lim_{t \to x} \frac{t^2 f(x) - x^2 f(t)}{t - x} = 1$ for each $x > 0$, then $f\left(\frac{3}{2}\right)$ is equal to

    (a) $\frac{23}{18}$ (b) $\frac{13}{6}$

    (c) $\frac{25}{9}$ (d) $\frac{31}{8}$ **[2016, online]**

31. If the function $f(x) = \begin{cases} -x, & x < 1 \\ a + \cos^{-1}(x + b) & 1 \leq x \leq 2 \end{cases}$ is differentiable at $x = 1$, then $\frac{a}{b}$ is equal to

    (a) $\frac{\pi + 2}{2}$ (b) $\frac{\pi - 2}{2}$

    (c) $\frac{-\pi - 2}{2}$ (d) $-1 - \cos^{-1}(2)$

Previous Years' B-Architecture Entrance Examination Questions

1. Let $f(x) = \begin{cases} ax & , \quad x < 2 \\ ax^2 + bx + 3, & x \geq 2 \end{cases}$

If f is differentiable for all x, then the value of (a, b) is equal to

(a) $(1, 2)$ (b) $\left(\frac{3}{2}, \frac{9}{2}\right)$

(c) $\left(\frac{3}{4}, -\frac{9}{2}\right)$ (d) $\left(\frac{3}{4}, -\frac{9}{4}\right)$ **[2007]**

2. Let $f : [0, \infty) \to [0, \infty)$ be given by

$$f(x) = \sum_{i=1}^{10} \frac{x^i}{i}.$$

If $f'(\cdot)$ denotes the derivative of $f(\cdot)$, then the value of $\lim_{x \to 1} \frac{f'(x) - 10}{x - 1}$ is

(a) 35 (b) 40

(c) 45 (d) 55 **[2008]**

3. Let $f : (-\infty, \infty) \to (-\infty, \infty)$ be given by

$$f(x) = x|x| + |x - 1| - |x - 2|^2 + |x - 3|^3$$

If A denotes the set of points where $f(\cdot)$ is not differentiable, then $A =$

(a) $\{3\}$ (b) $\{1\}$

(c) $\{0\}$ (d) $\{2\}$ **[2008]**

4. Let $f(\cdot)$ and $g(\cdot)$ be differentiable functions on $(-\infty, \infty)$ and let $f'(\cdot)$ and $g'(\cdot)$ denote derivatives of $f(\cdot)$ and $g(\cdot)$ respectively. If $f(0) = \frac{1}{2}$, $g(0) = \frac{1}{3}$, $f'(0) = 1$ and $g'(0) = 2$, then the value of $\lim_{x \to 0} \frac{2f(2x^2 + 3x) - 1}{3g(x) - 1}$ is

(a) 1 (b) $\frac{1}{2}$

(c) $\frac{1}{3}$ (d) $\frac{1}{4}$ **[2008]**

5. Let $f : (-\infty, \infty) \to (-\infty, \infty)$ be defined by

$$f(x) = \begin{cases} x^3, & \text{if } x > 0 \\ 0, & \text{if } x \leq 0 \end{cases}$$

and let $f'(\cdot)$ denote the derivative of $f(\cdot)$

Statement-1: $\lim_{x \to 0} f'(x) = f'(0)$

Statement-2: $f'(x)$ exists, for each $x \in (-\infty, \infty)$ and $f'(x)$ is continuous at $x = 0$ **[2008]**

6. Let $f : \mathbf{R} \to \mathbf{R}$ and $g : \mathbf{R} \to \mathbf{R}$ be functions defined by $f(x) = \text{sgn}(\sin x)$, $g(x) = \sin(\text{sgn}\, x)$ where

$$\text{sgn}\, \alpha = \begin{cases} 1 & \text{if } \alpha > 0 \\ -1 & \text{if } \alpha > 0 \\ 0 & \text{if } \alpha = 0 \end{cases}$$

If $A = f'(\pi)$ and $B = g'(\pi)$, then

(a) A does not exist and $B = 0$

(c) $A = 0$ and $B = 0$

(c) both A and B do not exist

(d) $A = 0$ and B does not exist **[2010]**

7. Let $f(x) = 2\tan^{-1}\left(\frac{1+x}{1-x}\right) + \sin^{-1}\left(\frac{1-x^2}{1+x^2}\right)$, $x \in \mathbf{R}$, $x \neq 1$

Statement-1: $f''(x) = 0$

Statement-2: The range of $f(x)$ is $\{\pi\}$ **[2010]**

8. If $f(x) = \begin{cases} 1 - x^2, & x \leq -1 \\ 2x + 2, & x > -1 \end{cases}$ then the derivative of $f(x)$ at $x = -1$ is

(a) 2 (b) 0

(c) $\frac{1}{2}$ (d) 3 **[2011]**

9. Amongst the following functions, a function that is differentiable at $x = 0$ is

(a) $\cos(|x|) - |x|$ (c) $\cos(|x|) + |x|$

(c) $\sin(|x|) + |x|$ (d) $\sin(|x|) - |x|$ **[2012]**

10. Let f be a differentiable function such that $8f(x) + 6f\left(\frac{1}{x}\right) - x = 5$ $(x \neq 0)$ and $y = x^2 f(x)$ then $\frac{dy}{dx}$ at $x = -1$ is

(a) $\frac{15}{14}$ (c) $-\frac{15}{14}$

(c) $-\frac{1}{14}$ (d) $\frac{1}{14}$ **[2013]**

11. If $f(x) = \begin{cases} \frac{1}{|x|} & \text{if } |x| > 2 \\ a + bx^2 & \text{if } |x| \leq 2 \end{cases}$

then $f(x)$ is differentiable at $x = -2$ for

(a) $a = \frac{3}{4}$ and $b = -\frac{1}{16}$

(b) $a = -\frac{1}{4}$ and $b = \frac{1}{16}$

(c) $a = \frac{1}{4}$ and $b = -\frac{1}{16}$

(d) $a = \frac{3}{4}$ and $b = \frac{1}{16}$ **[2014]**

12. Let $y(x) = (1 + x)(1 + x^2)(1 + x^4) \ldots(1 + x^{32})$. Then $\frac{dy}{dx}$ at $x = \frac{1}{2}$ is

(a) $1-65\left(\frac{1}{2}\right)^{62}$ (b) $1-63\left(\frac{1}{2}\right)^{64}$

(c) $4-65\left(\frac{1}{2}\right)^{62}$ (d) $4-63\left(\frac{1}{2}\right)^{64}$ **[2015]**

13. If $y(x) = \begin{vmatrix} \sin x & \cos x & \sin x + \cos x + 1 \\ 23 & 17 & 13 \\ 1 & 1 & 1 \end{vmatrix}$, $x \in \mathbf{R}$, then $\frac{d^2y}{dx^2} + y$ is equal to

(a) 4 (b) –10
(c) 0 (d) 6 **[2016]**

Hints and Solutions

Concept-based

1. $f(t) = \frac{1}{t} - \frac{5}{t^2} - \frac{1}{t^3} \Rightarrow f'(t) = -\frac{1}{t^2} + \frac{10}{t^3} + \frac{3}{t^4}$

So $f'\left(\frac{1}{a}\right) = -a^2 + 10a^3 + 3a^4$

2. $y = (2x - 1)^{-1/3} + 5\,(x^2 + 2)^{-3/4}$

$$y'(x) = -\frac{2}{3}\frac{1}{(2x-1)^{4/3}} - \frac{15x}{2(x^2+2)^{7/4}}$$

$$\Rightarrow \quad y'(0) = -\frac{2}{3}$$

3. $f'(1+) = \lim_{h\to 0+} \frac{f(1+h)-f(1)}{h} = \lim_{h\to 0+} \frac{\log(1+h)-\log 1}{h}$

$$= \lim_{h\to 0+} \frac{1}{h}\log(1+h) = \lim_{h\to 0+} \log(1+h)^{1/h}$$

$$f'(1-) = \lim_{h\to 0-} \frac{f(1+h)}{h} = \lim_{h\to 0-} \frac{\log(1+h)}{h}$$

$$= \lim_{h\to 0-} \log(1+h)^{-1/h(-1)} \qquad \begin{pmatrix} h \to 0-, \\ 1/h \to -\infty \end{pmatrix}$$

$$= \log e^{-1} = -1$$

4. Since $\sin^{-1} x$ is not differentiable at $x = \pm 1$, so f is not differentiable at all x for which $\left|\frac{2x}{1+x^2}\right| = 1$

$\Rightarrow \quad 2|x| = 1 + x^2 \Rightarrow (|x| - 1)^2 = 0$

$\Rightarrow \quad |x| = 1$

Hence f is not differentiable at $x = 1, -1$.

5. The domain of definition of the function is $-1 \le x \le 1$

$$y' = \frac{1}{2\sqrt{1-\sqrt{1-x^2}}} \cdot \frac{-1}{2\sqrt{1-x^2}}(-2x) \text{ at } x \ne 0, \pm 1$$

As $x \to 1-$ or $x \to -1+$, we have $y' \to \infty$. At $x = 0$,

$$\lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{\sqrt{1-\sqrt{1-x^2}}}{x}$$

Since $(1 - x^2)^{1/2} - 1 = -\frac{1}{2}x^2 + 0(x^4)$, so

$$\lim_{x\to 0} \frac{\sqrt{1-\sqrt{1-x^2}}}{x} = \lim_{x\to 0} \frac{\sqrt{\frac{1}{2}x^2}}{x} = \begin{cases} \frac{1}{\sqrt{2}} & \text{as } x \to 0+ \\ -\frac{1}{\sqrt{2}} & \text{as } x \to 0- \end{cases}$$

6. $$y'(x) = \frac{1}{\log^2 \log_3(\log_5 x)} \frac{d}{dx}(\log_3(\log_5 x))$$

$$= \frac{1}{\log_2 \log_3(\log_5 x)} \frac{1}{\log^3 \log_5 x} \frac{d}{dx}(\log_5 x)$$

$$= \frac{1}{x(\log 2 \log 3 \log 5)\log_3(\log_5 x)\log_5 x}$$

$$y'(125) = y'(5^3) = \frac{1}{125(\log 2 \log 3 \log 5)3}$$

$$= \frac{1}{375 \log 2 \log 3 \log 5}$$

7. $x = 1 + \frac{1}{t} \Rightarrow \frac{dx}{dt} = -\frac{1}{t^2}$ and $\frac{dy}{dt} = \frac{1}{t^2}$

So $\frac{dy}{dx} = -1$ for all t. Hence $\frac{d^2y}{dx^2} = 0$

8. $\frac{dx}{dt} = -3 \sin t$, $\frac{dy}{dt} = 4 \cos t$ so that

$\frac{dy}{dx} = -\frac{4}{3} \cot t$. For $x = \frac{3}{\sqrt{2}}$,

we have $\cos t = \frac{1}{\sqrt{2}}$ and $y = 2\sqrt{2}$, $\sin t = \frac{1}{\sqrt{2}}$.

Hence $\cot t = 1$. So, $\frac{dy}{dx} = -\frac{4}{3}$.

9. $4x^3 + 4y^3 \frac{dy}{dx} = 2xy^2 + 2yx^2 \frac{dy}{dx}$

$\Rightarrow \quad (4y^3 - 2yx^2)\frac{dy}{dx} = 2xy^2 - 4x^3$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{2x(y^2 - 2x^2)}{2y(2y^2 - x^2)} = \frac{x}{y} \cdot \frac{y^2 - 2x^2}{2y^2 - x^2}$$

10. $f(x) = |(|x| - 1)(|x| - 3)|$. Hence f is not differentiable at $|x| = 1$, $|x| = 3$ i.e. at $x = 1, -1, 3, -3$

Level 1

11. f being represented by polynomials is differentiable everywhere except possibly $x = 1$

$$f'(1+) = \lim_{h\to 0+} \frac{3(1+h)^3 - (1+h)^2 + (1+h) - 3}{h}$$

$$= \lim_{h\to 0} \frac{3[h^3 + 3h^2 + 3h] - (h^2 + 2h) + h}{h} = 8$$

$$f'(1-) = \lim_{h\to 0} \frac{(1+h)^4 + (1+h)^2 - (1+h) + 2 - 3}{h}$$

$$= \lim_{h\to 0} \frac{[h^4 + 4h^3 + 6h^2 + 4h] + (h^2 + 2h) - h}{h} = 5$$

$\lim_{x\to 1+} f(x) = 3 = \lim_{x\to 1} f(x) = f(1)$.

So f is continuous everywhere.

12. f is continuous, $f'(0+) = \lim_{x\to 0+} \sin\frac{1}{x}$ which does not exist. Similarly $f'(0-)$ does not exist.

13. $y = \frac{2}{x} \log(x - 2)$, $y'(x)$

$= 2\left[\frac{1}{x(x-2)} - \frac{1}{x^2}\log(x-2)\right]$, $y'(3) = \frac{2}{3}$.

14. f is continuous, since $\lim_{x\to 0} f(x) = 0 = f(0)$,

$$\lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{\sin x^2}{x^2} = 1.$$

15. Putting $x = \tan \theta$, $\frac{\sqrt{1 + x^2 - 1}}{x} = \frac{\sec\theta - 1}{\tan\theta}$

$$= \frac{1 - \cos\theta}{\sin\theta} = \tan\frac{\theta}{2}.$$

Thus $x = \tan^{-1}\frac{\sqrt{1+x^2} - 1}{x} = \frac{\theta}{2} = \frac{1}{2}\tan^{-1} x$.

Putting $x = \sin \theta$, we obtain $v = \tan^{-1}\left(\frac{2x\sqrt{1-x^2}}{1-2x^2}\right)$
$= 2 \sin^{-1} x$

$$\frac{du}{dv} = \frac{\left(\frac{1}{2}\right)\frac{1}{1+x^2}}{\frac{2}{\sqrt{1-x^2}}} \quad \Rightarrow \quad \left.\frac{du}{dv}\right|_{x=0} = \frac{1}{4}.$$

16. $n(a + b)^{n-1} = n(a^n - 1 + b^n - 1)$ is valid if $n = 2$.

17. $f(x) = \begin{cases} x^3, & x \geq 0 \\ x^3, & x < 0 \end{cases}$, $f'(0+) = 0 = f'(0-)$

18. $f(x) = \begin{cases} e^{-x}, & x \geq 0 \\ e^{x}, & x < 0 \end{cases}$, $f'(0+) = -1, f'(0-) = 1$.

19. $\frac{dy}{dx} = \frac{2t}{1/t} = 2t^2$, $y''(x) = \frac{d}{dt}(2t^2)\frac{dt}{dx} = 4t.\ t$

So $y''(1) = 4$.

20. For continuously differentiable function, apply intermediate value theorem to f' for the inequality

$$f'(0) \leq \frac{1}{2}\,(f'(0) + f'(1)) \leq f'(1) \text{ if } f'(0) \leq f'(1),$$

$$f'(1) \leq \frac{1}{2}\,(f'(0) + f'(1)) \leq f'(0) \text{ if } f'(1) \leq f'(0).$$

21. $f(x) = \begin{cases} -3x & x < -2 \\ -x + 4 & -2 \leq x < 0 \\ x + 4 & 0 \leq x \leq 2 \\ 3x & x > 2 \end{cases}$

$f'(-2+) = -1, f'(2-) = 1, f'(0+) = 1, f'(2+) = 3$.

22. $f'(x) = \begin{cases} 4x^3 \sin\left(\frac{1}{x}\right) - x^2 \cos\left(\frac{1}{x}\right), & x \neq 0 \\ 0 & x = 0 \end{cases}$

$$f''(x) = \begin{cases} 12x^2 \sin\left(\frac{1}{x}\right) - 4x\sin\frac{1}{x} + \sin\frac{1}{x} - 2x\cos\frac{1}{x}, & x \neq 0 \\ 0 & x = 0 \end{cases}$$

Since $f''(0) = \lim\limits_{x \to 0} \frac{4x^3 \sin\frac{1}{x} - x^2 \cos\frac{1}{x}}{x} = 0$.

Clearly $\lim\limits_{x \to 0} f''(x)$ doesn't exist.

23. $y \log x = x - y \quad \Rightarrow \quad \frac{y}{x} + (\log x)\frac{dy}{dx} = 1 - \frac{dy}{dx}$

$\Rightarrow \frac{dy}{dx} = -\frac{y}{x(1 + \log x)} \quad \Rightarrow \quad \left.\frac{dy}{dx}\right|_{x=1} = 1 - y(1) = 0$.

24. Let $u = f^{-1}(x) \Rightarrow f(u) = x \Rightarrow f'(u)\frac{du}{dx} = 1$

$$\Rightarrow \quad \frac{du}{dx} = \frac{1}{\sqrt{1 - (f(u))^2}} = \frac{1}{\sqrt{1 - x^2}}.$$

25. $y = \sin^{-1} x \quad \Rightarrow \quad \frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}}$

$\Rightarrow \quad y'^2(1 - x^2) = 1$

Differentiating w.r.t. x, we get

$2y'y''(1 - x^2) - 2xy'^2 = 0$

$\Rightarrow \quad y''(1 - x^2) = xy'$.

26. Let $u = f^{-1}(u) \quad \Rightarrow \quad f(u) = x \quad \Rightarrow \quad f'(u)\frac{du}{dx} = 1$

$$\Rightarrow \quad f''(u)\left(\frac{du}{dx}\right)^2 + f'(u)\frac{d^2u}{dx^2} = 0$$

$$\Rightarrow \quad f'(u)\left(\frac{1}{f(u)}\right)^2 + f'(u)\frac{d^2u}{dx^2} = 0$$

$$\Rightarrow \quad \frac{d^2u}{dx^2} = -\frac{1}{(f(u))^2} = -\frac{1}{x^2}.$$

27. $y'(x) = \frac{1}{\sqrt{1 - x^{-2}}}\, x^{-2}$ so $y'(2) = \frac{1}{2\sqrt{3}}$.

28. $$\frac{dy}{dx} = -\frac{2}{\sqrt{1 - 4t^2}} \Bigg/ \frac{2t}{\sqrt{1 - (t^2 - 1)^2}}$$

$$= -\frac{\sqrt{2t^2 - t^4}}{\sqrt{1 - 4t^2}\,.t} = -\frac{\sqrt{2 - t^2}}{\sqrt{1 - 4t^2}}$$

$$\Rightarrow \quad \left.\frac{dy}{dx}\right|_{t=0} = -\sqrt{2}$$

29. $$\frac{1}{1 + y^2}\frac{dy}{dx} - \frac{dy}{dx} + 1 = 0 \quad \Rightarrow \quad \frac{dy}{dx} = 1 + \frac{1}{y^2}$$

$$\Rightarrow \frac{d^2y}{dx^2} = -\frac{2}{y^3}\frac{dy}{dx} = -\frac{2(1 + y^2)}{y^5}.$$

30. $$f'(x) = \begin{vmatrix} 1 & 2x & 3x^2 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{vmatrix} + \begin{vmatrix} x & x^2 & x^3 \\ 0 & 2 & 6x \\ 0 & 2 & 6x \end{vmatrix} + \begin{vmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 0 & 6 \end{vmatrix}$$

$= 0 + 0 + 6x^2 = 6x^2$.

31. $$y = (\tan x \sin^2 x + \cos^2 x)\frac{1}{1 + \tan x}$$

$$= \frac{\sin^3 x + \cos^3 x}{\sin x + \cos x} = 1 - \sin x \cos x$$

$$= 1 - \frac{1}{2}\sin 2x$$

$$\frac{dy}{dx} = -\cos 2x.$$

32. $z'(t) = \frac{1}{2}\frac{3t^2}{(t^3 + 1)^{1/2}}$, $z'(2) = \frac{1}{2}.\frac{3.4}{3} = 2$.

33. $y = \cos^{-1}(\cos(\theta + x))$, $4 = r\cos\theta$, $5 = r\sin\theta$

$= \theta + x$ so $\frac{dy}{dx} = 1$.

34. $\frac{dy}{dx} = \frac{1}{\cos\left(\tan^{-1}\frac{e^x - e^{-x}}{2}\right)}\left(-\sin\left(\tan^{-1}\left(\frac{e^x - e^{-x}}{2}\right)\right)\right)\times$

$\frac{d}{dx}\left(\tan^{-1}\left(\frac{e^x - e^{-x}}{2}\right)\right)$

$\left.\frac{dy}{dx}\right|_{x=0} = 0$.

35. $y = -\log(1 + x)$ so $x\frac{dy}{dx} + 1 = -\frac{x}{1+x} + 1 = \frac{1}{1+x}$

$= e^y$.

36. $(1 - x^2)y^2 = (\sin^{-1} x)^2 \Rightarrow (1 - x^2)2yy' + (-2x)$

$y^2 = \frac{2\sin^{-1} x}{\sqrt{1-x^2}} = 2y$

$\Rightarrow (1 - x^2)y' - xy = 1$

37. $\frac{dy}{dx} = \frac{\sin^2 y}{\sin a} = \frac{\sin a \sin^2 y}{-\sin^2 y + \sin^2 a + \sin^2 y}$

$= \frac{\sin a \sin^2 y}{\sin(a+y)\sin(a-y) + \sin^2 y}$

$= \frac{\sin a \sin^2 y}{\sin(a+y)[\sin(a+y) - 2\sin y\cos a + \sin^2 y]}$

$= \frac{\sin a}{1 + \frac{\sin^2(a+y)}{\sin^2 y} - 2\cos a\frac{\sin(a+y)}{\sin y}}$

$= \frac{\sin a}{1 + x^2 - 2x\cos a}$.

38. $f(x) = \cot^{-1}\frac{3x - x^3}{1 - 3x^2} = \frac{\pi}{2} + 3\tan^{-1} x$

$f'(x) = \frac{3}{1+x^2}$ and $g(x) = \frac{\pi}{2} - \cos^{-1}\left(\frac{1-x^2}{1+x^2}\right)$

$= 2\tan^{-1} x$

so $g'(x) = \frac{2}{1+x^2}$. The required limit is equal to $\frac{f'(t)}{g'(t)}$

$= \frac{3}{2}$.

39. Verify the answers or consider $g(x) = \frac{f(x)}{\sin x}$ show that $g''(x) = -2\cot x\, g'(x) \Rightarrow g'(x) = c\,\text{cosec}^2 x$. Thus $\sin x f'(x) - \cos x f(x) = C$ but $f(0) = 0$, $f'(0) = 1$ so const $= 0$. $g(x) =$ const $\Rightarrow f(x) = C\sin x$ but $f'(0) = 1$ so $C = 1$.

40. $y'(x) = -\frac{\sin x}{\sqrt{1-\cos^2 x}} = -\frac{\sin x}{|\sin x|} = -\text{sgn}(\sin x)$.

41. $f(x) = \cos x^2$ as $[x] = 0$ for $0 < x < 1$ so $f'(x) = -2x\sin x^2$ hence $f'\left(\frac{\sqrt{\pi}}{2}\right) = -\frac{\sqrt{\pi}}{\sqrt{2}}$

42. $\frac{dy}{dx} = \frac{2b\sin t\cos t}{-2a\sin 2t} = -\frac{b}{a} \Rightarrow \frac{d^2y}{dx^2} = 0$.

43. $f(x) = \frac{\pi}{2} - \cot^{-1}\left(\cot\left(\frac{\pi}{4} - \frac{x}{2}\right)\right) = \frac{\pi}{4} + \frac{x}{2}$

Thus $f'(x) = \frac{1}{2}$.

44. $2^x\log 2 + 2^y\log 2\frac{dy}{dx} = 2^{x+y}\log 2\left(1 + \frac{dy}{dx}\right)$

Putting $x = y = 1$, we obtain

$(2 - 2^2)\frac{dy}{dx} = 2^2 - 2$

$\Rightarrow \frac{dy}{dx} = -1$

45. $2^s = \sin t \Rightarrow 2^s\log 2\frac{ds}{dt} = \cos t$

$\Rightarrow \frac{ds}{dt} = \frac{\cos t}{\sin t}\frac{1}{\log 2} = \frac{\cot t}{\log 2}$.

46. $x^2 + y^2 = 1 \Rightarrow 2x + 2yy' = 0 \Rightarrow x + yy' = 0$

Differentiating again $1 + y'^2 + yy'' = 0$

47. $f'(x) = 2x\cot x^2$, $f''(x) = 2[\cot x^2 - 2x^2\,\text{cosec}^2\,x^2]$

$f''\left(\sqrt{\pi}/2\right) = 2\left[\cot\pi/4 - \frac{2\pi}{4}\text{cosec}^2\,\pi/4\right]$

$= 2(1 - \pi)$.

48. $f(g(x) = x \Rightarrow f'(g(x))\,g'(x) = 1$

$\Rightarrow g'(x) = \frac{1}{f'(g(x))} = 1 + (g(x))^5$

$\Rightarrow g''(x) = 5(g(x))^4 g'(x) = 5(g(x))^4(1 + (g(x))^5)$

49. $u = f(\tan x)$, $v = g(\sec x)$

$\frac{du}{dx} = f'(\tan x)\sec^2 x$, $\frac{du}{dx} = g'(\sec x)\sec x\tan x$

$\therefore \frac{du}{dv} = \frac{du/dx}{dv/dx}$

$\Rightarrow \left.\frac{du}{dv}\right]_{x=\pi/4} = \frac{f'(1)(2)}{g'\left(\sqrt{2}\right)\left(\sqrt{2}\right)} = \frac{2\sqrt{2}}{4} = \frac{1}{\sqrt{2}}$

50. $y = (\log_{\cos x} \sin x)\,(\log_{nx} \cos x) + \sin^{-1}\left(\frac{2x}{1+x^2}\right)$

$$= \left(\frac{\log \sin x}{\log \cos x}\right)\left(\frac{\log \cos x}{\log nx}\right) + 2\tan^{-1} x$$

$$= \frac{\log \sin x}{\log(nx)} + 2\tan^{-1} x$$

$$\frac{dy}{dx} = \frac{\log(nx)(\cot x) - \frac{1}{x}\log \sin x}{(\log nx)^2} + \frac{2}{1+x^2}$$

$$\left.\frac{dy}{dx}\right]_{x=\pi/2} = 0 + \frac{2}{1+\pi^2/4} = \frac{8}{4+\pi^2}$$

51. Put $x = \sin\theta$ and $5/13 = \cos\alpha$, so that

$$y = \sin^{-1}[\sin(\theta+\alpha)] = \theta + \alpha$$

$$y = \sin^{-1} x + \cos^{-1}(5/13)$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{\sqrt{1-x^2}}$$

52. $g'(x) = 2[f(2\,f(x) + 2)]\;[f'(2\,f(x) + 2)\;(2\,f'(x))$

$$g'(0) = 4[f(2\,f(0) + 2)]\;[f'(2\,f(0) + 2)\;(2\,f'(0))$$

$$= 4f(0)\,f'(0)\,f'(0) = -4.$$

53. Put $x = 1$ in $x^{2x} - 2x^x \cot y - 1 = 0$, we have $1 - 2\cot y - 1 = 0 \Rightarrow \cot y = 0 \Rightarrow y = \pi/2$.

Differenting the given expression,

$2x \,.\, x^{2x-1} + 2\log x \,.\, x^{2x} - 2[x.\, x^{x-1} + (\log x)\, x^x]\cot y + 2x^x(\operatorname{cosec}^2 y)\, y'(x) = 0$

Putting $x = 1$, $y = \pi/2$, we have $y'(1) = -1$

54. For $x \neq 1$, $f'(x) = \sin\frac{1}{(x-1)} - \frac{(x-1)}{(x-1)^2}\cos\frac{1}{x-1}$

∴ f is differentiable at $x = 0$

$f'(1)$ doesn't exist.

55. $$\frac{dy}{dx} = \frac{1}{3}\left[\frac{1}{x+1} \times \frac{1}{2}\frac{3-3x}{x^2-x+1}\right] + \frac{1}{\sqrt{3}}\,\frac{2/\sqrt{3}}{1+\left(\frac{2x-1}{\sqrt{3}}\right)^2} = \frac{1}{x^3+1}$$

56. $y = -\log(1+x) \;\Rightarrow\; y' = -\frac{1}{1+x}$

$\Rightarrow\; (1+x)y' = -1$

$xy' = -1 - y' = -1 + \frac{1}{1+x} = -1 + e^y$. Since $y(1) = -\log 2$, so putting $x = 1$ in $xy' + 1 = e^y$, we get $y'(1) + 1 = \frac{1}{2} \;\Rightarrow\; y'(1) = -\frac{1}{2}$.

57. $$\frac{dy}{dx} = -\frac{1 + y\sin(xy)}{x\sin(xy)}$$

58. $\frac{dy}{dx} = \frac{2t - 3t^2}{1 - 4t^3}$ but $(x, y) = (0, 0)$ if and only if $t = 0$ or $t = 1$

59. $y'(x) = \cos(3\sin^{-1} x)\,\frac{3}{\sqrt{1-x^2}} \;\Rightarrow\; y'(0) = 3$

$(1 - x^2)\,y'^2 = 9\cos^2(3\sin^{-1} x) = 9(1 - y^2)$

$2(1 - x^2)\,y''y' - 2xy'^2 = -18yy'$

$\Rightarrow\; (1 - x^2)y'' - xy' + 9y = 0$

Putting $x = 0$, $y''(0) = -9y(0) = 0$.

60. $$\left|\frac{f(x) - f(y)}{x - y}\right| \le A|x - y|^{\alpha - 1}$$

Since $\alpha - 1 > 0$ so $\lim_{y\to x}|x - y|^{\alpha-1} = 0$.

Therefore $\lim_{y\to x}\frac{f(x) - f(y)}{x - y} = 0$

$\Rightarrow f'(x) = 0$ for $x \in \mathbf{R}$.

$\Rightarrow f$ is a constant function

61. For $\pi/2 < x < \pi$, $\tan x < 0$, so

$$y = \tan^{-1}(\cot x) + \cot^{-1}(\tan x)$$

$$= \tan^{-1}(\cot x) + \tan^{-1}(\cot x) + \pi$$

$$= 2\tan^{-1}(\cot x) + \pi$$

$$= -\cos^{-1}\left(\frac{1 - \cot^2 x}{1 + \cot^2 x}\right) + \pi$$

$$= -\cos^{-1}(\sin^2 x - \cos^2 x) + \pi$$

$$= -(\pi - \cos^{-1}(\cos 2x)) + \pi$$

$$= 2x$$

Hence $\frac{d^2y}{dx^2} = 0$ and y is a linear function of x.

62. Differentiating $f'(x) = f(1 - x)$, we get

$$f''(x) = -f'(1 - x) = -f(1 - (1 - x)) = -f(x)$$

$\Rightarrow\quad f(x) = A\cos x + B\sin x$

$f(\pi/2) = 1 \;\Rightarrow\; B = 1$

Also $f'(\pi/2) = f\left(1 - \frac{\pi}{2}\right) = A\cos\left(\frac{\pi}{2} - 1\right) + \sin\left(\frac{\pi}{2} - 1\right)$

$= A\sin 1 + \cos 1$

But $f'(x) = -A\sin x + B\cos x$, so $f'\left(\frac{\pi}{2}\right) = -A$

$\Rightarrow\; A(1 + \sin 1) + \cos 1 = 0$ i.e. $A = -\frac{\cos 1}{1 + \sin 1}$

Hence $f(x) = -\frac{\cos 1}{1 + \sin 1}\cos x + \sin x$.

Level 2

63. For f to be continuous $f(\pi/6) = \lim\limits_{x \to \pi/6+} f(x)$

$$\sin \frac{\pi}{3} = a\,\frac{\pi}{6} + b \text{ i.e. } \frac{\sqrt{3}}{2} = a\,\frac{\pi}{6} + b$$

$$f'(\pi/6+) = \lim_{h \to 0+} \frac{f(\pi/6+h) - f(\pi/6)}{h}$$

$$= \lim_{h \to 0+} \frac{a(\pi/6+h) + b - \sin \pi/3}{h}$$

$$= \lim_{h \to 0+} \frac{a(\pi/6+h) + b - (a\,\pi/6 + b)}{h}$$

$= a$.

$$f'\,(\pi/6-) = \lim_{h \to 0-} \frac{f(\pi/6+h) - f\,(\pi/6)}{h}$$

$$= \lim_{h \to 0-} \frac{\sin 2(\pi/6+h) - \sin \pi/3}{h}$$

$$= 2 \cos 2\,\frac{\pi}{6} = 2\frac{1}{2} = 1,$$

so $a = 1$, $b = \frac{\sqrt{3}}{2} - \frac{\pi}{6}$. For these values of a and b,

$$f'(x) = \begin{cases} 2\cos 2x & 0 < x \le \pi/6 \\ 1 & \pi/6 < x \le 1 \end{cases} \text{ which is continuous.}$$

64. $f(1) = 1 = \lim\limits_{x \to 1-} f(x) = \lim\limits_{x \to 1-} ax^2 + b = a + b$

$$f'(1\,+) = \lim_{h \to 0+} \frac{f\,(1+h) - f(1)}{h} = \lim_{h \to 0+} \frac{(1/(1+h)) - 1}{h}$$

$$= \lim_{h \to 0+} \frac{1-(1+h)}{h\,(1+h)} = -1$$

$$f'(1-) = \lim_{h \to 0-} \frac{f(1+h) - f(1)}{h}$$

$$= \lim_{h \to 0-} \frac{a(1+h)^2 + b - 1}{h}$$

$$= \lim_{h \to 0-} \frac{a + b - 1 + ah^2 + 2ah}{h}$$

$= 2a$.
so $a = -1/2$, $b = 3/2$

65. Since $[x - \pi]$ is an integer, so $\tan(\pi\,[x - \pi]) = 0$ for all x. Hence $f\,(x) = 0$ for all x, so $f'(x)$ exists for all x.

66. Since differentiability implies continuity so

$$f\,(0) = \lim_{x \to 0} f(x)$$

$$= \lim_{x \to 0} \left(1 + (-1 + \cos x)\right)^{\frac{1}{-1+\cos x} \times \frac{-2\sin^2 x/2}{2\sin x/2 \cos x/2}}$$

$$= \lim_{x \to 0} \left(1 + (-1 + \cos x)\right)^{\frac{1}{-1+\cos x} \times -\tan x/2}$$

$= e^0 = 1.$

67. $y(0) = \sin^{-1} 0 = 0$. Also

$$\sin y = \sin \alpha\, \frac{\sin x}{1 - \cos\alpha \sin x}$$

$$\cos y \frac{dy}{dx}$$

$$= \sin \alpha\, \frac{(1 - \cos\alpha \sin x)\cos x + \sin^2 x \cos\alpha}{(1 - \cos\alpha \sin x)^2}$$

At $x = 0$, $\left.\dfrac{dy}{dx}\right|_{x=0} = \sin \alpha$.

68. f is defined on $[0, \infty)$.

$$\lim_{h \to 0+} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0+} \frac{\sqrt{h+1} - 1}{\sqrt{h}\;h}$$

$$= \lim_{h \to 0+} \frac{1}{\sqrt{h}\,(\sqrt{h+1} + 1)}$$

which does not exist. f is clearly differentiable on $(0, \infty)$.

69. $\dfrac{dx}{dt} = \dfrac{1}{\sqrt{1-t^2}}$, $\dfrac{dy}{dt} = -\dfrac{2t}{1-t^2} \Rightarrow \dfrac{dy}{dx} = \dfrac{-2t}{\sqrt{1-t^2}}$

$$\frac{d^2y}{dx^2} = -2\frac{d}{dt}\left(\frac{t}{\sqrt{1-t^2}}\right)\frac{dt}{dx}$$

$$= -2\,\frac{\left(\sqrt{1-t^2} + \dfrac{t^2}{\sqrt{1-t^2}}\right) \times \sqrt{1-t^2}}{(1-t^2)}$$

$$= -2\,\frac{1}{1-t^2}$$

$$\Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=1/2} = -2 \cdot \frac{4}{3} = -\frac{8}{3}.$$

70. $2yy' + 2x = 0 \Rightarrow y' = -x/y$

$y'^2 + yy'' + 1 = 0 \Rightarrow yy'' = -(1 + x^2/y^2)$

so $|y''| = \dfrac{x^2 + y^2}{y^3}$

$$\frac{|\,y''\,|}{\sqrt{(1+y'^2)^3}} = \frac{x^2+y^2}{y^3\sqrt{(1+x^2/y^2)^3}} = \frac{x^2+y^2}{(x^2+y^2)^{3/2}}$$

$$= \frac{1}{\sqrt{x^2+y^2}} = \frac{1}{R} = k.$$

71. For (*a*), let $f(x) = |x|$ then $||x| - |y|| \le |x - y|$ for all $x, y \in \mathbf{R}$ so $|f(x) - f(y)| \le |x - y|$ but f is not differentiable at $x = 0$

For (*b*), let $h(x) = \begin{cases} x^{1/2}, & x \in [0,1] \\ 0, & \text{otherwise} \end{cases}$

Since for $x \in [0, 1]$ $|x^{1/2} - y^{1/2}| \le |x^{1/2} + y^{1/2}|$ so

$|x^{1/2} - y^{1/2}|^2 \le |x - y|$. Thus $|h(x) - h(y)| \le |x - y|^{1/2}$ but h is not differentiable.

If f satisfies $|f(x) - f(y)| \le k\,|x - y|^2$ then

$$\left|\frac{f(x) - f(y)}{x - y}\right| \le |x - y|$$

$$\Rightarrow \left|\lim_{y \to x} \frac{f(x) - f(y)}{x - y}\right| \le \lim_{y \to x} |x - y| = 0$$

$\Rightarrow f$ *is* differentiable and $f'(x) = 0$

For (*d*) Let $f(x) = |x|$, $f^2(x) = x^2$ is differentiable

on $\mathbf{R}$ but f is not differentiable.

72. $\left|\dfrac{f(x) - f(y)}{x - y}\right| \le |x - y|^2 \Rightarrow f'(x) = 0$

73. Since $\left|x \sin \dfrac{\pi}{x}\right| \le |x|$ so f is continuous and

bounded on [0, 1]

$\lim\limits_{x \to 0} \dfrac{x \sin \pi/x - 0}{x - 0} = \lim\limits_{x \to 0} \sin \pi/x$ which does not exist so f is not differentiable.

74. $$\lim_{x \to 0+} f(x) = \lim_{x \to 0+} \frac{|x|(3e^{1/|x|} + 4)}{2 - e^{1/|x|}}$$

$$= \lim_{x \to 0+} \frac{x\,(3e^{1/|x|} + 4)}{2 - e^{1/x}} = \lim_{x \to 0+} \frac{x\,(3 + 4.e^{-1/x})}{2\,.\,e^{-1/x} - 1}$$

$$= 0.\ \frac{3}{-1} = 0$$

$$\lim_{x \to 0-} f(x) = \lim_{x \to 0-} \frac{-x\,(3e^{-1/x} + 4)}{2 - e^{-1/x}}$$

$$= -\lim_{x \to 0-} \frac{x\,(3 + 4e^{-1/x})}{2\,e^{-1/x} - 1} = 0$$

Thus f is continuous at $x = 0$

$$\lim_{x \to 0+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0+} \frac{x\,(3e^{1/x} + 4)}{x\left(2 - e^{1/x}\right)}$$

$$= \lim_{x \to 0+} \frac{(3 + 4e^{-1/x})}{2\,e^{-1/x} - 1} = -3$$

$$\lim_{x \to 0-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0-} \frac{-(3 + 4e^{1/x})}{\left(2\,e^{1/x} - 1\right)} = 3.$$

75. $\lim\limits_{x \to 1+} f(x) = k \lim\limits_{x \to 1+} (x - 1) = 0$

$\lim\limits_{x \to 1-} f(x) = \lim\limits_{x \to 1-} (x^2 - 1) = 0$

f is continuous for any value of k

$$\lim_{h \to 0+} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0+} \frac{k(1 + h - 1)}{h} = k.$$

$$\lim_{h \to 0-} \frac{f(1+h) - f(1)}{h} = \lim_{h \to 0-} \frac{(1 + h)^2 - 1)}{h} = 2$$

f is differentiable only when $k = 2$.

76. $\lim\limits_{x \to a-} f(x) = \lim\limits_{x \to a-} \left(1/\sqrt{2}\right)\left(x + a/\sqrt{2}\right)$

$$= \frac{1}{\sqrt{2}}\left(a + a/\sqrt{2}\right)$$

$$= \frac{\sqrt{2} + 1}{2}\,a$$

$$\lim_{x \to a+} f(x) = \lim_{x \to a+} \left(1/\sqrt{2}\right)\left(\frac{x}{2} + a\right) = \frac{3a}{2\sqrt{2}}$$

f is clearly not conttnuous at $x = 0$,

so f' is not defined at 0 and a, hence not continuous.

77. Given function is a polynomial of degree 160. Differentiation one-time reduces a polynomial by one degree. Thus to obtain polynomial of degree 50, we has to differentiate 110 times.

78. The derivative of $y = \sin^{-1}\left(\dfrac{2x}{1 + x^2}\right)$ doesn't exist

for $\left|\dfrac{2x}{1 + x^2}\right| = 1$. So $2\,|x| = x^2 + 1$. For $x \ge 0$,

$(x - 1)^2 = 0 \Rightarrow x = 1$, if $x < 0$, then $(x + 1)^2 = 0$

so $x = -1$.

79. $\lim\limits_{x \to 0+} f(x) = \lim\limits_{x \to 0+} x^\alpha = 0$, f is continuous at $x = 0$

$$\lim_{h \to 0+} \frac{f(h) - f(0)}{h - 0} = \lim_{h \to 0+} \frac{h^\alpha}{h} = \lim_{h \to 0+} \frac{1}{h^{1-\alpha}}$$

which does not exist.

80. $\lim\limits_{x \to 0} \dfrac{f(x) - f(0)}{x - 0} = 0$ when x approach through

rational or irrational so f is differentiable at

$x = 0$. If $a \neq 0$ then

$\lim\limits_{x\to a} \dfrac{f(x)-f(a)}{x-a}$ does not exist. Morever f is continuous at $x = 0$ only.

81. $f(x) = x^{k}$ is $(n - 1)$ times differentiable at $x = 0$ if $k - (n - 1) \geq 0$ and not n-times differentiable if $k - n < 0$ so $n - 1 \leq k < n$, $k = \dfrac{3n-2}{3}$ satisfy this inequality.

82. We have

$$f(x) = \begin{cases} (-\tfrac{1}{2})(x+1) & \text{if} \quad x<-1 \\ \tan^{-1}x & \text{if} \quad -\leq x \leq 1 \\ (\tfrac{1}{2})(x-1) & \text{if} \quad x>1 \end{cases}$$

Since $f(-1) = \dfrac{\pi}{4}$, $f(1) = \dfrac{\pi}{4}$ and $\lim\limits_{x\to 1-} f(x) = -1$, $\lim\limits_{x\to 1+} f(x) = 0$ so f is not continuous at $x = -1, 1$ and hence not differentiable at $-1, 1$. Also

$$f'(x) = \begin{cases} -\tfrac{1}{2} & \text{if} \quad x<-1 \\ \dfrac{1}{1+x^2} & \text{if} \quad -1<x<1 \\ \tfrac{1}{2} & \text{if} \quad x>1 \end{cases}$$

Thus the domain of f' is $\mathbf{R} \sim \{-1, 1\}$

83. Let $y = \sin^{-1}\left(\dfrac{1-x^{2n}}{1+x^{2n}}\right)$ and $u = x^{2n}$, then

$$\frac{dy}{du} = \frac{dy}{dx}\cdot\frac{dx}{du}$$

$$= \frac{1}{\sqrt{1-\left(\dfrac{1-x^{2n}}{1+x^{2n}}\right)^2}}\,\frac{d}{dx}\left(\frac{1-x^{2n}}{1+x^{2n}}\right)\frac{1}{2\,n\,x^{2n-1}}$$

$$= \frac{1+x^{2n}}{\sqrt{4x^{2n}}}\,\frac{-(1+x^{2n})2nx^{2n-1}-(1-x^{2n})2n\,x^{2n-1}}{(1+x^{2n})^2}$$

$$\times\frac{1}{2n\,x^{2n-1}}$$

$$= \frac{1}{2\,x^{n}}\times\frac{-4\,n\,x^{2n-1}}{(1+x^{2n})}\,\frac{1}{2n\,x^{2n-1}}$$

$$= -\,\frac{1}{x^{n}\,(1+x^{2n})} = -\frac{1}{x^{n}+x^{3n}}.$$

84. Put $x^3 = \cos\theta$, $y^3 = \cos\phi$ so that given equation reduces to $\sin\theta + \sin\phi = a(\cos\theta - \cos\phi)$

$$\Rightarrow 2\sin\frac{\theta+\phi}{2}\cos\frac{\theta-\phi}{2} = -\,a\;2\sin\frac{\theta-\phi}{2}\sin\frac{\theta+\phi}{2}$$

$$\Rightarrow \cos\frac{\theta-\phi}{2} = -\text{ a }\sin\frac{\theta-\phi}{2}$$

$$\Rightarrow \theta - \phi = 2\tan^{-1}(-1/a)$$

$$\Rightarrow \frac{d\theta}{dx}-\frac{d\phi}{dx} = 0$$

$$\frac{d}{dx}(\cos^{-1}x^3) - \frac{d}{dx}(\cos^{-1}y^3) = 0$$

$$\Rightarrow -\frac{3x^2}{\sqrt{1-x^6}}+\frac{3y^2}{\sqrt{1-y^6}}\frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = \frac{x^2}{y^2}\sqrt{\frac{1-y^6}{1-x^6}}$$

85. $f(g(x)) = x \Rightarrow f'(g(x))\,g'(x) = 1$

Also $f'(x) = 2x + \sec^2 x = 2x + 1 + \tan^2 x$

$= 2x + 1 + (f(x) - x^2)^2$

$f'(g(x)) = 2g(x) + 1 + (f(g(x)) - (g(x)^2)^2$

$= 2\,g(x) + 1 + (x - (g(x))^2)^2$

Thus $g'(x) = \dfrac{1}{f'(g(x))}$

$$= \frac{1}{2\,g(x)+1+(x-(g(x))^2)^2}$$

86. $[x]$ is not continuous at integral points.

The number of integers lying in $(-\pi/2, \pi/2)$ is 3.

87. $\lim\limits_{h\to 0}\dfrac{f(x+h)-f(x)}{h}$

$$= \lim_{h\to 0}\frac{f(x)+f(h)+x^2h^2-f(x)}{h}$$

$$= \lim_{h\to 0}\frac{f(h)}{h}+x^2\lim_{h\to 0}h = 10.$$

Previous Years' AIEEE/JEE Main Questions

1. $f''(x) - g''(x) = 0 \Rightarrow f'(x) - g'(x) =$ constant. Putting $x = 1$, we get $f'(1) - g'(1) = C \Rightarrow C = 2g'(1) - g'(1) = g'(1) = 2$.

So $f'(x) - g'(x) = 2 \Rightarrow f(x) - g(x) = 2x + C'$. Putting $x = 2$ we have $f(2) - g(2) = 4 + C' \Rightarrow 4 + C' = 3g(2) - g(2) = 2g(2) = 6 \Rightarrow C' = 6 - 4 = 2$. Hence $f(x) - g(x) = 2x + 2$. At $x = \frac{3}{2}$

$$f\left(\frac{3}{2}\right) - g\left(\frac{3}{2}\right) = 2 \cdot \frac{3}{2} + 2 = 5.$$

2. $$\lim_{x\to 1} \frac{\sqrt{f(x)} - 1}{\sqrt{x} - 1} = \lim_{x\to 1} \frac{f(x) - f(1)}{x - 1} \times \frac{\sqrt{x} + 1}{\sqrt{f(x)} + 1}$$

$$= f'(1) \times \frac{2}{\sqrt{f(1)} + 1} = 2 \times \frac{2}{1+1} = 2$$

3. $$\frac{dy}{dx} = n\left(x + \sqrt{1+x^2}\right)^{n-1}\left(1 + \frac{x}{\sqrt{1+x^2}}\right) = \frac{ny}{\sqrt{1+x^2}}$$

$$(1 + x^2)\left(\frac{dy}{dx}\right)^2 = n^2y^2$$

$$\Rightarrow (1 + x^2)\ 2\frac{dy}{dx}\frac{d^2y}{dx} + 2x\left(\frac{dy}{dx}\right)^2 = 2n^2y\frac{dy}{dx}$$

$$\Rightarrow (1 + x^2)\frac{d^2y}{dx^2} + 2x\frac{dy}{dx} = n^2y.$$

4. $f'(x) = nx^{n-1} \Rightarrow f'(1) = n$

Also $f''(x) = n(n - 1)x^{n-2} \Rightarrow f''(1) = n(n - 1)$

$\Rightarrow f^k(1) = n(n - 1) \ldots (n - k + 1)$

So $f(1) - \frac{f'(1)}{1!} + \frac{f''}{2!} \cdots + \frac{(-1)^n f^n(1)}{n!}$

$$= 1 - \frac{n}{1!} + \frac{n(n-1)}{2!} + \cdots + \frac{(-1)^n n!}{n!}$$

$= (1 - 1)^n = 0.$

5. $$f(x) = \begin{cases} x & x < 0 \\ xe^{-2/x} & x > 0 \\ 0 & x = 0 \end{cases}$$

$$\lim_{x\to 0-} f(x) = 0 \text{ and } \lim_{x\to 0+} f(x) = \lim_{x\to 0+} xe^{-2/x} = 0$$

$$\lim_{x\to 0+} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0+} \frac{xe^{-2/x}}{x} = \lim_{x\to 0+} e^{-2/x} = 0$$

$$\lim_{x\to 0-} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0-} \frac{x - 0}{x} = 1.$$

So f is not differentiable at $x = 0$ but is continuous for all x.

6. $$\lim_{x\to a} \frac{f(a)g(x) - f(a) - g(a)f(x) + g(a)}{g(x) - f(x)}$$

$$= k \lim_{x\to a} \frac{g(x) - 1 - f(x) + 1}{g(x) - f(x)}$$

$= k$, so $k = 4$

7. We have $x = e^{y + x}$

$$\Rightarrow \log x = y + x \Rightarrow \frac{1}{x} = \frac{dy}{dx} + 1$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{x} - 1 = \frac{1-x}{x}$$

8. For $x \neq y$,

$$\left|\frac{f(x) - f(y)}{x - y}\right| \leq |x - y|$$

$$\Rightarrow \left|\frac{f(x+h) - f(x)}{h}\right| \leq |h|$$

Taking limit as $h \to 0$, we get

$|f'(x)| \leq 0$

But $|f'(x)| \geq 0$

$\therefore |f'(x)| = 0 \Rightarrow f'(x) = 0 \ \forall\ x$

Thus, $f(x)$ is a constant function.

Now, $f(0) = 0 \Rightarrow f(1) = 0$

9. As f is differentiable at $x = 1$, f is continuous at $x = 1$. Therefore,

$$f(1) = \lim_{h\to 0} f(1+h) = \lim_{h\to 0} h\left\{\frac{f(1+h)}{h}\right\}$$

$$= \left(\lim_{h\to 0} h\right)\left(\lim_{h\to 0} \frac{f(1+h)}{h}\right) = (0)\ (5) = 0$$

Now,

$$f^1(1) = \lim_{h\to 0} \frac{f(1+h) - f(1)}{h} = \lim_{h\to 0} \frac{f(1+h)}{h} = 5$$

10. We have

$$f(x) = \begin{cases} \dfrac{x}{1-x} & \text{if } x < 0 \\ \dfrac{x}{1+x} & \text{if } x \geq 0 \end{cases}$$

The function f is differentiable at all points except possibly at $x = 0$.

We have

$$Lf'(0) = \lim_{x\to 0-} \frac{f(x)-f(0)}{x-0} = \lim_{x\to 0} \frac{1}{1-x} = 1$$

and $$Rf'(0) = \lim_{x\to 0+} \frac{f(x)-f(0)}{x-0}$$

$$= \lim_{x\to 0+} \frac{1}{1+x} = 1$$

As $Lf'(0) = Rf'(0) = 1$, we get f is differentiable at $x = 0$. Thus f is differentiable for all $x \in (-\infty, \infty)$.

11. $m \log x + n \log y = (m + n) \log (x + y)$

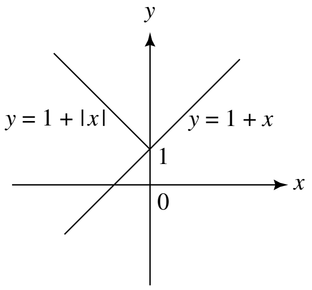
$$\Rightarrow \frac{m}{x} + \frac{n}{y}\frac{dy}{dx} = \frac{m+n}{x+y}\left(1+\frac{dy}{dx}\right)$$

$$\Rightarrow \left(\frac{n}{y} - \frac{m+n}{x+y}\right)\frac{dy}{dx} = \frac{m+n}{x+y} - \frac{m}{y}$$

$$\Rightarrow \frac{nx-my}{y(x+y)}\frac{dy}{dx} = \frac{nx-my}{(x+y)x}$$

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x}.$$

12. $f(x) = \min \{x + 1, |x| + 1\} = x + 1$, so is differentiable everywhere.



13. For $x \neq 1$,

$$f'(x) = \sin\left(\frac{1}{x-1}\right) - \frac{1}{x-1}\cos\left(\frac{1}{x-1}\right)$$

$\therefore$ f is differentiable at $x = 0$

$\lim\limits_{x\to 1} \dfrac{f(x)-f(0)}{x-1} = \lim\limits_{x\to 1} \sin\dfrac{1}{x-1}$ which does not exist.

$\therefore$ f is differentiable at $x = 0$ but not at $x = 1$.

14. Putting $x = 1$ in $x^{2x} - 2x^x \cot y - 1 = 0$, we get $1 - 2 \cot y - 1 = 0$

$\Rightarrow \cot y = 0 \Rightarrow y = \pi/2$.

Using the formula,

$\dfrac{d}{dx}\left[f(x)^{g(x)}\right] = g(x)\, f(x)^{g(x)-1} f'(x) + (g'(x) \log f(x))\, f(x)^{g(x)}$, we have

$2x.x^{2x-1}(1) + (2 \log x)x^{2x} - 2[x.x^{x-1}(1) + (\log x)\, x^x] \cot y + 2x^x (\operatorname{cosec}^2 y)\, y'(x) = 0$

Putting $x = 1$, $y = \pi/2$, we get

$2 + 0 - 2 (1) (0) + 2 \operatorname{cosec}^2 (\pi/2)\, y'(1) = 0$

$\Rightarrow y'(1) = -1.$

15. $g'(x) = 2[f(2f(x) + 2)]f'(2f(x) + 2)\,(2f'(x))$

$\Rightarrow g'(0) = 2[f(2f(0) + 2)]f'\,(2f(0) + 2)\,(2f'(0))$

$= 4(f(0))\, f'(0)^2 = 4(-1)(1)^2 = -4$

16. $$\frac{d^2x}{dy^2} = \frac{d}{dy}\left(\frac{dx}{dy}\right) = \frac{d}{dy}\left(\frac{1}{dy/dx}\right) = \frac{d}{dy}\left(\frac{1}{dy/dx}\right)\frac{dx}{dy}$$

$$= \frac{-1}{(dy/dx)^2}\left(\frac{d^2y}{dx^2}\right)\frac{dx}{dy}$$

$$= \frac{d^2y/dx^2}{(dy/dx)^3}$$

17. $$\lim_{x\to a} \frac{x^2 f(a) - a^2 f(x)}{x-a}$$

$$= \lim_{x\to a} \frac{(x^2-a^2)f(a) + a^2(f(a)-f(x))}{x-a}$$

$$= \lim_{x\to a} \left[(x+a)f(a) - a^2\frac{f(x)-f(a)}{x-a}\right]$$

$= 2a\, f\, (a) - a^2 f'(a)$

18. We have

$$f(x) = \begin{cases} (2-x)+(5-x) & \text{if } x \le 2 \\ (x-2)+(5-x) & \text{if } 2 < x \le 5 \\ (x-2)+(x-5) & \text{if } x > 5 \end{cases}$$

$$= \begin{cases} 7-2x & \text{if } x \le 2 \\ 3 & \text{if } 2 < x \le 5 \\ 2x-7 & \text{if } x > 5 \end{cases}$$

Note that $f'(4) = 0$ as f is a constant function in the interval $(2, 5)$.

Thus, the statement-1 is true.

Statement-2 is also true. But it is not the correct explanation for the statement-1.

19. $8f(x) + 6f\left(\frac{1}{x}\right) - x = 5.$ (i)

Replace x by $\frac{1}{x}$, we have $8f\left(\frac{1}{x}\right) + 6f(x) - \frac{1}{x} = 5$ (ii)

Solving (i) and (ii) for $f(x)$ and $f(1/x)$, we have

$$14f(x) = 5 - \frac{3}{x} + 4x$$

$$\Rightarrow 14f'(x) = \frac{3}{x^2} + 4$$

So $f(-1) = \frac{1}{14}\,[5 + 3 - 4] = \frac{2}{7}$

and $f'(-1) = \frac{1}{14}\,[3 + 4] = \frac{1}{2}$

Differentiating $y = x^2 f(x)$, we have $\frac{dy}{dx} = 2xf(x) + x^2 f'(x)$

$$\Rightarrow \left.\frac{dy}{dx}\right|_{x=-1} = -2f(-1) + f'(-1) = -\frac{4}{7} + \frac{1}{2} = -\frac{1}{14}.$$

20. $\frac{dx}{dt} = \frac{1}{2}\left(a^{\sin^{-1} t}\right)^{-\frac{1}{2}} \cdot a^{\sin^{-1} t}\,\frac{1}{\sqrt{1-t^2}}\ \log a$

$$= \frac{1}{2}\frac{\left(a^{\sin^{-1} t}\right)^{\frac{1}{2}}}{\sqrt{1-t^2}}\ \log a = \frac{1}{2}\frac{x}{\sqrt{1-t^2}} \log a$$

$$\frac{dy}{dt} = -\frac{1}{2}\left(a^{\cos^{-1} t}\right)^{-\frac{1}{2}} \cdot a^{\cos^{-1} t} \cdot \frac{1}{\sqrt{1-t^2}}\ \log a$$

$$= -\frac{1}{2}\frac{y}{\sqrt{1-t^2}}\ \log a$$

$$\Rightarrow \frac{dy}{dx} = -\frac{y}{x} \text{ so } 1 + \left(\frac{dy}{dx}\right)^2 = \frac{x^2 + y^2}{x^2}.$$

21. $y = \sec\,(\tan^{-1}x) = \sqrt{1 + (\tan(\tan^{-1} x))^2}$

$$\Rightarrow y = \sqrt{1+x^2}$$

$$\Rightarrow \frac{dy}{dx} = \frac{x}{\sqrt{1+x^2}}$$

$$\therefore \left.\frac{dy}{dx}\right|_{x=1} = \frac{1}{\sqrt{2}}$$

22. Let $y = f(x) = \frac{x^2 - x}{x^2 + 2x} = 1 - \frac{3x}{x(x+2)} = 1 - \frac{3}{x+2}$

$$\Rightarrow x = -\frac{3}{y-1} - 2 \text{ so } f^{-1}(x) = -\frac{3}{x-1} - 2$$

$$\frac{d}{dx}(f^{-1}(x)) = \frac{3}{(x-1)^2}.$$

23. $g(f(x)) = x \Rightarrow g'(f(x))f'(x) = 1$

$$\Rightarrow g'(f(x)) = 1 + x^5$$

$$\Rightarrow g'(x) = 1 + (f^{-1}(x))^5 = 1 + (g(x))^5.$$

24. $h(x) = (gof)\,(x) = g(f(x)) = \sin\,(x|x|)$

$$= \begin{cases} -\sin(x^2); & \text{if } \ x < 0 \\ \sin(x^2); & \text{if } \ x \ge 0 \end{cases}$$

We have

$$h'(x) = \begin{cases} -2\,x\cos(x^2); & \text{if } \ x < 0 \\ 2x\cos(x^2); & \text{if } \ x > 0 \end{cases}$$

Also, $Lh'(0) = \lim_{x\to 0-} \frac{h(x) - h(0)}{x - 0}$

$$= \lim_{x\to 0-} \frac{-\sin(x^2)}{x} = 0$$

and $Rh'(0) = 0$

Thus, $h'(x) = \begin{cases} -2\cos\,(x^2) & \text{if } \ x < 0 \\ 2x\cos\,(x^2) & \text{if } \ x \ge 0 \end{cases}$

Note that $h'(x)$ is continuous at all points except possibly at $x = 0$.

Now, $\lim_{x\to 0-} h'(x) = \lim_{x\to 0-} [-2x\cos\,(x^2)] = 0 = h'(0)$

and $\lim_{x\to 0+} h'(x) = \lim_{x\to 0+} [2x\cos\,(x^2)] = 0 = h'(0)$

This shows that h' is continuous at $x = 0$.

Also, h' is differentiable at all points except possibly at $x = 0$.

Now, $Lh''(0) = \lim_{x\to 0-} \frac{h'(x) - h'(0)}{x - 0} = -2$

and $Rh''(0) = 2$

This shows that h' is differentiable at all points except at $x = 0$.

25. We have $g(f(x)) = x$

$\Rightarrow g'(f(x))\, f'(x) = 1$

Now, $f(x) = 7 \Rightarrow x^2 - x + 5 = 7$

$\Rightarrow (x - 2)(x + 1) = 0 \Rightarrow x = 2$ as $x > 1/2$.

Thus, $g'(7)\, f'(2) = 1$

$$\Rightarrow g'(7) = \frac{1}{2(2)-1} = \frac{1}{3}.$$

26. For $x \in \mathbf{R}$ $0 \le |f(x)| \le x^2$

$$\Rightarrow \lim_{x\to 0} 0 \le \lim_{x\to 0} |f(x)| \le \lim_{x\to 0}(x^2)$$

$$\Rightarrow \lim_{x\to 0} |f(x)| = 0 \Rightarrow \left|\lim_{x\to 0} f(x)\right| = 0$$

$$\Rightarrow \lim_{x\to 0} f(x) = 0.$$

Also, $0 \le |f(0)| \le 0^2 \Rightarrow f(0) = 0$

$$\therefore \lim_{x\to 0} f(x) = 0 = f(0)$$

$\Rightarrow f$ is continuous at $x = 0$.

Also, for $x \ne 0$,

$$0 \le \left|\frac{f(x)-f(0)}{x}\right| \le \left|\frac{x^2-0}{x}\right| = |x|$$

$$\therefore \lim_{x\to 0}\left|\frac{f(x)-f(0)}{x-0}\right| = 0$$

$\Rightarrow f'(0) = 0$

27. $y = e^{nx} \Rightarrow$ In $y = nx$

$$\text{Now, } \frac{d^2y}{dx^2} = n^2e^{nx} = n^2y$$

$$\text{and } \frac{d^2x}{dy^2} = \frac{1}{ny^2}$$

$$\therefore \left(\frac{d^2y}{dx^2}\right)\left(\frac{d^2x}{dy^2}\right) = \frac{n}{y} = -ne^{-nx}$$

28. As g is differentiable at $x = 3$, g is continuous at $x = 3$.

$$\therefore \lim_{x\to 3-} g(x) = \lim_{x\to 3+} g(x) = g(3)$$

$$= k\sqrt{3+1} = 3m + 2 = k\sqrt{3+1}$$

$\Rightarrow 2k = 3m + 2$

Also, as g is differentiable at $x = 3$,

$$\lim_{x\to 3-} \frac{g(x)-g(3)}{x-3} = \lim_{x\to 3+} \frac{g(x)-g(3)}{x-3}$$

$$\Rightarrow \frac{k}{2(2)} = m \Rightarrow k = 4m.$$

$\therefore m = 2/5$ and $k = 8/5$

$\Rightarrow k + m = 2$

29. $f(x) = |\log 2 - \sin x|$, $x \in \mathbf{R}$

Let $a = \sin^{-1}(\log 2)$

For $-a < x < a$, $f(x) = \log 2 - \sin x$

$\Rightarrow g(x) = f(f(x)) = \log 2 - \sin(f(x))$

$= \log 2 - \sin(\log 2 - \sin x)$

$\Rightarrow g'(x) = (-\cos(\log 2 - \sin x))\, (-\cos x)$

$\therefore g'(0) = (-\cos(\log 2\ ))\, (-1) = \cos(\log 2)$

30. $$\lim_{t\to x} \frac{t^2 f(x) - x^2 f(t)}{t-x} = 1$$

$$\Rightarrow \lim_{t\to x} \frac{(t^2-x^2)f(x) - x^2(f(t)-f(x))}{t-x} = 1$$

$$\Rightarrow \lim_{t\to x}\left[(t+x)f(x) - x^2\frac{f(t)-f(x)}{t-x}\right] = 1$$

$\Rightarrow 2xf(x) - x^2f'(x) = 1$

$\Rightarrow x^2f'(x) - 2xf(x) = -1$

$$\Rightarrow f'(x) - \frac{2}{x}f(x) = \frac{1}{x^2}$$

$$\Rightarrow \frac{1}{x^2}f'(x) - \frac{2}{x^3}f(x) = \frac{1}{x^4}$$

$$\Rightarrow \frac{d}{dx}\left[\frac{1}{x^2}f(x)\right] = \frac{1}{x^4}$$

$$\Rightarrow \frac{1}{x^2}f(x) = \int x^{-4}dx = -\frac{1}{3}x^{-3} + C$$

$$\Rightarrow f(x) = -\frac{1}{3x} + Cx^2$$

$$\text{Now, } 1 = f(1) = -\frac{1}{3} + C \Rightarrow C = \frac{4}{3}$$

$$\text{Thus, } f(x) = -\frac{1}{3x} + \frac{4}{3}x^2$$

$$\therefore\ f\left(\frac{3}{2}\right) = -\frac{2}{9}+\frac{4}{3}\cdot\frac{9}{4} = \frac{25}{9}$$

31. As f is continuous at $x = 1$,

$$\lim_{x\to 1-} f(x) = \lim_{x\to 1+} f(x)$$

$$\Rightarrow -1 = a + \cos^{-1}(1 + b)$$

Also, as f is differentiable at $x = 1$, (1)

$$\lim_{x\to 1-}\frac{f(x)-f(1)}{x-1} = \lim_{x\to 1+}\frac{f(x)-f(1)}{x-1}$$

$$\Rightarrow -1 = \frac{-1}{\sqrt{1-(1+b)^2}}$$

$$\Rightarrow 1 - (1 + b)^2 = 1 \Rightarrow 1 + b = 0 \qquad (2)$$

From (1) and (2)

$$-1 = a + \cos^{-1}(0) = a+\frac{\pi}{2}$$

$$\Rightarrow a = -1 -\pi/2$$

Thus, $\dfrac{a}{b} = \dfrac{2+\pi}{2}$

Previous Years' B-Architecture Entrance Examination Questions

1. $\lim\limits_{x\to 2-} f(x) = \lim\limits_{x\to 2-} ax = 2a$ and $\lim\limits_{x\to 2+} f(x) = \lim\limits_{x\to 2+} (ax^2 + bx + 3) = 4a + 2b + 3$

Since f is differentiable so continuous, hence

$$2a + 2b + 3 = 0 \qquad \text{(i)}$$

Also $\lim\limits_{h\to 0+}\dfrac{f(2+h)-f(2)}{h}$

$$= \lim_{h\to 0+}\frac{a(2+h)^2+b(2+h)+3-(4a+2b+3)}{h}$$

$$= \lim_{h\to 0+}\frac{ah^2+4ah+bh}{h}$$

$$= 4a + b$$

$$\lim_{h\to 0-}\frac{f(2+h)-f(2)}{h}$$

$$= \lim_{h\to 0-}\frac{a(2+h)-(4a+2b+3)}{h}$$

$= a$ (using (i))

So $a = 4a + b \Rightarrow -3a = b$. Putting this in (i), we get $a = \dfrac{3}{4}$, $b = -\dfrac{9}{4}$.

2. $f'(x) = \sum\limits_{i=1}^{10} x^{i-1} \Rightarrow f'(1) = 10$ and $f''(x) = \sum\limits_{i=2}^{10}(i-1)x^{i-2}$.

Therefore,

$$\lim_{x\to 1}\frac{f'(x)-10}{x-1} = \lim_{x\to 1}\frac{f'(x)-f'(1)}{x-1} = f''(1) = \sum_{i=2}^{10}(i-1)$$

$$= 1 + \ldots + 9 = \frac{9\times 10}{2} = 45.$$

3. $h(x) = x|x| = \begin{cases} x^2, & x\ge 0\\ -x^2, & x<0\end{cases}$ is a differentiable function

$u(x) = |x - 2|^2 = (x - 2)^2$ is a differentiable function

$v(x) = |x - 3|^3 = \begin{cases} (x-3)^3, & x\ge 3\\ -(x-3)^3, & x<3\end{cases}$ is a differentiable function

$w(x) = |x - 1|$ is not differentiable at $x = 1$.

f is differentiable everywhere except at $x = 1$.

Hence $A = \{1\}$

4. $$\lim_{x\to 0}\frac{2f(2x^2+3x)-1}{3g(x)-1}\left(\frac{0}{0}\text{form}\right)$$

$$= \lim_{x\to 0}\frac{2(4x+3)f'(2x^2+3x)}{3g'(x)}$$

$$= \frac{2(0+3)f'(0)}{3g'(0)} = \frac{2.3.1}{3.2} = 1$$

5. $f'(x) = \begin{cases} 3x^2, & x>0\\ 0, & x<0\end{cases}$ and $\lim\limits_{x\to 0+}\dfrac{f(x)-f(0)}{x-0}$

$$= \lim_{x\to 0+}\frac{x^3}{x} = 0.$$

$$\lim_{x\to 0-}\frac{f(x)-f(0)}{x-0} = \lim_{x\to 0-}\frac{0-0}{x} = 0.$$

$f'(x)$ exists for all x and is continuous so

$$\lim_{x\to 0} f'(x) = f'(0)$$

6. $f(x) = \begin{cases} 1 & \text{if} \quad \sin x > 0 \\ -1 & \text{if} \quad \sin x < 0 \\ 0 & \text{if} \quad \sin x = 0 \end{cases}$ so

$$f(x) = \begin{cases} 1 & \text{if} \quad x \in (0, \pi) \\ -1 & \text{if} \quad x \in (\pi, 2\pi) \\ 0 & \text{if} \quad x = \pi \end{cases}$$

$\lim\limits_{h \to 0+} \dfrac{f(\pi + h) - f(\pi)}{h} = \lim\limits_{h \to 0+} \dfrac{-1}{h}$ which doesn't exist

So A doesnot exist.

$g(x) = \begin{cases} \sin 1, & x > 0 \\ \sin(-1), & x < 0 \\ 0 & x = 0 \end{cases}$ so $\lim\limits_{h \to 0+} \dfrac{g(\pi + h) - g(\pi)}{h}$

$$\lim_{h \to 0+} \frac{\sin 1 - \sin 1}{h} = 0.$$

and $\lim\limits_{h \to 0-} \dfrac{g(\pi + h) - g(\pi)}{h} = \lim\limits_{x \to 0-} \dfrac{\sin 1 - \sin 1}{h} = 0$.

Thus $B = 0$.

7. $u = 2\tan^{-1}\dfrac{1+x}{1-x} = 2\left(\dfrac{\pi}{4} + \tan^{-1} x\right)$ and

$= \dfrac{\pi}{2} - \cos^{-1}\dfrac{1-x^2}{1+x^2}$

Hence $f(x) = u + v = \pi$ for all x

$f'(x) = 0 \Rightarrow f''(x) = 0$.

8. $\lim\limits_{h \to 0-} \dfrac{f(-1+h) - f(-1)}{h} = \lim\limits_{h \to 0-} \dfrac{1 - (-1+h)^2 - 0}{h}$

$= \lim\limits_{h \to 0-} \dfrac{1 - (1 + h^2 - 2h)}{h} = 2$

$\lim\limits_{h \to 0+} \dfrac{f(-1+h) - f(-1)}{h} = \lim\limits_{h \to 0+} \dfrac{2(-1+h) + 2 - 0}{h}$

$= 2$.

So $f'(-1) = 2$.

9. $\cos |x| - |x| = \cos x - |x|$ which is not differentiable at $x = 0$.

$\cos |x| + |x| = \cos x + |x|$ which is not differentiable at $x = 0$

$u(x) = \sin(|x|) + |x| = \begin{cases} \sin x + x & \text{if } x \geq 0 \\ -(\sin x + x) & \text{if } x < 0 \end{cases}$

$\lim\limits_{h \to 0+} \dfrac{u(h) - u(0)}{h} = \lim\limits_{h \to 0+} \dfrac{\sin h + h}{h} = 2$

$\lim\limits_{h \to 0-} \dfrac{u(h) - u(0)}{h} = -\lim\limits_{h \to 0-} \dfrac{\sin h + h}{h} = -2$

So u is not differentiable at $x = 0$

Let $v(x) = \sin(|x|) - |x| = \begin{cases} \sin x - x, & \text{if } x \geq 0 \\ -\sin x + x, & \text{if } x < 0 \end{cases}$

$\lim\limits_{h \to 0+} \dfrac{v(h) - v(0)}{h} = \lim\limits_{h \to 0+} \dfrac{\sin h - h}{h} = 0$

$\lim\limits_{h \to 0-} \dfrac{v(h) - v(0)}{h} = \lim\limits_{h \to 0-} \dfrac{-\sin h + h}{h} = 0$

v is a differentiable function.

10. Same as Q.19 in AIEEE/JEE Question.

11. $f(x) = \begin{cases} \dfrac{1}{x} & \text{if} \quad x > 2 \\ -\dfrac{1}{x} & \text{if} \quad x < -2 \\ a + bx^2 & \text{if} \quad -2 \leq x \leq 2 \end{cases}$

$\lim\limits_{x \to -2-} f(x) = \lim\limits_{x \to -2-} -\dfrac{1}{x} = \dfrac{1}{2}$

$\lim\limits_{x \to -2+} f(x) = \lim\limits_{x \to -2+} (a + bx^2) = a + 4b$

Since f is differentiable so continuous, hence $a + 4b = \dfrac{1}{2}$

$\lim\limits_{h \to 0+} \dfrac{f(-2+h) - f(-2)}{h}$

$= \lim\limits_{h \to 0+} \dfrac{a + b(-2+h)^2 - (a + 4b)}{h}$

$= \lim\limits_{h \to 0+} \dfrac{bh^2 - 4bh}{h} = -4b$

$\lim\limits_{h \to 0-} \dfrac{f(-2+h) - f(-2)}{h} = \lim\limits_{h \to 0-} \dfrac{-\dfrac{1}{-2+h} - (a + 4b)}{h}$

$= \lim\limits_{h \to 0-} \dfrac{-\dfrac{1}{-2+h} - \dfrac{1}{2}}{h} = -\lim\limits_{h \to 0-} \dfrac{2 - 2 + h}{2h(-2+h)}$

$= -\lim\limits_{h \to 0-} \dfrac{1}{2(-2+h)}$

$= \frac{1}{4}.$

So $b = \frac{-1}{16}$ and $a = \frac{1}{2} + \frac{1}{4} = \frac{3}{4}.$

12. For $0 < x < 1$

$(1 - x)\, y(x) = (1 - x)(1 + x)(1 + x^2) \ldots (1 + x^{32})$

$= (1 - x^2)(1 + x^2) \ldots (1 + x^{32})$

$= (1 - x^4)(1 + x^4) \ldots (1 + x^{32})$

$= \ldots = 1 - x^{64}$

$\Rightarrow y(x) = \frac{1 - x^{64}}{1 - x}$

$$y'(x) = \frac{(1-x)(-64x^{64}) - (-1)(1 - x^{64})}{(1-x)^2}$$

$$\Rightarrow y'\left(\frac{1}{2}\right) = \frac{\left(\frac{1}{2}\right)(-64)\left(\frac{1}{2}\right)^{63} + 1 - \left(\frac{1}{2}\right)^{64}}{\left(1 - \frac{1}{2}\right)^2}$$

$$= 4\left[1 - 65\left(\frac{1}{2}\right)^{64}\right] = 4 - 65\left(\frac{1}{2}\right)^{62}$$

13. Using $C_2 \to C_2 - C_1$, $C_3 \to C_3 - C_1$, we get

$$y(x) = \begin{vmatrix} \sin x & \cos x - \sin x & \cos x + 1 \\ 23 & -6 & -10 \\ 1 & 0 & 0 \end{vmatrix}$$

$= -10(\cos x - \sin x) + 6 \cos x + 6$

$= 10 \sin x - 4 \cos x + 6$

$\frac{dy}{dx} = 10 \cos x + 4 \sin x$

$\frac{d^2y}{dx^2} = -10 \sin x + 4 \cos x = -y + 6$

$\Rightarrow \frac{d^2y}{dx^2} + y = 6.$

CHAPTER ELEVEN

Applications of Derivatives

THE DERIVATIVE AS A RATE OF CHANGE

In case of a linear function $y = mx + b$ the graph is a straight line and the slope m measures the steepness of the line by giving the rate of climb of the line, the rate of change of y with respect to x.

As x changes from x_0 to x_1, y changes m times as much:

$$y_1 - y_0 = m(x_1 - x_0)$$

Thus the slope $m = (y_1 - y_0)/(x_1 - x_0)$ gives the change in y per unit change in x.

In more general case of a differentiable function $y = f(x)$, the difference quotient

$$\frac{f(x+h) - f(x)}{x + h - x} = \frac{f(x+h) - f(x)}{h},\ h \neq 0$$

gives the average rate of change of y (or f) with respect to x. The limit as h approaches zero is the derivative $dy/dx = f'(x)$, which can be interpreted as the *instantaneous rate of change of* y with respect to x. Since the graph is a curve, the rate of change of y can vary from point to point.

Illustration 1

Find the rate of change of volume of a sphere with respect to its radius when $r = 4$ cm

$$V = \frac{4}{3}\pi r^3 \qquad \frac{dV}{dr} = 4\pi r^2$$

when $\quad r = 4, \qquad \dfrac{dV}{dr} = 64\pi$

Illustration 2

A point is in motion along a curve $12y = x^3$. Which of its coordinate change faster?

Differentiating both the coordinates with respect to t we have

$$12\frac{dy}{dt} = 3x^2\frac{dx}{dt}$$

$$\Rightarrow \qquad \frac{y'_t}{x'_t} = \frac{x^2}{4}$$

Hence, if

(i) $-2 < x < 2$, then $\dfrac{y'_t}{x'_t} < 1$, i.e. the rate of change of the ordinate is less than that of the abscissa.

(ii) For $x > 2$ or $x < -2$, $\dfrac{y'_t}{x'_t} > 1$ i.e. the rate of change of the ordinate is greater than that of the abscissa.

(iii) For $x = \pm 2$, the rate of change of ordinate is equal to that of the abscissa.

Velocity and Acceleration

Suppose that an object is moving along a straight line and that, for each time t during a certain time interval, the object has (coordinate) $x(t)$. Then at time $t + h$, the position of the object is $x(t + h)$, and $x(t + h) - x(t)$ is the change in position that the object experienced during the time period t to $t + h$. The ratio

$$\frac{x(t+h) - x(t)}{t + h - t} = \frac{x(t+h) - x(t)}{h}$$

gives the average velocity of the object during this time period. If

$$\lim_{h \to 0} \frac{x(t+h) - x(t)}{h} = x'(t)$$

exists, then $x'(t)$ gives the (instantaneous) rate of change of position with respect to time. This rate of change of position is called the velocity of the object. If the velocity function is itself differentiable, then its rate of change with respect t time is called the acceleration, in symbols

$$a(t) = v'(t) = x''(t)$$

the speed is by definition the absolute value of the velocity:

$$\text{speed at time } t = |v(t)|$$

If the velocity and acceleration have the same sign then the object is speeding up, but if the velocity and acceleration have opposite signs then the object is slowing down.

A sudden change in acceleration is called a *jerk*. Thus, *Jerk* is the derivative of acceleration. If a body's position at the time t is $x(t)$, the body's jerk at time t is

$$j = \frac{da}{dt} = \frac{d^3x}{dt^3}$$

Illustration 3

A point moves in a straight line so that its distance from the start in t sec is equal to $s = \frac{1}{4}t^4 - 4t^3 + 16t^2$. What will be acceleration and at what times is its velocity equal to zero?

$$v = \frac{ds}{dt} = t^3 - 12t^2 + 32t$$

$$a = \frac{d^2s}{dt^2} = 3t^2 - 24t + 32$$

$$\begin{aligned} v = 0 \quad &\Rightarrow \quad t^3 - 12t^2 + 32t = 0 \\ &\Rightarrow \quad t(t^2 - 12t + 32) = 0 \\ &\Rightarrow \quad t(t-4)(t-8) = 0 \end{aligned}$$

at $t = 0$, $t = 4$, $t = 8$ the velocity will be zero and the corresponding acceleration will be 32, – 16, 32 respectively.

Illustration 4

A body whose mass is 3 kg performs rectilinear motion according to the formula $s = 1 + t + t^2$, where s is measured in cm and t in secs. Determine the kinetic energy $\left(\frac{mv^2}{2}\right)$ of the body in 5*s* after the start.

$$\frac{ds}{dt} = 1 + 2t, \quad v = \left.\frac{ds}{dt}\right|_{t=5} = 11 \text{ cm/s}$$

$$\begin{aligned} \text{K.E.} = \frac{mv^2}{2} = \frac{3000 \times 121}{2} &= 181500 \text{ gm cm}^2/\text{s}^2 \\ &= 181.5 \times 10^3 \text{ erg.} \end{aligned}$$

Differentials Let $y = f(x)$ be a differentiable function. Let $h \neq 0$. The difference $f(x + h) - f(x)$ is called the increment of f from x to $x + h$, and is denoted by Δf.

$$\Delta f = f(x + h) - f(x)$$

The product $f'(x)\,h$ is called the differential of f at x with increment h, and is denoted by df

$$df = f'(x)\,h$$

The change in f from x to $x + h$ can be approximated by $f'(x)\,h$;

$$f(x + h) - f(x) \simeq f'(x)\,h.$$

Illustration 5

Find the increment and differential of the function

$$y = 3x^3 + x - 1 \quad \text{at } x = 1, \Delta x = 0.1.$$

$$dy = (9x^2 + 1)\,\Delta x$$

$$\begin{aligned} \text{At} \quad x = 1, \Delta x = 0.1, dy &= (9 + 1)(0.1) \\ &= 1 \end{aligned}$$

$$\begin{aligned} \Delta y &= [3(x + \Delta x)^3 + (x + \Delta x) - 1] - (3x^3 + x - 1) \\ &= 9x^2\,\Delta x + 9x\,\Delta x^2 + 3\Delta x^3 + \Delta x \end{aligned}$$

$$\Delta y - dy = 9x\,\Delta x^2 + 3\Delta x^3$$

$$\text{At} \quad x = 1, \Delta x = 0.1$$

$$\Delta y - dy = 0.09 + 0.003 = 0.093.$$

TANGENT AND NORMAL

Let $y = f(x)$ be the equation of a curve, and let $P(x_0, y_0)$ be a point on it. Let PT be the tangent, PN the normal and PM the perpendicular to the x-axis (Fig. 11.1).

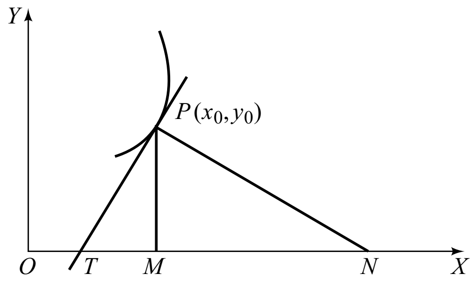


Fig. 11.1

The slope of the tangent to the curve $y = f(x)$ at P is given by $f'(x_0)$ Thus the equation of the tangent to the curve $y = f(x)$ at (x_0, y_0) is

$$y - y_0 = f'(x_0)(x - x_0)$$

Since PN is perpendicular to PT, it follows that, if $f'(x_0) \neq 0$, the slope of PN is $-1/f'(x_0)$. Hence the equation of the normal to the curve $y = f(x)$ at (x_0, y_0) is

$$f'(x_0)(y - y_0) + (x - x_0) = 0$$

An equation of the normal parallel to the x-axis is $y = y_0$. The *length of the tangent* at (x_0, y_0) is PT, and it is equal to

$$|y_0|\sqrt{1 + \frac{1}{(f'(x_0))^2}}\,.$$

The *length of the normal* is PN and it is equal to

$$|y_0|\sqrt{1 + (f'(x_0))^2}\,.$$

TM is called subtangent and the *length of the subtangent* is equal to

$$\left|\frac{1}{f'(x_0)}y_0\right|$$

MN is called subnormal and the *length of the subnormal* is equal to $|y_0 f'(x_0)|$.

Illustration 6

Derive the equation of tangent and normal at (x_0, y_0) of the curve $y = \log x$.

$$\frac{dy}{dx} = \frac{1}{x} \quad \Rightarrow \quad \left.\frac{dy}{dx}\right|_{x=x_0} = \frac{1}{x_0}$$

Hence equation of tangent at (x_0, y_0) is

$$y - \log x_0 = \frac{1}{x_0}(X - x_0)$$

Equation of normal is

$$Y - \log x_0 = -x_0(X - x_0)$$

Length of tangent = $|\log x_0|\sqrt{1 + x_0^2}$

Length of normal = $|\log x_0|\sqrt{1 + \dfrac{1}{x_0^2}}$

Length of subtangent = $|x_0 \log x_0|$

Length of subnormal = $|y_0|x_0|$

ANGLE BETWEEN TWO CURVES

An angle of intersection of two curves is defined as the angle between the tangents to the two curves at their point of intersection. Let $y = f(x)$ and $y = g(x)$ be two curves, and let $P(x_0, y_0)$ be their point of intersection. Also, let ψ and φ be the angles of inclination of the two tangents at P with the x-axis, and let θ be the angle between the two tangents. Then

$$\pm \tan\theta = \frac{\tan\varphi - \tan\psi}{1 + \tan\varphi \tan\psi} = \frac{g'(x_0) - f'(x_0)}{1 + f'(x_0)\, g'(x_0)}$$

Orthogonal Curves

If the angle of intersection between two curves is a right angle then the two curves are said to be intersecting orthogonally. Two curves $y = f(x)$ and $y = g(x)$ cut orthogonally if $f'(x)\, g'(x) = -1$.

THE ROLLE'S AND LAGRANGE'S THEOREMS

Rolle's theorem Let $f(x)$ be a function defined on a closed interval $[a, b]$, such that (i) $f(x)$ is continuous on $[a, b]$, (ii) $f(x)$ is derivable on $]a, b[$, and (iii) $f(a) = f(b)$. Then there exists a $c \in\ ]a, b[$ such that $f'(c) = 0$.

Rolle's theorem for polynomials If $\phi(x)$ is any polynomial, then between any pair of roots of $\phi(x) = 0$ lies a root of $\phi'(x) = 0$.

If a polynomial equation $P(x) = 0$ has at least n real roots, then $P'(x) = 0$ has at least $(n-1)$ real roots, $P''(x) = 0$ has at least $(n-2)$ real roots and so on.

Lagrange's Mean Value theorem Let $f(x)$ be a function defined on $[a, b]$, such that (i) $f(x)$ is continuous on $[a, b]$, and (ii) $f(x)$ is derivable on $]a, b[$. Then there exists a $c \in\ ]a, b[$ such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

Illustration 7

Check the validity of Rolle's theorem for $y = 4^{\sin x}$ in the interval $[0, \pi]$.

Being exponential function, y is a continuous function x and $y' = (4^{\sin x})(\log 4)\cos x$. Also $y(0) = 4^{\circ} = 1$ and $y(\pi) = 4^{\sin\pi} = 4^{\circ} = 1$. Hence all the hypothesis of Rolle's theorem are satisfied. For conclusion,

$$y'(\pi/2) = 0 \quad \text{and} \quad \pi/2 \in [0, \pi]$$

Illustration 8

Show that the equation $x^3 - 3x + C = 0$ cannot have two different roots in (0, 1).

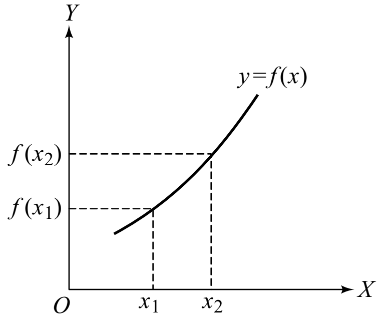
Consider $f(x) = x^3 - 3x + C$. Suppose f has two distinct roots say x_1 and x_2 in (0,1). f is a polynomial so continuous on $[x_1, x_2]$ and differentiable in (x_1, x_2) and $f(x_1) = f(x_2) = 0$ so by Rolle's theorem there is $\alpha \in (x_1, x_2) \subseteq (0, 1)$ such that

$$f'(\alpha) = 0 \quad \Rightarrow \quad 3\alpha^2 - 3 \neq 0 \quad \Rightarrow \quad \alpha = \pm 1 \notin (0, 1).$$

So $x^3 - 3x + c = 0$ cannot have two different roots in (0, 1).

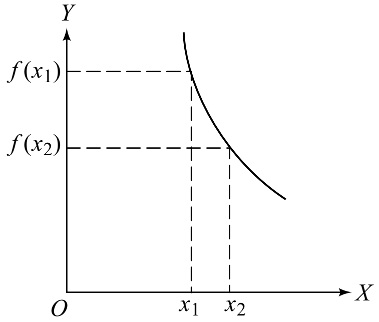
MONOTONICITY

A function $f(x)$ defined on a set D is said to be non-decreasing, increasing, non-increasing and decreasing respectively, if for any $x_1, x_2 \in D$ and $x_1 < x_2$, we have $f(x_1) \leq f(x_2)$, $f(x_1) < f(x_2)$, $f(x_1) \geq f(x_2)$ and $f(x_1) > f(x_2)$, respectively (Figs 11.2 and 11.3). The function $f(x)$ is said to be monotonic if it possesses any of these properties.



An increasing function

Fig. 11.2



A decreasing function

Fig. 11.3

As an immediate consequence of Lagrange's Mean theorem, we have

Testing monotonicity Let $f(x)$ be continuous on $[a, b]$ and differentiable on $]a, b[$. Then

(i) for $f(x)$ to be non-decreasing (non-increasing) on $[a, b]$ it is necessary and sufficient that $f'(x) \geq 0$ ($f'(x) \leq 0$) for all $x \in\ ]a, b[$.

(ii) for $f(x)$ to be increasing (decreasing) on $[a, b]$ it is necessary and sufficient that $f'(x) > 0$ ($f'(x) < 0$) for all $x \in]a, b[$.

Illustration 9

Show that the function $y = \sqrt{2x - x^2}$ increases in the interval (0, 1) and decreases in (1, 2)

$$y'(x) = \frac{1}{2}\frac{2-2x}{\sqrt{2x-x^2}} = \frac{1-x}{\sqrt{(2-x)x}} \quad x \neq 0, 2.$$

y' is not defined at $x = 0$, $x = 2$.

$y'(x) > 0$ if $1 - x > 0$ so y increases on (0, 1) and $y'(x) < 0$ for $x \in (1, 2)$, so y decreases on (1, 2).

Illustration 10

Find the interval of monotonicity of $y = \dfrac{1-x+x^2}{1+x+x^2}$

$$y'(x) = \frac{(1+x+x^2)(-1+2x)-(1-x+x^2)(1+2x)}{(1+x+x^2)^2}$$

$$= \frac{-2+2x^2}{(1+x+x^2)^2} = \frac{2(x^2-1)}{(1+x+x^2)^2}$$

Since the denominator is always positive so the sign of $y'(x)$ according to the sign of $x^2 - 1$.

Thus $y'(x) > 0 \Leftrightarrow x^2 - 1 > 0 \Leftrightarrow x > 1$ or $x < -1$

Hence y increases on $(1, \infty) \cup (-\infty, -1)$ and decreases on $(-1, 1)$.

MAXIMA AND MINIMA

A function has a local *maximum* at the point x_0 if the value of the function $f(x)$ at that point is greater than its values at all points other than x_0 of a certain interval containing the point x_0. In other words, a function $f(x)$ has a maximum at x_0 if it is possible to find an interval (α, β) containing x_0, i.e., with $\alpha < x_0 < \beta$, such that for all points different from x_0 in (α, β), we have $f(x) < f(x_0)$.

A function $f(x)$ has a local minimum at x_0 if there exists an interval (α, β) containing x_0 such that $f(x) > f(x_0)$ for $x \in (\alpha, \beta)$ and $x \neq x_0$.

One should not confuse the local maximum and local minimum of a function with its largest and smallest values over a given interval. The local maximum of a function is the largest value only in comparison to the values it has at all points sufficiently close to the point of local maximum. Similarly, the local minimum is the smallest value only in comparison to the values of the function at all points sufficiently close to the local minimum point.

The general term for the maximum and minimum of a function is *extremum*, or the extreme values of the function. A necessary condition for the existence of an extremum at the point x_0 of the function $f(x)$ is that where $f'(x_0) = 0$, or $f'(x_0)$ does not exist. The points at which $f'(x) = 0$, or where $f'(x)$ does not exist, are called *critical points* of the function f.

First derivative test

(i) If $f'(x)$ changes sign from positive to negative at x_0, i.e., $f'(x) > 0$ for $x < x_0$, and $f'(x) < 0$ for $x > x_0$, then the function attains a local maximum at x_0.

(ii) If $f'(x)$ changes sign from negative to positive at x_0, i.e., $f'(x) < 0$ for $x < x_0$, and $f'(x) > 0$ for $x > x_0$, then the function attains a local minimum at x_0.

(iii) If the derivative does not change sign in moving through the point x_0, there is no extremum at that point.

Second derivative test Let f be twice differentiable, and let c be a root of the equation $f'(x) = 0$. Then

(i) c is a local maximum point if $f''(c) < 0$

(ii) c is a local minimum point if $f''(c) > 0$.

However, if $f''(c) = 0$, then the following result is applicable. Let $f'(c) = f''(c) = \cdots = f^{(n-1)}(c) = 0$ (where f^r denotes the rth derivative), but $f^{(n)}(c) \neq 0$.

(i) If *n is even* and $f^{(n)}(c) < 0$, there is a local maximum at c, while if $f^{(n)}(c) > 0$, there is a local minimum at c.

(ii) If n is *odd*, there is no extremum at the point c.

The *greatest* (*least*) value of continuous function $f(x)$ on the interval $[a, b]$ is attained either at the critical points or at the end-points of the interval. To find the greatest (least) value of the function, we have to compute its values at all the critical points on the interval $]a, b[$, and the values $f(a)$,

$f(b)$ of the function at the end-points of the interval, and choose the greatest (least) out of the numbers so obtained.

Illustration 11

Find the extrema of $y = 2x^3 - 3x^2$. y is differentiable function and $y' = 6x^2 - 6x = 6x(x - 1)$.

So, points extremum are 0 and 1 $y'' = 6(2x - 1)$ $y''(1) = 6 > 0$, $y''(0) = -6 < 0$.

Hence $y_{\max} = y(0) = 0$

and $y_{\min} = y(1) = 2 - 3 = -1$

Illustration 12

Find the greatest and least value of $y = x^3 - 3x^2 + 6x - 2$ on $[-1, 1]$. y is a differentiable function of x and $y'(x) = 3x^2 - 6x + 6 = 3(x^2 - 2x + 2) = 3((x - 1)^2 + 1) > 0$.

Hence y increases on $[-1, 1]$. Thus the greatest value $= y(1) = 1 - 3 + 6 - 2 = 2$, least value $= y(-1) = -1 - 3 - 6 - 2 = -12$.

Point of Inflection

A point $x = c$ is said to be point of inflection for a curve $y = f(x)$ if $f''(c) = 0$ or is not defined and $f'''(c) \neq 0$

SOLVED EXAMPLES

Concept-based

Straight Objective Type Questions

Example 1: The approximate value of cos 31° is

(a) 0.52 (b) 0.851

(c) 0.641 (d) 0.681

Ans. (b)

Solution: Known value near to cos 31° is cos 30°

$$= \cos\frac{\pi}{6} = \frac{\sqrt{3}}{2}$$

Let $y = \cos x \quad y'(x) = -\sin x$

$$\cos 31 = \cos\left(\frac{\pi}{6} + \frac{\pi}{180}\right). \text{ So putting } x = \frac{\pi}{6} \text{ and } \Delta x = \frac{\pi}{180},$$

we have $y'\left(\dfrac{\pi}{6}\right) = -\sin\dfrac{\pi}{6} = -\dfrac{1}{2}$

$\cos(x + \Delta x) \simeq \cos x + f'(x)\,\Delta x$. Putting $x = \dfrac{\pi}{6}$ and $\Delta x = \dfrac{\pi}{180}$, we have

$$\cos 31 \simeq \frac{\sqrt{3}}{2} - \frac{1}{2}\frac{\pi}{180} = \frac{1.732}{2} - \frac{1}{2} \times \frac{3.14}{180}$$

$$= 0.851$$

Example 2: The tangent line at (2, 4) to the curve $y = x^3 - 3x + 2$ meets the x-axis at

(a) (2, 0) (b) $\left(\dfrac{7}{2}, 0\right)$

(c) $\left(\dfrac{11}{9}, 0\right)$ (d) $\left(\dfrac{14}{9}, 0\right)$

Ans. (d)

Solution: $\dfrac{dy}{dx} = 3x^2 - 3 = 3(x^2 - 1)$

$$\left.\frac{dy}{dx}\right|_{x=2} = 3(4 - 1) = 9$$

Equation of tangent at (2, 4) is

$$Y - 4 = 9(X - 2)$$

This meets x-axis if $Y = 0$

$$\Rightarrow \quad \frac{-4}{9} = X - 2 \quad \Rightarrow \quad X = 2 - \frac{4}{9} = \frac{14}{9}.$$

Example 3: The slope of the tangent to the curve

$$x = t^2 + 3t - 8$$
$$y = 2t^2 - 2t - 5$$

at the point (2, –1) is

(a) 2/3 (b) 6/7

(c) 4/5 (d) 3/2

Ans. (b)

Solution: We need to determine the value of t corresponding to the given point, so

$$\left.\begin{array}{l} 2 = t^2 + 3t - 8 \\ -1 = 2t^2 - 2t - 5 \end{array}\right] \begin{array}{l} \Rightarrow \\ \Rightarrow \end{array} \left.\begin{array}{l} t^2 + 3t - 10 = 0 \\ t^2 - t - 2 = 0 \end{array}\right] \begin{array}{l} \Rightarrow \quad t = 2, -5 \\ \Rightarrow \quad t = 2, -1 \end{array}$$

Hence common value is 2

$$y'|_{x=2} = \left(\frac{\frac{dy}{dt}}{\frac{dx}{dt}}\right)_{t=2} = \left(\frac{4t - 2}{2t + 3}\right)_{t=2} = \frac{6}{7}.$$

Example 4: The interval in which $y = \dfrac{1}{4x^3 - 9x^2 + 6x}$ is increasing is

(a) $(-\infty, \infty)$ (b) (0, 1/2)

(c) (1/2, 1) (d) $(1, \infty)$

Ans. (c)

Solution: $$y'(x) = -\frac{12x^2 - 18x + 6}{(4x^3 - 9x^2 + 6x)^2}$$

$$= -\frac{6(2x - 1)(x - 1)}{(4x^3 - 9x^2 + 6x)^2}$$

$$y'(x) > 0 \Leftrightarrow (2x-1)(x-1) < 0$$
$$\Leftrightarrow \text{(i)}\ \ 2x-1>0,\quad x-1<0$$
$$\text{(ii)}\ \ 2x-1<0,\quad x-1>0$$

(i) $\Rightarrow$ $x \in (1/2, 1)$ case (ii) is not possible. Hence y increases on $(1/2, 1)$

Example 5: Let $y = x - \log(1 + x)$, the minimum value of y is

(a) 1 (b) 0

(c) –1 (d) $\frac{1}{2}$

Ans. (b)

Solution: $y'(x) = 1-\frac{1}{1+x}=\frac{x}{1+x}$. The domain y is $x > -1$. so $y'(x) = 0 \Rightarrow x = 0$

$y''(x) = \frac{1}{(1+x)^2} > 0$. Hence y is min at $x = 0$ and $y_{\min} = 0 - \log 1 = 0$

Example 6: A covered box of volume 72 cm^3 and the base sides in a ratio of 1:2 is to be made. The length all sides so that the total surface area is the least possible is

(a) 2, 4, 9 (b) 8, 3, 3

(c) 6, 6, 2 (d) 6, 3, 4

Ans. (d)

Solution: Let l, b, h be the dimensions $l = 2b$, so $V = lbh = 2b^2h$

$$\Rightarrow \quad 72 = 2b^2h \quad \Rightarrow \quad h = \frac{36}{b^2}$$

The surface area $S = 2(lb + bh + lh)$

$$= 2\left(2b^2 + \frac{3b}{b} + 2b \times \frac{36}{b^2}\right)$$
$$= 2\left(2b^2 + \frac{108}{b}\right)$$
$$= 4\left(b^2 + \frac{54}{b}\right)$$

$\frac{dS}{db} = 4\left(2b - \frac{54}{b^2}\right)$, $\frac{dS}{db}$ is zero if $b = 3$ and

$$\frac{d^2S}{db^2} = 4\left(2 + \frac{108}{b^3}\right) > 0$$

Hence S is minimum when $b = 3$. So the dimensions are $6, 3, \frac{36}{9} = 6, 3, 4$

Example 7: A point on the curve $y = x^3 - 3x + 5$ at which the tangent line is parallel to $y = -2x$ is

(a) (1, 3) (b) (0, 5)

(c) $\left(\frac{1}{\sqrt{3}}, 5-\frac{8\sqrt{3}}{9}\right)$ (d) $\left(\frac{1}{\sqrt{2}}, 0\right)$

Ans. (c)

Solution: Since $y'(x) = 3x^2 - 3$, so by the condition of parallelism

$$3x^2 - 3 = -2$$
$$x = \pm\frac{1}{\sqrt{3}}$$

If $x = \frac{1}{\sqrt{3}}$, then $y = \frac{1}{3\sqrt{3}} - \frac{3}{\sqrt{3}} + 5$

$$= 5 - \frac{8}{3\sqrt{3}} = 5 - \frac{8\sqrt{3}}{9}.$$

Example 8: The greatest value of $y = \sin 2x - x$ on $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ is

(a) $\frac{\pi}{2}$ (b) 1

(c) 2 (d) $-\frac{\pi}{2}$

Ans. (a)

Solution $y' = 2\cos 2x - 1 \Rightarrow y'(x) = 0 \Leftrightarrow \cos^2 x = \frac{1}{2}$

So, $y'(x) = 0$ if $x = \frac{\pi}{6}$. Thus the critical points of y in $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ are $-\frac{\pi}{2}, \frac{\pi}{6}, \frac{\pi}{2}$. Now $y\left(-\frac{\pi}{2}\right) = \frac{\pi}{2}$, $y\left(\frac{\pi}{2}\right) = -\frac{\pi}{2}$ and $y\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2} - \frac{\pi}{2}$. The greatest value is $\frac{\pi}{2}$.

Example 9: The point of inflection of $y = x^3 - 5x^2 + 3x - 5$ is

(a) $\frac{1}{2}$ (b) $\frac{3}{4}$

(c) $\frac{7}{4}$ (d) $\frac{5}{4}$

Ans. (d)

Solution: Since y is twice differentiable function so for inflection points $y''(x) = 0$, $y'''(x) \neq 0$

$$y'(x) = 3x^2 - 10x + 3$$
$$y'' = 6x - 10. \quad \text{So, } y''(x) = 0 \text{ if } x = \frac{5}{4}$$
$$y'''(x) = 6 \neq 0. \quad \text{So, } x = \frac{5}{4} \text{ is a point of inflection.}$$

Example 10: The minimal rate of change of the function $f(x) = 3x^5 - 5x^3 + 5x - 7$ is

(a) $\frac{3}{4}$ (b) $\frac{5}{4}$

(c) $\frac{2}{3}$ (d) $\frac{3}{2}$

Ans. (b)

Solution Rate of change of $f(x)$ is $f'(x)$

$$= 15x^4 - 15x^2 + 5 = 15\left(x^4 - x^2 + \frac{1}{3}\right)$$

$$= 15\left(\left(x^2 - \frac{1}{2}\right)^2 + \frac{1}{12}\right) \ge \frac{15}{12} = \frac{5}{4}$$

The minimum vale of f' is attained at $x = +\frac{1}{\sqrt{2}}$ and equals $\frac{5}{4}$.

LEVEL 1

Straight Objective Type Questions

Example 11: A spherical balloon is expanding. If the radius is increasing at the rate of 5 inch per minute, the rate at which the volume increases (in cubic inches per minute) when the radius is 10 inch is

(a) $100\,\pi$ (b) $1000\,\pi$
(c) $2000\,\pi$ (d) $500\,\pi$

Ans. (c)

Solution: The volume $V = \frac{4}{3}\pi r^3$, r being the radius. It is given that $\frac{dr}{dt}$ = 5 inch/min and we have to find $\frac{dV}{dt}$ when r = 5 inches.

$$\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$$

$$\Rightarrow \qquad \left.\frac{dV}{dt}\right|_{r=10} = 4\pi\,(100)5 = 2000\,\pi.$$

Example 12: An object is moving in the clockwise direction around the unit circle $x^2 + y^2 = 1$. As it passes through the point $(1/2, \sqrt{3}/2)$, its y-coordinate is decreasing at the rate of 3 units per second. The rate at which the x-coordinate changes at this point is (in units per second)

(a) 2 (b) $3\sqrt{3}$
(c) $\sqrt{3}$ (d) $2\sqrt{3}$

Ans. (b)

Solution: We find $\frac{dx}{dt}$ when $x = \frac{1}{2}$ and $y = \frac{\sqrt{3}}{2}$ given that $\frac{dy}{dt}$ = – 3 units/s and $x^2 + y^2 = 1$.

Differentiating $x^2 + y^2 = 1$, we have

$$2x\,\frac{dx}{dt} + 2y\,\frac{dy}{dt} = 0.$$

Putting $x = 1/2$, $y = \sqrt{3}/2$ and $dy/dt = -3$, we have

$$\frac{1}{2}\frac{dx}{dt} + \frac{\sqrt{3}}{2}(-3) = 0 \quad \Rightarrow \quad \frac{dx}{dt} = 3\sqrt{3}.$$

Example 13: An approximate value of cos 40° is

(a) 0.7688 (b) 0.7071
(c) 0.7117 (d) 0.7

Ans. (a)

Solution:

Let $f(x) = \cos x$. 40° = 45° – 5°

$$= \frac{\pi}{4} - \frac{\pi}{180} \times 5 = \frac{\pi}{4} - \frac{\pi}{36} \text{ radians}$$

We use a differential to estimate the change in cos x when x decreases from $\pi/4$ to $\pi/4 - (\pi/36)$

$$f'(x) = -\sin x \text{ and } df = f'(x)\,h = -h\sin x$$

With $x = \pi/4$ and $h = -\pi/36$, df is given by

$$df = -f'(x)h = -\left(-\frac{\pi}{36}\right)\sin\left(\frac{\pi}{4}\right)$$

$$= \frac{\pi}{36}\cdot\frac{\sqrt{2}}{2} = \frac{\pi\sqrt{2}}{72} = 0.0617$$

$$\cos 40 \cong \cos 45 + 0.0617 \cong 0.7071 + 0.0617$$
$$= 0.7688.$$

Example 14: The values of x for which the tangents to the curves $y = x\cos x$, $y = (\sin x)/x$ are parallel to the axis of x are roots of (respectively)

(a) $\sin x = x$, $\tan x = x$ (b) $\cot x = x$, $\sec x = x$
(c) $\cot x = x$, $\tan x = x$ (d) $\tan x = x$, $\cot x = x$

Ans. (c)

Solution: Let $y = f(x) = x\cos x$ and $y = g(x) = (\sin x)/x$. Now $f'(x) = -x\sin x + \cos x$ and $g'(x) = (x\cos x - \sin x)/x^2$. Since the tangents are parallel to x-axis so $f'(x) = 0$ and $g'(x) = 0$, which is turn give $\cot x = x$ and $\tan x = x$ respectively.

Example 15: The length of the subtangent to the ellipse $x = a\cos t$, $y = b\sin t$ at $t = \pi/4$ is

(a) a (b) b
(c) $b/\sqrt{2}$ (d) $a/\sqrt{2}$

Ans. (d)

Solution: $\frac{dx}{dt} = -a \sin t$ and $\frac{dy}{dt} = b \cos t$, therefore $\left.\frac{dy}{dx}\right|_{t=\pi/4} = -\frac{b}{a} \cot(\pi/4) = -\frac{b}{a}$. The length of the subtangent = $\left|y_0 \frac{dx}{dy}\right|_{t=\pi/4} = \left|b \sin\frac{\pi}{4} \times -\frac{a}{b}\right| = \frac{a}{\sqrt{2}}$.

Example 16: Tangent of the angle at which the curve $y = a^x$ and $y = b^x$ $(a \neq b > 0)$ intersect is given by

(a) $\frac{\log ab}{1+\log ab}$
(b) $\frac{\log a/b}{1+(\log a)(\log b)}$
(c) $\frac{\log ab}{1+(\log a)(\log b)}$
(d) none of these

Ans. (b)

Solution: Intersection of the two curves is given by $a^x = b^x$ which implies $x = 0$. If α is the angle at which the two curves intersect then

$$\tan\alpha = \frac{m_1 - m_2}{1+m_1m_2} = \left.\frac{a^x \log a - b^x \log b}{1+a^x b^x (\log a)(\log b)}\right|_{x=0}$$

$$= \frac{(\log a/b)}{1+(\log a)(\log b)}. \qquad \text{(Putting } x = 0\text{)}$$

Example 17: For the parabola $y^2 = 16x$, the ratio of the length of the subtangent to the abscissa is

(a) 2 : 1
(b) 1 : 1
(c) $x : y$
(d) $x^2 : y$

Ans. (a)

Solution: Differentiating, $2y\frac{dy}{dx} = 16$ so $\frac{dy}{dx} = \frac{8}{y}$. Thus the length of the subtangent is $y.\frac{dx}{dy} = \frac{y^2}{8} = \frac{16x}{8} = 2x$. Hence length of the subtangent: abscissa = $2x : x = 2 : 1$.

Example 18: If the tangent to the curve $x^3 - y^2 = 0$ at $(m^2, -m^3)$ is parallel to $y = -\frac{1}{m}x - 2m^3$, then the value of m^2 is

(a) 1/3
(b) 1/6
(c) 2/3
(d) – 2/3

Ans. (c)

Solution: Differentiating $x^3 - y^2 = 0$, we have

$$\frac{dy}{dx} = \frac{3x^2}{2y} \Rightarrow \left.\frac{dy}{dx}\right|_{(m^2-m^3)} = -\frac{3m^4}{2m^3} = -\frac{3m}{2}.$$

According to the given condition, $-\frac{3}{2}m = -\frac{1}{m}$

$$\Rightarrow m^2 = \frac{2}{3}$$

Example 19 If the function $f(x) = \frac{cx+d}{(x-1)(x-4)}$ has a turning point at the point (2, – 1) then

(a) $c = 2, d = 0$
(b) $c = 1, d = 0$
(c) $c = 1, d = -1$
(d) $c = 1, d = 1$

Ans. (b)

Solution: $f'(x) = \frac{c(x-1)(x-4)-(cx+d)(2x-5)}{(x-1)^2(x-4)^2}$

So $\quad 0 = f'(2) = \frac{-2c+(2c+d)}{4} = \frac{d}{4} \quad \Rightarrow \quad d = 0$

Also $\quad -1 = f(2) = \frac{2c+d}{-2} = -c \quad \Rightarrow \quad c = 1.$

Example 20: The distance between the origin and the normal to the curve $y = e^{2x} + x^2$ at the point whose abscissa is 0 is

(a) $1/\sqrt{5}$
(b) $2/\sqrt{5}$
(c) $3/\sqrt{5}$
(d) $2/\sqrt{3}$

Ans. (b)

Solution: The point on the curve corresponding to $x = 0$ is (0,1)

$$\frac{dy}{dx} = 2e^{2x} + 2x \quad \Rightarrow \quad \left.\frac{dy}{dx}\right|_{x=0} = 2$$

Hence the equation of the normal at the point (0, 1) is

$$y - 1 = (-1/2)(x-0) \Rightarrow 2y + x - 2 = 0$$

Therefore, the distance of the point (0, 0) from this line is $2/\sqrt{5}$.

Example 21: The function $f(x) = 1 + x(\sin x)[\cos x]$, $0 < x \leq \pi/2$

(a) is continuous on $(0, \pi/2)$
(b) is strictly decreasing in $(0, \pi/2)$
(c) is strictly increasing in $(0, \pi/2)$
(d) has global maximum value 2.

Ans. (a)

Solution: For $0 < x \leq \pi/2$, $[\cos x] = 0$. Hence $f(x) = 1$ for all $x \in (0, \pi/2]$. Trivially $f(x)$ is continuous on $(0, \pi/2)$. This function is neither strictly increasing nor strictly decreasing and its global maximum is 1.

Example 22: Let f be an increasing function on $[a, b]$ and g a decreasing function from $[a, b]$ to $[a, b]$, then

(a) $f \circ g$ is a decreasing function
(b) $g \circ f$ is an increasing function
(c) $f \circ g$ is an increasing function
(d) none of these

Ans. (a)

Solution: For $x_1 < x_2$, $x_1, x_2 \in [a, b]$, since g is decreasing so $g(x_1) > g(x_2) \Rightarrow f(g(x_1)) > f(g(x_2))$ i.e. $f \circ g$ is decreasing function on $[a, b]$. Similarly $g \circ f$ is also decreasing function.

Example 23: If $a < 0$ and $f(x) = e^{ax} + e^{-ax}$. Suppose that $S = \{x : f(x) \text{ is monotonically decreasing}\}$ then

(a) $S = \{x : x > 0\}$ (b) $S = \{x : x < 0\}$
(c) $S = \{x : x > 1\}$ (d) $S = \{x : x < 1\}$

Ans. (b)

◎ **Solution:** $f'(x) = a(e^{ax} - e^{-ax})$. So f is monotonically decreasing if and only if $e^{ax} - e^{-ax} > 0$, i.e. $e^{2ax} > 1$ which is true if and only if $2ax > 0$. Since $a < 0$, we must have $x < 0$.

◉ **Example 24:** The equation of the horizontal tangent to the graph of the function $y = e^x + e^{-x}$ is

(a) $y = -2$ (b) $y = -1$
(c) $y = 2$ (d) none

Ans. (c)

◎ **Solution:** The slope of the horizontal tangent is 0, so $0 = dy/dx = e^x - e^{-x} \Rightarrow e^{2x} = 1 \Rightarrow x = 0$. If $x = 0$ then $y = 2$. Hence the equation of horizontal tangent at (0, 2) is $y = 2$.

◉ **Example 25:** Let $f(x)$ and $g(x)$ be defined and differentiable for $x \geq x_0$ and $f(x_0) = g(x_0)$, $f'(x) > g'(x)$ for $x > x_0$ then

(a) $f(x) < g(x)$ for some $x > x_0$
(b) $f(x) = g(x)$ for some $x > x_0$
(c) $f(x) > g(x)$ for all $x > x_0$
(d) none of these

Ans. (c)

◎ **Solution:** Consider the function $\phi(x) = f(x) - g(x)$ on the interval $[x_0, x]$. By Lagrange's theorem we have $\phi(x) - \phi(x_0) = \phi'(z)(x - x_0)$ for some $z \in (x_0, x)$. Since $\phi(x_0) = 0$, $\phi'(z) = f'(z) - g'(z) > 0$. So $\phi(x) - \phi(x_0) = \phi(x) = (f'(z) - g'(z))(x - x_0) > 0 \Rightarrow \phi(x) > 0$

Thus $f(x) > g(x)$ for all $x > x_0$.

◉ **Example 26:** If $y = 2x + \cot^{-1} x + \log\left(\sqrt{1+x^2} - x\right)$, then y

(a) decreases on $(-\infty, \infty)$
(b) decreases on $[0, \infty)$
(c) neither decreases nor increases on $[0, \infty)$
(d) increases on $(-\infty, \infty)$

Ans. (d)

Solution:

$$y'(x) = 2 - \frac{1}{1+x^2} + \frac{1}{\sqrt{1+x^2} - x}\frac{d}{dx}\left(\sqrt{1+x^2} - x\right)$$

$$= 2 - \frac{1}{1+x^2} + \frac{1}{\sqrt{1+x^2} - x} \times \left(\frac{x}{\sqrt{1+x^2}} - 1\right)$$

$$= 2 - \frac{1}{1+x^2} - \frac{1}{\sqrt{1+x^2}} \geq 0$$

since $1/(1+x^2)$ and $1/\sqrt{1+x^2}$ are less than or equal to 1 for all x. So $f(x)$ increases on $(-\infty, \infty)$.

◉ **Example 27** The equation $x^4 - 7x + 2 = 0$ has

(a) exactly two real and distinct solutions
(b) has four real roots
(c) no real root
(d) all the four roots lie between 0 and 2

Ans. (a)

◎ **Solution:** Let $f(x) = x^4 - 7x + 2$. Since $f(0) = 2$, $f(1) = -4$ and $f(2) = 4$

so by Intermediate value theorem there is $x_1 \in (0, 1)$ and $x_2 \in (1, 2)$ such that $f(x_1) = f(x_2) = 0$. Also $f'(x) = 4x^3 - 7$, so $f(x)$ decreases for $x < (7/4)^{1/3}$ and increases for $x > (7/4)^{1/3}$ and $1 < (7/4)^{1/3} < 2$. Thus $f(x)$ cannot be zero at any other point.

◉ **Example 28:** The maximum value of $x^{1/x}$ is

(a) $(1/e)^e$ (b) $e^{1/e}$
(c) e (d) $1/e$

Ans. (b)

◎ **Solution:** Let $f(x) = x^{1/x} \Rightarrow \log f(x) = (1/x)\log x$. Differentiating both the sides, we have $f'(x) = f(x)\left[\frac{1 - \log x}{x^2}\right]$.

So $f'(x) = 0 \Leftrightarrow x = e$. Also $f'(x) > 0$ for $0 < x < e$ and $f'(x) < 0$ for $e < x < \infty$. Thus, $f(x)$ has a maximum at $x = e$ and $\max f(x) = e^{1/e}$

◉ **Example 29:** Let $P(x) = a_0 + a_1 x^2 + a_2 x^4 + \dots + a_n x^{2n}$ be a polynomial in a real variable x with $0 < a_0 < a_1 \dots < a_n$. The function $P(x)$ has

(a) neither a maximum nor a minimum
(b) only one maximum
(c) only one minimum
(d) none of these

Ans. (c)

◎ **Solution:** Since $P(x)$ is a polynomial, it is differentiable, and its extremum values are given by $P'(x) = 0$

$$\Rightarrow \quad 2a_1x + 4a_2x^3 + \dots + 2na_n x^{2n-1} = 0$$

$$\Rightarrow \quad 2x(a_1 + 2a_2x^2 + \dots + na_n x^{2n-2}) = 0$$

But, $a_1 > 0$ and other terms of $2a_2 x^2 + \dots + n\, a_n x^{2n-2}$ are non negative so we have $x = 0$. Also $P''(x) = 2a_1 + 12a_2 x^2 + \dots + 2n(2n-1)\, a_n x^{2n-2}$ so that $P''(0) = 2a_1 > 0$. Therefore, $P(x)$ has only one minimum at $x = 0$.

◉ **Example 30:** If $f(x) = \dfrac{x}{\sin x}$ and $g(x) = \dfrac{x}{\tan x}$, where $0 < x \leq 1$, then in this interval

(a) $f(x)$ and $g(x)$ are increasing functions
(b) both $f(x)$ and $g(x)$ are decreasing functions
(c) $f(x)$ is an increasing function
(d) $g(x)$ is an increasing function

Ans. (c)

◎ **Solution:** Let $f(x) = \dfrac{x}{\sin x} \Rightarrow f'(x) = \dfrac{\sin x - x\cos x}{\sin^2 x}$

Let $u(x) = \sin x - x\cos x$ so $u'(x) = \cos x - \cos x + x\sin x = x\sin x > 0$ for $0 < x \le 1$. Hence u is an increasing so $u(x) > u(0) = 0$. Thus $f'(x) > 0$ for $0 < x \le 1$. i.e. f is an increasing function. Now

$$g'(x) = \frac{\tan x - x\sec^2 x}{\tan^2 x}.$$

Let $v(x) = \tan x - x\sec^2 x$. Since $v'(x) = \sec^2 x - \sec^2 x - 2x\sec^2 x\tan x = -2x\sec^2 x\tan x < 0$ for $0 < x \le 1$. Hence $v(x) < v(0) = 0$ so $g'(x) < 0$ for $0 < x \le 1$. Thus g is a decreasing function.

Example 31: If $f(x) = x^{2/3}$ then

(a) (0, 0) is a point of maximum
(b) (0, 0) is not a point of minimum
(c) (0, 0) is a critical point
(d) There is no critical point

Ans. (c)

Solution: $\frac{dy}{dx} = \frac{2}{3}x^{-1/3}$. This derivative is never zero, but there is no derivative for $x = 0$. So (0, 0) is a critical point. If $x < 0$ then $\frac{dy}{dx} < 0$ and if $x > 0$ then $\frac{dy}{dx} > 0$. Thus (0, 0) is a point of minimum.

Example 32: Let $f(x) = (ax + b)/(cx + d)$ $(da - cb \ne 0, c \ne 0)$ then $f(x)$ has

(a) a critical point (b) no point of inflection
(c) a maximum (d) a minimum

Ans. (b)

Solution: $f'(x) = \frac{da - cb}{(cx + d)^2} \ne 0$ for any $x \in \mathbf{R}$ so f has no critical point in particular no minimum and no maximum. Now

$f''(x) = \frac{-2(da - cb)c}{(cx + d)^3} \ne 0$ for any $(x, f(x))$. Hence f has no point of inflection.

Example 33: Let $f(x) = (x - a)^m (x - b)^n$, where $m, n \in \mathbf{I}$ and $m, n > 1$. Then

(a) $(a, 0)$, $(b, 0)$ are the only critical points of f
(b) there are $m + n$ critical points of f
(c) there are exactly three critical points of f
(d) none of these

Ans. (c)

Solution: $f'(x) = m(x - a)^{m-1}(x - b)^n + n(x - a)^m(x - b)^{n-1}$

$= (x - a)^{m-1}(x - b)^{n-1}[(m + n)x - (mb + na)]$. Thus $f'(x) = 0 \Rightarrow x = a, x = b, x = \frac{mb + na}{m + n}$. So f has exactly three critical points.

Example 34: A ball is dropped from a platform 19.6 m high. Its position function is

(a) $x = -4.9t^2 + 19.6 (0 \le t \le 1)$
(b) $x = -4.9t^2 + 19.6 (0 \le t \le 2)$
(c) $x = -9.8t^2 + 19.6 (0 \le t \le 2)$
(d) $x = -4.9t + 19.6 (0 \le t \le 2)$

Ans. (b)

Solution: We have $a = \frac{d^2x}{dt^2} = -9.8$. The initial conditions are $x(0) = 19.6$ and $v(0) = 0$.

So $\quad v = \frac{dx}{dt} = -9.8t + v(0) = -9.8t$

$\therefore \quad x = -4.9t^2 + x(0) = -4.9t^2 + 19.6$

Now, the domain of the function is restricted since the ball hits the ground after a certain time. To find this time we set $x = 0$ and solve for t.

$$0 = -4.9t^2 + 19.6 \quad \Rightarrow \quad t = 2$$

Thus $\quad x = -4.9t^2 + 19.6 \quad (0 \le t \le 2)$

Example 35: Let $f(n) = 20n - n^2$ $(n = 1, 2, 3\ldots)$, then

(a) $f(n) \to \infty$ as $n \to \infty$
(b) $f(n)$ has no maximum
(c) The maximum value of $f(n)$ is greater than 200.
(d) None of these

Ans. (d)

Solution: Consider $f(x) = 20x - x^2$, defined for all real number x. $f'(x) = 20 - 2x$ and $f''(x) = -2$. Hence $x = 10$ is a point of maximum. Thus the maximum value of $f(n)$ is $200 - 100 = 100$.

Example 36: The point of the curve $y = x^2$ that is closest to $(4, -1/2)$ is

(a) (1, 1) (b) (2, 4)
(c) (2/3, 4/9) (d) (4/3, 16/9)

Ans. (a)

Solution: Let the required point be (x, y) on the curve so $d = \sqrt{(x-4)^2 + (y + 1/2)^2}$ should be minimum. It is enough to consider

$$D = (x - 4)^2 + (y + 1/2)^2 = (x - 4)^2 + (x^2 + 1/2)^2.$$

$D' = 4x^3 + 4x - 8$. Now for critical points

$D' = 0$ so $x^3 + x - 2 = 0 \quad \Rightarrow \quad x = 1$. Clearly D'' at $x = 1$ is $16 > 0$. Thus D is minimum when $x = 1$. So the required point is (1, 1)

Example 37: The smallest value of M such that $|x^2 - 3x + 2| \le M$ for all x in the interval $[1, 5/2]$ is

(a) 1/4 (b) 3/4
(c) 5/4 (d) 5/16

Ans. (b)

Solution: Consider $f(x) = x^2 - 3x + 2$ on $[1, 5/2]$. Now $f'(x) = 2x - 3$ so the only critical point is 3/2. Since $f(1) = 0$, $f(3/2) = -5/4$ and $f(5/2) = 3/4$. min $\{f(x): x \in [1, 5/2]\} = 0$, hence the

$\max\{|f(x)|: x \in [1, 5/2]\} = \max\{f(x): x \in [1, 5/2]\} = 3/4$. Thus $M = 3/4$.

◉ **Example 38:** The number of solutions of the equation $a^{f(x)} + g(x) = 0$, where $a > 0$, $g(x) \neq 0$ and $g(x)$ has minimum value 1/2, is

(a) one (b) two
(c) infinitely many (d) zero

Ans. (d)

◎ **Solution:** $a^{f(x)} = -g(x) \leq -1/2$, since $g(x) \geq 1/2$ for all x. But this is not possible as $a^{f(x)} > 0$ for all x. Thus the number of solution is zero.

◉ **Example 39:** The minimum value of $f(x) = |3 - x| + |2 + x| + |5 - x|$ is

(a) 0 (b) 7
(c) 8 (d) 10

◎ **Solution:**

$$f(x) = \begin{cases} 6 - 3x, & x < -2 \\ 10 - x, & -2 \leq x < 3 \\ x + 4, & 3 \leq x < 5 \\ 3x - 6, & x \geq 5 \end{cases}$$

The function f is decreasing for $x \in (-\infty, 3)$ and increases on $(3, \infty)$. Hence $x = 3$ is a point of minimum and $\min f(x) = 7$.

◉ **Example 40:** If $f(x) = x(x - 2)(x - 4)$, $1 \leq x \leq 4$, then a number satisfying the conclusion of the mean value theorem is

(a) 1 (b) 2
(c) 5/2 (d) 7/2

Ans. (a)

◎ **Solution:** $f'(x) = (x - 2)(x - 4) + x(x - 4) + x(x - 2) = 3x^2 - 12x + 8$. Also $f(4) = 0$ and $f(1) = 3$. Thus $\dfrac{f(4) - f(1)}{4 - 1} = -1$. We must have $-1 = f'(x)$

$$\Rightarrow \quad 3x^2 - 12x + 9 = 0$$
$$\Rightarrow \quad x^2 - 4x + 3 = 0$$
$$\Rightarrow \quad x = 1 \quad \text{or} \quad x = 3.$$

◉ **Example 41:** The sum of the intercepts of a tangent to $\sqrt{x} + \sqrt{y} = \sqrt{a}$, $a > 0$ upon the coordinate axes is

(a) $2a$ (b) a
(c) $a/2$ (d) $\sqrt{a}$

Ans. (b)

◎ **Solution:** $\dfrac{1}{2\sqrt{x}} + \dfrac{1}{2\sqrt{y}}\dfrac{dy}{dx} = 0 \Rightarrow \dfrac{dy}{dx} = -\dfrac{\sqrt{y}}{\sqrt{x}}$.

Equation of tangent at any point (x, y) of the curve is $Y - y = -\dfrac{\sqrt{y}}{\sqrt{x}}(X - x)$. So intercepts of X-axis and Y-axis are $x + \sqrt{xy}$ and $y + \sqrt{xy}$.

Therefore, the sum of intercepts $= x + y + 2\sqrt{xy} = \left(\sqrt{x} + \sqrt{y}\right)^2 = a$.

◉ **Example 42:** Let x and y be two real numbers such that $x > 0$ and $xy = 1$. The minimum value of $x + y$ is

(a) 1 (b) 1/2
(c) 2 (d) 1/4

Ans. (c)

◎ **Solution:** If $xy = 1$ then $S = x + y = x + 1/x$ and $S'(x) = 1 - 1/x^2 \Rightarrow S'(x) = 0 \Leftrightarrow x = 1$ (as $x > 0$). Also $S''(x) = 2/x^3 > 0$ for $x = 1$. Hence minimum value of $x + y$ is 2.

Alternatively $S = x + \dfrac{1}{x} = \left(\sqrt{x} - \dfrac{1}{\sqrt{x}}\right)^2 + 2 \geq 2$ and $S = 2$ for $x = 1$. Hence the minimum value of S is 2.

◉ **Example 43:** The function $\dfrac{\sin(x + \alpha)}{\sin(x + \beta)}$ has no maximum or minimum if (k an integer)

(a) $\beta - \alpha = k\pi$ (b) $\beta - \alpha \neq k\pi$
(c) $\beta - \alpha = 2k\pi$ (d) none of the above

Ans. (b)

◎ **Solution:** Let $f(x) = \dfrac{\sin(x + \alpha)}{\sin(x + \beta)}$, so that

$$f'(x) = \frac{\sin(x + \beta)\cos(x + \alpha) - \cos(x + \beta)\sin(x + \alpha)}{\sin^2(x + \beta)}$$
$$= \frac{\sin(\alpha - \beta)}{\sin^2(x + \beta)}$$

Thus, $f(x)$ has no maximum or minimum if $f'(x) \neq 0$. i.e. if $\sin(\beta - \alpha) \neq 0$ equivalently $\beta - \alpha \neq k\pi$, $k \in \mathbf{I}$.

◉ **Example 44:** The tangent to the curve $y = x^3 - 6x^2 + 9x + 4$, $0 \leq x \leq 5$ has maximum slope at x which is equal to

(a) 2 (b) 3
(c) 4 (d) none of these

Ans. (d)

◎ **Solution:** $u = \dfrac{dy}{dx} = 3x^2 - 12x + 9$. For u to be maximum or minimum $\dfrac{du}{dx} = 0$ which is true if and only if $6x - 12 = 0 \Leftrightarrow x = 2$. Now $u(0) = 9$, $u(2) = -3$ and $u(5) = 24$. Thus the maximum of $u(x)$, $0 \leq x \leq 5$ is $u(5)$ so $x = 5$.

◉ **Example 45:** The set of all values of the parameters a for which the points of minimum of the function $y = 1 + a^2x - x^3$ satisfy the inequality $\dfrac{x^2 + x + 2}{x^2 + 5x + 6} \leq 0$ is

(a) an empty set

(b) $\left(-3\sqrt{3}, -2\sqrt{3}\right)$

(c) $\left(2\sqrt{3}, 3\sqrt{3}\right)$

(d) $\left(-3\sqrt{3},-2\sqrt{3}\right)\cup\left(2\sqrt{3},3\sqrt{3}\right)$

Ans. (c)

◎ **Solution:** $\frac{dy}{dx}=a^2-3x^2=0 \Leftrightarrow x=\pm a/\sqrt{3}$. Since $\frac{d^2y}{dx^2} = -6x$ so y is minimum for $x=-a/\sqrt{3}$.

Since $x^2+x+2>0$ for all x so for $\frac{x^2+x+2}{x^2+5x+6}\le 0$, we must have $x^2+5x+6<0$. If $x=-a/\sqrt{3}$, we have $a^2/3-5a/\sqrt{3}+6<0$ i.e. $a^2-5\sqrt{3}\,a+18<0 \Leftrightarrow (a-2\sqrt{3})(a-3\sqrt{3})<0$ i.e. $a\in(2\sqrt{3},3\sqrt{3})$.

◉ **Example 46:** The point of intersection of the tangents drawn to the curve $x^2y=1-y$ at the points where it is met by the curve $xy=1-y$ is given by

(a) $(0,-1)$
(b) $(1,1)$
(c) $(0,1)$
(d) none of these

Ans. (c)

◎ **Solution:** The intersection of $x^2y=1-y$ and $xy=1-y$ are given by $x^2y=xy$. Since $y\neq 0$ on any of two curves so we must have $x=0,1$. Thus the curves intersects at $(0,1)$; $(1,1/2)$.

Now, differentiating $x^2y=1-y$, we have $\frac{dy}{dx}=-\frac{2xy}{1+x^2}$. Thus $\left.\frac{dy}{dx}\right|_{(0,1)}=0$ and $\left.\frac{dy}{dx}\right|_{(1,1/2)}=-\frac{1}{2}$. Equations of tangents are $Y=1$ and $Y-1/2=(-1/2)(X-1)$. Their intersection is given by $(0,1)$.

◉ **Example 47:** The equation of the tangent to the curve $y=(2x-1)\,e^{2(1-x)}$ at the point of its maximum is

(a) $y=1$
(b) $x=1$
(c) $x+y=1$
(d) $x-y=-1$

Ans. (a)

◎ **Solution:** $y'(x)=-2\,(2x-1)\,e^{2(1-x)}+2e^{2(1-x)}=2e^{2(1-x)}(-2x+2)$

Thus $y'(x)=0 \Rightarrow x=1$. Since, $y''(1)<0$ so $(1,1)$ is the point of maximum and an equation of tangent to the curve is $y-1=0\,(x-1)$, i.e. $y=1$.

◉ **Example 48:** If the function $f(x)=x^2+\alpha/x$ has a local minimum at $x=2$, then the value of α is

(a) 8
(b) 18
(c) 16
(d) none of these

Ans. (c)

◎ **Solution:** $f'(x)=2x-\alpha/x^2$, so $f'(x)=0 \Leftrightarrow 2x=\alpha/x^2 \Leftrightarrow x=(\alpha/2)^{1/3}$. Clearly for $x=(\alpha/2)^{1/3}$, we have $f''(x)>0$. So $2=(\alpha/2)^{1/3}\Rightarrow \alpha=16$.

◉ **Example 49:** Three normals are drawn to the parabola $y^2=4x$ from the point $(c,0)$. These normals are real and distinct when

(a) $c=0$
(b) $c=1$
(c) $c=2$
(d) $c=3$

Ans. (d)

◎ **Solution:** Any point on $y^2=4x$ is $(t^2,2t)$. Since $\frac{dy}{dx}=\frac{2}{y}$ so $\left.\frac{dy}{dx}\right|_{(t^2,2t)}=\frac{2}{2t}=\frac{1}{t}$. Hence equation of normal at $(t^2,2t)$ is

$$Y-2t=-t\,(X-t^2)$$

This passes through $(c,0)$ if $-2t=-t\,(c-t^2)$

$$\Rightarrow \quad t=0,\ t^2=c-2$$

Thus the roots are real and distinct if $c>2$ so $c=3$ is the correct choice.

◉ **Example 50:** The function $f(x)=(\log(x-1))^2\,(x-1)^2$ has

(a) local extremum at $x=1$
(b) point of inflection at $x=1$
(c) local extremum at $x=2$
(d) point of inflection at $x=2$

Ans. (c)

◎ **Solution:** $f'(x)=(x-1)^2\,2\log(x-1)\cdot 1/(x-1)+2(\log(x-1))^2(x-1)$

$$=2\,(x-1)\,[\log(x-1)]\,[1+\log(x-1)]$$

$f'(x)=0 \Rightarrow x=2$ or $1+e^{-1}$, since the domain of f is $\{x : x>1\}$.

$$f''(x)=2\log(x-1)\,(1+\log(x-1))+2\,(x-1)\times\left[\frac{1}{x-1}+\frac{2}{x-1}\log(x-1)\right]$$

$f''(2)=2>0$. Hence $x=2$ is a point of extremum.

◉ **Example 51:** If $f(x)=\log x$ satisfies Lagrange's theorem on $[1,e]$ then value of $c\in(1,e)$ such that the tangent at c is parallel to line joining $(1,f(1))$ and $(e,f(e))$ is

(a) $e-\frac{3}{2}$
(b) $\frac{1+e}{2}$
(c) $e-1$
(d) $e-\frac{1}{2}$

Ans. (c)

◎ **Solution:** $f'(c)=\frac{1}{c}$

So $\frac{f(e)-f(1)}{e-1}=f'(c)=\frac{1}{c}$

$$\Rightarrow \quad \frac{\log e-\log 1}{e-1}=\frac{1}{c}$$

$$\Rightarrow \quad \frac{1}{e-1}=\frac{1}{c} \quad \Rightarrow \quad c=e-1$$

Example 52: The value of c for which the conclusion of Lagrange's theorem holds for the function $f(x) = \sqrt{a^2 - x^2}, a > 1$ on the interval [1, a] is

(a) $\dfrac{a(a+1)}{2}$ (b) $\dfrac{1+a}{2}$

(c) $\dfrac{\sqrt{a(a+1)}}{2}$ (d) $\dfrac{a(a-1)}{2}$

Ans. (c)

Solution: $\dfrac{f(a) - f(1)}{a-1} = f'(c) = \dfrac{-c}{\sqrt{a^2 - c^2}}$

$$\frac{\sqrt{a^2 - a^2} - \sqrt{a^2 - 1}}{a-1} = \frac{-c}{\sqrt{a^2 - c^2}}$$

$$\Rightarrow \quad -\sqrt{\frac{a+1}{a-1}} = -\frac{c}{\sqrt{a^2 - c^2}}$$

$$\Rightarrow \quad \frac{a+1}{a-1} = \frac{c^2}{a^2 - c^2}$$

$$\Rightarrow \quad (a + 1)(a^2 - c^2) = c^2(a - 1)$$

$$\Rightarrow \quad c^2(-a - 1 + 1 - a) = -(a + 1)a^2$$

$$\Rightarrow \quad c^2(2a) = (a + 1)a^2$$

$$\Rightarrow \quad c^2 = \frac{(a+1)a}{2}$$

Since $c \in (1, a)$ so $c = \sqrt{\dfrac{(a+1)a}{2}}$

Example 53: Let $f(x) = \begin{cases} |x-2| + a, & \text{if } x \le 2 \\ 4x^2 + 3x + 1, & \text{if } x > 2 \end{cases}$

If $f(x)$ has a local minimum at $x = 2$, then

(a) $a > 21$ (b) $a \le 21$

(c) $a > 30$ (d) $a > 24$

Ans. (b)

Solution: Since f has a local minimum at $x = 2$

So $f(2) \le f(x)$ for x in an open interval around 2.

$$\Rightarrow \quad f(2) \le \lim_{x \to 2+} f(x)$$

Thus, $a = f(2) \le \lim\limits_{x \to 2} 4x^2 + 3x + 1 = 21$

Example 54 If $y = mx + 2$ is parallel to a tangent to curve $e^{4y} = 1 + 16x^2$ then

(a) $|m| \le 1$ (b) $|m| < 1$

(c) $|m| > 1$ (d) $|m| \ge 1$

Ans. (a)

Solution Differentiating, we have

$$4e^{4y}\frac{dy}{dx} = 32x$$

$$\Rightarrow \quad \frac{dy}{dx} = \frac{8x}{1+16x^2}$$

According to the given condition

$$m = \frac{8x}{1+16x^2}$$

$$|m| = \left|\frac{8x}{1+16x^2}\right| \le 1 \ \ (\text{since } 16x^2 - 8\,|x| + 1 = (4\,|x| - 1)^2 \ge 0)$$

Example 55: Given the function $f(x) = x^2 e^{-2x}$, $x > 0$. Then $f(x)$ has the maximum value equal to

(a) e^{-2} (b) $(2e)^{-1}$

(c) e^{-1} (d) none of these.

Ans. (a)

Solution: $f'(x) = 2xe^{-2x} - 2x^2e^{-2x} = 2(1 - x)x\,e^{-2x}$. Now, $f'(x) = 0$ $\Leftrightarrow$ $x = 1, 0$. Also $f''(x) = 2(1 - x)e^{-2x} - 2xe^{-2x} - 4(1 - x)xe^{-2x}$, so $f''(1) = -2e^{-2} < 0$ and $f''(0) > 0$. Thus max $f(x) = f(1) = e^{-2}$.

Example 56: Let $f(x) = (x - 4)(x - 5)(x - 6)(x - 7)$ then

(a) $f'(x) = 0$ has four real roots

(b) three roots of $f'(x) = 0$ lie in $(4, 5) \cup (5, 6) \cup (6, 7)$

(c) the equation $f'(x) =$ has only two roots

(d) three roots of $f'(x) = 0$ lie in $(3, 4) \cup (4, 5) \cup (5, 6)$

Ans. (b)

Solution: Since $f(4) = f(5) = f(6) = f(7) = 0$, so by Rolle's theorem applied to the intervals [4, 5], [5, 6], [6, 7] there exist $x_1 \in (4, 5)$, $x_2 \in (5, 6)$, $x_3 \in (6,7)$ such that $f'(x_1) = f'(x_2) = f'(x_3) = 0$. Since f' is a polynomial of degree 3 so cannot have four roots.

Example 57: If $f(x) = \dfrac{x^2 - 1}{x^2 + 1}$ for every real number x, then the minimum value of f

(a) does not exist because f is unbounded

(b) is not attained even though f is bounded

(c) is equal to 1

(d) is equal to – 1

Ans. (d)

Solution: We have $f(x) = \dfrac{x^2 - 1}{x^2 + 1} = 1 - \dfrac{2}{x^2 + 1}$

$f(x)$ will attain its minimum value when $2/(x^2 + 1)$ is maximum i.e. when $x^2 + 1$ is minimum i.e. at $x = 0$. Thus min $f(x) = f(0) = -1$. Since $-1 \le f(x) < 1$ so f is bounded.

Example 58: For all $x \in (0, 1)$

(a) $e^x < 1 + x$ (b) $\log_e(1 + x) < x$

(c) $\sin x > x$ (d) $\log_e x > x$

Ans. (b)

Solution: Since $e^x = \sum\limits_{n=0}^{\infty} \dfrac{x^n}{n!} > 1 + x$ for $x > 0$ so (*a*) is not true. Also $\log x$ is an increasing function so $x > \log(1 + x)$. Again $e^x > x$ for $x > 0$ so $x > \log_e x$. We know that

$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} \ldots = x - \left(\frac{x^3}{3!} - \frac{x^5}{5!} + \ldots\right)$ The terms inside the brackets are positive since $x \in (0, 1)$ so $\sin x < x$.

◉ **Example 59:** Let f be a differentiable function on **R** and $h(x) = f(x) - (f(x))^2 + (f(x))^3$ for all $x \in$ **R**. Then

(a) h increases whenever f decreases
(b) h decreases whenever f increases
(c) h increases or decreases accordingly as f increases or decreases
(d) nothing can be claimed in general

Ans. (c)

◎ **Solution:** $h'(x) = f'(x) - 2f(x)f'(x) + 3(f(x))^2 f'(x)$

$$= f'(x)\,[1 - 2f(x) + 3(f(x))^2]$$

Since $1 - 2f(x) + 3(f(x))^2 = 3\left[\left(f(x) - \frac{1}{3}\right)^2 + \frac{2}{9}\right] > 0$ for all x

so $h'(x) > 0$ or < 0 accordingly as $f'(x) > 0$ or < 0. Hence h increases or decreases according as f increases or decreases.

◉ **Example 60:** Let $f(x) = ax^3 + bx^2 + cx + d$, $b^2 - 3ac > 0$, $a > 0$, $c < 0$. Then $f(x)$ has

(a) local maximum at some $x \in \mathbf{R}^+$
(b) a local maximum at some $x \in \mathbf{R}^-$
(c) a local minima at $x = 0$
(d) local minima at some $x \in \mathbf{R}^-$, $\mathbf{R}^+ = (0, \infty)$. $\mathbf{R}^- = (-\infty, 0)$

Ans. (b)

◎ **Solution:** $f'(x) = 3ax^2 + 2bx + C$. The discriminant $D = 4b^2 - 12ac = 4(b^2 - 3ac) > 0$

So $f'(x) = 0$ has exactly two real roots say α, β so $f'(x) = 3a(x - \alpha)(x - \beta)$. But $\frac{c}{a} < 0 \Rightarrow \alpha\beta < 0$. So we have $\alpha < 0$, $\beta > 0$ or $\alpha > 0$, $\beta > 0$. If $\alpha < 0$, $\beta > 0$, for $x < \alpha$, $f'(x) > 0$ and for $x > \alpha$ but near to α, $f'(x) > 0$. Also for $x < \beta$, but close to β, $f'(x) < 0$ and for $x > \beta$, $f'(x) > 0$. Thus f has local maxima at $x = \alpha$ which is $\mathbf{R}^-$ and f has local minima at $x = \beta \in \mathbf{R}^+$
In case $\alpha > 0$, $\beta < 0$, our conclusion is same *i.e.*, local minima at $x = \alpha$ and local maxima at $x = \beta$.

◉ **Example 61:** If $f(x) = \begin{cases} 3 - x^2, & x \le 2 \\ \sqrt{a + 14} - |x - 48|, & x > 2 \end{cases}$ and $f(x)$ has a local maxima at $x = 2$, then

(a) a cannot be determined
(b) least value of a is 2011
(c) greatest value of a is 2011
(d) $a \ge 3010$

Ans. (c)

◎ **Solution:** Since f has local maxima at $x = 2$, so $\lim_{h \to 0} f(2 + h) \le f(2)$

Since $\lim_{h \to 0-} f(2 + h) = \lim_{h \to 0-} 3 - (2 + h)^2 = f(2)$

So we must have $\lim_{h \to 0+} f(2 + h) \le f(2)$

$$\Rightarrow \quad \lim_{h \to 0+} \sqrt{a + 14} - |2 + h - 48| \le -1$$

$$\Rightarrow \quad \sqrt{a + 14} \le 46 - 1 = 45$$

$$\Rightarrow \quad a \le 2011.$$

The greatest value of a is 2011.

◉ **Example 62:** The total number of local maxima and local minima of the function

$$f(x) = \begin{cases} (2 + x)^3, & -3 < x \le -1 \\ x^{2/3}, & - < x < 2 \end{cases}$$

(a) 0 (b) 1
(c) 2 (d) 3

Ans. (c)

◎ **Solution:** Since $\lim_{x \to -1-} f(x) = \lim_{x \to -1+} f(x) = 1$

So, f is continuous on $(-3, 2)$. Also

$$f'(x) = \begin{cases} 3(x + 2)^2, & -3 < x < -1 \\ (2/3)\,x^{-1/3}, & -1 < x < 0, 0 < x < 2 \end{cases}$$

$f'(0)$ does not exist

$$\mathrm{L}f'(-1) = \lim_{x \to -1-} \frac{f(x) - f(1)}{x + 1} = \lim_{x \to -1-} \frac{(x + 2)^3 - 1}{x + 1}$$

$$= \lim_{x \to -1-} \frac{(x + 1)\left[(x + 2)^2 + (x + 2) + 1\right]}{x + 1} = 3.$$

$$\mathrm{R}f'(-1) = \lim_{x \to -1+} \frac{x^{2/3} - 1}{x + 1}$$

$$= \lim_{x \to 1+} \frac{\left(x^{1/3} - 1\right)\left(x^{1/3} + 1\right)}{\left(x^{1/3} + 1\right)\left(x^{2/3} + x^{1/3} + 1\right)} = -2$$

So f is not differentiable at $x = -1$
For $x \ne 0, -1$, $f'(x) \ne 0$. Critical points of f are -1, 0. At $x = -1$, f has a local maximum and at $x = 0$, f has a local minimum.

◉ **Example 63:** Let $g : \mathbf{R} \to (-\pi/2, \pi/2)$ be given by $g(u) = 2\tan^{-1}(e^u) - \pi/2$, then g is

(a) even and is strictly increasing in $(0, \infty)$
(b) odd and is strictly decreasing in $(-\infty, \infty)$
(c) odd and is strictly increasing in $(-\infty, \infty)$
(d) neither even nor odd, but is strictly increasing in $(-\infty, \infty)$.

Ans. (c)

◎ **Solution:** $g(-u) = 2\tan^{-1}\left(\frac{1}{e^u}\right) - \pi/2$

$$= 2\cot^{-1} e^u - \pi/2$$

$$= 2\left[\pi/2 - \tan^{-1} e^u\right] - \pi/2$$

$$= \pi/2 - \tan^{-1} e^u = -g(u)$$

Also, $g'(u) = \dfrac{2\,e^u}{1+e^{2u}} > 0 \ \forall\ u \in \mathbf{R}$

Thus g is an odd function which is strictly increasing on **R**.

◉ **Example 64:** Let $f(x) = \begin{cases} x^{\alpha} \log x & , \text{ if } x > 0 \\ 0 & , \text{ if } x = 0 \end{cases}$

If Rolle's theorem can be applied to f on [0, 1] then value of α can be

(a) – 1 (b) – 1/2
(c) 0 (d) 1/2

Ans. (d)

◎ **Solution:** For the Rolle's theorem to be applicable on [0, 1], we must have that f is continuous on [0, 1] and in particular at $x = 0$ from the right.

So $\lim\limits_{x \to 0+} x^{\alpha} \log x = f(0) = 0$

$$\Rightarrow \quad \lim_{x \to 0+} \frac{\log x}{x^{-\alpha}} = 0$$

$$\Rightarrow \quad \lim_{x \to 0+} \frac{(1/x)}{(-\alpha) x^{-\alpha-1}} = 0 \quad \Rightarrow \quad \lim_{x \to 0+} \frac{x^{\alpha}}{-\alpha} = 0$$

This is possible only if $\alpha > 0$.

◉ **Example 65:** Suppose that $f(x) = x^3 - px + q$ has three distinct real roots where $p, q > 0$. Then which one of the following hold?

(a) $f(x)$ has minima at $\sqrt{\dfrac{p}{3}}$ and maxima at $-\sqrt{\dfrac{p}{3}}$.

(b) $f(x)$ has minima at $-\sqrt{\dfrac{p}{3}}$ and maxima at $\sqrt{\dfrac{p}{3}}$.

(c) $f(x)$ has minima at both $\sqrt{\dfrac{p}{3}}$ and $-\sqrt{\dfrac{p}{3}}$.

(d) $f(x)$ has maxima at both $\sqrt{\dfrac{p}{3}}$ and $-\sqrt{\dfrac{p}{3}}$.

Ans. (a)

◎ **Solution:** As $f(x) = 0$ has three real and distinct zero so $f'(x) = 3x^2 - p = 0$ has two real and distinct zeros by Rolle's Theorem.

So $x = \pm\sqrt{\dfrac{p}{3}}$.

$f'(x) > 0$ if $x < -\sqrt{\dfrac{p}{3}}$; $f'(x) < 0$ if $-\sqrt{\dfrac{p}{3}} < x < \sqrt{\dfrac{p}{3}}$;

$f'(x) > 0$ if $x > \sqrt{\dfrac{p}{3}}$.

Thus $f(x)$ has a local maximum at $x = -\sqrt{\dfrac{p}{3}}$ and a local minimum at $x = \sqrt{\dfrac{p}{3}}$.

◉ **Example 66:** Given $P(x) = x^4 + ax^3 + bx^2 + cx + d$ such that $x = 0$ is the only real root of $P'(x) = 0$.
If $P(-1) < P(1)$, then in the interval [– 1, 1]

(a) $P(-1)$ is the minimum but $P(1)$ is not the maximum of P
(b) neither $P(-1)$ is the minimum nor $P(1)$ is the maximum of P
(c) $P(-1)$ is the minimum and $P(1)$ is the maximum of P
(d) $P(-1)$ is not minimum but $P(1)$ is the maximum of P

Ans. (d)

◎ **Solution:** $P'(x) = 4x^3 + 3ax^2 + 2\,bx + c$

As $P'(0) = 0$ so $c = 0$

$\therefore$ $P'(x) = x(4x^2 + 3ax + 2b)$

As $x = 0$ is the only real root of $P'(x) = 0$, roots of $4x^2 + 3ax + 2b$ must have imaginary roots,
therefore $4x^2 + 3ax + 2\,b > 0 \ \forall\ x \in \mathbb{R}$

Thus $P'(x) < 0$ for $x < 0$
> 0 for $x > 0$

Therefore, $x = 0$ is a point of local minimum at $x = 0$ As $P(-1) < P(1)$, we get $P(1)$ is maximum but $P(-1)$ is not minimum of P on [– 1, 1].

◉ **Example 67:** Let $f: \mathbf{R} \to \mathbf{R}$ be defined by

$$f(x) = \begin{cases} k - 2x & , \text{ if } x \le -1 \\ 2x + 3 & , \text{ if } x > -1 \end{cases}$$

If f has a local minimum at $x = -1$, then a possible value of k is

(a) –1/2 (b) – 1
(c) 1 (d) 0

Ans. (b)

◎ **Solution:** If f has a local minimum at $x = -1$ then $\lim\limits_{h \to 0} f(-1+h) \ge f(-1) = k + 2$

$$\Rightarrow \quad \lim_{h \to 0+} f(-1+h) \ge k + 2$$

$$\Rightarrow \quad \lim_{h \to 0+} 2(-1+h) + 3 \ge k + 2$$

$\Rightarrow \quad 1 \ge k + 2 \Rightarrow k \le -1.$

◉ **Example 68:** The value of a in order that $f(x) = \sin x - \cos x - ax + b$ decreases for all real values of x is given by

(a) $a \ge \sqrt{2}$ (b) $a < \sqrt{2}$
(c) $a \ge 1$ (d) $a < 1$

Ans. (a)

Solution: $f'(x) = \cos x + \sin x - a$

$$= \sqrt{2}\sin(x + \pi/4) - a$$

$f'(x) \le 0$ for all x if

$$a \ge \max_{x \in \mathbf{R}} \sqrt{2}\sin(x + \pi/4) = \sqrt{2}$$

Example 69: The curve that passes through the point (2, 3), and has the property that the segment of any tangent to it lying between the coordinate axes is bisected by the point of contact, is given by :

(a) $2y - 3x = 0$ (b) $y = \dfrac{6}{x}$

(c) $x^2 + y^2 = 13$ (d) $\left(\dfrac{x}{2}\right)^2 + \left(\dfrac{y}{3}\right)^2 = 2$

Ans. (b)

Solution: The equation of tangent at (x, y) to the curve $y = f(x)$ is given by

$$Y - y = \frac{dy}{dx}(X - x)$$

This tangent meets the axes at $A\left(x - y\dfrac{dx}{dy}, 0\right)$ and $B\left(0, y - x\dfrac{dy}{dx}\right)$. We are given mid point of AB as (x, y) so,

$$\frac{1}{2}\left(x - y\frac{dx}{dy}\right) = x \text{ and } \frac{1}{2}\left(y - \frac{xdy}{dx}\right) = y$$

$$\Rightarrow \quad \frac{dx}{x} + \frac{dy}{y} = 0 \quad \Rightarrow \quad \log|xy| = C$$

$$\Rightarrow \quad xy = \pm e^c = A$$

As it passes through (2, 3) so $A = 6$

$\therefore$ $xy = 6$ or $y = 6/x$

Example 70: A spherical balloon is filled with 4500 π cubic meters of helium gas. If a leak in the balloon causes the gas to escape at the rate of 72 π cubic meters per minute, then the rate (in meters per minute) at which the radius of the balloon decreases 49 minutes after the leakage began is :

(a) 7/9 (b) 2/9

(c) 9/2 (d) 9/7

Ans. (b)

Solution: Let r be the radius of the balloon and V be its volume. It is given that

$$\frac{dV}{dt} = -72\pi$$

$$\frac{d}{dt}\left(\frac{4}{3}\pi r^3\right) = -72\pi \Rightarrow \frac{4}{3}\pi r^3 = -72\pi t + C$$

When $t = 0$, $\dfrac{4}{3}\pi r^3 = V = 4500\pi$

$$\therefore \quad \frac{4}{3}\pi r^3 = 4500\pi - 72\pi t$$

When $t = 49$, $\dfrac{4}{3}\pi r^3 = 4500\pi - (72\pi)(49) = 972\pi$

$\Rightarrow$ $r^3 = 729$ so $r = 9$

Also, $\dfrac{d}{dt}\left(\dfrac{4}{3}\pi r^3\right) = -72\pi \Rightarrow 4\pi r^2 \dfrac{dr}{dt} = -72\pi$

$$\Rightarrow \quad \frac{dr}{dt} = -\frac{72\pi}{4\pi r^2} = -\frac{18}{r^2}. \text{ So } \left.\frac{dr}{dt}\right|_{r=9} = -\frac{2}{9}.$$

Assertion-Reason Type Questions

Example 71: Let $f(x) = 2\sqrt{x}$ and $g(x) = 3 - 1/x$, $x > 1$

Statement-1: $f(x) > g(x)$ $(x > 1)$

Statement-2: $f(x) - g(x)$ increases on $(1, \infty)$

Ans. (a)

Solution: $f'(x) - g'(x) = \dfrac{x^{3/2} - 1}{x^2} > 0$ for $x > 1$

Hence $f(x) - g(x) > f(1) - g(1) = 0$, $x > 1$

Therefore $f(x) > g(x)$, $x > 1$.

Example 72: Let $f(x) = x^4 - 2x^2 + 5$ be defined on $[-2, 2]$

Statement-1: The range of $f(x)$ is [2, 13]

Statement-2: The greatest value of f is attained at $x = 2$

Ans. (d)

Solution: $f'(x) = 4x^3 - 4x = 4x(x - 1)(x + 1)$. The critical points of f are 0, – 1, 1 But $f(0) = 5$, $f(1) = 4$, $f(-1) = 4$, $f(2) = 13$. So the range of f is [4, 13] and grea, test value of f is at $x = 2$.

Example 73: Let $f(x) = 2x^3 + 3x^2 - 12x + 1$

Statement-1: f decreases on $(-2, 1)$

Statement-2: The solution set of $x^2 + x - 2 < 0$ is $(-2, 1)$.

Ans. (a)

Solution: $f'(x) = 6x^2 + 6x - 12 = 6(x - 1)(x + 2)$

So $f'(x) < 0$ if and only if $x \in (-2, 1)$.

Example 74: Let $y = x + \dfrac{a^2}{x}$ $(a > 0)$

Statement-1: $y_{\max} = -2a$ (local mix)

Statement-2: $y_{\min} = 2a$ (local min)

Ans. (b)

◎ **Solution:** $y'(x) = 1 - \frac{a^2}{x^2} = \frac{(x-a)(x+a)}{x^2}$

⇒ $y'(x) > 0$ for $x \in (a, \infty) \cup (-\infty, -a)$ and $y'(x) < 0$ for $x \in (-a, a)$. Therefore y is local maximum at $x = -a$ and loval minimum at $x = a$.

◉ **Example 75:** Let $f(x) = (x-1)(x-2)(x-3)(x-4)$

Statement-1: $f'(x) = 0$ has three roots lying in $(1, 2) \cup (2, 3) \cup (3, 4)$

Statement-2: Rolle's theorem is valid for f on $[1, 4]$

Ans. (b)

◎ **Solution:** Applying Rolle's theorem on [1, 2], [2, 3], [3, 4], we get three roots of $f'(x) = 0$ on (1, 2) (2, 3), (3, 4).

◉ **Example 76:** Let f be a function defined by

$$f(x) = \begin{cases} \frac{\tan x}{x} & , \text{ if } x \neq 0 \\ 1 & , \text{ if } x = 0 \end{cases}$$

Statement-1: $x = 0$ is point of maxima of f

Statement-2: $f'(0) = 0$

Ans (b)

◎ **Solution:** Let $g(x) = \tan x - x$, $-\pi/2 < x < x/2$

⇒ $g'(x) = \text{see}^2 x - 1 = \tan^2 x > 0$ for $-\pi/2 < x < \pi/2$

⇒ g increases on $(-\pi/2, \pi/2)$

⇒ $\tan x < x$ for $-\pi/2 < x < \pi/2$

Thus $f(x) = \frac{\tan x}{x} < 1$ for $-\pi/2 < x < \pi/2$, $x \neq 0$

and $f(1) = 1$, ∴ $x = 0$ in point of maxima.

Also $\lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{\tan x - x}{x^2}$

$$= \lim_{x\to 0} \frac{\sec^2 x - 1}{2x} = \frac{1}{2} \lim \frac{\tan^2 x}{x} = 0$$

Hence $f'(0) = 0$

Thus, both the statements are true. However statement: 2 in not a correct explanation of statement: 1.

◉ **Example 77:** Let $a, b \in \mathbf{R}$ be such that the function f given by $f(x) = \log |x| + bx^2 + ax$, $x \neq 0$ has extreme values at $x = -1$ and $x = 2$

Statement-1: f has local maximum at $x = -1$ and at $x = 2$

Statement-2: $a = 1/2$ and $b = -1/4$.

Ans. (a)

◎ **Solution:** $f'(x) = \frac{1}{x} + 2bx + a$, $x \neq 0$

As $x = -1$ and $x = 2$ are extreme value of f, $f'(-1) = 0$ and $f'(2) = 0$

⇒ $-1 - 2b + a = 0$ and $\frac{1}{2} + 4b + a = 0$

Solving these equations, we get $a = 1/2$, $b = -1/4$

Thus $f'(x) = \frac{1}{x} - \frac{1}{2}x + \frac{1}{2} = -\frac{1}{2x}(x+1)(x-2)$.

We have $f'(x) > 0$, if $x < -1$; $f'(x) < 0$, if $-1 < x < 0$; $f'(x) > 0$, if $0 < x < 2$ and $f'(x) < 0$, if $x > 2$.

Therefore, $f(x)$ has a local maximum at $x = -1$ and $x = 2$. Thus statement-1 and statement-2 are True and statement-2 is a correct explanation for statement :1.

◉ **Example 78:** **Statement 1:** $x^y > y^x$, $e < x < y$

Statement 2: $f(x) = \frac{\log x}{x}$ is a decreasing function for $x > e$.

Ans. (a)

◎ **Solution:** Let $f(x) = \frac{\log x}{x}$

$$f'(x) = \frac{1 - \log x}{x^2}$$

Thus $f'(x) > 0$ if $1 - \log x > 0$ i.e. $\log x < 1$ i.e. $x < e$ and $f'(x) < 0$ if $x > e$.

So f increases on $(0, e)$ and decreases on (e, ∞)

$$e < x < y \Rightarrow f(x) > f(y) \quad \Rightarrow \frac{\log x}{x} > \frac{\log y}{y}$$

⇒ $y \log x > x \log y$ ⇒ $x^y > y^x$.

◉ **Example 79:** Let $f(x) = |x - 7| + |x - 10| + |x - 12|$

Statement 1: $f(x)$ has a minimum at $x = 12$

Statement 2: f is not differentiable at $x = 12$

Ans. (d)

◎ **Solution:** $f(x) = \begin{cases} 29 - 3x & , \quad x < 7 \\ 15 - x & , \quad 7 \leq x < 10 \\ x - 5 & , \quad 10 \leq x < 12 \\ 3x - 29 & , \quad x \geq 12 \end{cases}$

Since $f'(x)$ changes sign around $x = 10$ from negative to positive f has minimum at $x = 10$.

f is clearly not differentiable at $x = 12$.

◉ **Example 80:** Let b, c be two non-zero real numbers such that $b^2 \leq 3c$

Let $f(x) = x^3 + bx^2 + cx + d$, $x \in \mathbf{R}$.

Statement 1: f is 1–1 function

Statement 2: f is strictly function

Ans. (c)

◎ **Solution:** $f'(x) = 3x^2 + 2bx + c$

The discriminant of f' is $4b^2 - 12c = 4(b^2 - 3c) < 0$.

So, $f'(x) > 0$. Hence f is an increasing function.

If there exists x_1, x_2 s.t. $x_1 \neq x_2$ (say $x_1 < x_2$) and $f(x_1) = f(x_2)$ then by Rolle's theorem there is $c \in (x_1, x_2)$ such that $f'(c) = 0$ but $f'(x) > 0$ for all x. So f is 1 – 1.

LEVEL 2

Straight Objective Type Questions

Example 81: The point M (x, y) of the graph of the function $y = e^{-|x|}$ so that area bounded by the tangent at M and the coordinate axes is greatest is

(a) $(1, e^{-1})$ (b) $(2, e^{-2})$
(c) $(-2, e^{2})$ (d) $(0, 1)$

Ans. (a)

Solution: For $x \geq 0$, $y = e^{-x}$. The equation of tangent is $Y - y = -e^{-x}(X - x)$. This will intersect coordinate axes at $(x + ye^{x}, 0)$ and $(0, y + xe^{-x})$. Hence the area of the required triangle A is $\frac{1}{2}(y + xe^{-x})(x + ye^{x})$

$$= \frac{1}{2}(1 + x)^2 e^{-x} \qquad [\because y = e^{-x}]$$

Now $$\frac{dA}{dx} = \frac{1}{2}[-(1 + x)^2 e^{-x} + 2(1 + x)e^{-x}]$$

$$= \frac{1}{2}(1 + x)e^{-x}(1 - x)$$

Note that $\frac{dA}{dx} = 0 \Rightarrow \quad x = 1, -1$

Also, $\frac{dA}{dx} > 0$, if $0 \leq x < 1$ and $\frac{dA}{dx} < 0$ if $x < 1$. Hence A is maximum when $x = 1$ so $y = e^{-1}$. Since y is even function other possibility of M is $(-1, e^{-1})$.

Example 82: The abscissa of the point on the curve $9y^2 = x^3$, the normal at which cuts off equal intercepts on the coordinate axes is

(a) 2 (b) 4
(c) – 4 (d) – 2

Ans. (b)

Solution: Differentiating $9y^2 = x^3$ we have $\frac{dy}{dx} = \frac{x^2}{6y}$.

Any point on the curve is of the form $(t^2, t^3/3)$ and so $\frac{dy}{dx}$ at this point is $t/2$. Thus an equation of normal is

$$y - t^3/3 = (-2/t)(X - t^2)$$

This will intersect coordinate axes at $(0, 2t + t^3/3)$ and $\left(\frac{t^4}{6} + t^2, 0\right)$. Hence we must have

$$2t + \frac{t^3}{3} = t^2 + \frac{t^4}{6} \Rightarrow 2 + \frac{t^2}{3} = t + \frac{t^3}{6}$$

Clearly $t = 2$ satisfies, the last equation. Hence the abscissa of the required point is 4. (For $t = 0$, the normal meets both the axes only at origin.)

Example 83: A curve passes through the point (2, 0) and the slope of the tangent at any point (x, y) is $x^2 - 2x$ for all value of x. The point of maximum ordinate on the curve is

(a) (0, 4/3) (b) (0, 2/3)
(c) (1, 2/3) (d) (2, 4/3)

Ans. (a)

Solution: $\frac{dy}{dx} = x^2 - 2x = \frac{d}{dx}\left(\frac{x^3}{3} - x^2 + c\right)$

$$y = \frac{x^3}{3} - x^2 + c$$

Since the curve passes through (2, 0), we get $0 = 8/3 - 4 + c$, i.e., $c = 4/3$

Hence the equation of the curve is

$$y = \frac{x^3}{3} - x^2 + \frac{4}{3}$$

Now, from $dy/dx = 0$, we get $x = 0$ or 2. Also

$$\frac{d^2y}{dx^2} = 2x - 2 \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{x=0} = -2 \textit{ and } \left.\frac{d^2y}{dx^2}\right|_{x=2} = 2$$

Hence at $x = 0$, y has a maximum. Thus the required point is (0, 4/3).

Example 84: If the tangent to the curve $2y^3 = ax^2 + x^3$ at the point (a, a) cuts off intercepts α and β on the coordinate axes, where $\alpha^2 + \beta^2 = 61$ then the value of $|a|$ is

(a) 16 (b) 28
(c) 30 (d) 31

Ans. (c)

Solution: The slope of the tangent is

$$\frac{dy}{dx} = \frac{2ax + 3x^2}{6y^2}$$

and the value of this slope at (a, a) is 5/6. Therefore, the equation

$$y - a = \frac{5}{6}(x - a) \Rightarrow \frac{x}{-a/5} + \frac{y}{a/6} = 1,$$

represents the tangent. Thus the x-intercept α is $-a/5$, and the y-intercept β is $a/6$. From $\alpha^2 + \beta^2 = 61$, we now get

$$\frac{a^2}{25} + \frac{a^2}{36} = 61 \Rightarrow a^2 = 25 \times 36 \Rightarrow |a| = 30.$$

Example 85: The coordinates of the point on the parabola $y^2 = 8x$, which is at minimum distance from the circle $x^2 + (y + 6)^2 = 1$ are

(a) (2, – 4) (b) (18, – 12)
(c) (2, 4) (d) none of these

Ans. (a)

◎ **Solution:** A point on the parabola is at a minimum distance from the circle if and only if it is at a minimum distance from the centre of the circle. Any point on the parabola $y^2 = 8x$ is of the form $P(2t^2, 4t)$. The centre of the circle $x^2 + (y + 6)^2 = 1$ is $O\ (0, -6)$

$$OP^2 = 4t^4 + (-6 - 4t)^2 = 4\,(t^4 + 4t^2 + 12t + 9)$$

Let $$A = t^4 + 4t^2 + 12t + 9$$

$$\frac{dA}{dt} = 4t^3 + 8t + 12 = 4\,(t^3 + 2t + 3) = 4(t + 1)\,(t^2 - t + 3)$$

So $$\frac{dA}{dt} = 0 \text{ if } t = -1. \text{ Moreover,}$$

$$\left.\frac{d^2A}{dt^2}\right|_{t=-1} = 4\,(3\,(-1)^2 + 2) > 0.$$

Hence required point is $P(2, -4)$.

◉ **Example 86:** The equation $e^{x-8} + 2x - 17 = 0$ has

(a) two real roots (b) one real root
(c) eight real roots (d) four real roots

Ans. (b)

◎ **Solution:** Clearly $x = 8$ satisfies the given equation. Assume that $f(x) = e^{x-8} + 2x - 17 = 0$ has a real root α other than $x = 8$. We may suppose that $\alpha > 8$ (the case for $\alpha < 8$ is exactly similar). Applying Rolle's theorem on $[8, \alpha]$, we get $\beta \in (8, \alpha)$, such that $f'(\beta) = 0$. But $f'(\beta) = e^{\beta-8} + 2$, so that $e^{\beta-8} = -2$ which is not possible. Hence there is no real root other than 8.

◉ **Example 87:** The maximum and minimum value of $f(x) = ab \sin x + b\sqrt{1-a^2}\, \cos x + c$ lie in the interval (assuming $|a| < 1, b > 0$)

(a) $[b - c, b + c]$ (b) $(b - c, b + c)$
(c) $[c - b, b + c]$ (d) none of these

Ans. (c)

◎ **Solution:** $f'(x) = ab \cos x - b\sqrt{1-a^2}\, \sin x = b \cos (x + \phi)$ where $\phi = \cos^{-1} a$. So $f'(x) = 0 \Rightarrow x = (2m + 1)(\pi/2 - \phi)$

Also $f''(x) = -b \sin (x + \phi)$. Thus $f''(\pi/2 - \phi) = -b < 0$ and $f''\,(3\pi/2 - \phi) = b > 0$. Hence f has maximum at $\pi/2 - \phi$ and minimum at $3\pi/2 - \phi$. Moreover, $\max f = ab \sin (\pi/2 - \phi) + b\sqrt{1-a^2}\, \cos (\pi/2 - \phi) + c = a^2b + b(1 - a^2) + c = b + c$ and $\min f = c - b$.

> *Alternatively* $f(x) = b \sin (x + \phi) + c$, $\phi = \cos^{-1} a$ so
> $\max f(x) = b.1 + c$ and $\min f(x) = -b + c = c - b$

◉ **Example 88:** The maximum area of the rectangle whose sides pass through the angular points of a given the rectangle is of sides a and b is

(a) $(1/2)\,(ab)^2$ (b) $(1/2)\,(a + b)$
(c) $(1/2)\,(a + b)^2$ (d) none of these

Ans. (c)

◎ **Solution:** Let $ABCD$ be the given rectangle of sides a and b and $EFGH$ be any rectangle, whose sides pass through A, B, C, D.

$$A = \text{Area } EFGH = (b \sin \theta + a \cos \theta)\,(a \sin \theta + b \cos \theta) = ab + (a^2 + b^2) \sin \theta \cos \theta.$$

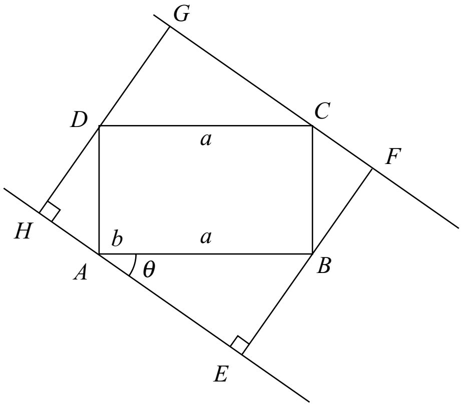


Fig. 11.4

$$dA/d\theta = (a^2 + b^2) \cos 2\theta \text{ so } dA/d\theta = 0 \quad \Rightarrow \quad \theta = \pi/4$$

$$\Rightarrow \quad \frac{d^2A}{d\theta^2} = -2\,(a^2 + b^2) \sin 2\theta, \text{ so } \left.\frac{d^2A}{d\theta^2}\right|_{\theta=\pi/4} < 0$$

Hence $A_{\max} = (1/2)\,(a + b)^2$.

◉ **Example 89:** The image of the interval $[-1, 3]$ under $f(x) = 4x^3 - 12x$ is

(a) $[-2, 0]$ (b) $[-8, 72]$
(c) $[-8, 0]$ (d) $[8, 72]$

Ans. (b)

◎ **Solution:** To find the image of the given interval, we must find the set of values of $f(x)$ for $x \in [-1, 3]$. By virtue of the continuity of $f(x)$, the image is the interval

$$\left[\min_{x\in[-1,3]} f\,(x), \max_{x\in[-1,3]} f\,(x)\right]$$

The critical points of $f(x)$ are given by $f'(x) = 12x^2 - 12 = 12\,(x^2 - 1) = 0$. That is, $x = \pm 1$, so that $f(1) = -8$, $f(-1) = 8$ and $f(3) = 72$.

$$\therefore \quad \max_{x\in[-1,3]} f(x) = f(3) = 72 \text{ and } \min_{x\in[-1,3]} f(x) = f(1) = -8$$

Hence the image of $[-1, 3]$ under the mapping $f(x)$ is $[-8, 72]$.

◉ **Example 90:** The difference between the greatest and least values of the function $f(x) = \cos x + (1/2) \cos 2x - (1/3) \cos 3x$ is

(a) 3/8 (b) 2/3
(c) 8/7 (d) 9/4

Ans. (d)

◎ **Solution:** The given function is periodic, with period 2π. So the difference between the greatest and least values of the function is the difference between these values on the interval $[0, 2\pi]$. We have

$$f'(x) = -(\sin x + \sin 2x - \sin 3x)$$
$$= -4 \sin x \sin (3x/2) \sin (x/2).$$

Hence $x = 0, 2\pi/3, \pi$ and 2π are the critical points. Also, $f(0) = 1 + 1/2 - 1/3 = 7/6$, $f(2\pi/3) = -13/12$, $f(\pi) = -1/6$ and $f(2\pi) = 7/6$. Hence the greatest value is 7/6 and the least value is $-13/12$. Thus the difference is

$$7/6 - (-13/12) = 27/12 = 9/4.$$

◉ **Example 91:** The longest distance of the point $(a, 0)$ from the curve $2x^2 + y^2 - 2x = 0$ is

(a) $\sqrt{1-2a+2a^2}$ (b) $\sqrt{1-2a+a^2}$

(c) $\sqrt{1+2a+2a^2}$ (d) $\sqrt{1+a+a^2}$

Ans. (a)

◎ **Solution** Let (x, y) be any point on the curve $2x^2 + y^2 - 2x = 0$. Its distance S from the point $(a, 0)$ is given by

$$T = S^2 = (x-a)^2 + y^2 = (x-a)^2 + (2x - 2x^2)$$
$$= -x^2 + 2x(1-a) + a^2 \qquad (1)$$

For S to be maximum, we have $dT/dx = 0$
$\Rightarrow \; -2x + 2(1-a) = 0 \;\Rightarrow\; x = 1-a$. Since $d^2T/dx^2 < 0$, so S^2 is maximum when $x = 1-a$ and this maximum value is given by $-(1-a)^2 + 2(1-a)^2 + a^2 = 1 - 2a + 2a^2$. Hence $S_{\max} = (1 - 2a + 2a^2)^{1/2}$.

◉ **Example 92:** The sides of the rectangle of the greatest area, that can be inscribed in the ellipse $x^2 + 2y^2 = 8$, are given by

(a) $4\sqrt{2}, 4$ (b) $4, 2\sqrt{2}$

(c) $2, \sqrt{2}$ (d) $2\sqrt{2}, 2$

Ans. (b)

◎ **Solution:** Any point on the ellipse $\dfrac{x^2}{8} + \dfrac{y^2}{4} = 1$ is $(2\sqrt{2}\cos\theta, 2\sin\theta)$. [see Fig. 11.5]

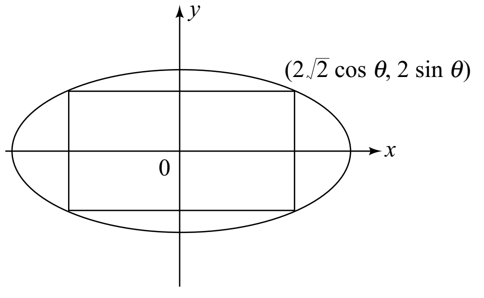

Fig. 11.5

$$A = \text{Area of the inscribed rectangle}$$
$$= 4(2\sqrt{2}\cos\theta)(2\sin\theta)$$
$$= 8\sqrt{2}\sin 2\theta$$
$$\frac{dA}{d\theta} = 16\sqrt{2}\cos 2\theta = 0 \;\Rightarrow\; \theta = \pi/4$$

Also $\dfrac{d^2A}{d\theta^2} = -32\sqrt{2}\sin 2\theta < 0$ for $\theta = \pi/4$.

Hence, the inscribed rectangle is of largest area if the sides are $4\sqrt{2}\cos \pi/4$ and $4 \sin(\pi/4)$ i.e. 4 and $2\sqrt{2}$.

◉ **Example 93:** An equation of the circle that is tangent to $y = x^3$ at (1, 1) and has the same second derivative there is

(a) $x^2 + y^2 + 24x - 28y + 2 = 0$

(b) $2(x^2 + y^2) + 12x - 8y - 8 = 0$

(c) $3(x^2 + y^2) - 24x + 10y + 8 = 0$

(d) none of these

Ans. (d)

◎ **Solution:** $\dfrac{dy}{dx} = 3x^2$ so $\left.\dfrac{dy}{dx}\right|_{(1,1)} = 3$ and $\left.\dfrac{d^2y}{dx^2}\right|_{(1,1)} = 6$

Let the required circle be $x^2 + y^2 + 2gx + 2fy + c = 0$.
Since this should pass through (1, 1) so we have

$$2 + 2g + 2f + c = 0 \qquad (1)$$

Also $\quad 2x + 2y\dfrac{dy}{dx} + 2g + 2f\dfrac{dy}{dx} = 0$

Putting $x = 1$, $y = 1$ and $\dfrac{dy}{dx} = 3$, we have

$$1 + 3 + g + 3f = 0$$

Again differentiating (1), we have

$$1 + \left(\frac{dy}{dx}\right)^2 + y\frac{d^2y}{dx^2} + f\frac{d^2y}{dx^2} = 0$$

Putting $y = 1$, $\dfrac{dy}{dx} = 3$ and $\dfrac{d^2y}{dx^2} = 6$, we have

$$16 + 6f = 0 \qquad \Rightarrow \qquad f = -8/3$$

so $g = 4$ and $c = -14/3$. Thus required circle is

$$3(x^2 + y^2) + 24x - 16y - 14 = 0.$$

◉ **Example 94:** Let $f(x) = 6x^{4/3} - 3x^{1/3}$, $x \in [-1, 1]$. Then

(a) The maximum value of $f(x)$ on $[-1, 1]$ is 3

(b) The maximum value of $f(x)$ on $[-1, 1]$ is 9

(c) The minimum value of $f(x)$ on $[-1, 1]$ is 0

(d) none of these

Ans. (b)

◎ **Solution:** $f'(x) = \dfrac{8x-1}{x^{2/3}}$. Thus $f'(x) = 0$ when $x = 1/8$ and $f'(x)$ does not exist when $x = 0$. Now $f(-1) = 9$, $f(0) = 0$, $f(1/8) = -9/8$ and $f(1) = 3$.
The maximum value of $f(x)$ is 9 and the minimum value is $-9/8$ on $[-1, 1]$.

Example 95: Let $g(x) = (\log(1 + x))^{-1} - x^{-1}, x > 0$ then

(a) $1 < g(x) < 2$ (b) $-1 < g(x) < 0$
(c) $0 < g(x) < 1$ (d) none of these

Ans. (c)

Solution: For $x > 0$, consider the function $f(x) = \log(1 + x)$ on the interval $[0, x]$. Since the function is differentiable on $(0, x)$, by Lagrange's theorem, there is *a* $\xi \in (0, x)$ such that

$$\frac{\log(1+x) - \log(1+0)}{x - 0} = f'(\xi) = \frac{1}{1+\xi}$$

$$\Rightarrow \quad \frac{\log(1+x)}{x} = \frac{1}{1+\xi} < 1$$

$$\Rightarrow \quad \log(1 + x) < x \quad \Rightarrow \quad g(x) > 0$$

Also $\quad \xi \in (0, x) \quad \Rightarrow \quad \xi < x \quad \Rightarrow \quad \dfrac{1}{1+\xi} > \dfrac{1}{1+x}$

$$\Rightarrow \quad \frac{\log(1+x)}{x} > \frac{1}{1+x}$$

$$\Rightarrow \quad \log(1 + x) > \frac{x}{1+x} \Rightarrow g(x) < 1.$$

Example 96: The maximum value of $\dfrac{x^2 - x + 1}{x^2 + x + 1}$ for all real values of x is

(a) 1/2 (b) 1
(c) 2 (d) 3

Ans. (d)

Solution: Let $S = \dfrac{x^2 - x + 1}{x^2 + x + 1} = 1 - \dfrac{2x}{x^2 + x + 1}$

$$S'(x) = -2\,\frac{\left(x^2 + x + 1\right) - x\,(2x + 1)}{\left(x^2 + x + 1\right)^2}$$

$$= -2\,\frac{-x^2 + 1}{\left(x^2 + x + 1\right)^2}$$

$S'(x) = 0 \Leftrightarrow x = \pm 1$. Since $S'(x) > 0$ for $x < -1$ and $S'(x) < 0$ for $-1 < x < 1$, also $S'(x) > 0$ for $x > 1$. So S is maximum when $x = -1$. Hence $S_{\max} = 1 + 2/1 = 3$.

Example 97: If the tangent at (1, 1) on $y^2 = x(2 - x)^2$ meets the curve again at P, then P is

(a) (4, 4) (b) (– 1, 2)
(c) (9/4, 3/8) (d) none of these

Ans. (c)

Solution: $2y\dfrac{dy}{dx} = (2 - x)^2 - 2x(2 - x)$

$$= 3x^2 - 8x + 4. \text{ So } \left.\frac{dy}{dx}\right|_{(1,\,1)} = -1/2.$$

An equation of tangent at (1, 1) is $Y - 1 = (-1/2)(X - 1)$ i.e. $Y = (-1/2)x + 3/2$. The intersection of this line with the given curve is given by $(-x/2 + 3/2)^2 = x(2 - x)^2$

$$\Rightarrow \quad x^2 - 6x + 9 = 16x + 4x^3 - 16x^2. \text{ So,}$$

$$4x^3 - 17x^2 + 22x - 9 = 0$$

$$\Rightarrow \quad (x - 1)(4x - 9)(x + 1) = 0.$$

Thus $x = 1, 9/4, -1$. But $x = -1$ cannot lie on the given curve so required point is (9/4, 3/8).

Example 98: If the curves $y^2 = 6x$, $9x^2 + by^2 = 16$, cut each other at right angles then the value of b is

(a) 2 (b) 4
(c) 9/2 (d) none of these

Ans. (c)

Solution: The intersection of the two curves is given by

$$9x^2 + 6bx - x = x \qquad \text{(i)}$$

Differentiating $y^2 = 6x$, we have $\dfrac{dy}{dx} = \dfrac{3}{y}$.

Differentiating $9x^2 + 6y^2 = 16$, we have $\dfrac{dy}{dx} = -\dfrac{9x}{by}$.

For curves to intersect at right angles, we must have at the points of intersection $\dfrac{3}{y}\left(\dfrac{-9x}{by}\right) = -1 \quad \Rightarrow \quad 27x = by^2$. Thus we must have

$$9x^2 + 9y^2 = 16 \quad \Rightarrow \quad 9x^2 + 27x - 16 = 0 \qquad \text{(ii)}$$

(i) and (ii) must be identical so $27 = 6b \Rightarrow b = 9/2$.

Example 99: The distance of that point on $y = x^4 + 3x^2 + 2x$ which is nearest to the line $y = 2x - 1$ is

(a) $4/\sqrt{5}$ (b) $3/\sqrt{5}$
(c) $2/\sqrt{5}$ (d) $1/\sqrt{5}$

Ans. (d)

Solution: Distance of any point (x, y) from $y = 2x - 1$ is: $\left|\dfrac{y - 2x + 1}{\sqrt{5}}\right|$. If (x, y) is on $y = x^4 + 3x^2 + 2x$ then this distance is $S = \dfrac{x^4 + 3x^2 + 1}{\sqrt{5}}$

$$\frac{dS}{dx} = \frac{4x3 + 6x}{\sqrt{5}} \quad \Rightarrow \quad \frac{dS}{dx} = 0 \quad \Rightarrow \quad x = 0.$$

Also, $S'(x) < 0$ for $x < 0$ and $S'(x) > 0$ for $x > 0$.
Thus S is minimum when $x = 0$, and min. S is $1/\sqrt{5}$.

Example 100: A given right circular cone has a volume p, and the largest right circular cylinder that can be inscribed in the cone has a volume q. Then $p : q$ is

(a) 9 : 4 (b) 8 : 3
(c) 7 : 2 (d) none of these

Ans. (a)

◎ **Solution:** Let H be the height of the cone and α be its semi vertical angle. Suppose that x is the radius of the inscribed cylinder and h be its height $h = QL = OL - OQ = H - x \cot \alpha$

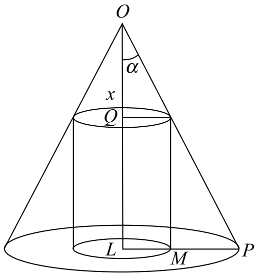

Fig. 11.6

$$V = \text{volume of the cylinder}$$

$$= \pi x^2 (H - x \cot \alpha)$$

Also $p = \dfrac{1}{3} \pi (H \tan \alpha)^2 H$ (i)

$$\frac{dV}{dx} = \pi (2Hx - 3x^2 \cot \alpha)$$

so $\dfrac{dV}{dx} = 0 \Leftrightarrow x = 0,$

$$x = \frac{2}{3} H \tan \alpha, \left.\frac{d^2V}{dx^2}\right|_{x=\frac{2}{3}H\tan\alpha} = -2\pi H < 0. \text{ so}$$

V is maximum when $x = \dfrac{2}{3} H \tan \alpha$ and $q = V_{\max} = \pi \dfrac{4}{9} H^2 \tan^2 \alpha \dfrac{1}{3} H = \dfrac{4}{9} p$. [using (i)]

Hence $p : q = 9 : 4$.

◉ **Example 101:** The set of all values of a for which $f(x) = (a^2 - 3a + 2)(\cos^2(x/4) - \sin^2(x/4)) + (a - 1)x + \sin 1$ doesn't possess critical points is

(a) $[1, \infty)$ (b) $(-2, 4)$

(c) $(1, 3) \cup (3, 5)$ (d) $(0, 1) \cup (1, 4)$

Ans. (d)

◎ **Solution:** The given function can be written as

$$f(x) = (a - 1)(a - 2) \cos (x/2) + (a - 1) x + \sin 1.$$

It is clearly differentiable, so its critical points are given by

$$f'(x) = (-1/2)(a - 1)(a - 2) \sin (x/2) + (a - 1) = 0$$

If $a = 1$, $f'(x) = 0$ for all x, while for values of a other than 1, $f'(x)$ will be zero if

$$(a - 2) \sin (x/2) = 2$$

In order not to have critical point, a must therefore satisfy $a \neq 1$ and $\left|\dfrac{2}{a-2}\right| > 1$ which is the same as saying $a \in (0, 1) \cup (1, 4)$.

◉ **Example 102:** Let $x, p \in \mathbf{R}$, $x + 1 > 0$, $p \neq 0, 1$. Then

(a) $(1 + x)^p > 1 + px$ for $p > 0$

(b) $(1 + x)^p > 1 + px$ for $p \in (-\infty, 0) \cup (1, \infty)$

(c) $(1 + x)^p > 1 + px$ for $0 < p < 1$

(d) $(1 + x)^p < 1 + px$ for $p < 1$

Ans. (b)

◎ **Solution:** Let $f(x) = (1 + x)^p - (1 + px)$ so $f(0) = 0$. Now $f'(x) = p(1 + x)^{p-1} - p$ and $f''(x) = p(p - 1)(1 + x)^{p-2}$. Let $p \in (-\infty, 0) \cup (1, \infty)$ then $f''(x) > 0$ so f' is increasing. This implies $f' < 0$ on $(-1, 0)$ and $f' > 0$ on $(0, \infty)$ as $f'(0) = 0$. Therefore f decreases on $(-1, 0)$ and increases on $(0, \infty)$ but $f(0) = 0$ so $f(x) > 0$ if $x > -1$ $(x \neq 0)$. Thus $(1 + x)^p > 1 + px$ for $p \in (-\infty, 0) \cup (1, \infty)$. Similarly it follows that $(1 + x)^p < 1 + px$, if $0 < p < 1$.

◉ **Example 103:** If $f(x) = \dfrac{a \sin x + b \cos x}{c \sin x + d \cos x}$ decreases for all x if

(a) $ad - bc < 0$ (b) $ad - bc > 0$

(c) $ab - cd > 0$ (d) $ab - cd < 0$

Ans. (a)

Solution: $$f'(x) = \frac{(a \cos x - b \sin x)(c \sin x + d \cos x) - (a \sin x + b \cos x)(c \cos x - d \sin x)}{(c \sin x + d \cos x)^2}$$

$$= \frac{ad(\cos^2 x + \sin^2 x) - bc(\cos^2 x + \sin^2 x)}{(c \sin x + d \cos x)^2}$$

$$= \frac{ad - bc}{(c \sin x + d \cos x)^2}$$

f decreases for all x if and only if $f'(x) < 0$ for all x i.e. $ad - bc < 0$.

◉ **Example 104:** On the interval $[0, 1]$ the function $x^{25}(1 - x)^{75}$ takes its maximum value at the point

(a) 0 (b) 1/3

(c) 1/2 (d) 1/4

Ans. (d)

◎ **Solution:** Let $f(x) = x^{25}(1 - x)^{75}$. The critical points of f are given by $f'(x) = 0$. But

$$f'(x) = x^{24}(1 - x)^{74}[25 - 25x - 75x]$$

$$= 25x^{24}(1 - x)^{74}(1 - 4x)$$

Thus the critical points are 0, 1, 1/4

Since $f(0) = 0$, $f(1) = 0$ and $f(1/4) = (1/4)^{25}(3/4)^{75}$

so f takes its maximum value at $x = 1/4$.

◉ **Example 105:** For $a > 0$, the value of a for which the equation $ax^2 = \log x$ possess a single root is

(a) 1/2 (b) $1/2e$

(c) $1/e$ (d) $2e^{-1}$

Ans. (b)

◎ **Solution:** For $a > 0$, the curves $y_1 = ax^2$ and $y_2 = \log x$ can have only one point in common if they touch each other. At the point of tangency $y'_1(x) = y'_2(x) \Rightarrow 2ax = 1/x \Rightarrow x = 1/\sqrt{2a}$ (clearly x cannot be negative). Putting this value in $ax^2 = \log x$, we have $(1/2) = \log (2a)^{-1/2} \Rightarrow \log 2a = -1 \Rightarrow a = 1/2e$.

EXERCISE

Concept-based
Straight Objective Type Questions

1. The length of the tangent to the curve $x = a \sin^3 t$, $y = a \cos^3 t$ $(a > 0)$ at an arbitrary is
   (a) $a \cos^2 t$ (b) $a \sin^2 t$
   (c) $\dfrac{a \sin^2 t}{\cos t}$ (d) $\dfrac{a \cos^2 t}{\sin t}$

2. Equation of normal to $x = 2e^t$, $y = e^{-t}$ at $t = 0$ is
   (a) $x + y - 4 = 0$
   (b) $x + 2y - 4 = 0$
   (c) $2x - y - 3 = 0$
   (d) $x - 2y - 3 = 0$

3. A point moves according $s = \dfrac{2}{9} \sin \dfrac{\pi}{2} t + s_0$. The acceleration at the end of first second is
   (a) $-\dfrac{\pi}{18}$ (b) $-\dfrac{\pi^2}{18}$
   (c) $\dfrac{\pi}{18}$ (d) $\dfrac{\pi^2}{18}$

4. Let $f(x) = x \log x - x + 1$ then the set $\{x : f(x) > 0\}$ is equal to
   (a) $(1, \infty)$ (b) $(1/e, \infty)$
   (c) $[e, \infty)$ (d) $(0, 1) \cup (1, \infty)$

5. On the curve $y = x^3$, the point at which the tangent line in parallel to the chord through the point $(-1, -1)$ and $(2, 8)$ is
   (a) $(1, 1)$ (b) $\left(\dfrac{1}{2}, \dfrac{1}{8}\right)$
   (c) $\left(\dfrac{1}{3}, \dfrac{1}{27}\right)$ (d) $\left(-\dfrac{1}{2}, -\dfrac{1}{8}\right)$

6. Let $f(x) = 2x^2 - \log x$, then
   (a) f increases on $(0, \infty)$
   (b) f decrease on $\left(\dfrac{1}{2}, \infty\right)$
   (c) f increases on $\left(\dfrac{1}{2}, \infty\right)$
   (d) f decreases on $(0, 1)$

7. Let $f(x) = \dfrac{3}{4}x^4 - x^3 - 9x^2 + 7$, then the number of critical points in $[-1, 4]$ is
   (a) 4 (b) 3
   (c) 2 (d) 1

8. On the curve $x^3 = 12y$, the values of x for which the abscissa changes at a faster rate than the ordinate is
   (a) $(-2, 2) \sim \{0\}$ (b) $(-3, 3) \sim \{0\}$
   (c) $(1, 4)$ (d) $(2, 4)$

9. The value of $k > 0$ for which the curves $\dfrac{x^2}{k^2} + \dfrac{y^2}{4} = 1$ and $y^2 = 16x$ cut each other orthogonally is
   (a) 1 (b) $\dfrac{2\sqrt{3}}{3}$
   (c) $3\sqrt{3}$ (d) $5\sqrt{5}$

10. The least value of $g(t) = 8t - t^4$ on $[-2, 1]$ is
    (a) -16 (b) -20
    (c) -32 (d) 7

LEVEL 1

Straight Objective Type Questions

11. Let $f(x) = \tan^{-1} x$ and $g(x) = \dfrac{x}{1 + x^2}, x > 0$ then
    (a) $f(x) < g(x)$, on $(0, \infty)$
    (b) $f(x) \le g(x)$ on $[1, \infty)$
    (c) $g(x) < f(x)$ on $(0, \infty)$
    (d) none of these

12. Let $f(x) = (x - 2)(x - 3)(x - 4)(x - 5)(x - 6)$ then
    (a) $f'(x) = 0$ has five real roots
    (b) four roots of $f'(x) = 0$ lie in $(2, 3) \cup (3, 4) \cup (4, 5) \cup (5, 6)$
    (c) the equation $f'(x)$ has only three roots
    (d) four roots of $f'(x) = 0$ lie in $(1, 2) \cup (2, 3) \cup (3, 4) \cup (4, 5)$

13. Let $f(x) = (x - 3)^5 (x + 1)^4$ then
    (a) $x = -1$ is point of minima
    (b) $x = -1$ is point of maxima
    (c) $x = 7/9$ is a point of maxima
    (d) $x = -1$ is neither a point of maxima and minima.

14. The normal to the curve represented parametrically by $x = a(\cos\theta + \theta\sin\theta)$ and $y = a(\sin\theta - \theta\cos\theta)$ at any point θ, is such that it
    (a) makes a constant angle with the x-axis
    (b) is at a constant distance from the origin
    (c) does not touch a fixed circle
    (d) passes through the origin.

15. The value of a for which the equation $x^3 - 3x + a = 0$ has two distinct roots in [0, 1], is given by
    (a) – 1
    (b) 1
    (c) 3
    (d) none of these

16. If the sum of the squares of the intercepts on the axes cut off by the tangent to the curve $x^{1/3} + y^{1/3} = a^{1/3}$ $(a > 0)$ at $(a/8, a/8)$ is 2, then a has the value
    (a) 1
    (b) 2
    (c) 4
    (d) 8

17. The value of m for which the area of the triangle included between the axes and any tangent to the curve $x^m y = b^m$ is constant, is
    (a) 1/2
    (b) 1
    (c) 3/2
    (d) 2

18. If the tangent at any point on the curve $x^4 + y^4 = a^4$ cuts off intercepts p and q on the coordinate axes, the value of $p^{-4/3} + q^{-4/3}$ is
    (a) $a^{-4/3}$
    (b) $a^{-1/2}$
    (c) $a^{1/2}$
    (d) none of these

19. The interval of increase of the function $y = x - 2\sin x$ if $0 \le x \le 2\pi$, is
    (a) (0, π)
    (b) (0, π)
    (c) (π/2, π)
    (d) (π/3, 5π/3)

20. The greatest value of $y = (x + 1)^{1/3} - (x - 1)^{1/3}$ on [0, 1] is
    (a) 1
    (b) 2
    (c) 3
    (d) $2^{1/3}$

21. Let f be a function defined by $f(x) = 2x^2 - \log|x|$, $x \neq 0$ then
    (a) f increase on $[-1/2, 0] \cup [1/2, \infty)$
    (b) f decreases on $(-\infty, 0)$
    (c) f increases on $(-\infty, -1/2)$
    (d) f decreases on $[1/2, \infty]$

22. The shortest distance of (0, 0) from the curve $y = \dfrac{e^x + e^{-x}}{2}$ is
    (a) 1/2
    (b) 1/3
    (c) 2
    (d) none of these

23. The normal to the circle $x^2 + y^2 - 2x - 2y = 0$ passing through (2, 2) is
    (a) $x = y$
    (b) $2x + y - 6 = 0$
    (c) $x + 2y - 6 = 0$
    (d) $x + y - 4 = 0$

24. If $f(0) = 0$ and $f''(x)$ exists and > 0, for all $x > 0$ then $f(x)/x$
    (a) decreases on (0, ∞)
    (b) increases on (0, ∞)
    (c) decreases on (1, ∞)
    (d) neither increases nor decreases on (0, ∞)

25. The value of k so that the equation $x^3 - 12x + k = 0$ has distinct roots in [0, 2] is
    (a) 4
    (b) 2
    (c) –2
    (d) none of these

26. Let $f(x) = 6x^{4/3} - 3x^{1/3}$ defined on [– 1, 1] then
    (a) maximum value of f is 7
    (b) maximum value of f is 5
    (c) maximum value of f is 9
    (d) minimum value of f is – 3/2

27. An equation of tangent line at an inflection point of $f(x) = x^4 - 6x^3 + 12x^2 - 8x + 3$ is
    (a) $y = 3x + 4$
    (b) $y = 4$
    (c) $y = 3x + 2$
    (d) none of these

28. The number of real roots of the equation $2x^3 - 3x^2 + 6x + 6 = 0$ is
    (a) 1
    (b) 2
    (c) 3
    (d) none of these

29. Let $f(x) = (x - 2)(x^4 - 4x^3 + 6x^2 - 4x + 1)$ then value of local minimum of f is
    (a) – 2/3
    (b) $-(4/5)^4$
    (c) $-4^4/5^5$
    (d) $-(4/5)^5$

30. Let $f(x) = x^2 - 2|x| + 2$, $x \in [-1/2, 3/2]$ then
    (a) $\min\limits_{x \in [-1/2, 3/2]} f(x) = 1/2$
    (b) $\min\limits_{x \in [-1/2, 3/2]} f(x) = 1$
    (c) $\max\limits_{x \in [-1/2, 3/2]} f(x) = 3/2$
    (d) none of these

31. A critical point of the function $f(x) = \dfrac{|x-1|}{x^2}$ is
    (a) – 1
    (b) 3
    (c) 2
    (d) 1/2

32. The function $f(x) = x^x$ decreases on the interval
    (a) $(0, e)$
    (b) (0, 1)
    (c) $(0, 1/e)$
    (d) none of these

33. The interval of increase of the function $y = x - e^x + \tan(\pi/7)$ is
    (a) (– ∞, 1)
    (b) (0, ∞)
    (c) (– ∞, 0)
    (d) (1, ∞)

34. Let $f(x) = x^2 + px + q$. The value of (p, q) so that $f(1) = 3$ is an extreme value of f on [0, 2] is
    (a) (– 2, 2)
    (b) (1, 4)
    (c) (– 2, 4)
    (d) (– 2, 3)

35. The number of inflection points of a function given by a third degree polynomial is exactly

(a) 2 (b) 1
(c) 3 (d) 0

36. Let $f(x) = 2\tan^{-1} x + \sin^{-1} \dfrac{2x}{1+x^2}$ then
(a) $\max f(x) = \pi/2$ (b) $\min f(x) = \pi/4$
(c) $\max f(x) = \pi$ (d) none of these

37. If the normal to the curve $x^3 = y^2$ at the point $(m^2, -m^3)$ is $y = mx - 2m^3$, then the value of m^2 is
(a) 1 (b) 1/2
(c) 1/3 (d) 2/3

38. Let $f(x) = 2\sin x + \cos 2x$ $(0 \le x \le 2\pi)$ and $g(x) = x + \cos x$ then
(a) g is a decreasing function
(b) f increases on $(0, \pi/2)$
(c) f increases on $(0, \pi/6) \cup (\pi/2, 5\pi/6)$
(d) f decreases on $(0, \pi/2)$

39. The minimum value of the function $f(x) = \tan x + \cot x$ in the interval $(0, \pi/2)$ is
(a) 1 (b) 0
(c) 2 (d) 1/2

40. The number of points of extremum of the function $f(x) = 3x^4 - 4x^3 + 6x^2 + b$ for any value of b is
(a) 4 (b) 3
(c) 1 (d) 2

41. The shortest distance of the line $y - x - 1 = 0$ from $x = y^2$ is
(a) 3/8 (b) $3\sqrt{2}/4$
(c) 3/4 (d) $3\sqrt{2}/8$

42. The value of a for which the extremum of the function $f(x) = x^3 - 3ax^2 + 3(a^2 - 1)x + 1$ lie in the interval $(-2, 4)$ lie in
(a) $(-1, 0)$ (b) $(-2, 4)$
(c) $(-1, 5)$ (d) $(-1, 3)$

43. If $A > 0$, $B > 0$ and $A + B = \pi/3$ then the maximum value of $\tan A \tan B$ is
(a) 1/3 (b) 1/2
(c) $1/\sqrt{2}$ (d) $\sqrt{3}/2$

44. The maximum value of $|x \log x|$ for $0 < x \le 1$ is
(a) 0 (b) $1/e$
(c) $2e^{-1}$ (d) none of these

45. The greatest value of the function $\log_x 1/9 - \log_3 x^2$ $(x > 1)$ is
(a) 2 (b) 0
(c) -4 (d) -2

46. Let f be differentiable for all x. If $f(1) = -2$ and $f'(x) \ge 2$ for $x \in [1, 6]$ then
(a) $f(6) < 8$ (b) $f(6) \ge 8$
(c) $f(6) \ge 10$ (d) $f(6) \le 5$

47. An extremum value of the function
$f(x) = (\sin^{-1} x)^3 + (\cos^{-1} x)^3$ $(-1 < x < 1)$ is
(a) $7\pi^3/8$ (b) $\pi^3/8$
(c) $\pi^3/32$ (d) $\pi^3/16$

48. Let $f(x) = x \log x + 3x$. Then
(a) f increases on (e^{-4}, ∞)
(b) f increases on $(0, \infty)$
(c) f decreases on $(0, \infty)$
(d) f decreases on $(0, e^{-2})$

49. Let $f(x) = x^2 e^{-x}$ then
(a) $\max f(x) = e^{-1}$ (b) $\max f(x) = 4e^{-2}$
(c) $\min f(x) = e^{-1}$ (d) $\min f(x) > 0$

50. The minimum value of $f(x) = |3 - x| + |2 + x| + |5 - x|$ is
(a) 0 (b) 7
(c) 8 (d) 10

51. Let $f(x) = 2 + 2x - 3x^{2/3}$ on $[-1, 10/3]$. Then f has
(a) Absolute maximum at an end point
(b) Absolute minimum at an interior point
(c) Absolute minimum is $f(10/3)$
(d) Absolute minimum is $f(-1)$

52. If f and g are defined on $[0, \infty)$ by
$$f(x) = \lim_{n\to\infty} \frac{x^n - 1}{x^n + 1} \text{ and } g(x) = \int_0^x f(t)\, dt.$$
Then
(a) g has local maximum at $x = 1$
(b) g has local minimum at $x = 1$
(c) g is an increasing function on $(0, \infty)$
(d) g is a decreasing function on $(0, \infty)$.

53. Let $f(x) = \sin x + \cos x$ then
(a) $x = 17\pi/4$ is a point of minima
(b) $x = 13\pi/4$ is a point of maxima
(c) $x = 21\pi/4$ is a point of minima
(d) $x = 29\pi/4$ is a point of maxima

54. If $f(x) = x\, e^{x(1-x)}$, then $f(x)$ is
(a) increasing on $[-1/2, 1]$
(b) decreasing on **R**
(c) increasing on **R**
(d) decreasing on $[-1/2, 1]$

55. The tangent to the curve $y = e^x$ drawn at the point (c, e^c) intersects the line joining the points $(c - 1, e^{c-1})$ and $(c + 1, e^{c+1})$
(a) on the left of $x = c$ (b) on the right of $x = c$
(c) at no point (d) at all points

Assertion-Reason Type Questions

56. **Statement-1:** $e^{\pi} > \pi^{e}$
Statement-2: The function $x^{1/x}$ $(x > 0)$ has local maximum at $x = e$.

57. **Statement-1:** $|\cot x - \cot y| \le |x - y|$ for all $x, y \in (-\pi/2, \pi/2)$
Statement-2: If f is differentiable on an open interval and $|f'(x)| \le M$ then $|f(x) - f(y)| \le M |x - y|$.

58. **Statement-1:** The function $f(x) = 2 \sin x + \cos 2x$ $(0 \le x \le 2\pi)$ has minimum at $x = \pi/3$ and maximum at $5\pi/3$.
Statement-2: The function $f(x)$ above decreases on $(0, \pi/3)$, increases on $(\pi/3, 5\pi/3)$ and decreases on $(5\pi/2, 2\pi)$

59. Let $f(x) = \tan^{-1} \dfrac{1-x}{1+x}$
Statement-1: The difference between the greatest and smallest value of $f(x)$ on $[0, 1]$ is $\pi/4$
Statement-2: If a function g decreases on $[a, b]$ then the greatest value of $g = g(a)$ and least value of g is $g(b)$.

60. Let $f(x) = \dfrac{x}{\log x}$
Statement-1: The minimum value of $f(x)$ is e
Statement-2: $\log x > 1$ for $x > e$ and < 1 for $x < e$.

LEVEL 2

Straight Objective Type Questions

61. The critical points of the function $f(x) = (x - 2)^{2/3} (2x + 1)$ are
(a) -1 and 2 (b) 1
(c) 1 and $-1/2$ (d) 1 and $1/2$

62. The function $f(x) = (1/4)x^3 - \sin \pi x + 3$ on $[-2, 2]$ takes the value
(a) 1 (b) $16/3$
(c) 6 (d) 8

63. The greatest value of $f(x) = \tan^{-1} x - \dfrac{1}{2} \log x$ on $[1/\sqrt{3}, \sqrt{3}]$ is
(a) $\pi/2 + (1/2) \log 3$ (b) $\pi/6 + (1/4) \log 3$
(c) $\pi/6 + (1/2) \log 3$ (d) $\pi/4 - (1/4) \log 3$

64. Equations of those tangents to $4x^2-9y^2=36$ which are perpendicular to the straight line $2y + 5x = 10$; are
(a) $5(y - 3) = \left(x - \sqrt{117/4}\right)$
(b) $5(y - 2) = 2(x - \sqrt{18})$
(c) $5(y + 2) = 2(x - \sqrt{18})$
(d) none of these

65. If $a, b, c, \in \mathbf{R}$, then
$$f(x) = \begin{vmatrix} x+a^2 & ab & ac \\ ab & x+b^2 & bc \\ ac & bc & x+c^2 \end{vmatrix} \text{ decrease on}$$
(a) $(-(2/3)(a^2 + b^2 + c^2), 0)$
(b) $(0, (2/3)(a^2 + b^2 + c^2))$
(c) $((1/3)(a^2 + b^2 + c^2), 0)$
(d) none of these

66. A channel 27 m wide falls at a right angle into another channel 64 m wide. The greatest length of the log that can be floated along this system of channels is
(a) 120 (b) 125
(c) 100 (d) 110

67. For $a \in [\pi, 2\pi]$, the function
$$f(x) = \frac{1}{3} \sin a \tan^3 x + (\sin a - 1) \tan x + \frac{\sqrt{a-2}}{\sqrt{8-a}}$$
has
(a) $x = n\pi$ $(n \in \mathbf{I})$ as critical points
(b) no critical points
(c) $x = 2n\pi$ $(n \in \mathbf{I})$ as critical points
(d) $x = (2n + 1)\pi$ $(n \in \mathbf{I})$ as critical points.

68. The value of a for which the function
$f(x) = (4a - 3)(x + \log 5) + 2(a - 7) \cot (x/2) \sin^2 (x/2)$ does not possess critical point is
(a) $(-\infty, -4/3]$ (b) $(-\infty, -1)$
(c) $[1, \infty)$ (d) $(0, \infty)$

69. The interval to which b may belong so that the function
$$f(x) = \left(1 - \frac{\sqrt{21-4b-b^2}}{b+1}\right)x^3 + 5x + \sqrt{6}$$
is increasing at every point of its domain is
(a) $[-7, 0]$ (b) $[-6, 0]$
(c) $[1, 4]$ (d) $[2, 3]$

70. A tangent is drawn at a variable point on an ellipse $x^2/a^2 + y^2/b^2 = 1$, then minimum area of the triangle formed by the tangent and the coordinate axes is

(a) ab (b) $(a^2 + b^2)/2$
(c) $(a + b)^2/4$ (d) $2\,ab$

71. The set of all x for which $\log(1 + x) \leq x$ is

(a) $(1, \infty)$ (b) $(0, \infty)$
(c) $(-1, \infty)$ (d) none of these

72. The minimum value of $2^{(x^2-3)^3} + 27$ is

(a) 2^{27} (b) 2
(c) 1 (d) none of these

73. Let $f(x) = \begin{cases} |x| & \text{for } 0 < |x| \leq 2 \\ 1 & \text{for } x = 0 \end{cases}$

Then at $x = 0$, f has

(a) a local maximum (b) no local maximum
(c) a local minimum (d) no extremum

74. If $f(x) = xe^{x(1-x)}$, then $f(x)$ is

(a) increasing on $[-1/2, 1]$
(b) decreasing on **R**
(c) increasing on **R**
(d) decreasing on $[-1/2, 1]$

75. Let $f(x) = \begin{cases} x^{\alpha} \log x & \text{if } x > 0 \\ 0 & \text{if } x = 0 \end{cases}$

Rolle's theorem can be applied to f on $[0, 1]$ then value of α can be

(a) -1 (b) $-1/2$
(c) 0 (d) 1/2

76. A cone is made from a circular sheet of radius $\sqrt{3}$ by cutting out a sector and gluing the cut edges of the remaining piece together. The maximum volume attainable for the cone is

(a) $\pi/3$ (b) $\pi/6$
(c) $2\pi/3$ (d) $3\sqrt{3}\pi$

77. The dimensions of the rectangle of maximum area that can be inscribed in the ellipse $(x/4)^2 + (y/3)^2 = 1$ are

(a) $\sqrt{8}, \sqrt{2}$ (b) 4, 3
(c) $2\sqrt{8}, 3\sqrt{2}$ (d) none of these

78. The condition for $y = ax^4 + bx^3 + cx^2 + dx + e$ to have points of inflection is

(a) $b^2 - 4ac > 0$ (b) $3b^2 - 8ac = 0$
(c) $3b^2 - 8ac > 0$ (d) $3b^2 - 8ac < 0$

79. The largest value of m such that $|x^2 - 3x + 2| \geq m$ for all x in the interval $[3/2, 7/4]$ is

(a) 3/4 (b) 3/8
(c) 3/16 (d) 7/4

80. The point in the interval $[0, \pi]$ for which the curve $y = (1/2)x$ and $y = \sin x$ are farthest apart is

(a) $\pi/2$ (b) $\pi/4$
(c) $\pi/6$ (d) π

81. The points at which the tangents to the curve $ax^2 + 2hxy + by^2 = 1$ is parallel to y-axis is

(a) $(0, 0)$
(b) where $hx + by = 0$ meets it
(c) where $ax + hy$ meets it
(d) none of these

82. If the point on $y = x \tan \alpha - \dfrac{ax^2}{2u^2 \cos^2 \alpha}$ $(0 < \alpha < \pi/2)$ where the tangent is parallel to $y = x$ has an ordinate $u^2/4a$ then the value of α is

(a) $\pi/2$ (b) $\pi/6$
(c) $\pi/3$ (d) none of these

83. Let $f(x) = \begin{cases} |x-1| + a, & x \leq 1 \\ 2x + 3, & x > 1 \end{cases}$

If $f(x)$ has local minimum at $x = 1$ and $a \geq 5$ then the value of a is

(a) 5 (b) 6
(c) 11/2 (d) 15/2

84. Let $g(x) = \int_0^x f(t)\,\mathrm{d}t$ and $f(x)$ satisfies the equation $f(x+y) = f(x) + f(y) + 2xy - 1$ for all $x, y \in \mathbf{R}$ and $f'(0) = 2$ then

(a) g increases on $(0, \infty)$ and decreases on $(-\infty, -0)$
(b) g increases on $(0, \infty)$
(c) g decreases on $(0, \infty)$ and increases $(-\infty, 0)$
(d) g decreases on $(-\infty, \infty)$

85. The area of the triangle formed by the positive x-axis and the normal and the tangent to the circle $x^2 + y^2 = 4$ at $(1, \sqrt{3})$ is

(a) $2\sqrt{3}$ (b) $\sqrt{3}$
(c) $4\sqrt{3}$ (d) 3

86. The interval into which the function $y = \dfrac{x-1}{x^2 - 2x + 3}$ transforms the entire real line is

(a) $[1/3, 2]$ (b) $[-1/3, 2]$
(c) $[-1/3, 1]$ (d) none of these

87. The angle at which $x^2 + y^2 = 16$ can be seen from the point $(8, 0)$ is

(a) $\pi/6$ (b) $\pi/4$
(c) $\pi/2$ (d) $\pi/3$

88. The critical points of the function $f(x) = (x + 2)^{2/3}(2x - 1)$ are

(a) -1 and 2 (b) 1
(c) 1 and $-1/2$ (d) -1 and -2

89. The function $f(x) = \dfrac{\log(\pi + x)}{\log(e + x)}$ is

(a) increasing on $[0, \infty)$
(b) decreasing on $[0, \infty)$
(c) increasing on $[0, \pi/e)$ and decreasing on $[\pi/e, \infty)$
(d) decreasing on $[0, \pi/e)$ and increasing on $[\pi/e, \infty)$

90. A rectangle with perimeter 32 cm has greatest area if its length is

(a) 12 (b) 10
(c) 8 (d) 14

91. The greatest value of the function

$f(x) = \cot^{-1} x + (1/2) \log x$ on $[1, \sqrt{3}]$ is

(a) $(\pi/6) + 0.25 \log 3$ (b) $(\pi/3) - 0.25 \log 3$
(c) $\pi/4$ (d) $\tan^{-1} e - 1/2$

92. A particle is moving along the parabola $y^2 = 4(x + 2)$. As it passes through the point (7, 6) its y-coordinate is increasing at the rate of 3 units per second. The rate at which x-coordinate change at this instant is (in units/sec)

(a) 4 (b) 6
(c) 8 (d) 9

93. The perimeter of a rectangle is fixed at 24 cm. If the length l of the rectangle is increasing at the rate of 1 cm per second, the value of l for which the area of rectangle start to decrease is

(a) 2 cm (b) 6 cm
(c) 4 cm (d) 8 cm

94. The rate at which fluid level inside vertical cylindrical tank of radius r drop if we pump fluid out at the rate of 3cm^3 l/min is

(a) $-\dfrac{1}{\pi r^2}$ (b) $\dfrac{3}{\pi r^2}$
(c) $\dfrac{2}{\pi r^2}$ (d) $\dfrac{4}{\pi r}$

95. The length l of a rectangle is decreasing at the rate of 2 cm/sec while the widths w is increasing at the rate of 2 cm/sec. When $l = 12$ and $w = 5$, the rate of change of area is (in cm^2/sec)

(a) 14 (b) 12
(c) 8 (d) 4

96. Let f be twice differentiable function such that $f(x) = x^2$, $x = 1, 2, 3$. Then

(a) $f''(x) = 2\ \forall\ x \in (1, 3)$
(b) $f''(x) = 2$ for some $x \in (1, 3)$
(c) $f''(x) = 3\ \forall\ x \in (2, 3)$
(d) $f''(x) = f'(x)$ for some $x \in (2, 3)$

97. A tangent drawn to the curve $y = f(x)$ at $P(x, y)$ cuts the x-axis and y-axis at A and B respectively such that $BP : AP = 3 : 1$, given that $f(1) = 1$ then

(a) equation of the curve is $x\dfrac{dy}{dx} - 3y = 0$.
(b) normal at (1, 1) is $x + 3y = 4$.
(c) curve passes through (2, 1/8)
(d) equation of the curve is $x\dfrac{dy}{dx} + 4y = 0$.

98. If $0 < b^2 < c$ then $f(x) = x^3 + bx^2 + cx + d$

(a) has no local minima
(b) has no local maxima
(c) is strictly increasing on **R**
(d) is strictly decreasing on **R**

Previous Years' AIEEE/JEE Main Questions

1. If $2a + 3b + 6c = 0 (a, b, c \in \mathbf{R})$ then the quadratic equation $ax^2 + bx + c = 0$ has

(a) at least one root in [0, 1]
(b) at least one root in [2, 3]
(c) at least one root.
(d) none of these **[2002, 2004]**

2. The maximum distance from origin of a point on the curve $x = a \sin t - b \sin\left(\dfrac{at}{b}\right)$, $y = a \cos t - b \cos\left(\dfrac{at}{b}\right)$, both $a, b > 0$ is

(a) $a - b$ (b) $a + b$
(c) $\sqrt{a^2 + b^2}$ (d) $\sqrt{a^2 - b^2}$ **[2002]**

3. If the function $f(x) = 2x^3 - 9ax^2 + 12a^2x + 1$ where $a > 0$, attains its maximum and minimum at p and q respectively such that $p^2 = q$, then a equals

(a) 1 (b) 2
(c) 1/2 (d) 3 **[2003]**

4. If $u = \sqrt{a^2 \cos^2\theta + b^2 \sin^2\theta} + \sqrt{a^2 \sin^2\theta + b^2 \cos^2\theta}$

then the difference between the maximum and minimum values of u^2 is given by

(a) $(a+b)^2$ (b) $2\sqrt{a^2+b^2}$

(c) $2(a^2+b^2)$ (d) $(a-b)^2$ **[2004]**

5. A function $y = f(a)$ has a second order derivative $f''(x) = 6(x-1)$. If its graph passes through the point (2, 1) and at that point the tangent to the graph is $y = 3x - 5$, then the function is

(a) $(x+1)^3$ (b) $(x-1)^3$

(c) $(x-1)^2$ (d) $(x+1)^2$ **[2004]**

6. The normal to the curve $x = a(1 + \cos\theta)$, $y = a\sin\theta$ at θ always passes through the fixed point

(a) (0, 0) (b) $(0, a)$

(c) $(a, 0)$ (d) (a, a) **[2004]**

7. A function is matched below against an interval where it is supported to be increasing which is of the following pairs in incorrectly matched?

	Interval	Function
(a)	$(-\infty, 1/3)$	$3x^2 - 2x + 1$
(b)	$(-\infty, -4)$	$x^3 + 6x^2 + 6$
(c)	$(-\infty, \infty)$	$x^3 - 3x^2 + 3x + 3$
(d)	$(2, \infty)$	$2x^3 - 3x^2 - 12x + 6$

[2005]

8. The normal to the curve $x = a(\cos\theta + \theta\sin\theta)$, $y = a(\sin\theta - \theta\cos\theta)$ at any point Q is such that

(a) it passes through $\left(\dfrac{a\pi}{2}, -a\right)$

(b) it is at constant distance from origin

(c) it passes through origin

(d) it makes angle $\dfrac{\pi}{2} + \theta$ with the x-axis **[2005]**

9. Let f be differentiable for all x. If $f(1) = -2$ and $f'(x) \geq 2$ for $x \in [1, 6]$ then

(a) $f(6) < 5$ (b) $f(6) = 5$

(c) $f(6) \geq 8$ (d) $f(6) < 8$ **[2005]**

10. A spherical iron ball 10 cm in radius is coated with a layer of ice of uniform thickness that melts at a rate of 50 cm^3/min. When the thickness of ice is 5 cm, then the rate at which the thickness of ice decreases, is

(a) $1/54\pi$ cm/min (b) $5/6\pi$ cm/min

(c) $1/36\pi$ cm/min (d) $1/8\pi$ cm/min **[2005]**

11. The function $f(x) = \dfrac{x}{2} + \dfrac{2}{x}$ has a local minimum at

(a) $x = 1$ (b) $x = 2$

(c) $x = -2$ (d) $x = 0$ **[2006]**

12. A value of c for which the conclusion of mean value theorem holds for the function $f(x) = \log x$ on the interval [1, 3] is

(a) $2\log_3 e$ (b) $(1/2)\log 3$

(c) $\log_3 c$ (d) $\log 3$. **[2007]**

13. The function $f(x) = \tan^{-1}(\sin x + \cos x)$ is an increasing function is

(a) $(\pi/4, \pi/2)$ (b) $(-\pi/2, \pi/4)$

(c) $(0, \pi/2)$ (d) $(-\pi/2, \pi/2)$ **[2007]**

14. Suppose the cube $x^3 - px + q$ has three distinct real roots where $p > 0$ and $q > 0$. Then which one of the following holds?

(a) The cubic has minima at $\sqrt{\dfrac{p}{3}}$ and maxima at $-\sqrt{\dfrac{p}{3}}$

(b) The cubic has minima at $-\sqrt{\dfrac{p}{3}}$ and maxima at $\sqrt{\dfrac{p}{3}}$

(c) The cubic has minima at both $\sqrt{\dfrac{p}{3}}$ and $-\sqrt{\dfrac{p}{3}}$

(d) The cubic has maxima at both $\sqrt{\dfrac{p}{3}}$ and $-\sqrt{\dfrac{p}{3}}$

[2008]

15. Given $P(x) = x^4 + ax^3 + bx^2 + cx + d$ such that $x = 0$ is the only real root of $P'(x) = 0$.

If $P(-1) < P(1)$, then in the interval $[-1, 1]$

(a) $P(-1)$ is the minimum but $P(1)$ is not the maximum of P

(b) neither $P(-1)$ is the minimum nor $P(1)$ is the maximum of P

(c) $P(-1)$ is the minimum and $P(1)$ is the maximum of P

(d) $P(-1)$ is not minimum but $P(1)$ is the maximum of P. **[2009]**

16. Let $f : \mathbf{R} \to \mathbf{R}$ be defined by

$$f(x) = \begin{cases} k - 2x, & \text{if } x \leq -1 \\ 2x + 3, & \text{if } x > -1 \end{cases}$$

If f has a local minimum at $x = -1$, then a possible value of k is

(a) $-1/2$ (b) -1

(c) 1 (d) 0 **[2010]**

17. The curve that passes through the point (2, 3), and has the property that the segment of any tangent to it lying between the coordinate axes is bisected by the point of contact, is given by:

(a) $2y - 3x = 0$ (b) $y = 6/x$

(c) $x^2 + y^2 = 13$ (d) $\left(\dfrac{x}{2}\right)^2 + \left(\dfrac{y}{3}\right)^2 = 2$

[2011]

18. Let f be a function defined by

$$f(x) = \begin{cases} \dfrac{\tan x}{x} & , x \neq 0 \\ 1 & , x = 0 \end{cases}$$

Statment-1: $x = 0$ is point of maxima of f **[2011]**

Statement-2: $f'(0) = 0$.

19. Let $a, b \in \mathbf{R}$ be such that the function f given by $f(x) = \log|x| + bx^2 + ax$, $x \neq 0$ has extreme values at $x = -1$ and $x = 2$

Statement-1: f has local maximum at $x = -1$ and at $x = 2$

Statement-2: $a = 1/2$ and $b = -1/4$. **[2012]**

20. A spherical balloon is filled with 4500π cubic meters of helium gas. If a leak in the balloon causes the gas to escape at the rate of 72π cubic meters per minute, then the rate (in meters per minute) at which the radius of the balloon decreases 49 minutes after the leakage began is

(a) 7/9 (b) 2/9

(c) 9/2 (d) 9/7 **[2012]**

21. The cost of running a bus from A to B is Rs. $\left(av + \dfrac{b}{v}\right)$, where v km/h is the average speed of bus. When the bus travels at 30 km/h, the cost comes out to be Rs. 75 while at 40 km/h, it is Rs. 65. Then the most economical speed in km/h of the bus is

(a) 45 (b) 50

(c) 60 (d) 40 **[2013, online]**

22. If the surface area of a sphere of radius r is increasing uniformly at the rate of 8 cm^2/s then the rate of change of its volume is

(a) constant (b) proportional to $\sqrt{r}$

(c) proportional to r^2 (d) proportional to r **[2013, online]**

23. The real number k for which the equation $2x^3 + 3x + k = 0$ has two distinct real roots in $[0, 1]$

(a) lies between 2 and 3

(b) lies between –1 and 0

(c) does not exist

(d) lies between 1 and 2 **[2013]**

24. The maximum area of a right angled triangle with hypotenuse h is

(d) $\dfrac{h^2}{2\sqrt{2}}$ (b) $\dfrac{h^2}{2}$

(c) $\dfrac{h^2}{\sqrt{2}}$ (d) $\dfrac{h^2}{4}$ **[2013, online]**

25. **Statement-1:** The equation $x \log x = 2 - x$ is satisfied by at least one value of x lying between 1 and 2

Statement-2: The function $f(x) = x \log x$ is an increasing function in $[1, 2]$ and $g(x) = 2 - x$ is a decreasing function in $[1, 2]$ and the graphs represented by these functions intersect at a point in $[1, 2]$.**[2013, online]**

26. **Statement-1:** The function $x^2(e^x + e^{-x})$ is increasing for all $x > 0$

Statement 2: The function x^2e^x and x^2e^{-x} are increasing for all $x > 0$ and sum of two increasing functions in any interval (a, b) is an increasing function in (a, b) **[2013, online]**

27. If f and g are differentiable function in $[0, 1]$ satisfying $f(0) = 2 = g(1)$, $g(0) = 0$ and $f(1) = 6$ then for some $c \in (0, 1)$

(a) $2f'(c) = g'(c)$ (b) $2f'(c) = 3g'(c)$

(c) $f'(c) = g'(c)$ (d) $f'(c) = 2g'(c)$ **[2014]**

28. If $x = -1$ and $x = 2$ are extreme points of $f(x) = \alpha \log|x| + \beta x^2 + x$ then:

(a) $\alpha = -6, \beta = \dfrac{1}{2}$ (b) $\alpha = -6, \beta = -\dfrac{1}{2}$

(c) $\alpha = 2, \beta = -\dfrac{1}{2}$ (d) $\alpha = 2, \beta = \dfrac{1}{2}$ **[2014]**

29. If the volume of a spherical ball is increasing at the rate of 4π cc/sec, then the rate of increase of its radius (in cm/sec), when the volume is 288π cc is

(a) $\dfrac{1}{9}$ (b) $\dfrac{1}{6}$

(c) $\dfrac{1}{36}$ (d) $\dfrac{1}{24}$ **[2014, online]**

30. If non-zero real number b and c are such that $\min f(x) > \max g(x)$ where $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ $(x \in \mathbf{R})$ then $\left|\dfrac{c}{b}\right|$ lies in the interval:

(a) $\left[\dfrac{1}{\sqrt{2}}, \sqrt{2}\right]$ (b) $\left[0, \dfrac{1}{2}\right]$

(c) $\left[\dfrac{1}{2}, \dfrac{1}{\sqrt{2}}\right]$ (d) $\left[\sqrt{2}, \infty\right]$ **[2014, online]**

31. Let f and g be two differentiable functions on $\mathbf{R}$ such that $f'(x) > 0$ and $g'(x) < 0$ for all $x \in \mathbf{R}$. Then for all x

(a) $g(f(x)) > g(f(x-1))$

(b) $f(g(x)) > f(g(x+1)$

(c) $f(g(x)) > f(g(x-1))$

(d) $g(f(x)) < g(f(x+1))$ **[2014 online]**

32. If Rolle's theorem holds for the function $f(x) = 2x^3 + ax^2 + bx$ in the interval $[-1, 1]$ for the point $c = \frac{1}{2}$, then the value of $2a + b$ is

(a) 1 (b) – 1
(c) 2 (d) – 2
[2014, 2015 online]

33. Let $f(x)$ be a polynomial of degree four having extreme value at $x = 1$ and $x = 2$. If $\lim_{x\to 0}\left[1+\frac{f(x)}{x^2}\right] = 3$, then $f(2)$ is equal to

(a) –8 (b) – 4
(c) 0 (d) 4 **[2015]**

34. The equation of a normal to the curve $\sin y = x\sin\left(\frac{\pi}{3}+y\right)$ at $x = 0$ is

(a) $2x + \sqrt{3}y = 0$ (b) $2y - \sqrt{3}x = 0$
(c) $2y + \sqrt{3}x = 0$ (d) $2x - \sqrt{3}y = 0$
[2015, online]

35. Let k and K be the minimum and maximum values of the function $f(x) = \frac{(1+x)^{0.6}}{1+x^{0.6}}$ in $[0, 1]$ respectively, then the order pair (k, K) is equal to

(a) $(1, 2^{0.6})$ (b) $(2^{-0.4}, 2^{0.6})$
(c) $(2^{-0.6}, 1)$ (d) $(2^{-0.4}, 1)$ **[2015, online]**

36. From the top of a 64 metres high tower, a stone is thrown upward vertically with the velocity of 48m/s. The greatest height (in metres) attained by stone, assuming the value of the gravitational acceleration $g = 32$ m/s^2, is:

(a) 100 (b) 88
(c) 128 (d) 112 **[2015, online]**

37. The distance, from the origin, of the normal to the curve, $x = 2\cos t + 2t\sin t$, $y = 2\sin t - 2t\cos t$ at $t = \frac{\pi}{4}$, is

(a) 4 (b) $2\sqrt{2}$
(c) 2 (d) $\sqrt{2}$ **[2015, online]**

38. Let the tangents drawn to the circle, $x^2 + y^2 = 16$ from the point $P(0, h)$ meet the x-axis at points A and B. If the area of ΔAPB is minimum, then h is equal to:

(a) $4\sqrt{3}$ (b) $3\sqrt{3}$
(c) $3\sqrt{2}$ (d) $4\sqrt{2}$ **[2015]**

39. Consider

$$f(x) = \tan^{-1}\left(\sqrt{\frac{1+\sin x}{1-\sin x}}\right),\ x\in\left(0,\frac{\pi}{2}\right).$$

A normal to $y = f(x)$ at $x = \frac{\pi}{6}$ also passes through the point:

(a) (0, 0) (b) $\left(0,\frac{2\pi}{3}\right)$
(c) $\left(\frac{\pi}{6},0\right)$ (d) $\left(\frac{\pi}{4},0\right)$ **[2016]**

40. If m and M are are the minimum and the maximum values of $4+\frac{1}{2}\sin^2 2x - 2\cos^4 x$, $x \in \mathbf{R}$, then $M - m$ is equal to

(a) $\frac{9}{4}$ (b) $\frac{15}{4}$
(c) $\frac{7}{4}$ (d) $\frac{1}{4}$ **[2016, online]**

41. If the tangent at a point P, with parameter t, on the curve $x = 4t^2 + 3$, $y = 8t^3 - 1$, $t \in \mathbf{R}$ meets the curve again at a point Q, then the coordinates of Q are:

(a) $(16t^2 + 3, -64t^3 - 1)$ (b) $(4t^2 + 3, -8t^3 - 1)$
(c) $(t^2 + 3, t^3 - 1)$ (d) $(t^2 + 3, -t^3 - 1)$
[2016, online]

42. Let $f(x) = \sin^4 x + \cos^4 x$. Then f is an increasing function in the interval

(a) $\left]\frac{5\pi}{8},\frac{3\pi}{4}\right[$ (b) $\left]\frac{\pi}{2},\frac{5\pi}{8}\right[$
(c) $\left]\frac{\pi}{4},\frac{\pi}{2}\right[$ (d) $\left]0,\frac{\pi}{4}\right[$ **[2016, online]**

43. Let C be a curve given by $y(x) = 1+\sqrt{4x-3}$, $x>\frac{3}{4}$. If P is a point on C, such that the tangent at P has slope $\frac{2}{3}$, then a point through which the normal at P passes, is

(a) (1, 7) (b) (3, –4)
(c) (4, –3) (d) (2, 3) **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. The slope of the normal to curve $y = x^3 - 4x^2$ at $(2, -1)$ is

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$

(c) 4 (d) –4 **[2006]**

2. For the curve $x = t^2 - 1$, $y = t^2 - t$, the tangent line is perpendicular to the x-axis when

(a) $t = 0$ (b) $t = 1$

(c) $t = \frac{1}{\sqrt{3}}$ (d) $t = \frac{1}{2}$ **[2006]**

3. If $f(x) = 4^{\sin x}$ satisfies the Rolle's theorem on $[0, \pi]$, then the value of $c \in (0, \pi)$ for which $f'(c) = 0$ is

(a) $c = \frac{\pi}{6}$ (b) $c = \frac{\pi}{4}$

(c) $c = \frac{\pi}{2}$ (d) $c = \frac{\pi}{3}$ **[2006]**

4. The value of c for which the conclusion of Lagrange's mean value theorem holds for the function $f(x) = \sqrt{25 - x^2}$ on the interval $[1, 5]$ is

(a) $\sqrt{3}$ (b) $\sqrt{5}$

(c) $\sqrt{15}$ (d) 2 **[2007]**

5. Let $f(x) = \begin{cases} |x-1| + a & \text{if } x \le 1 \\ 2x + 3 & \text{if } x > 1 \end{cases}$

If $f(x)$ has a local minimum at $x = 1$, then

(a) $a > 5$ (b) $0 < a \le 5$

(c) $a \le 5$ (d) $a = 5$ **[2007]**

6. If m is the slope of a tangent to the curve $e^{2y} = 1 + 4x^2$ then

(a) $|m| \le 1$ (b) $|m| > 1$

(c) $|m| \ge 1$ (d) $|m| < 1$ **[2007]**

7. Let $f : (-\infty, \infty) \to (-\infty, \infty)$ be a continuous and differentiable function and let $f'(\cdot)$ denote the derivative of $f(\cdot)$. If $f(0) = -2$ and $f'(x) \le 3$ for each $x \in [0, 2]$, then the largest possible value of $f(2)$ is

(a) 1 (b) 2

(c) 3 (d) 4 **[2008]**

8. Let f: $[-1, 2] \to (-\infty, \infty)$ be given by

$$f(x) = \frac{x^4 + 3x^2 + 1}{x^2 + 1}$$

Then the maximum possible value of $f(\cdot)$ on $[-1, 2]$ is

(a) 1 (b) $\frac{29}{5}$

(c) $\frac{21}{5}$ (d) $\frac{28}{5}$ **[2008]**

9. Let $y = f(x)$ be a curve which passes through $(3, 1)$ and is such that normal at any point on it passes through $(1, 1)$. Then $y = f(x)$ describes

(a) a circle of area π

(b) an ellipse of area 2π

(c) an ellipse of area 3π

(d) a circle of area 4π **[2008]**

10. Let $f(x) = \begin{cases} x \sin\frac{\pi}{x} & , \quad 0 < x \le 1 \\ 0 & , \quad x = 0 \end{cases}$

then $f'(x) = 0$ for

(a) exactly two values of x

(b) no value of x

(c) infinitely many values of x

(d) exactly one value of x **[2009]**

11. Let $f(x) = [1 - x^2]$, $x \in \mathbf{R}$, where [ ] is the greatest integer function. Then

(a) f is increasing

(b) $x = 0$ is the point of maxima of f

(c) f is continuous at $x = 0$

(d) f is decreasing **[2009]**

12. A particle is constrained to move along the curve $y = \sqrt{x}$ starting at the origin at time t = 0. The point on the curve where the abscissa and the ordinate are changing at the same rate is:

(a) $\left(\frac{1}{2}, \frac{1}{\sqrt{2}}\right)$ (b) $\left(\frac{1}{8}, \frac{1}{2\sqrt{2}}\right)$

(c) $\left(\frac{1}{4}, \frac{1}{2}\right)$ (d) $(1, 1)$ **[2009]**

13. If the tangent and normal to the hyperbola $x^2 - y^2 = 4$ at a point cut off intercepts a_1 and a_2 respectively on x-axis and b_1 and b_2 respectively on y-axis then the value of $a_1 a_2 + b_1 b_2$ is

(a) –1 (b) 0

(c) 4 (d) 1 **[2010]**

14. Let f be a differentiable function defined on **R** such that $f(0) = -3$. If $f'(x) \le 5$ for all x then

(a) $f(2) > 7$ (b) $f(2) \leq 7$
(c) $f(2) > 8$ (d) $f(2) = 8$ **[2010]**

15. Let f be a function defined on $\left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$ by $f(x) = 3\cos^4 x - 6\cos^3 x - 6\cos^2 x - 3$. Then the range of $f(x)$ is
(a) $[-12, -3]$ (b) $[-6, -3]$
(c) $[-6, 3]$ (d) $(-12, 3]$ **[2010]**

16. The function $f(x) = xe^{-x}$ has
(a) neither maximum nor minimum at $x = 1$
(b) a minimum at $x = 1$
(c) a maximum at $x = 1$
(d) a maximum at $x = -1$ **[2011]**

17. Each side of a square is increasing at the uniform rate of 1m/sec. If after sometime the area of the square is increasing at the rate of 8 m^2/sec, then the area of square at that time in sq. meters is
(a) 4 (b) 9
(c) 16 (d) 25 **[2012]**

18. The rate of change of the volume of a sphere with respect to its surface area when the radius is 2 units is:
(a) 4 (b) 3
(c) 2 (d) 1 **[2013]**

19. If m is the slope of a tangent to curve $e^y = 1 + x^2$ at the point (x, y) on the curve then all possible values of m lie in the interval:
(a) $[0, 1]$ (b) $(1, \infty)$
(c) $(-\infty, -1)$ (d) $[-1, 1]$ **[2013]**

20. $f(x) = |x \log x|$, $x > 0$ is monotonically decreasing in:
(a) $\left(0, \dfrac{1}{e}\right)$ (b) $\left[\dfrac{1}{e}, 1\right]$
(c) $(1, e)$ (d) (e, ∞) **[2014]**

21. Let $f(x) = |x - x_1| + |x - x_2|$, where x_1 and x_2 are distinct real numbers. Then the number of points at which $f(x)$ is minimum
(a) 1 (b) 2
(c) 3 (d) more than 3 **[2014]**

22. The maximum value of $f(x) = 2\sin x + \sin 2x$, in the interval $\left[0, \dfrac{3}{2}\pi\right]$ is
(a) $\sqrt{2} + 1$ (b) $2\sqrt{3}$
(c) $\dfrac{3\sqrt{3}}{2}$ (d) $\sqrt{3}$ **[2015]**

23. The abscissa of a point, tangent at which to the curve $y = e^x \sin x$, $x \in [0, \pi]$, has maximum slope, is:
(a) $\dfrac{\pi}{4}$ (b) $\dfrac{\pi}{2}$
(c) π (d) 0 **[2016]**

24. Let $p(x)$ be a real polynomial of degree 4 having extreme values at $x = 1$ and $x = 2$. If $\lim\limits_{x \to 0} \dfrac{p(x)}{x^2} = 1$, then $p(4)$ is equal to:
(a) 16 (b) 32
(c) 64 (d) 8 **[2016]**

Reasoning Type

25. Let b, c be two non-zero real numbers such that $b^2 \leq 3c$. Let $f(x) = x^3 + bx^2 + cx + d$, $x \in \mathbf{R}$.

Statement-1: f is a 1 – 1 function.
Statement-2: f is a strictly decreasing function on **R**.
[2009]

26. **Statement-1:** The function f defined on **R** as $f(x) = \min\{x, x^2)$ is not differentiable at $x = 1$.

Statement-2: The smaller angle between the tangents to the curve $y = x$ and $y = x^2$ at $x = 1$ is $\tan^{-1}\dfrac{1}{3}$.
[2010]

27. **Statement-1:** If $f(x) = e^{(x-1)(x-3)}$ then Rolle's theorem is applicable to $f(x)$ in the interval $[1, 3]$.

Statement-2: Mean value theorem is applicable to $f(x) = e^{(x-1)(x-3)}$ in the interval $[1, 4]$. **[2011]**

28. Let $f(x) = x^2 - 8x + 12$, $x \in [2, 6]$.

Statement 1: $f'(c) = 0$ for some $c \in (2, 6)$.

Statement 2: f is continuous on $[2, 6]$ and differentiable on $(2, 6)$ with $f(2) = f(6)$. **[2012]**

29. Let $a, b, c \in \mathbf{R}$, $a > 0$ and the function $f: \mathbf{R} \to \mathbf{R}$ be defined by $f(x) = ax^2 + bx + c$

Statement-1: $b^2 < 4ac \Rightarrow f(x) > 0$ for every value of x.

Statement-2: f is strictly decreasing in the interval $\left(-\infty, -\dfrac{b}{2a}\right)$ and strictly increasing in the interval $\left(-\dfrac{b}{2a}, \infty\right)$ **[2012]**

Hints and Solutions

Concept-based

1. $$\frac{dy}{dx} = \frac{-a\cos^2 t+\sin t}{a\sin^2 t\cos t} = -\frac{\cos t}{\sin t}$$

Length of the tangent $= |y|\sqrt{1+\frac{\sin^2 t}{\cos^2 t}}$

$$= \frac{a\cos^3 t}{\cos t} = a\cos^2 t$$

2. $\frac{dy}{dx} = -\frac{e^{-t}}{2e^{t}} = -\frac{1}{2}e^{-2t}$. If $t = 0$ then $X = 2$, $y = 1$

Equation of normal is

$$Y - 1 = 2e^{2t}\Big|_{t=0}(X-2)$$

$\Rightarrow$ $Y - 1 = 2(X - 2) \Rightarrow 2X - Y - 3 = 0.$

3. $\frac{ds}{dt} = \frac{\pi}{9}\cos\frac{\pi}{2}t$ and $a = \frac{d^2s}{dt^2} = \frac{-\pi^2}{18}\sin\frac{\pi}{2}t$

$a(\mathrm{t} = 1) = -\frac{\pi^2}{18}$

4. $f'(x) = 1 + \log x - 1 = \log x > 0$ for $x > 1$. So f is increasing for $x > 1 \Rightarrow f(x) > f(1) = 0$ for $x > 1$. $f'(x) < 0$ for $0 < x < 1 \Rightarrow f$ is decreasing for $0 < x < 1 \Rightarrow f(x) > f(1) = 0$ for $0 < x < 1$.

5. $\frac{dy}{dx} = 3x^2$, we need x such that $3x^2 = \frac{8+1}{2+1} = \frac{9}{3} = 3$ $\Rightarrow x^2 = 1$ so $x = 1$ or -1. Thus two points are $(-1, -1)$ and $(1, 1)$.

6. $$f'(x) = 4x - \frac{1}{x}$$

The function f increases if $4x - \frac{1}{x} > 0$ *i.e.* $x > 1/2$

The function f decreases if $4x - \frac{1}{x} < 0$ *i.e.* $0 < x < \frac{1}{2}$

7. f is differentiable function, so the critical points are given by $f'(x) = 0$

   $f'(x) = 3x^3 - 3x^2 - 18x = 3x\,(x + 2)\,(x - 3)$

   The critical points of f are 0, –2, 3 but only 0, 3 $\in$ [–1 4].

8. $3x^2 \dfrac{dx}{dy} = 12 \Rightarrow \dfrac{dx}{dy} = \dfrac{4}{x^2}$. We need $\left|\dfrac{dx}{dy}\right| > 1$

   $\Rightarrow \dfrac{4}{x^2} > 1 \Rightarrow x^2 < 4, x \neq 0 \Rightarrow x \in (-2, 2) \sim \{0\}$.

9. For $\dfrac{x^2}{k^2} + \dfrac{y^2}{4} = 1$, $\dfrac{dy}{dx} = \dfrac{-4x}{k^2 y}$ and for $y^3 = 16x$,

   $\dfrac{dy}{dx} = \dfrac{16}{3y^2}$. For orthogonality $\left(\dfrac{-4x}{k^2 y}\right)\left(\dfrac{16}{3y^2}\right) = -1$

   $\Rightarrow \quad 64x = 3k^2 y^3 = 48k^2 x$

   $\Rightarrow \quad k^2 = \dfrac{4}{3} \Rightarrow k = \dfrac{2\sqrt{3}}{3}$

10. $g'(t) = 0 \Rightarrow 8 - 4t^3 = 0 \Rightarrow t^3 = 2$ so $t = 2^{1/3}$ but $2^{1/3} \notin [-2, 1]$. Now $g(-2) = -32$, $g(1) = 7$ So –32 in the least value.

Level 1

11. Let $h(x) = \tan^{-1} x - \dfrac{x}{1+x^2}$, $h'(x) = \dfrac{1}{1+x^2} - \dfrac{1}{x^2+1} + \dfrac{2x^2}{(x^2+1)^2} > 0$ for all x. For $x > 0$ $h(x) > h(0) = 0$

    $\Rightarrow f(x) > g(x)$ on $(0, \infty)$

12. $f(2) = f(3) = f(4) = f(5) = f(6) = 0$,

    so, by Rolle's theorem applied on [2, 3], [3, 4], [4, 5], [5, 6] there are $x_1 \in (2, 3)$, $x_2 \in (3,4)$, $x_3 \in (4, 5)$, $x_4 \in (5, 6)$ such that $f'(x_i) = 0$, $i = 1, 2, 3, 4$. Since f' is polynomial of degree 4 so cannot have five roots.

13. $f'(x) = (x - 3)^4\,(x + 1)^3\,(9x - 7)$

    For $x < -1$, $f'(x) > 0$ and for $-1 < x < 0$, $f'(x) < 0$. $x = -1$ is a point of maxima.

14. $\dfrac{dy}{dx} = \tan\theta$, so equation the equation of normal is $y - a(\sin\theta - \theta\cos\theta) = -\cot\theta(x - a(\cos\theta + \theta\sin\theta)$ which simplifies to $x\cos\theta + y\sin\theta = a$. The distance of the normal from origin is $|\,a\,|$.

15. Apply Rolle's theorem to show that the given equation cannot have two real distinct roots.

16. $\left(\dfrac{dy}{dx}\right)$ $(a/8, a/8) = -1$. The equation of tangent at $(a/8, a/8)$ is $y + x = a/4$. The x and y intercepts of this line both equal $a/4$, so

    $2 = \dfrac{a^2}{16} + \dfrac{a^2}{16} \Rightarrow a = 4$.

17. The slope of tangent to $x^m\, y = b^m$ is $\dfrac{dy}{dx} = -\dfrac{my}{x}$. So the equation of tangent is $Y - y = -\dfrac{my}{x}(X - x)$ which simplifies to $\dfrac{X}{x + \frac{x}{m}} + \dfrac{Y}{y + my} = 1$. Thus the base of the triangle is the X-intercept, $x + x/m$ and the height is the y-intercept, $y + my$. So the area of the triangle is

    $$(1/2)\left(x + \frac{x}{m}\right)(y + my)$$

    $$= \frac{xy\,(1+m)^2}{2m} = \frac{b^m\,(1+m)^2}{2m\,n^{m-1}}$$

    which is constant if $m = 1$.

18. The slope of the tangent is $-x^3/y^3$ and its equation is $\dfrac{X}{a^4/x^3} + \dfrac{Y}{a^4/y^3} = 1$.

    Thus the required intercepts are $p = a^4/x^3$ and $q = a^4/y^3$ so that

    $p^{-4/3} + q^{-4/3} = a^{-16/3}\,(x^4 + y^4) = a^{-16/3}\,a^4 = a^{-4/3}$

19. $1 - 2\cos x > 0$ if $\cos x < 1/2 \Rightarrow x \in \left(\dfrac{\pi}{3}, \dfrac{5\pi}{3}\right)$.

20. For $x \neq -1, 1$, $\dfrac{dy}{dx} = \dfrac{(x-1)^{2/3} - (x+1)^{2/3}}{3(x^2-1)^{2/3}} = 0$ only at $x = 0$. $y(0) = 2$, $y(-1) = y(1) = 2^{1/3}$, so the greatest value of y is 2.

21. $f'(x) = 4x - \dfrac{1}{x} = \dfrac{4x^2 - 1}{x} = \dfrac{(2x-1)\,(2x+1)x}{x^2}$

	$2x - 1$	$2x + 1$	x	$f'(x)$
$x < -1/2$	–	–	–	–
$-1/2 < x < 0$	–	+	–	+
$0 < x < 1/2$	–	+	+	–
$x > 1/2$	+	+	+	+

    Thus f increases on $[-1/2, 0] \cup [1/2, \infty]$.

22. Let (x, y) be any point on $y = \dfrac{e^x + e^{-x}}{2}$

$U = S^2$ = square of distance of (x, y) from $(0, 0)$

$$= x^2 + \frac{e^{2x}+e^{-2x}}{4} + \frac{1}{2}$$

$$\frac{dU}{dx} = 2x + \frac{e^{2x}-e^{-2x}}{2} = 0 \text{ for } x = 0$$

and $\frac{d^2U}{dx^2} > 0$ at $x = 0$. Hence S^2 is min for $x = 0$ and min $S^2 = \frac{1}{2}+\frac{1}{2} = 1$.

23. $2x + 2y\frac{dy}{dx} - 2 - 2\frac{dy}{dx} = 0 \Rightarrow \left.\frac{dy}{dx}\right|_{(2,2)} = -1$
Required equation of normal is $y - 2 = (x - 2)$ $\Rightarrow$ $y = x$.

24. Let $g(x) = \frac{f(x)}{x} \cdot g'(x) = \frac{xf'(x)-f(x)}{x^2}$.
Let $h(x) = x f'(x) - f(x)$, $h'(x) = xf''(x) > 0$
So $h(x) > h(0) = 0$ for $x > 0'$. Hence $g'(x) > 0$, $x > 0$ g increases on $(0, \infty)$.

25. If α and β are real and distinct roots of $x^3 - 12x + k = 0$. Then $f(x) = x^3 - 12x + k$ satisfies $f(\alpha) = f(\beta) = 0$ then there $\gamma \in [\alpha, \beta] \subseteq [0, 2]$ such that $f'(\gamma) = 0$ i.e., $3v^2 - 12 = 0 \Rightarrow \gamma = \pm 2$. Not possible.

26. $f'(x) = 8x^{1/3} - x^{-2/3} = \frac{8x-1}{x^{2/3}} = 0$ if $x = 1/8$
$f(1) = 3$, $f(-1) = 6 + 3 = 9$, $f\left(\frac{1}{8}\right) = -9/8$ thus max $f = 9$.

27. $f'(x) = 4x^3 - 18x^2 + 24x - 8$, $f''(x) = 12x^2 - 36x + 24 = 12(x^2 - 3x + 2) = 12(x - 1)(x - 2)$, $f''(x) = 0 \Rightarrow x = 1, 2$
If $x = 1$ then $y = 2$. If $x = 2$, $y = 3$. So equation of tangent at $(1, 2)$ is $y - 2 = f'(1)(x - 1) = 2(x - 1)$. Equation of the tangent at $(2, 3)$ is $y - 3 = f'(2)(x - 2) = 0$.

28. The odd degree has at least one real root if the equation has at two real roots then by Rolle's theorem there is $\gamma \in [\alpha, \beta]$ such that $6\gamma^2 - 6\gamma + 6 = 0 \Rightarrow \gamma^2 - \gamma + 1 = 0$ which is not possible for $\gamma \in \mathbf{R}$.

29. $f(x) = (x - 2)(x - 1)^4 \Rightarrow f'(x) = (x - 1)^4 + 4(x - 1)^3(x - 2) = (x - 1)^3(5x - 9)$ so for $1 < x < 9/5$, $f'(x) < 0$ and for $x > 9/5$, $f'(x) > 0$. Thus $x = 9/5$
f has local minimum $f(9/5) = -\frac{1}{5}\left(\frac{4}{5}\right)^4$.

30. $f(x) = \begin{cases} x^2+2x+2, & -1/2 \le x \le 0 \\ x^2-2x+2, & 0 < x \le 3/2 \end{cases}$
and $f'(1) = 0$
$f'(0)$ doesn't exist. Since $f(0) = 2$, $f(-1/2) = 5/4$, $f(3/2) = 5/4$, $f(1) = 1$ so Max. $f(x) = 2$ and min $f(x) = 1$.

31. The function is not differentiable at $x = 0$ and $x = 1$. Now

$$f(x) = \begin{cases} \frac{x-1}{x^2} & x \ge 1 \\ \frac{1-x}{x^2}, & x < 1 \\ & x \ne 0 \end{cases} \Rightarrow f'(x) = \begin{cases} \frac{-x+2}{x^3} \text{ if } x > 1 \\ \frac{x-2}{x^3}, \text{ if } & x < 1 \\ & x \ne 0 \end{cases}$$

so we get a third critical point $x = 2$.

32. The derivative of the function, $x^x(\log x + 1)$, is negative when $\log < -1$ i.e., when $x < e^{-1}$.

33. $y'(x) = 1 - e^x$ is positive when $e^x < 1$ i.e., when $x < 0$

34. $3 = f(1) = 1 + p + q$ and $f'(1) = 0 \Rightarrow 2 + p = 0$ $\Rightarrow p = -2$, $q = 4$.

35. Let $f(x) = ax^3 + bx^2 + cx + d$, $a \ne 0$, $f''(x) = 6ax + 2b$, $f''(x) = 0$
$\Rightarrow x = \frac{-b}{3a}$ $f'''(x) = 6a \ne 0$. So only one point of inflection.

36. $f(x) = \begin{cases} 4\tan^{-1} x & \text{if } -1 \le x \le 1 \\ 4\tan^{-1} x - \pi & \text{if } x > 1 \\ 4\tan^{-1} x + \pi & \text{if } x < -1 \end{cases}$
So max $f(x) = 4\frac{\pi}{2} - \pi = \pi$

37. $\left.\frac{dy}{dx}\right|_{(m^2, -m^3)} = -\frac{3m}{2}$ The equation of normal at $(m^2, -m^3)$ is $Y + m^3 = (2/3m)(X - m^2)$. Simplifying we have $Y = (2/3m)X - (2m/3 + m^3)$ which is identical with $y = 2mx - 2m^3$ if $m^2 = 2/3$.

38. $f'(x) = 2\cos x - 2\sin 2x = 2\cos x(1 - 2\sin x) > 0$
if (i) $\cos x > 0$, $\sin x < 1/2$ (ii) $\cos x < 0$, $\sin x > 1/2$
i.e., if $x \in (0, \pi/6) \cup (3\pi/2, 2\pi)$ or $x \in (\pi/2, 5\pi/6)$.
So f increases on $(0, \pi/6) \cup (\pi/2, 5\pi/6)$.

39. $f'(x) = \sec^2 x - \operatorname{cosec}^2 x = \frac{\sin^2 x - \cos^2 x}{\sin^2 x \cos^2 x} = \frac{-\cos 2x}{\sin^2 x \cos^2 x}$ $f'(\pi/4) = 0$, $f'(3\pi/4) = 0$. For $0 < x < \pi/4$, $f'(x) < 0$ and for $\pi/4 < x < \pi/2$, $f'(x) > 0$. Min $f(x) = f(\pi/4) = 2$.

40. $f'(x) = 12x(x^2 - x + 1)$, $f'(x) = 0$ only for $x = 0$.

41. Distance of (t^2, t) on $y^2 = x$ from $y - x - 1 = 0$ is $\frac{|t-t^2-1|}{\sqrt{2}} = \frac{t^2-t+1}{\sqrt{2}} + 1$. This is minimum if $t = 1/2$. So the shortest distance $= 3\sqrt{2}/8$.

42. $f'(x) = 3(x - (a + 1))\,(x - (a - 1)) = 0 \Rightarrow x = a \pm 1$.
$a - 1 \in (-2, 4) \Rightarrow a \in (-1, 5)$, $a + 1 \in (-2, 4) \Rightarrow a \in (-3, 3)$

43. $y = \tan A \tan (\pi/3 - A) = \dfrac{x(\sqrt{3} - x)}{1 + \sqrt{3}x}$, where $x = \tan A$.

$\dfrac{dy}{dx} = \dfrac{-(\sqrt{3}x - 1)\,(x + \sqrt{3})}{(1 + \sqrt{3}x)^2}$. As $0 < A < \pi/3$, $x = \tan A > 0$

$\dfrac{dy}{dx} = 0 \Rightarrow x = \dfrac{1}{\sqrt{3}} \cdot \dfrac{dy}{dx} > 0$ for $0 < x < \dfrac{1}{\sqrt{3}}$ and is < 0 for $x > \dfrac{1}{\sqrt{3}}$. So $y_{\max} = y = \left(x = 1/\sqrt{3}\right) = 1/3$.

44. $f(x) = -x \log x$, for $0 < x < 1$, and $f'(x) = -(1 + \log x)$. So $f'(x) = 0 \Rightarrow x = e^{-1}$. It is easy to see max $f(x) = f(e^{-1}) = e^{-1}$.

45. $f(x) = \log_x (1/9) - \log_3 x^2 = -\dfrac{\log 9}{\log x} - \dfrac{2\log x}{\log 3}$

$f'(x) = \dfrac{2((\log 3)^2 - (\log x)^2)}{x(\log x)^2 \log 3}$ so $f'(x) = 0 \Rightarrow \log x = \pm \log 3$
$\Rightarrow x = 3$ or $1/3$. One can see by first derivative test that max $f(x) = f(3) = -4$.

46. Applying Lagrange's mean value theorem there is $c \in (1, 6)$ such that $\dfrac{f(6) - +(1)}{5} = f'(c) \ge 2$
$\Rightarrow f(6) \ge f(1) + 10 = 8$.

47. $f'(x) = 3[(\sin^{-1} x)^2 - (\cos^{-1} x)^2]\sqrt{1 - x^2}$
$f'(x) = 0 \Rightarrow \sin^{-1} x = \cos^{-1} x$ or $\sin^{-1} x = -\cos^{-1} x$ but
$\sin^{-1} x + \cos^{-1} x = \pi/2$ so $\sin^{-1} x = \cos^{-1} x \Rightarrow \sin^{-1} x = \pi/4$
$\Rightarrow x = 1/\sqrt{2}$. Thus $f(1/\sqrt{2}) = \pi^3/32$.

48. $f'(x) = \log x + 4$ so $f'(x) > 0$ if $\log x > -4$ i.e., $x > e^{-4}$.

49. $f'(x) = (2 - x)xe^{-x}$. $f'(x) = 0 \Rightarrow x = 0, 2$
For $0 < x < 2$, $f'(x) > 0$ and for $x > 2$, $f'(x) < 0$
So max $f(x) = f(2) = 4e^{-2}$.

50. $f(x) =$

$$\begin{cases} 6 - 3x & , x \le -2 \\ 10 - x & , \ 2 < x \le 3 \\ 4 + x & , 3 < x \le 5 \\ 3x - 6 & , x > 5 \end{cases} \qquad \min f(x) = f(3) = 7.$$

51. f is not differentiable at $x = 0$. For $x \ne 0$, $f'(x) = 2 - 3x^{-1/3}$. So $f'(x) = 0$
$\Rightarrow x = \dfrac{27}{8} > \dfrac{10}{3}$, hence $f'(x)$ is never zero, for $x \ne 0$.

Now $f(-1) = -3$, $f(0) = 2$

$f(10/3) = \dfrac{26}{3} - 3\left(\dfrac{10}{3}\right)^{2/3} > 0$ but is less then 2.

Hence absolute minimum is $f(-1)$ and absolute maximum is $f(0)$.

52. $f(x) = \displaystyle\lim_{n \to \infty} \frac{x^n - 1}{x^n + 1} = \begin{cases} -1, & \text{if} \quad 0 \le x < 1 \\ 1, & \text{if} \quad x > 1 \\ 0, & \text{if} \quad x = 1 \end{cases}$

$g'(x) = f(x)$. Hence g has local minimum at $x = 1$.

53. $f'(x) = \cos x - \sin x = 0 \Rightarrow x = n\pi + \pi/4$
$f''(x) = -\sin x - \cos x = -(\sin x + \cos x)$

$$f''\left(n\pi + \frac{\pi}{4}\right) = (-1)^{n+1}\left(\sin\frac{\pi}{4} + \cos\frac{\pi}{4}\right)$$
$$= (-1)^{n+1}\sqrt{2}$$

If n is even then $f(x)$ has maxima and if n is odd then $f(x)$ has minima.

54. Let $f(x) = xe^{x(1-x)}$, we can write
$f'(x) = -(x - 1)(2x + 1)\,e^{x(1-x)}$
since $e^{x(1-x)} > 0\ \forall\, x \in \mathbf{R}$ so
$f'(x) < 0$ for $x < -1/2$; $f'(x) > 0$ for $-1/2 < x < 1$ and is < 0 for $x > 1$.
Thus $f(x)$ increases on $[-1/2, 1]$

55. Equation tangent at $P(c, e^c)$ is $y - e^c = e^c\,(x - c)$ (1)
The equation of line joining $(c + 1, e^{c+1})$ and (c^{-1}, e^{c-1}) is

$$y - e^{c+1} = \frac{1}{2}\,(e^{c+1} - e^{c-1})\,(x - c - 1) \qquad (2)$$

Subtracting (2) from (1)
$e^c\,(e - 1) =$

$$e^c\left[(x - c)\left\{1 - \frac{1}{2}\left(e - e^{-1}\right)\right\} + \frac{1}{2}\left(e - e^{-1}\right)\right]$$

$$\Rightarrow e - 1 = (x - c)\left[1 - \frac{1}{2}\left(e - e^{-1}\right)\right] + \frac{1}{2}\left(e - e^{-1}\right)$$

$$\Rightarrow c - x = \frac{e + e^{-1} - 2}{e - e^{-1} - 2} > 0 \quad \Rightarrow \quad x < c$$

Thus two lines meet on the left of $x = c$.

56. Consider $f(x) = x^{1/x}$

$$f'(x) = x^{1/x}\left(\frac{1 - \log x}{x^2}\right)$$

f has local maximum at $x = e$
Since $\pi > e$ and f decreases on (e, ∞) so $f(\pi) < f(e) \Rightarrow \pi^e < e^\pi$.

57. Applying Lagrange's mean value on $[x, y]$, we have $c \in (x, y)$ such that

$$f'(c) = \frac{f(y) - f(x)}{y - x}$$

$| f(y) - f(x) | = | f'(c) | \, | y - x | \le M \, | y - x |$
(if $| f'(x) | \le M$)
and $| f'(y) - f(x) | \ge M \, | x - y |$ (if $|f'(x) | \ge M$)
Putting $f(x) = \cot x$, $f'(x) = -\operatorname{cosec}^2 x$, $| f'(x) | \ge 1$
Hence $| \cot x - \cot y | \ge | x - y |$

58. $f'(x) = 2 \cos x - 2 \sin 2x = 2 \cos x (1 - 2 \sin x)$
Now determine the sign of $f'(x)$ on $[0, 2\pi]$.

59. $f(x) = \pi/4 - \tan^{-1} x \;\Rightarrow\; f'(x) = -\dfrac{1}{1+x^2} < 0$ for all x. So the greatest value is $f(0) = \pi/4$ and least value is $f(1) = 0$.

60. $f'(x) = \dfrac{1 - \log x}{(\log x)^2}$.

Level 2

61. $f'(x) = (2/3)(x - 2)^{-1/3}(2x + 1) + 2(x - 2)^{2/3}$

$= \left(\dfrac{10}{3}\right)(x - 1)(x - 2)^{-2/3}$

$f'(x) = 0 \Rightarrow x = 1$ also $f'(x)$ does not exist at $x = 2$, hence the critical points are $x = 1$ and

$x = 2$.

62. $f(-2) = 1$

63. $f'(x) = \dfrac{1}{1+x^2} - \dfrac{1}{2x} = \dfrac{-(1-x)^2}{\left(1+x^2\right)2x} < 0$

for $x > 0$ i.e. f decreases on $\left[1/\sqrt{3}, \sqrt{3}\right]$
Therefore, the greatest value is $f\left(1/\sqrt{3}\right)$

$= \tan^{-1} \dfrac{1}{\sqrt{3}} - \dfrac{1}{2} \log \dfrac{1}{\sqrt{3}} = \dfrac{\pi}{6} + \dfrac{1}{4} \log 3.$

64. $\dfrac{x^2}{9} - \dfrac{y^2}{4} = 1 \Rightarrow \dfrac{2x}{9} - \dfrac{y}{2}\dfrac{dy}{dx} = 0 \Rightarrow \dfrac{dy}{dx} = \dfrac{4x}{9y}$

The tangent will be perpendicular to $2y + 5x = 10$ if $\dfrac{4x}{9y} \times \left(\dfrac{-5}{2}\right) = -1 \Rightarrow 10x = 9y$

Substituting the value of x in $\dfrac{x^2}{9} - \dfrac{y^2}{4} = 1$, we have $\left(\dfrac{9}{100} - \dfrac{1}{4}\right) y^2 = 1$, which is not possible. Thus there is no point on the curve at which the tangent is perpendicular to $2y + 5x = 10$.

65. $$f'(x) = \begin{vmatrix} 1 & 0 & 0 \\ ab & x+b^2 & bc \\ ac & bc & x+c^2 \end{vmatrix} + \begin{vmatrix} x+a^2 & ab & ac \\ 0 & 1 & 0 \\ ac & bc & x+c^2 \end{vmatrix} + \begin{vmatrix} x+a^2 & ab & ac \\ ab & x+b^2 & bc \\ 0 & 0 & 1 \end{vmatrix}$$

$= (x + b^2)(x + c^2) - b^2c^2 + (x + a^2)(x + c^2)$
$- a^2 c^2 + (x + a^2)(x + b^2) - a^2 b^2$
$= 3x^2 + 2(a^2 + b^2 + c^2) x$
$= x (3x + 2(a^2 + b^2 + c^2))$

f decreases if $x < 0$ and $x > -\dfrac{2}{3}(a^2 + b^2 + c^2)$
i.e. on $((-2/3)(a^2 + b^2 + c^2), 0)$.

66. Let 'a' be the part of log in the channel of width 27 m and 'b' be the part of log in the channel of width 64 m.

So $l = a + b$

$= 27 \operatorname{cosec} \theta + 64 \sec \theta$

$\dfrac{dl}{d\theta} = -27 \operatorname{cosec} \theta \cot \theta + 64 \sec \theta \tan \theta$

$\dfrac{dl}{d\theta} = 0 \Rightarrow \tan \theta = \dfrac{3}{4}$

One can verify that $\dfrac{d^2l}{d\theta^2} < 0$ for $\theta = \tan^{-1} \dfrac{3}{4}$

$\max l = 27 \times \dfrac{5}{3} + 64 \times \dfrac{5}{4} = 125.$

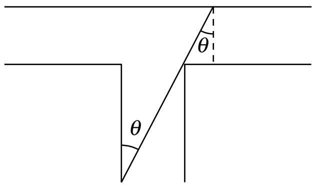

Fig. 11.7

67. $f'(x) = \sin a \tan^2 x \sec^2 x + (\sin a - 1) \sec^2 x$

$= \sec^2 x (\sin a \tan^2 x + (\sin a - 1))$

Since $\sec^2 x \neq 0$ so $\tan^2 x = \dfrac{1 - \sin a}{\sin a}$

Now $a \in [\pi, 2\pi]$ so $\sin a < 0$. Hence L.H.S. is ≥ 0 but R.H.S. < 0. Thus there is no critical point.

68. The derivative of $f(x)$ is $(4a - 3) + (a - 7) \cos x$. It is

zero when $\cos x = \dfrac{4a-3}{7-a} \Rightarrow \left|\dfrac{4a-3}{7-a}\right| \le 1$

$$\Rightarrow -1 \le \frac{4a-3}{7-a} \le 1 \Rightarrow a - 7 \le 4a - 3 \le 7 - a$$

i.e. when $a \ge -4/3$ or $a \le 2$. Hence the interval when f has no critical points are $(-\infty - 4/3]$ and $[2, \infty)$.

69. $f'(x) = 3\left(1 - \frac{\sqrt{21-4b-b^2}}{b+1}\right) x^2 + 5 > 0$ if

$$x^2 > \frac{-5}{3\left(1 - \frac{\sqrt{21-4b-b^2}}{b+1}\right)} \text{ if}$$

$$1 - \frac{\sqrt{21-4b-b^2}}{b+1} > 0$$

which is trivially true if $b + 1 < 0$ i.e. $b < -1$

If $b + 1 > 0$ then

$(b + 1)^2 > 21 - 4b - b^2 \Rightarrow (b - 2)(b + 5) > 0$

i.e. $b > 2$ or $b < -5$

so $b \in [2, 3]$.

70. Any point on the ellipse is given by $(a \cos \theta, b \sin \theta)$

Also $\frac{dy}{dx} = -\frac{b^2x}{a^2y} = \frac{-b}{a} \cot \theta$

The equation of tangent at $(a \cos \theta. b \sin \theta)$ is $Y - b \sin \theta = \frac{-b}{a} \cot\theta (X - a \cos \theta)$

This tangent cuts the coordinate axes at the points $\left(0, \frac{b}{\sin\theta}\right)$ and $\left(\frac{a}{\cos\theta}, 0\right)$

The area of the triangle formed by the tangent and the coordinate axes is

$$A = \frac{1}{2}\frac{ab}{\sin\theta\cos\theta} = ab \operatorname{cosec} 2\theta$$

But $\operatorname{cosec} 2\theta$ is smallest when $\theta = \pi/4$

$A_{\min} = ab.$

71. Let $f(x) = x - \log(1 + x)$. The domain of f is $(-1, \infty)$. $f'(x) = 1 - \frac{1}{1+x} = \frac{1+x-1}{1+x} = \frac{x}{1+x}$. Since $1 + x > 0$ for $x \in$ dom f so $f'(x) > 0$ if $x > 0$ and $f'(x) < 0$ for $(-1, 0)$. Thus f increases $(0, \infty)$. Morever, $f(0) = 0$. Hence $f(x) \ge f(0) = 0 \Rightarrow x \ge \log(1 + x)$ for $x \in (0, \infty)$.

For $x \in (-1, 0)$, f decreases so

$f(x) \ge f(0)$. Hence $x \ge \log(1 + x)$ on $(-1, \infty)$.

72. $2^{(x^2-3)^2} + 27 \ge 28$ and the value 28 is attained at $x = \sqrt{3}$. Hence the minimum value of $2^{(x^2-3)^2} + 27$ is 28.

73. $f(x) = \begin{cases} -x & -2 < x < 0 \\ 1 & x = 0 \\ x & 0 < x < 2 \end{cases}$

f is not continuous at $x = 0$. Morever

$f(0) > f(a)$ for $a \in (-1/2, 1/2) \sim \{0\}$. f has local maximum at $x = 0$.

74. $f'(x) = e^{x(1-x)} + x(1 - 2x)e^{x(1-x)}$

$= (1 + x - 2x^2)e^{x(1-x)} = -(x - 1)(2x + 1)e^{x(1-x)}$

Since $e^{x(1-x)} > 0$ for all x, so $f'(x) > 0$ if and only if $(x - 1)(1 + 2x) < 0$ i.e $-1/2 = \min(1, -1/2) < x < \max(1, -1/2) = 1$.

Thus f increases on $[-1/2, 1]$.

75. Clearly $f(0) = f(1) = 0$. For f to be continuous on $[0, 1]$, we must have $\lim\limits_{x\to 0+} x^{\alpha} \log x = 0$. This is possible only if $\alpha > 0$. Thus $\alpha = 1/2$ is only such value.

76. Let h be the height of cone, then the radius r of the cone satisfies $r^2 = 3 - h^2$

$V = \frac{1}{3}\pi(3 - h^2)h$ so $\frac{dV}{dh} = \frac{1}{3}\pi(-3h + 3)$

$\frac{dV}{dh} = 0 \Rightarrow h = 1$. Also $\frac{d^2V}{dh^2} = -\pi < 0$

so $V_{\max} = \frac{1}{3}\pi(3 - 1) = \frac{2\pi}{3}$.

77. Any point on the ellipse is of the form $(4 \cos \theta, 3 \sin \theta)$, $0 \le \theta \le 2\pi$. Area A of a rectangle inscribed in the ellipse $= 4 \times 4 \cos\theta \times 3 \sin \theta = 24 \sin 2\theta$. This will be maximum when $2\theta = \pi/2$ or $\theta = \pi/4$. Hence the dimensions of the ellipse are

$2 \cdot 4 \cdot \frac{1}{\sqrt{2}}$ and $2 \cdot 3 \cdot \frac{1}{\sqrt{2}}$ i.e. $2\sqrt{8}$ and $3\sqrt{2}$.

78. $y' = 4ax^3 + 3bx^2 + 2cx + d$

$y'' = 12ax^2 + 6bx + 2c$, $y'' = 0$ should have real distinct roots. This is true if $36b^2 - 96ac > 0$

i.e. $3b^2 - 8ac > 0$.

79. $f(x) = |x^2 - 3x + 2|$

$= -(x^2 - 3x + 2)$, $3/2 \le x \le 7/4$

$f'(x) = -(2x - 3)$. So the critical points are

3/2, 7/4 . $f(3/2) = \dfrac{1}{4}$, $f(7/4) = \dfrac{3}{16}$. Thus

$f(x) \geq \dfrac{3}{16}$. So $m = \dfrac{3}{16}$

80. We are looking for $x \in [0, \pi]$ for which $|(1/2)x - \sin x|$ is maximum.

$$S = \begin{cases} (1/2)x - \sin x & \text{if } (1/2)x \geq \sin x \\ \sin x - (1/2)x & \text{if } \sin x < (1/2)x \end{cases}$$

$\dfrac{dS}{dx} = 1/2 - \cos x = 0 \Rightarrow \cos x = 1/2 \Rightarrow x = \pi/3$

Thus critical points are $x = 0, \pi/3, \pi$. $S(0) = 0$,

$S(\pi/3) = \dfrac{\sqrt{3}}{2} - \dfrac{\pi}{6}$, $S(\pi) = \dfrac{\pi}{2}$. Thus

$S_{\max} = \pi/2$ at $x = \pi$.

81. $2ax + 2h\left(x\dfrac{dy}{dx} + y\right) + 2\,by\,\dfrac{dy}{dx} = 0$

$\Rightarrow \dfrac{dy}{dx} = -\dfrac{ax + hy}{hx + by}$

The tangent will be || to Y-axis if $hx + by = 0$

82. $\dfrac{dy}{dx} = \tan\alpha - \dfrac{ax}{u^2\cos^2\alpha}$. The tangent will be parallel to $y = x$ if $\tan\alpha - \dfrac{ax}{u^2\cos^2\alpha} = 1$

$\Rightarrow x = \dfrac{(\tan\alpha - 1)\,u^2\cos^2\alpha}{a}$

$= \dfrac{u^2}{a}(\sin\alpha - \cos\alpha)\cos\alpha$

The corresponding ordinate is given by

$y = \dfrac{u^2}{a}(\sin\alpha - \cos\alpha)\cos\alpha\tan\alpha$

$- \dfrac{a}{2u^2\cos^2\alpha}\dfrac{u^4}{a^2}(\sin\alpha - \cos\alpha)^2\cos^2\alpha$

$= \dfrac{u^2}{a}\left[\sin^2\alpha - \sin\alpha\cos\alpha - \dfrac{1}{2}(1 - 2\sin\alpha\cos\alpha)\right]$

$= \dfrac{u^2}{a}(\sin^2\alpha - 1/2)$

According to given condition

$\dfrac{u^2}{a}(\sin^2\alpha - 1/2) = \dfrac{u^2}{4a}$.

$\Rightarrow \sin^2\alpha = 3/4$

83. $f(x) = \begin{cases} 1 - x + a, & x \leq 1 \\ 2x + 3, & x > 1 \end{cases}$

If $f(x)$ has local minimum at $x = 1$, then $f(1) \leq f(1 + h)$, $h > 0$ i.e. $a \leq 2\,(1 + h) + 3$

Hence $a \leq 5$. So $a = 5$.

84. $f'(x) = \lim\limits_{h\to0}\dfrac{f(x+h) - f(x)}{h}$

$= \lim\limits_{h\to0}\dfrac{f(x) + f(h) + 2xh - 1 - f(x)}{h}$

$= \lim\limits_{h\to0}\dfrac{f(h) - f(0)}{h} + 2x$

(Putting $x = y = 0$ we obtain $f(0) = 1$)

$= f'(0) + 2x = 2\,(x + 1)$

$f(x) = (x + 1)^2 + C$. Putting $x = 0$, we obtain $C = 0$. Thus $f(x) = (x + 1)^2$. But $g'(x) = f(x) = (x + 1)^2 > 0$ so g increases on $(-\infty, \infty)$ in particular on $(0, \infty)$.

85. $\dfrac{dy}{dx} = -\dfrac{x}{y}$, $\left.\dfrac{dy}{dx}\right|_{(1,\sqrt{3})} = -\dfrac{1}{\sqrt{3}}$

Equation of tangent at $(1, \sqrt{3})$ is
$Y - \sqrt{3} = \left(1/\sqrt{3}\right)(X - 1)$

This will intersect X – axis at (4, 0). Equation of the normal at $(1, \sqrt{3})$ is

$Y - \sqrt{3} = \sqrt{3}\,(X - 1)$

This will intersect X-axis at (0, 0) so the required area of the triangle

$= \dfrac{1}{2}4\sqrt{3} = 2\sqrt{3}$.

86. $y' = \dfrac{x^2 - 2x + 3 - 2(x-1)^2}{(x^2 - 2x + 3)^2} = \dfrac{-(x-1)^2 + 2}{(x^2 - 2x + 3)^2}$

$y' = y\ 0$ for $x = 1 \pm \sqrt{2}$

$y' > 0$ for $1 < x < 1 + \sqrt{2}$ and $y' < 0$ for $x > 1 + \sqrt{2}$

$y_{\max} = y\left(1 + \sqrt{2}\right)$. Similarly $y_{\min} = y\left(1 - \sqrt{2}\right)$

$y\left(1 + \sqrt{2}\right) = \dfrac{\sqrt{2}}{4}$ and $y\left(1 - \sqrt{2}\right) = -\dfrac{\sqrt{2}}{4}$.

87. Equation of tangent at any point (x_1, y_1) is
$xx_1 + yy_1 = 16$

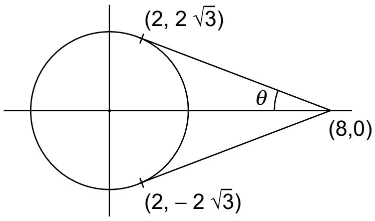

Fig. 11.8

This passes through (8, 0) if $8x_1 = 16$ i.e. $x_1 = 2$ so $y_1 = 2\sqrt{3}$. The slope of tangent is $-\sqrt{3}$.

Therefore $\theta = \pi/6$ and $2\theta = \pi/3$.

88. For $x \neq -2$,

$$f'(x) = \frac{2}{3}(x+2)^{-1/3}(2x-1) + (x+2)^{2/32}\,2$$

$$= \frac{(10/3)(x+1)}{(x+2)^{1/3}}$$

$f'(x) = 0 \Rightarrow x = -1$ clearly f is not differentiable at $x = -2$. Thus the critical points are – 1, – 2.

89. $$f'(x) = \frac{\log(e+x) \times \frac{1}{\pi + x} - \log(\pi + x) \times \frac{1}{e+x}}{(\log(e+x))^2}$$

$$= \frac{\log(e+x)\times(e+x) - (\pi+x)\log(\pi+x)}{(\pi+x)(e+x)(\log(e+x))^2}$$

Since log function is an increasing function and $e < \pi$, $\log(e+x) < \log(\pi + x)$

$\Rightarrow (e + x)\log(e + x) < (e + x)\log(\pi + x) < (\pi + x)\log(\pi + x)$ for all $x > 0$. Thus $f'(x) < 0$ for all $x > 0$.

$\Rightarrow f$ decreases on $[0, \infty)$.

90. $2(1 + b) = 32 \Rightarrow l + b = 16$.

Area of rectangle $A = lb = l(16 - l)$

$\frac{dA}{dl} = 16 - 2l$ so $\frac{dA}{dl} = 0 \Rightarrow l = 8$

$\frac{dA}{dl} = -2 < 0$. Thus A is maximum when $l = 8$.

91. $$f'(x) = -\frac{1}{1+x^2} + \frac{1}{2x} = \frac{(1-x)^2}{(1+x^2)2x} > 0 \text{ for } x \in (1, \sqrt{3})$$

f increases on $[1, \sqrt{3}]$. The greatest value of f is equal to $f(\sqrt{3}) = \cot^{-1}\sqrt{3} + \frac{1}{2}\log\sqrt{3}$

$$= \frac{\pi}{6} + \frac{1}{4}\log 3.$$

92. $2y\frac{dy}{dt} = 4\frac{dx}{dt}$. According to the given condition

$\left.\frac{dy}{dt}\right|_{(7,6)} = 3$. So

$2 \times 6 \times 3 = 4\frac{dx}{dt} \Rightarrow \frac{dx}{dt} = 9$ unit/s.

93. $2(l + b) = 24 \Rightarrow l + b = 12$

$\frac{dl}{dt} + \frac{db}{dt} = 0$. If $\frac{dl}{dt}$ is 1 cm/s

then $\frac{db}{dt} = -1$. $\frac{dA}{dt} = l\frac{db}{dt} + b\frac{dl}{dt} = b - l$

$\frac{dA}{dt}$ will start decreasing if $b - l \le 0$ but $b + l = 12$ so $l = 6$.

94. $V = \pi r^2 h \Rightarrow \frac{dV}{dt} = \pi r^2 \frac{dh}{dt}$

$\Rightarrow \frac{dh}{dt} = -\frac{3}{\pi r^2}$.

95. $\frac{dA}{dt} = l\frac{db}{dt} + b\frac{dl}{dt}$

$\left.\frac{dA}{dt}\right|_{l = 12, b = 5} = 12 \times 2 + 5 \times (-2) = 14.$

96. Let $g(x) = f(x) - x^2$. As f is twice differentiable so g is also twice differentiable.

Also

$g(1) = f(1) - 1^2 = 1 - 1 = 0$

$g(2) = f(2) - 2^2 = 2^2 - 2^2 = 0$

$g(3) = f(3) - 3^2 = 3^2 - 3^2 = 0$

By Rolle's theorem $\exists\ \alpha \in (1, 2)$ and $\beta \in (2, 3)$ such that $g'(\alpha) = 0$, $g'(\beta) = 0$.

Again applying Rolle's theorem $\exists\ \gamma \in (\alpha, \beta)$ such that $g''(\gamma) = 0$

As $\alpha \in (1, 2)$, $\beta \in (2, 3)$, $(\alpha, \beta) \subset (1, 3)$

$g''(\gamma) = f''(\gamma) - 2 = 0 \Rightarrow f''(\gamma) = 2$

So there is some $x \in (1, 3)$ such that $f''(x) = 2$.

97. Equation of tangent at $P(x, y)$

$Y - y = f'(x)(X - x)$

so $A = \left(x - y\dfrac{1}{f'(x)}, 0\right)$ and $B = (0, y - x f'(x))$.

$3{:}1 = BP{:}AP$

$= \sqrt{x^2 + x^2(f'(x))^2} : \sqrt{y^2/(f'(x))^2 + y^2}$

$$\frac{9}{1} = \frac{x^2(1+(f'(x))^2)}{y^2(1+(f'(x))^2)} \quad (f'(x))^2 = \frac{x^2(f'(x))^2}{y^2}$$

$$\Rightarrow 9\frac{y^2}{x^2} = (f'(x^2)) \Rightarrow 3\frac{y}{x} = \pm\frac{dy}{dx}$$

$$\Rightarrow \frac{x^3}{y} = \text{Const or } x^3y = C$$

Since $f(1) = 1$, so Const $= 1$

Thus the curve is either $x^3 = y$ or $x^3y = 1$. The last curve passes through $(2, 1/8)$

98. f is a differentiable function and

$$f'(x) = 3x^2 + 2bx + c$$

$$= 3\left[\left(x + \frac{b}{3}\right)^2 + \frac{c}{3} - \frac{b^2}{9}\right]$$

$$= 3\left[(x + b/3)^2 + \frac{3c - b^2}{9}\right]$$

Since $b^2 < c < 3c$ so $3c - b^2 > 0$ and hence

$f'(x) > 0$ i.e. f is strictly increasing on **R**.

Previous Years' AIEEE/JEE Questions

1. Let $f(x) = \dfrac{1}{3}ax^3 + \dfrac{1}{2}bx^2 + cx \cdot$

Note that f is continuous and differentiable on **R**. We have

$f(0) = 0$ and $f(1) = \dfrac{a}{3} + \dfrac{b}{2} + c = 0$.

$\therefore$ By the Rolle's theorem $\exists\ \alpha \in (0, 1)$ such that $f'(\alpha) = 0$.

i.e. $a\alpha^2 + b\alpha + c = 0$.

2. $$\frac{dx}{dt} = a\cos t - b\cdot\frac{a}{b}\cos\left(\frac{at}{b}\right) = a\left[\cos t - \cos\frac{at}{b}\right]$$

$$\frac{dy}{dt} = -a\sin t + b\cdot\frac{a}{b}\sin\left(\frac{at}{b}\right) = a\left[\sin\frac{at}{b} - \sin t\right]$$

$$\Rightarrow \frac{dy}{dx} = \frac{\sin\frac{at}{b} - \sin t}{\cos t - \cos\frac{at}{b}} = \frac{2\cos\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\sin\left(\left(\frac{a}{b}-1\right)\frac{t}{2}\right)}{-2\sin\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\sin\left(\left(1-\frac{a}{b}\right)\frac{t}{2}\right)}$$

$$= \cot\left(\frac{a}{b}+1\right)\frac{t}{2}$$

Equation tangent at any point is

$$Y - \left(a\cos t - b\cos\frac{at}{b}\right)$$

$$= \cot\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\left(X - \left(a\sin t - b\sin\frac{a}{b}t\right)\right) \qquad \text{(i)}$$

Distance of origin from (i) is

$$S = \left|\frac{\left(a\cos t - b\cos\frac{at}{b}\right) - \cot\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\left(a\sin t - b\sin\frac{a}{b}t\right)}{\sqrt{1+\cot^2\left(\frac{a}{b}+1\right)\frac{t}{2}}}\right|$$

$$= \left|\sin\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\left(a\cos t - b\cos\frac{at}{b}\right) - \cos\left(\left(\frac{a}{b}+1\right)\frac{t}{2}\right)\left(a\sin t - b\sin\frac{a}{b}t\right)\right|$$

$$= \left|a\sin\left(\left(\frac{a}{b}+1\right)\frac{t}{2} - t\right) - b\sin\left(-\frac{a}{b}t + \left(\frac{a}{b}+1\right)\frac{t}{2}\right)\right|$$

$$= \left|a\sin\left(-\frac{t}{2} + \frac{a}{b}\frac{t}{2}\right) + b\sin\left(\frac{t}{2}\frac{a}{b} - \frac{t}{2}\right)\right|$$

$$= \left|(a+b)\sin\left(\frac{a}{b}\frac{t}{2} - \frac{t}{2}\right)\right|$$

So the maximum value of S is $a + b$.

3. $f'(x) = 6x^2 - 18ax + 12a^2 = 6(x^2 - 3ax + 2a^2)$

$f''(x) = 6(2x - 3a)$. According to the given condition $f'(p) = 0\ f'(q)$ and $f''(p) < 0$, $f''(q) > 0$.

$p + q = 3a$, $pq = 2a^2$. Since $p^2 = q$, so $p^3 = 2a^2$ and $p + p^2 = 3a$ and $p < \dfrac{3a}{2}$ and $q > \dfrac{3a}{2}$. $p = \dfrac{-1 \pm \sqrt{1+12a}}{2}$

thus $\left(\dfrac{-1 \pm \sqrt{1+12a}}{2}\right)^3 = 2a^2$. Clearly $a = 2$ satisfy this equation as for $a = 1$, $1/2$, 3 the L.H.S. is irrational and R.H.S. is a rational number.

4. We have

$$u = \sqrt{\frac{a^2+b^2}{2} + \frac{a^2-b^2}{2}\cos 2\theta} + \sqrt{\frac{a^2+b^2}{2} - \frac{a^2-b^2}{2}\cos 2\theta}$$

Squaring, we get

$$u^2 = a^2 + b^2 + 2\sqrt{\left(\frac{a^2+b^2}{2}\right)^2 - \left(\frac{a^2-b^2}{2}\right)^2 \cos^2 2\theta}$$

Thus, $\max (u^2) = a^2 + b^2 + 2\left(\frac{a^2+b^2}{2}\right)$

$= 2(a^2 + b^2)$

and $\min (u^2) = a^2 + b^2 + 2\sqrt{\left(\frac{a^2+b^2}{2}\right)^2 - \left(\frac{a^2-b^2}{2}\right)^2}$

$= a^2 + b^2 + 2ab = (a + b)^2$

$\therefore \max (u^2) - \min (u^2) = (a - b)^2.$

5. $f''(x) = 6(x - 1) \Rightarrow f'(x) = 3(x - 1)^2 + C_1$

But $f'(x)]_{(2,\,1)} = \left.\frac{dy}{dx}\right]_{(2,1)} = 3$

$\therefore 3 = 3(2 - 1)^2 + C_1 \Rightarrow C_1 = 0$

Thus, $f'(x) = 3(x - 1)^2$

$\Rightarrow f(x) = (x - 1)^3 + C_2$

As $y = f(x)$ passes through $(2, 1)$

$1 = (2 - 1)^3 + C_2 \Rightarrow C_2 = 0$

$\therefore f(x) = (x - 1)^3$

6. $\frac{dx}{d\theta} = -a \sin \theta,\ \frac{dy}{d\theta} = a \cos \theta$

$\therefore \frac{dy}{dx} = \frac{-a\cos\theta}{a\sin\theta} \Rightarrow$ slope of normal at θ is $\frac{\sin\theta}{\cos\theta}$.

Thus, equation of normal at θ is

$y - a \sin \theta = \frac{\sin\theta}{\cos\theta}[x - a(1 + \cos \theta)]$

This clearly passes through $(a, 0)$

7. If $f(x) = 3x^2 - 2x + 1$, then

$f'(x) = 6x - 2 = 6\left(x - \frac{1}{3}\right) < 0$ for $x < \frac{1}{3}$

Thus, $f(x)$ decreases on the interval $(-\infty, 1/3]$.

If $f(x) = x^3 + 6x^2 + 6$,

$f'(x) = 3x^2 + 12x = 3x (x + 4) > 0$ if $x < -4$

$\Rightarrow f(x)$ increases on $(-\infty, -4]$

If $f(x) = x^3 - 3x^2 + 3x + 3$, then

$f'(x) = 3x^2 - 6x + 3 = 3(x - 1)^2 \geq 0\ \forall\ x$

$f(x)$ increases on $(-\infty, \infty)$

If $f(x) = 2x^3 - 3x^2 - 12x + 6$, then

$f'(x) = 6x^2 - 6x - 12 = 6(x^2 - x - 2)$

$= 6(x - 2)(x + 1) > 0$ for $x > 2$

$\Rightarrow f(x)$ increases on $[2, \infty)$

8. $x = a(\cos \theta + \theta \sin \theta),\ y = a(\sin \theta - \theta \cos \theta)$

$\Rightarrow \frac{dx}{d\theta} = a(-\sin \theta + \sin \theta + \theta \cos \theta) = a\theta \cos \theta$

and $\frac{dy}{d\theta} = a(\cos\theta - \cos \theta + \theta \sin \theta) = a\theta \sin \theta$

$\therefore \frac{dy}{dx} = \frac{\sin\theta}{\cos\theta}$

Equation of normal at θ

$y - a(\sin \theta - \theta \cos \theta) = -\frac{\cos\theta}{\sin\theta}\{x - a(\cos \theta + \theta \sin \theta)\}$

$\Rightarrow x \cos \theta + y \sin \theta = a\{\cos^2 \theta + \theta \cos \theta \sin \theta + \sin^2\theta - \theta \cos \theta \sin \theta\}$

$\Rightarrow x \cos \theta + y \sin \theta = a$

This line is at a distance a from the origin.

9. By the Lagrange's mean value theorem,

$\frac{f(6) - f(1)}{6 - 1} = f'(\alpha)$ for some $\alpha \in (1, 6)$

$\Rightarrow f(6) + 2 = 5f'(\alpha) \geq 10$

$\Rightarrow f(6) \geq 8$

10. Let thickness of ice at time t be r cm. Then volume of ice:

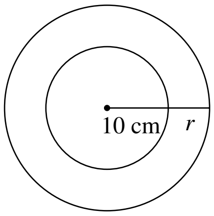

Fig. 11.9

$V = \frac{4}{3}\pi(10 + r)^3 - \frac{4}{3}\pi(10)^3$

$\frac{dV}{dt} = 4\pi(10 + r)^2 \frac{dr}{dt}$

$\Rightarrow -50 = 4\pi(10 + r)^2 \frac{dr}{dt}$

$$\Rightarrow \frac{dr}{dt} = \frac{-50}{4\pi(10+r)^2}$$

$$\Rightarrow \left.\frac{dr}{dt}\right]_{r=5} = \frac{-50}{4\pi(15)^2}$$

$$= -\frac{1}{18\pi}$$

$\therefore$ thickness is decreasing at the rate $\frac{1}{18\pi}$ cm/min.

11. $f'(x) = \frac{1}{2} - \frac{2}{x^2} = \frac{(x-2)(x+2)}{2x^2}$

For local maximum/minimum, set $f'(x) = 0$

$\Rightarrow x = \pm 2$.

As $f'(x) < 0$ for $0 < x < 2$

and $f'(x) > 0$ for $2 < x < \infty$,

$f(x)$ has a local minimum at $x = 2$.

12. $\frac{f(3)-f(1)}{3-1} = f'(c)$

$\Rightarrow \frac{\log_e 3}{2} = \frac{1}{c}$

$\Rightarrow c = 2\log_3 e$

13. $f'(x) = \frac{\cos x - \sin x}{1+(\sin x + \cos x)^2}$

$f'(x) > 0$ if and only if $\cos x > \sin x$

This is true if $x \in \left(-\frac{\pi}{2}, \frac{\pi}{4}\right)$

14. As $f(x) = x^3 - px + q$ has three real and distinct, roots, $f'(x) = 3x^2 - p$ has two distinct zeros by Rolle's theorem.

Now $f'(x) = 0 \Rightarrow x = \pm\sqrt{\frac{p}{3}}$

We have $f'(x) > 0$ if $x < -\sqrt{\frac{p}{3}}$

< 0 if $-\sqrt{\frac{p}{3}} < x < \sqrt{\frac{p}{3}}$

> 0 if $x > \sqrt{\frac{p}{3}}$

Thus $f(x)$ has a local maximum at $x = -\sqrt{\frac{p}{3}}$ and local minimum at $x = \sqrt{\frac{p}{3}}$

15. $P(x) = x^4 + ax^3 + bx^2 + cx + d$

$\Rightarrow P'(x) = 4x^3 + 3ax^2 + 2bx + c$

As $P'(0) = 0$, we get $c = 0$

$\therefore P'(x) = x(4x^2 + 3ax + 2b)$

As $x = 0$ is the only real root of $P'(x) = 0$, roots of $4x^2 + 3ax + 2b = 0$ must be imaginary, therefore

$4x^2 + 3ax + 2b > 0 \ \forall\ x \in \mathbf{R}$

Thus, $P'(x) < 0$ for $x < 0$

> 0 for $x > 0$.

$\therefore x = 0$ is a point of local minimum at $x = 0$.

Graph of $y = P(x)$ is given in Fig. 11.10.

As $P(-1) < P(1)$, we get $P(1)$ is maximum but $P(-1)$ is not minimum of P on $[-1, 1]$.

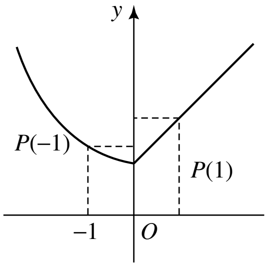

Fig. 11.10

16. f will be continuous at $x = -1$ if

$\Rightarrow \lim_{x\to -1-} f(x) = \lim_{x\to -1+} f(x) = f(-1)$

$\Rightarrow k + 2 = 2(-1) + 3 = k + 2$

$\Rightarrow k = -1$

For this value of k, f is continuous at $x = -1$, $f'(-1)$ does not exist and $f'(x) < 0$ for $x < -1$

and $f'(x) > 0$ for $x > -1$,

therefore, f has a local minimum at $x = -1$.

17. Equation of tangent at (x, y) to the curve $y = f(x)$ is given by

$Y - y = \frac{dy}{dx}(X - x)$

This tangent meets the axes at $A\left(x - y\frac{dx}{dy}, 0\right)$ and $B\left(0, y - x\frac{dy}{dx}\right)$.

We are given mid-point of $AB = (x, y)$

$\Rightarrow \frac{1}{2}\left(x - y\frac{dx}{dy}\right) = x$ and $\frac{1}{2}\left(y - x\frac{dy}{dx}\right) = y$

$\Rightarrow \frac{dx}{x} + \frac{dy}{y} = 0$

$\Rightarrow \log |xy| = c \Rightarrow xy = \pm e^c = A$.

As it passes through (2, 3), we get $6 = A$

$\therefore xy = 6$ or $y = 6/x$

18. Let $g(x) = \tan x - x, -\pi/2 < x < \pi/2$

$\Rightarrow g'(x) = \sec^2 x - 1 = \tan^2 x > 0$ for $-\pi/2 < x < \pi/2$.

Thus, $g(x)$ is a strictly increasing function on $(-\pi/2, \pi/2)$.

Therefore, $\tan x < x$ for $-\pi/2 < x < \pi/2$

$\Rightarrow f(x) = \frac{\tan x}{x} < 1$ for $-\pi/2 < x < \pi/2, x \neq 0$.

$\therefore x = 0$ is a point of maxima.

Also,

$$f'(0) = \lim_{x\to 0} \frac{f(x) - f(0)}{x}$$

$$= \lim_{x\to 0} \frac{\frac{\tan x}{x} - 1}{x}$$

$$= \lim_{x\to 0} \frac{\tan x - x}{x^2} \quad \left[\frac{0}{0}\text{form}\right]$$

$$= \lim_{x\to 0} \frac{\sec^2 x - 1}{2x}$$

$$= \frac{1}{2}\lim_{x\to 0} \frac{(\tan x)^2}{x} = 0$$

Thus, both the statements are true. However, statement-2 is not a correct explanation of statement-1.

19. $f'(x) = \frac{1}{x} + 2bx + a, x \neq 0$.

As $x = -1$ and $x = 2$ are extreme values of f so

$f'(-1) = 0 = f'(2)$

$\Rightarrow -1 - 2b = a = 0$ and $\frac{1}{2} + 4b + a = 0$

Solving we get, $a = \frac{1}{2}$ and $b = -\frac{1}{4}$

So $f'(x) = \frac{1}{x} - \frac{1}{2}x + \frac{1}{2} = -\frac{1}{2x}(x + 1)(x - 2)$

We have

$$\begin{aligned} f'(x) &> 0 \text{ if } x < -1 \\ &< 0 \text{ if } -1 < x < 0 \\ &> 0 \text{ if } 0 < x < 2 \\ &< 0 \text{ if } x > 2 \end{aligned}$$

Thus $f(x)$ has a local maximum at $x = -1$ and $x = 2$

$\therefore$ statement-1 and statement-2 are both true and statement-2 is a correct explanation for the statement-1.

20. Let r be the radius of balloon and V be its volume.

It is given that $\frac{dV}{dt} = -72\pi$

$\Rightarrow \frac{d}{dt}\left(\frac{4}{3}\pi r^3\right) = -72\pi$

$\Rightarrow \frac{4}{3}\pi r^3 = -72\pi t + k$

When $t = 0$, $k = \frac{4}{3}\pi r^3 = V = 4500\pi$

$\therefore \frac{4}{3}\pi r^3 = 4500\pi - 72\pi t$

When $t = 49$, $\frac{4}{3}\pi r^3 = 4500\pi - (72\pi)(49) = 972\pi$

$\Rightarrow r^3 = 729 \Rightarrow r = 9$

Also, $\frac{d}{dt}\left(\frac{4}{3}\pi r^3\right) = -72\pi \Rightarrow 4\pi r^2 \frac{dr}{dt} = -72\pi$

$\frac{dr}{dt} = \frac{-72\pi}{4\pi r^2} = \frac{-18}{r^2} \Rightarrow \left.\frac{dr}{dt}\right|_{r=9} = -\frac{2}{9}$.

21. $C = av + \frac{b}{v}$. According to the given conditions,

$75 = a.30 + \frac{b}{30}$ and $65 = a.40 + \frac{b}{40}$

Solving $a = \frac{1}{2}$, $b = 1800$. Thus

$$C = \frac{1}{2}v + \frac{1800}{v}$$

$\frac{dC}{dv} = \frac{1}{2} - \frac{1800}{v^2}$ so $\frac{dc}{dv} = 0 \Rightarrow v = 60$

$\frac{d^2C}{dv^2} = \frac{3600}{v^3} > 0$. Thus C is minimum when $v = 60$.

22. $S = 4\pi r^2$, $8 = \frac{dS}{dt} = 8\pi r\frac{dr}{dt} \Rightarrow \frac{dr}{dt} = \frac{1}{\pi r}$

$$V = \frac{4}{3}\pi r^3$$

$$\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt} = 4r \text{ so } \frac{dV}{dt}\alpha r.$$

23. Let $f(x) = 2x^3 + 3x + k$

Suppose $\alpha, \beta \in [0, 1]$, $\alpha < \beta$ be such that $f(\alpha) = 0 = f(\beta)$.

As f is differentiable on $[\alpha, \beta]$,

By the Rolle's theorem there exists $r \in (a, b)$ such that $f'(r) = 0 \Rightarrow 6r^2 + 3 = 0$.

But $6r^2 + 3 = 0$ is not true for any real r.

Thus, there is no real value of k, for which $2x^3 + 3x + k = 0$ has two real and distinct roots in $[0, 1]$.

24. $A = \frac{1}{2}pb$, p is the perpendicular and b is the base

$p^2 + b^2 = h^2$ so $A = \frac{1}{2}p\sqrt{h^2 - p^2}$

$$\frac{dA}{dp} = \frac{1}{2}\sqrt{h^2 - p^2} + \frac{1}{4}p\frac{(-2p)}{\sqrt{h^2 - p^2}} = \frac{1}{2}\frac{h^2 - p^2 - p^2}{\sqrt{h^2 - p^2}}$$

$\frac{dA}{dp} = 0 \Rightarrow p = \frac{h}{\sqrt{2}}$. It is easy to see that A is maximum for $p = \frac{h}{\sqrt{2}}$, so $A_{\max} = \frac{1}{2}\frac{h}{\sqrt{2}}\sqrt{h^2 - \frac{h^2}{2}}$

$= \frac{h^2}{4}$.

25. If $f(x) = x \log x$ then $f'(x) = 1 + \log x > 0$ for $x \in [1, 2]$ so f increases on $[1, 2]$. For $g(x) = 2 - x$, $g'(x) = -1$ so g decreases on $[1, 2]$. Therefore $g(x) = f(x)$ for some $x \in [1, 2]$. Hence the statement-1 follows.

26. Let $f(x) = x^2e^x$, $f'(x) = 2xe^x + x^2e^x > 0$ for $x > 0$.

$g(x) = x^2e^{-x}$, $g'(x) = 2xe^{-x} - x^2e^{-x} = (2x - x^2)\, e^{-x}$

$g'(x) > 0$ for $x < 2$ and $g'(x) < 0$ for $x > 2$. Hence g decreases for $x > 2$ and increases on $(0, 2)$. Statement-2 is not true. If $h(x) = x^2(e^x + e^{-x})$ then $h'(x) = 2x(e^x + e^{-x}) + x^2\,(e^x - e^{-x}) > 0$ for $x > 0$. Hence h increases for $x > 0$.

27. Let $F(x) = f(x) - 2g(x)$

$F(0) = f(0) - 2g(0) = 2 - 0 = 2.$

$F(1) = f(1) - 2g(1) = 6 - 4 = 2$

F is continuous on $[0, 1]$ and differentiable on $(0, 1)$ with $F(0) = F(1)$, so by Rolle's theorem there is $c \in (0, 1)$ s. t. $f(c) = 0 \Rightarrow f'(c) = 2g'(c)$.

28. $f'(x) = \frac{\alpha}{x} + 2\beta x + 1$

As $x = -1$ and $x = 2$ are extreme points so $f'(-1) = f'(2) = 0$ i.e.

$-\alpha - 2\beta + 1 = 0$

$\frac{\alpha}{2} + 4\beta + 1 = 0$

Solving $\alpha = 2$, $\beta = -\frac{1}{2}$.

29. $V = \frac{4}{3}\pi r^3$. When $V = 288\pi$ C.C then $288\pi = \frac{4}{3}\pi r^3$

$\Rightarrow r = 6$. Also $\frac{dV}{dt} = 4\pi r^2\frac{dr}{dt} \Rightarrow 4\pi = 4\pi 36\frac{dr}{dt}$

$\Rightarrow \frac{dr}{dt} = \frac{1}{36}$.

30. $f(x) = x^2 + 2bx + 2c^2 = (x + b)^2 + 2c^2 - b^2$ so $\min f(x) = 2c^2 - b^2$. Also $g(x) = -x^2 - 2cx + b^2 = b^2 + c^2 - (x + c)^2 \Rightarrow \max g(x) = b^2 + c^2$

Thus $2c^2 - b^2 > b^2 + c^2$

$\Rightarrow \left|\frac{c}{b}\right| > \sqrt{2} \Rightarrow \left|\frac{c}{b}\right| \in \left(\sqrt{2}, \infty\right)$.

31. Note that f is a strictly increasing function and g is a strictly decreasing function.

Now, $x < x + 1 \Rightarrow g(x) > g(x + 1)$

$\Rightarrow f(g(x)) > f(g(x + 1))$

32. $f(-1) = f(1)$

$\Rightarrow -2 + a - b = 2 + a + b$

$\Rightarrow b = -2$

Also, $f'(c) = 0 \Rightarrow 6c^2 + 2ac + b = 0$

$\Rightarrow \frac{3}{2} + a - 2 = 0 \Rightarrow a = \frac{1}{2}$

Thus, $2a + b = 1 - 2 = -1$

33. $\lim\limits_{x\to 0}\left[1 + \frac{f(x)}{x^2}\right] = 3$

$\Rightarrow \lim\limits_{x\to 0}\frac{f(x)}{x^2} = 2$

$\therefore f(x)$ must be of the form

$f(x) = ax^4 + \text{b}x^3 + 2x^2$

$\Rightarrow f'(x) = 4ax^3 + 3bx^2 + 4x$

As $f(x)$ has extreme values at $x = 1$ and $x = 2$,

$4a + 3b + 4 = 0$

$32a + 12b + 8 = 0$

Solving these we get $a = \frac{1}{2}$, $b = -2$

Thus, $f(2) = \frac{1}{2}(2^4) - 2(2^3) + 2(2^2) = 0.$

34. When $x = 0$, $\sin y = 0 \Rightarrow y = 0$ (since all lines given pass through origin)

$$\cos y \frac{dy}{dx} = \sin\left(\frac{\pi}{3}+y\right) + x\cos\left(\frac{\pi}{3}+y\right)\frac{dy}{dx}$$

When $x = 0$, $y = 0$, therefore

$$\left.\frac{dy}{dx}\right]_{(0,0)} = \sin\left(\frac{\pi}{3}\right) + 0 = \frac{\sqrt{3}}{2}$$

Thus, slope of normal at (0, 0) is $-2/\sqrt{3}$ and its equation is

$$y = \left(-2/\sqrt{3}\right)x \text{ or } 2x + \sqrt{3}y = 0$$

35. Let $m = 0.6$,

$$f'(x) = \frac{(1+x^m)(m)(1+x)^{m-1} - mx^{m-1}(1+x)^m}{(1+x^m)^2}$$

$$= \frac{m(1+x)^{m-1}(1+x^m - x^{m-1} - x^m)}{(1+x^m)^2}$$

$$= \frac{m(1+x)^{m-1}(1-x^{m-1})}{(1+x^m)^2}$$

For $0 < x < 1$, $f'(x) < 0$

as $x^{m-1} = x^{-0.4} = 1/x^{0.4} > 1$ for $0 < x < 1$.

Thus, $f'(x) < 0$ for $0 < x < 1$

$\Rightarrow f(x)$ is strictly decreasing on [0, 1]

$\therefore$ $k = \max f(x) = f(0) = 1$

and $k = \min f(x) = f(1) = 2^{-0.4}$

Hence, $(k, K) = (2^{-0.4}, 1)$

36. If s is the height at any instant, then

$-2g(s - 64) = v^2 - u^2$

where v is the initial speed and v is the speed at that instant.

At the highest point,

$-2(32)(s - 64) = 0 - 48^2$

$$\Rightarrow s = 64 + \frac{48^2}{64} = 100.$$

37. Let $x_1 = x(\pi/4)$ and $y_1 = y(\pi/4)$.

$$\frac{dx}{dt} = -2\sin t + 2\sin t + 2t\cos t = 2t\cos t$$

$$\frac{dy}{dt} = 2\cos t - 2\cos t + 2t\sin t = 2t\sin t$$

$$\therefore \frac{dy}{dx} = \tan t \Rightarrow \left.\frac{dy}{dx}\right]_{t=\pi/4} = 1$$

$\Rightarrow$ slope of normal at $t = \pi/4$ is -1.

Thus, equation of normal at (x_1, y_1) is

$y - y_1 = -(x - x_1)$ or $x + y - (x_1 + y_1) = 0$

Its distance from the origin is

$$d = \frac{|x_1 + y_1|}{\sqrt{2}}$$

$$\text{But } x_1 + y_1 = 2\left(\frac{1}{\sqrt{2}}\right)\left(1+\frac{\pi}{4}\right) + 2\left(\frac{1}{\sqrt{2}}\right)\left(1-\frac{\pi}{4}\right)$$

$$= 2\sqrt{2}$$

$\therefore$ $d = 2$

38. Let coordinates of A be $(k, 0)$ then equation of tangent PA is

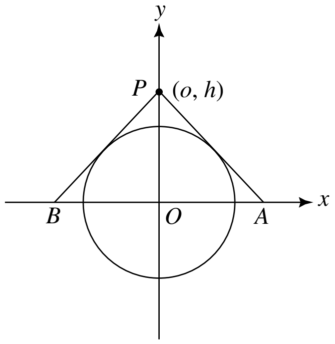

Fig. 11.11

$$\frac{x}{k} + \frac{y}{h} = 1, \text{ where } |h|, |k| > 4.$$

$$\frac{1}{\sqrt{\frac{1}{k^2}+\frac{1}{h^2}}} = 4 \quad (1)$$

$$\Rightarrow \frac{|h||k|}{\sqrt{h^2+k^2}} = 4$$

Let Δ = Area of ΔPAB = 2(area of ΔOAP)

$$= 2\left(\frac{1}{2}\right)(|h|\,|k|) = 4\sqrt{h^2+k^2}$$

$$\text{But from (1), } k^2 = \frac{16h^2}{h^2-16}$$

$$\therefore\ \Delta^2 = 16(h^2 + k^2) = 16\left(h^2 + \frac{16h^2}{h^2 - 16}\right)$$

$$= \frac{16h^4}{h^2 - 16}$$

But Δ is minimum if and only if Δ^2 is, we therefore minimize, Δ^2.

We have

$$\frac{d}{dh}(\Delta^2) = 16\left[\frac{4h^3(h^2 - 16) - h^4(2h)}{(h^2 - 16)^2}\right]$$

$$= \frac{32h^3(h - 4\sqrt{2})(h + 4\sqrt{2})}{(h^2 - 16)^2}$$

As $\frac{d}{dh}(\Delta^2) = 0$ for $h = 4\sqrt{2}$ and $\frac{d}{dh}(\Delta^2) < 0$ if $4 < h < 4\sqrt{2}$ and is > 0 if $h > 4\sqrt{2}$

Thus Δ^2 is minimum when $h = 4\sqrt{2}$.

39. For $x \in (0, \pi/2)$

$1 + \sin x = 1 - \cos(\pi/2 + x)$

$= 2\sin^2(\pi/4 + x/2)$

and $1 - \sin x = 1 + \cos(\pi/2 + x)$

$= 2\cos^2(\pi/4 + x/2)$

$$\therefore\ f(x) = \tan^{-1}\left[\tan\left(\frac{\pi}{4} + \frac{x}{2}\right)\right] = \frac{\pi}{4} + \frac{x}{2}$$

$\Rightarrow f'(x) = 1/2$

An equation of normal to $y = f(x)$ at $x = \pi/6$ is

$$y - \left(\frac{\pi}{4} + \frac{\pi}{12}\right) = -2\left(x - \frac{\pi}{6}\right)$$

$$\Rightarrow y - \frac{\pi}{3} = -2x + \frac{\pi}{3}$$

$\Rightarrow 2x + y = 2\pi/3$

It passes through $(0, 2\pi/3)$

40. Let $E = 4 + \frac{1}{2}\sin^2 2x - 2\cos^4 x$

$$= 4 + \frac{1}{2}\sin^2 2x - \frac{1}{2}(2\cos^2 x)^2$$

$$= 4 + \frac{1}{2}(1 - \cos^2 2x) - \frac{1}{2}(1 + \cos x)^2$$

$$= 4 + \frac{1}{2}(1 + \cos 2x)\,[1 - \cos 2x - 1 - \cos 2x]$$

$$= 4 - \frac{1}{2}(1 + \cos 2x)(2\cos 2x)$$

$$= 4 - \cos 2x - \cos^2 2x$$

$$= \frac{9}{4} - \left(\frac{1}{2} + \cos 2x\right)^2$$

Note that

$m = 0$ when $\cos 2x = 1$

and $M = \frac{9}{4}$ when $\cos 2x = -1/2$.

So $M - m = \frac{9}{4}$.

41. An equation of tangent at $P(4t^2 + 3, 8t^3 - 1)$ is

$$y - (8t^3 - 1) = \frac{24t^2}{8t}(x - (4t^3 + 3)) \text{ as } \frac{dy}{dx} = \frac{24t^2}{8t}$$

It will meet the curve again at

$Q(4t_1^{\,2} + 3, 8t_1^{\,3} - 1)$ if

$8t_1^{\,3} - 8t^3 = 3t[4t_1^{\,2} - 4t^2]$

$\Rightarrow 2(t_1 - t)(t_1^{\,2} + t^2 + tt_1) = 3(t_1 - t)(tt_1 + tt^2)$

$\Rightarrow (t_1 - t)(2t_1^{\,2} - tt_1 - t^2) = 0$

$$\Rightarrow (t_1 - t)(t_1 - t)(2t_1 + t) = 0 \Rightarrow t_1 = t,\ -\frac{1}{2}t.$$

Thus, coordinates of Q are $(t^2 + 3, -t^3 - 1)$

42. $f(x) = \sin^4 x + \cos^4 x$, since f is differentiable and

$f'(x) = 4\sin^3 x\cos x - 4\cos^3 x\sin x$

$= -2\sin x\cos x(\cos^2 x - \sin^2 x)$

$= -\sin(4x) > 0$

$$\forall x \in \left(\frac{\pi}{4}, \frac{\pi}{2}\right)$$

$$\Rightarrow f(x) \text{ increases on } \left]\frac{\pi}{4}, \frac{\pi}{2}\right[$$

43. $$\frac{dy}{dx} = \frac{4}{2\sqrt{4x - 3}} = \frac{2}{\sqrt{4x - 3}} = \frac{2}{3}$$

$\Rightarrow \sqrt{4x - 3} = 3 \Rightarrow x = 3$

For $x = 3$, $y = 1 + \sqrt{(4)(3) - 3} = 4$

The equation of normal at $(3, 4)$ is

$$y - 4 = -\frac{3}{2}(x - 3)$$

It passes through $(1, 7)$.

Previous Years' B-Architecture Entrance Examination Questions

1. $\frac{dy}{dx} = 3x^2 - 8x$. $\left.\frac{dy}{dx}\right|_{(2,-1)} = 12 - 16 = -4$. So the slope of the normal is $\frac{1}{4}$.

2. $\frac{dx}{dt} = 2t$, $\frac{dy}{dt} = 2t - 1 \Rightarrow \frac{dy}{dx} = \frac{2t-1}{2t}$ so tangent line is perpendicular to x-axis if $t = 0$.

3. $f(0) = f(\pi) = 1$. $f'(x) = \cos x\, 4^{\sin x}$ so $f'(c) = 0 \Rightarrow \cos c = 0 \Rightarrow c = \frac{\pi}{2}$.

4. $f(5) = 0$, $f(1) = \sqrt{24}$. $\frac{f(5)-f(1)}{5-1} = \frac{1}{4}\sqrt{24} = \sqrt{\frac{3}{2}}$

   $f'(x) = \frac{-x}{\sqrt{25-x^2}}$ so $f'(c) = \sqrt{\frac{3}{2}} \Rightarrow \frac{c^2}{25-c^2} = \frac{3}{2}$

   $\Rightarrow 2c^2 = 75 - 3c^2 \Rightarrow c^2 = 15$. For $c \in (1, 5)$, we have $c = \sqrt{15}$.

5. $f(x) = \begin{cases} 1-x+a & \text{if} \quad x \le 1 \\ 2x+3 & \text{if} \quad x > 1 \end{cases}$, $f(1) = a$

   So we must have $\lim\limits_{x\to 1+} f(x) \ge a$ i.e. $5 \ge a$ or $a \le 5$

6. $2y = \log(1 + 4x^2) \Rightarrow 2\frac{dy}{dx} = \frac{8x}{1+4x^2}$

   $\Rightarrow \frac{dy}{dx} = \frac{4x}{1+4x^2}$

   Since $4x \le 1 + 4x^2$ so $|m| \le 1$

7. We have $\frac{f(2)-f(0)}{2-0} = f'(c)$ for some $c \in (0, 2)$

   $f(2) = 2f'(c) + f(0) \le 6 - 2 = 4$.

8. $f'(x) = \frac{(x^2+1)(4x^3+6x)-(x^4+3x^2+1)2x}{(x^2+1)^2}$

   $= \frac{2x(x^2(x^2+2)+2)}{(x^2+1)^2}$

   $f'(x) = 0$ for $x = 0$, $f'(x) < 0$, for $x < 0$, $f'(x) > 0$ for $x > 0$

   $f(-1) = \frac{5}{2}$, $f(2) = \frac{29}{5}$, $f(0) = 1$ so the maximum value of f is $\frac{29}{5}$.

9. Equation of normal at any point is $Y - y = -\frac{1}{f'(x)}(X - x)$.

   This passes through (1, 1), so $1 - y = -\frac{1}{f'(x)}(1 - x)$

   $\Rightarrow 1 - y = -\frac{dx}{dy}(1 - x)$

   $\Rightarrow \frac{-(1-y)^2}{2} = \frac{(1-x)^2}{2} + c$

   Since it passes through (3, 1) so

   $0 = 2 + C \Rightarrow C = -2$

   $\Rightarrow (x - 1)^2 + (y - 1)^2 = 4$ which is circle of radius 2 so the area is 4π.

10. $f'(x) = \sin\frac{\pi}{x} - \frac{\pi}{x}\cos\frac{\pi}{x}$, $0 < x \le 1$

    $f'(0)$ does not exist. $f'(x) = 0 \Rightarrow \tan\frac{\pi}{x} = \frac{\pi}{x}$

    Since $0 < x \le 1$ so $\pi \le \frac{\pi}{x} < \infty$. By drawing graph of $\tan x$ and x, we can see that there are infinitely many solutions.

11. Since $1 - x^2$ is a decreasing function and $[x]$ is an increasing function so $f(x) = [1 - x^2]$ is a decreasing function.

12. $\frac{dy}{dt} = \frac{1}{2\sqrt{x}}\frac{dx}{dt}$. If $\frac{dy}{dt} = \frac{dx}{dt}$ then $2\sqrt{x} = 1$

    or $x = \frac{1}{4}$ so $y = \frac{1}{2}$.

13. $2x - 2y\frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{x}{y}$.

    Equation of tangent at (x, y)

    $Y - y = \frac{x}{y}(X - x)$

    So $a_1 = -\frac{y^2}{x} + x = \frac{4}{x}$, $b_1 = y - \frac{x^2}{y} = -\frac{4}{y}$

    Equation of normal at (x, y)

    $Y - y = \frac{y}{x}(X - x)$

    So $a_2 = 2x$, $b_2 = 2y$

    $a_1a_2 + b_1b_2 = \frac{4}{x} \times 2x - \frac{4}{y} \times 2y = 0$.

14. $\dfrac{f(2)-f(0)}{2-0} = f'(c)$ for some $c \in (0, 2)$

$f(2) = f(0) + 2f'(c) \le -3 + 2.5 = 7.$

15. $f\left(\dfrac{\pi}{2}\right) = f\left(-\dfrac{\pi}{2}\right) = -3$. Also $f'(x) =$

$6 \cos x \sin x\ (2 \cos x + 1)\ (\cos x - 2)$

For $x \in \left[-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right]$, $2 \cos x + 1 \ne 0$, $\cos x - 2 \ne 0$ so

$f'(x) = 0 \Rightarrow \sin x = 0 \Rightarrow x = 0.$

$f(0) = 3 - 6 - 6 - 3 = -12$. Hence range of $f(x)$ is $[-12, -3]$.

16. $f'(x) = e^{-x} - xe^{-x} = e^{-x}(1 - x)$, $f'(x) = 0 \Rightarrow x = 1$

$f''(x) = -e^{-x}(1 - x) + e^{-x}(-1)$, $f''(1) = -e^{-1} < 0$

f has maximum at $x = 1$.

17. Area $A(x) = x^2 \Rightarrow \dfrac{dA}{dt} = 2x\dfrac{dx}{dt}$

$\Rightarrow 8 = 2x\dfrac{dx}{dt} = 2x$

$\Rightarrow x = 4 \Rightarrow A = 16$

18. $V = \dfrac{4}{3}\pi r^3 \Rightarrow \dfrac{dV}{dr} = 4\pi r^2$ and $S = 4\pi r^2 \Rightarrow \dfrac{dS}{dr} = 8\pi r$

$\dfrac{dV}{dS} = \dfrac{4\pi r^2}{8\pi r} = \dfrac{1}{2}r$, $\left.\dfrac{dV}{dS}\right|_{r=2} = 1.$

19. $e^y = 1 + x^2 \Rightarrow y = \log(1 + x^2)$, so $m = \dfrac{dy}{dx} = \dfrac{2x}{1+x^2}$

$|m| \le 1 \Rightarrow m \in [-1, 1]$

20. $f(x) = |x \log x| = x\, |\log x| = \begin{cases} -x\log x, & 0 < x \le 1 \\ x\log x, & x > 1 \end{cases}$

$f'(x) = \begin{cases} -(1+\log x), & 0 < x < 1 \\ 1+\log x, & x > 1 \end{cases}$

$f'(x) < 0$ if $1 + \log x > 0$ for $0 < x < 1 \Rightarrow \log x > -1 \Rightarrow x > e^{-1}$ for $0 < x < 1$

So $x \in \left[\dfrac{1}{e}, 1\right]$.

21. By drawing the graph, we get two points of minimum.

22. $f(x) = 2 \sin x + \sin 2x = 2 \sin x + 2 \sin x \cos x$

$= 2 \sin x\ (1 + \cos x)$

$f'(x) = 2 \cos x\ (1 + \cos x) - 2 \sin x \sin x$

$= 2\ [\cos x + \cos^2 x - (1 - \cos^2 x)]$

$= 2\ [2\cos^2 x + \cos x - 1]$

$= 2\ (\cos x + 1)\ (2 \cos x - 1)$

Now, $f'(x) = 0 \Rightarrow x = \pi/3$ ($\because\ 0 < x < \pi$)

We have $f(0) = 0$, $f\left(\dfrac{\pi}{3}\right) = 2\left(\dfrac{\sqrt{3}}{2}\right) + \dfrac{\sqrt{3}}{2} = \dfrac{3}{2}\sqrt{3}$,

and $f(\pi) = 0$.

Thus, maximum value is $\dfrac{3}{2}\sqrt{3}$.

23. $m = \dfrac{dy}{dx} = e^x(\sin x + \cos x)$

$\dfrac{dm}{dx} = 2e^x \cos x = 0 \Rightarrow x = \dfrac{\pi}{2}$

$\dfrac{d^2m}{dx^2} = 2e^x\ (\cos x - \sin x)$

$\left.\dfrac{d^2m}{dx^2}\right]_{x=\pi/2} = 2e^{\pi/2}(-1) < 0$

Thus m is maximum when $x = \pi/2$

24. As $\lim\limits_{x\to 0} \dfrac{p(x)}{x^2} = 1$, $p(x)$ must be of the from

$p(x) = x^2 + ax^3 + bx^4\ \ a, b \in \mathbf{R}$

$p'(x) = 2x + 3ax^2 + 4bx^3$

As $p'(1) = 0$, $p'(2) = 0$, we get

$2 + 3a + 4b = 0$ and $4 + 12a + 32b = 0$

$\Rightarrow 3a + 4b = -2$, $3a + 8b = -1$

$\Rightarrow a = -1$, $b = \dfrac{1}{4}$

$\therefore\ p(4) = 4^2(1 + 4a + 16b) = 16(1 - 4 + 4) = 16$

25. $f'(x) = 3x^2 + 2bx + c$. Discriminant of $f'(x) = 4(b^2 - 3ac) \le 0$

So $f'(x) > 0$ and hence f increases. Since f is continuous and increasing so f is $1 - 1$.

26. $\min(x, x^2) = \begin{cases} x^2 & 0 < x \le 1 \\ x & x > 1 \end{cases}$, $\lim\limits_{h\to 0+} \dfrac{f(1+h)-f(1)}{h} =$

$\lim\limits_{h\to 0+} \dfrac{1+h-1}{h} = 1$

$\lim\limits_{h\to 0-} \dfrac{f(1+h)-f(1)}{h} = \lim\limits_{h\to 0-} \dfrac{(1+h)^2-1}{h} = 2$. So f is not differentiable at $x = 1$.

For $y = x$, $\frac{dy}{dx} = 1$ so $\tan\theta_1 = 1$. For $y = x^2$, $\frac{dy}{dx} = 2x$ so $\left.\frac{dy}{dx}\right]_{x=1} = 2$. $\tan\theta = \frac{2-1}{1+2\times 1} = \frac{1}{3}$

27. f in statement-1 is continuous function on [1, 3] and differentiable on (1, 3) $f(3) = 1 = f(1)$ so Rolle's theorem is applicable. Again the mean value is applicable so statement-2 is true but is not a correct explanation for statement-1.

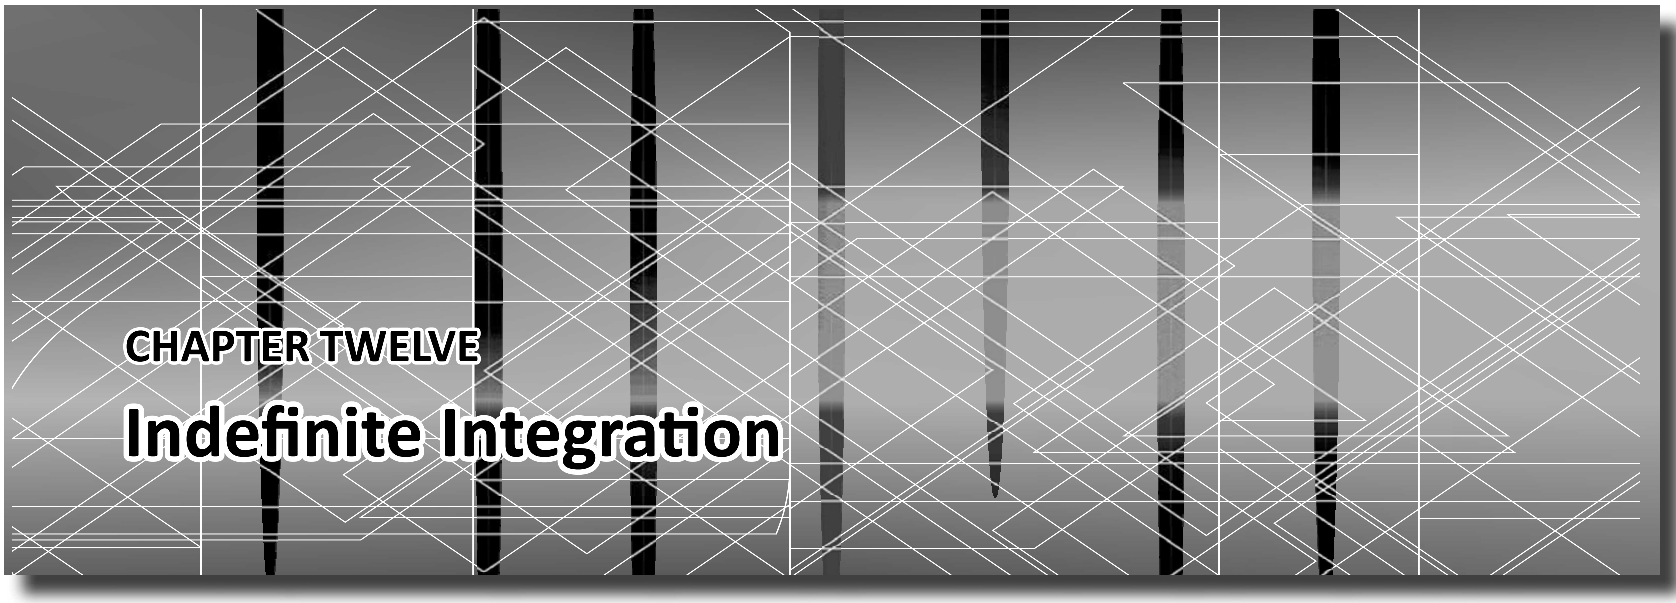
28. f is continuous on [2, 6] and differentiable on (2, 6) being a polynomial also $f(2) = 0 = f(6)$ so by Rolle's theorem there is $c \in (2, 6)$ such that $f'(c) = 0$.

29. $f(x) = a\left(x^2 + \frac{b}{a}x + \frac{c}{a}\right) = a\left(\left(x + \frac{b}{2a}\right)^2 + \frac{c}{a} - \frac{b^2}{4a^2}\right)$

$$= a\left(\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a^2}\right) > 0$$

$f'(x) = 2ax + b$. So $f'(x) > 0$ if $x > -\frac{b}{2a}$ and

$f'(x) < 0$ if $x < -\frac{b}{2a}$.



CHAPTER TWELVE

Indefinite Integration

A function $F(x)$ is an antiderivative of a function $f(x)$ if $F'(x) = f(x)$ for all x in the domain of f. The set of all antiderivatives of f is the indefinite integral of f with respect to x, denoted by

$$\int f(x)\, dx$$

The function f is the integrand of the integral and x is the variable of integration. By mean value theorem, once we have found one antiderivative, the other antiderivative of f differ from F by a constant. We indicate this by

$$\int f(x)\, dx = F(x) + C$$

The constant C is the constant of integration or arbitrary constant.

TABLE OF BASIC FORMULA

S.No.	*f(x)*	$\int f(x)\,dx$*
1.	0	C
2.	$x^n \ (n \neq -1)$	$\frac{1}{n+1} x^{n+1}$
3.	$\frac{1}{x}$	$\log \lvert x \rvert$
4.	e^x	e^x
5.	$a^x \ (a > 0, a \neq 1)$	$\frac{a^x}{\log a}$
6.	$\cos x$	$\sin x$
7.	$\sin x$	$-\cos x$
8.	$\sec^2 x$	$\tan x$
9.	$\operatorname{cosec}^2 x$	$-\cot x$
10.	$\sec x \tan x$	$\sec x$
11.	$\operatorname{cosec} x \cot x$	$-\operatorname{cosec} x$
12.	$\frac{1}{\sqrt{1-x^2}}$	$\sin^{-1} x$ or $-\cos^{-1} x$
13.	$\frac{1}{1+x^2}$	$\tan^{-1} x$ or $-\cot^{-1} x$
14.	$\tan x$	$\log \lvert \sec x \rvert$ or $-\log \lvert \cos x \rvert$
15.	$\cot x$	$\log \lvert \sin x \rvert$ or $-\log \lvert \operatorname{cosec} x \rvert$
16.	$\sec x$	$\log \lvert \sec x + \tan x \rvert$ or $\log \left\lvert \tan\left(\frac{x}{2} + \frac{\pi}{4}\right) \right\rvert$
17.	$\operatorname{cosec} x$	$\log \lvert \operatorname{cosec} x - \cot x \rvert$ or $\log \left\lvert \tan \frac{x}{2} \right\rvert$
18.	$\frac{1}{\sqrt{a^2-x^2}} \ (a \neq 0)$	$\sin^{-1}\left(\frac{x}{a}\right)$
19.	$\frac{1}{\sqrt{x^2+a^2}}$	$\log \left\lvert x + \sqrt{x^2+a^2} \right\rvert$
20.	$\frac{1}{\sqrt{x^2-a^2}}$	$\log \left\lvert x + \sqrt{x^2-a^2} \right\rvert$
21.	$\sqrt{a^2-x^2} \ (a \neq 0)$	$\frac{x}{2}\sqrt{a^2-x^2} +$ $\frac{1}{2} a^2 \sin^{-1}\left(\frac{x}{a}\right)$
22.	$\sqrt{x^2+a^2}$	$\frac{x}{2}\sqrt{x^2+a^2}$ $+ \frac{1}{2} a^2 \log \left\lvert x + \sqrt{x^2+a^2} \right\rvert$
23.	$\sqrt{x^2-a^2}$	$\frac{x}{2}\sqrt{x^2-a^2}$ $- \frac{1}{2} a^2 \log \left\lvert x + \sqrt{x^2-a^2} \right\rvert$
24.	$\frac{1}{x^2-a^2} \ (a \neq 0)$	$\frac{1}{2a} \log \left\lvert \frac{x-a}{x+a} \right\rvert$

*Always add a constant of integration

S.No.	*f(x)*	*∫ f(x) dx**
25.	$\dfrac{1}{a^2 - x^2}$ $(a \neq 0)$	$\dfrac{1}{2a}\log\left\|\dfrac{a+x}{a-x}\right\|$
26.	$\dfrac{1}{a^2 + x^2}$ $(a \neq 0)$	$\dfrac{1}{a}\tan^{-1}\left(\dfrac{x}{a}\right)$
27.	Integration by parts $u(x)\, v(x)$	$v(x) \int u(x)dx -$ $\int\left[\int \dfrac{dv}{dx} \int u(x)\, dx\right] dx$

TIP

Remembering formulae 21, 22 and 23.

$$\int (\text{integrand})\, dx = \frac{x}{2}\,(\text{integrand}) \pm \frac{a^2}{2}\int \frac{dx}{\text{integrand}}$$

Note: Use a^2 or $-a^2$ as given in the integrand.

*Always add a constant of integration

A LIST OF EVALUATION TECHNIQUES

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
1.	$\int f'(x+a)\, dx$	$f(x+a) + C$
2.	$\int f'(ax+b)dx,\ a \neq 0$	$\dfrac{1}{a} f(ax+b) + C$
3.	$\int \dfrac{f'(x)}{f(x)}\, dx$	$\log \|f(x)\| + C$
4.	$\int (f(x))^n f'(x)\, dx,\ n \neq -1$	$\dfrac{1}{n+1} (f(x))^{n+1} + C$
5.	$\int f'(g(x))\, g'(x)\, dx$	$f(g(x)) + C$
6.	$\int \cos mx \cos nx\, dx$	Use product to sum identities $\cos A \cos B = \dfrac{1}{2}[\cos(A-B) + \cos(A+B)]$
	$\int \sin mx \sin nx\, dx$	$\sin A \sin B = \dfrac{1}{2}[\cos(A-B) - \cos(A+B)]$
	$\int \sin mx \cos nx\, dx$	$\sin A \cos B = \dfrac{1}{2}[\sin(A-B) + \sin(A+B)]$
7.	$\int \sin^m x \cos^n x\, dx$ where $m, n \in N$	If m is odd put $\cos x = t$ If n is odd put $\sin x = t$ If both m and n are odd, put $\sin x = t$ if $m \geq n$ and $\cos x = t$ otherwise. If both m and n are even, use power reducing formulae $\sin^2 x = \dfrac{1}{2}(1 - \cos 2x)$ $\cos^2 x = \dfrac{1}{2}(1 + \cos 2x)$

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
		If $m + n$ is a negative even integer, put $\tan x = t$
8.	$\int \frac{a\sin x + b\cos x + c}{p\sin x + q\cos x + r}dx$ $\int \frac{ae^x + be^{-x}}{pe^x + qe^{-x}}\,dx$ ($p, q \neq 0$ and at least one of $a, b \neq 0$)	Write Num = α (DEN) + $\beta\,\frac{d}{dx}$ (DEN) + γ Find α, β and by comparing the coefficients of $\cos x$, $\sin x$ and constant term (or e^x, e^{-x}) write the integral as $\alpha\int dx + \beta\int\frac{\frac{d}{dx}(DEN)}{DEN}dx + \gamma\int\frac{dx}{\text{DEN}}$
9.	$\int \frac{a\tan x + b}{p\tan x + q}\,dx$ $\int \frac{ae^{2x} + b}{pe^{2x} + q}dx$ ($p, q \neq 0$, at least one of $a, b \neq 0$)	Change to $\int \frac{a\sin x + b\cos x}{p\sin x + q\cos x}\,dx$ or $\int \frac{ae^x + be^{-x}}{be^x + qe^{-x}}\,dx$ and use (8) above
10.	$\int \frac{dx}{a\sin x \pm b\cos x}$ (Both $a, b \neq 0$)	Use $a = r\cos\alpha$, $b = r\sin\alpha$ to put the integral in the form $\frac{1}{r}\int\frac{dx}{\sin(x \pm \alpha)}$. Now, use formula for $\int \operatorname{cosec} x\,dx$
11.	$\int\frac{dx}{\sqrt{Q}}$ or $\int\frac{L}{\sqrt{Q}}\,dx$ or $\int\frac{dx}{Q}$ or $\int\frac{L}{Q}\,dx$ or $\int\sqrt{Q}$ or $\int L\sqrt{Q}$ where $L = px + q$, $p \neq 0$ and $Q = ax^2 + bx + c$, $a \neq 0$	Write $Q = a\left(x^2 + \frac{b}{a}x + \frac{c}{a}\right)$ and put $t = x + \frac{b}{2a}$
12.	$\int\sqrt{\frac{L_1}{L_2}}\,dx$ where $L_1 = ax + b$, $a \neq 0$ $L_2 = px + q$, $p \neq 0$	Write as $\int\sqrt{\frac{L_1}{L_1 L_2}}\,dx$ to reduce to form $\int\frac{L}{\sqrt{Q}}\,dx$
13.	$\int\frac{dx}{L\sqrt{Q}}$	Put $L = \frac{1}{t}$ to reduce to form $\int\frac{dx}{\sqrt{Q}}$

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
	where $L = px + q, p \neq 0$ and $Q = ax^2 + bx + c, a \neq 0$	
14.	$\int \frac{\sqrt{Q}}{L}\,dx$ where $L = px + q, p \neq 0$ $Q = ax^2 + bx + c,$ $a \neq 0$	Rewrite the integrand as $\frac{Q}{L\sqrt{Q}}$ Divide Q by L to obtain $Q = L_1\,(L) + \alpha$ where L_1 is a linear expression in x and α is a constant. The integral reduces to $\int \frac{L_1}{\sqrt{Q}}\,dx + \alpha\int \frac{dx}{L\sqrt{Q}}$.
15.	$\int \frac{Q_1}{\sqrt{Q_2}}\,dx$ where $Q_1 = ax_2 + bx + c, a \neq 0$ $Q_2 = px^2 + qx + r, p \neq 0$	Write $Q_1 \equiv \alpha\, Q_2 + \beta\, \frac{d}{dx}\,[Q_2] + \gamma$ Find α, β, γ and write the integral as $\alpha \int \sqrt{Q_2}\,dx + \beta \int \frac{\frac{d}{dx}}{\sqrt{Q_2}}\,[Q_2]\,dx + \gamma \int \frac{dx}{\sqrt{Q_2}}$
16.	$\int \frac{dx}{L_1\sqrt{L_2}}$ where $L_1 = ax + b$ and $L_2 = px + q,$ with $a, p \neq 0, \quad a \neq p.$	Put $L_2 = t^2$
17.	$\int \frac{dx}{Q_1\sqrt{Q_2}}$ where $Q_1 = ax^2 + b, Q_2 = px^2 + q$ with $a, p \neq 0, p \neq 0$	First put $x = 1/t$ and simplify then put $p + qt^2 = u^2$
18.	$\int R(x^{1/p,}\, x^{1/q,}\, x^{1/r} \ldots)\,dx$ where R is a rational function.	Let $l = l\text{cm}\,(p, q, r, \ldots)$ and put $x = t^l$
19.	$\int e^x\,(f(x) + f'(x))\,dx$	Write as $\int e^x f(x)\,dx + \int e^x f'(x)\,dx$ Integrate the first integral just once by parts taking e^x as the second function to obtain $e^x f(x) - \int e^x f'(x)\,dx + \int e^x f'(x)\,dx$ Cancel the last two integrals.
20.	$\int e^{ax} \cos\,(bx + c)\,dx$ or $\int e^{ax} \sin\,(bx + c)\,dx$	Integrate by parts taking e^{ax} as the second function to obtain $\frac{1}{a} e^{ax} \cos\,(bx + c) + \frac{b}{a} \int e^{ax} \cos\,(bx + c)\,dx$ Again integrate by parts taking e^{ax} as the second function and then bring a multiple of $\int e^{ax} \cos\,(bx + c)\,dx$ to the left.

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
21.	$\int \frac{P(x)}{Q(x)}\,dx$ where $P(x)$ and $Q(x)$ are polynomials in x	If deg $P(x) \geq$ deg $Q(x)$ first isolate the quotient $A(x)$ when $P(x)$ is divided by $Q(x)$. Now, $\frac{P(x)}{Q(x)} = A(x) + \frac{B(x)}{Q(x)}$ where deg $B(x) <$ deg $Q(x)$ Now use techniques 22 to 29
22.	$\int \frac{P(x)}{Q(x)}\,dx$ where deg $P(x) <$ deg $Q(x)$ and $Q(x)$ is a product of distinct linear factors, that is, $Q(x) = A(x - \alpha_1)(x - \alpha_2)\dots(x - \alpha_r)$ where $a_i'\,s$ are distinct and $A \neq 0$	Write $\frac{P(x)}{Q(x)} = \frac{A_1}{x-\alpha_1} + \frac{A_2}{x-\alpha_2} + \dots + \frac{A_n}{x-\alpha_n}$ Evaluate $A_i'\,s$ and use $\int \frac{dx}{x-a} = \log\lvert x-a\rvert$
23.	$\int \frac{P(x)}{(x-a)^n}\,dx$ where $n \geq 1$ and $P(x)$ is a polynomial in x.	Put $x - a = t$, express $P(x)$ in terms of t_s and then integrate.
24.	$\int \frac{P(x)\,dx}{(x-a)^m\,(x-b)^n}$ where $m, n \geq 1$, $a \neq b$, and deg $P(x) < m + n$.	Write the integrand as $\frac{A_1}{x-a} + \frac{A_2}{(x-a)^2} + \dots \frac{A_m}{(x-a)^m}$ $+ \frac{B_1}{x-b} + \frac{B_2}{(x-b)^2} + \dots + \frac{B_n}{(x-b)^n}$ Evaluate A_i's and B_j's and the integral.
25.	$\int \frac{P(x)\,dx}{(x-a)(x^2+bx+c)}$ where $b^2 - 4c < 0$ and deg $P(x) < 3$	Write the integrand as $\frac{A}{x-a} + \frac{Bx+C}{x^2+bx+c}$
26.	$\int \frac{x^2+1}{x^4+kx^2+1}\,dx$	Divide the numerator by x^2 to obtain $\int \frac{(1+1/x^2)\,dx}{x^2+1/x^2+k}$ Now, put $x - 1/x = t$

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
27.	$\int \frac{x^2-1}{x^4+kx^2+1}\,dx$	Divide the numerator by x^2 to obtain
		$\int \frac{(1-1/x^2)\,dx}{x^2+1/x^2+k}$ Now, put $x + 1/x = t$
28.	$\int \frac{xP(x^2)}{Q(x^2)}\,dx$	Put $x^2 = t$
	where P and Q are polynomials in x	
29.	$\int \frac{P(x^2)}{Q(x^2)}\,dx$	Put $x^2 = t$
	where P and Q are polynomials in x	for partial fractions *not for integration*
30.	$\int \frac{1}{(x^2+a^2)^n}\,dx = A_n$	Begin with A_{n-1}
	where $n > 1$	$A_{n-1} = \int 1.\frac{1}{(x^2+a^2)^{n-1}}\,dx$
		Integrate by parts and obtain a reduction formula.
31.	$\int R(\sin x, \cos x)\,dx$	Universal substitution
	where R is a rational function	$\tan(x/2) = t$.
	Special Cases	
	(a) If $R(-\sin x, \cos x)$ $= -R(\sin x, \cos x)$	Put $\cos x = t$
	(b) If $R(\sin x, -\cos x)$ $= -R(\sin x, \cos x)$	Put $\sin x = t$
	(c) If $R(-\sin x, -\cos x)$ $= R(\sin x, \cos x)$	Put $\tan x = t$
32.	$\int x^m (a + bx^n)^p\,dx$	
	where m, n, p are rational numbers.	
	(a) p is a positive integer	Expand $(a + bx^n)^p$ by using binomial theorem
	(b) p is a negative integer,	Put $x = t^k$
	$m = \frac{a}{b}, n = \frac{c}{d},$	where $k = l$ cm (b, d)
	$a, b, c, d \in \mathbf{I}, b > 0, d > 0$	
	(c) $\frac{m+1}{n}$ is an integer	Put $a + bx^n = t^s$ where $p = r/s$, $r, s \in \mathbf{I}$, $s > 0$.
	(d) $\frac{m+1}{n} + p$ is an integer	Put $a + bx^n = x^n t^s$ where $p = r/s$, $r, s \in \mathbf{I}$, $s > 0$.

S.No.	*Form of Integrate*	*Value/Evaluation Technique*
33.	$\int \frac{P_n(x)}{\sqrt{ax^2+bx+c}}\,dx$ where $P_n(x)$ is a polynomial of degree n in x.	Write $\int \frac{P_n(x)}{\sqrt{ax^2+bx+c}}\,dx = Q_{n-1}(x)\sqrt{ax^2+bx+c} + k \int \frac{dx}{\sqrt{ax^2+bx+c}}$ where $Q_{n-1}(x)$ is a polynomial of degree $(n-1)$ in x and k is a constant. Differentiate both the sides w.r.t. x and multiplying by $\sqrt{ax^2+bx+c}$ to get the identity $P_n(x) = Q'_{n-1}(x)(ax^2+bx+c) + \frac{1}{2} Q_{n-1}(x)(2ax+b) + k$ Compare coefficients to obtain $Q_{n-1}(x)$ and k.

SOME TIPS FOR SIMPLIFYING COMPUTATIONS

1. In case of $\frac{1}{\sqrt{Q}}$, $\sqrt{Q}$, or $\frac{1}{Q}$, where $Q = ax^2 + bx + c$, the substitution $x + \frac{b}{2a} = t$ may be used instead of completing the square in the quadratic Q.

   If $Q = (x - \alpha)(x - \beta)$ with $\alpha \neq \beta$, then $x - \frac{1}{2}(\alpha + \beta) = t$ can be used.

2. In case of $\frac{L}{\sqrt{Q}}$, $L\sqrt{Q}$ and $\frac{L}{Q}$
   where $L = px + q$ and $Q = ax^2 + bx + c$, $p \neq 0$, $q \neq 0$, the *following steps in unnecessary*
   Express

   $$L = \alpha \frac{d}{dx}[Q] + \beta$$

   The problem can be easily solved by putting

   $$x + \frac{b}{2a} = t$$

3. To evaluate

   $$\int R\left(x, \sqrt{ax^2+bx+c}\right) dx$$

   where R is a rational function of x and

   $$\sqrt{ax^2+bx+c},$$

   we may use the following substitutions.

   (i) $\sqrt{ax^2+bx+c} = t \pm x\sqrt{a}$ if $a > 0$

   (ii) $\sqrt{ax^2+bx+c} = tx \pm \sqrt{c}$ if $c > 0$

   (iii) $\sqrt{ax^2+bx+c} = t(x - \alpha)$
   where α is a real root of $ax^2 + bx + c = 0$

4. To evaluate

   $$I = \int \frac{dx}{a + b\sin x}$$

   we rewrite

   $$I = \int \frac{dx}{a - b\cos(\pi/2 + x)}$$

   and put $\pi/2 + x = \theta$.
   This will lead to simpler computation then direct evaluation.

SOME TIPS FOR PARTIAL FRACTIONS

1. Partial fractions

   $$f(x) = \frac{P(x)}{(x - a_1)\ldots(x - a_n)}$$

   (where deg $P(x) < n$ and $a_1, a_2 \ldots a_n$ are distinct) is given by

   $$\frac{A_1}{x - a_1} + \frac{A_2}{x - a_2} + \ldots + \frac{A_n}{x - a_n}$$

   where

$$A_i = \frac{P(a_i)}{(a_i - a_1)\dots(a_i - a_{i-1})(a_i - a_{i+1})\dots(a_i - a_n)}$$

= value of the expression $(x - a_i) f(x)$ at $x = a_i$.
In other words, A_i is the value obtained by substituting $x = a_i$ everywhere in $f(x)$ except in the factor $x - a_i$.
For instance,

$$\frac{2x-1}{(x-1)(x+1)(x-2)} \equiv \frac{2(1)-1}{(1+1)(1-2)}\frac{1}{x-1}$$

$$+ \frac{2(-1)-1}{(-1-1)(-1-2)}\frac{1}{x+1}$$

$$+ \frac{2(2)-1}{(2-1)(2+1)}\frac{1}{x-2}$$

$$\equiv -\frac{1}{2}\frac{1}{x-1} - \frac{1}{2}\frac{1}{x+1} + \frac{1}{x-2}$$

Justification

There exists one and only polynomial of degree two which takes value 2(1) – 1 or 1 at $x = 1$, 2(– 1) – 1 or – 3 at $x = – 1$ and 2(2) – 1 or 3 at $x = 2$.
Indeed, it is the polynomial*

$$\frac{1\,(x+1)(x-2)}{(1+1)(1-2)} + \frac{(-3)(x-1)(x-2)}{(-1-1)(-1-2)}$$

$$+ \frac{3(x-1)(x-2)}{(2-1)(2+1)}$$

2. If $P(x) = b_0 + b_1 x + \dots + b_n x^n$, the partial fraction of

$$\frac{P(x)}{(x-a_1)\dots(x-a_n)}$$

where, $a_1, a_2, \dots a_n$ are distinct, is given by

$$b_n + \frac{A_1}{x-a_1} + \frac{A_2}{x-a_2} + \dots + \frac{A_n}{x-a_n}$$

where A_i's are given in (1) above for instance, if a, b, c are distinct

$$\frac{x^3}{(x-a)(x-b)(x-c)} \equiv 1 + \frac{a^3}{(a-b)(a-c)}\frac{1}{x-a}$$

$$+ \frac{b^3}{(b-a)(b-c)}\frac{1}{x-b}$$

$$+ \frac{c^3}{(c-a)(c-b)}\frac{1}{x-c}$$

3. To resolve

$$\frac{1}{(x-a)^r (x-b)}$$

where $a \neq b$, put $x - a = y$, so that

$$\frac{1}{(x-a)^r (x-b)} = \frac{1}{y^r (y + a - b)}$$

$$= \frac{1}{(a-b)\,y^r}\left[1 + \frac{y}{a-b}\right]^{-1}$$

Now expand $\left(1 + \dfrac{y}{a-b}\right)^{-1}$ upto y^{r-1} and divide by y^r to obtain

$$\frac{C_0}{y^r} + \frac{C_1}{y^{r+1}} + \dots + \frac{C_{r+1}}{y}.$$

The value $\boldsymbol{C_k}$ is the coefficient of $\dfrac{1}{(x-a)^{r-k}}$.

Coefficient of $\dfrac{1}{x-b}$ is $\dfrac{1}{(b-a)^r}$

For instance, if $x - 1 = y$, then

$$\frac{1}{(x-1)^3 (x-2)} = \frac{1}{y^3 (y-1)} = \frac{1}{y^3}(1-y)^{-1}$$

$$= \frac{1}{y^3}(1 + y + y^2 + \dots)$$

Thus,

$$\frac{1}{(x-1)^3 (x-2)} = \frac{1}{x-2} - \frac{1}{x-1}$$

$$- \frac{1}{(x-1)^2} - \frac{1}{(x-1)^3}$$

Illustration Resolve

$$\frac{1}{(x+1)^3 (x+2)^2}$$

into partial fraction. First, put $x + 1 = y$,

$$\frac{1}{(x+1)^3 (x+2)^2} = \frac{1}{y^3 (y+1)^2}$$

$$= \frac{1}{y^3}(1 - 2y + 3y^2 - \dots)$$

Next, put $x + 2 = z$

$$\frac{1}{(x+1)^3 (x+2)^2} = \frac{1}{z^2 (z-1)^3} = -\frac{1}{z^2}(1 - z)^{-3}$$

$$= -\frac{1}{z^2}(1 + 3z + \dots)$$

Thus,

$$\frac{1}{(x+1)^3 (x+2)^3} = \frac{3}{x+1} - \frac{2}{(x+1)^2} + \frac{1}{(x+1)^3}$$

$$- \frac{3}{x+2} - \frac{1}{(x+2)^2}$$

---

* It is known is Lagranges's interpolation polynomial.

4. To obtain partial fractions of

$$\frac{1}{(x-a)(x-b)(x^2+c^2)}$$

where $a \neq b$.

Coefficients corresponding to $\frac{1}{x-a}$ and $\frac{1}{x-b}$ can be obtained as explained in (1).
For instance, we can write

$$\frac{1}{x(x+1)(x^2+2)} \equiv \frac{1}{2x} - \frac{1}{3(x+1)} + \frac{Ax+B}{x^2+2}$$

To obtain A and B, we rewrite above expression as

$$1 \equiv \frac{1}{2}(x+1)(x^2+2) - \frac{1}{3}x(x^2+2)$$
$$+ (Ax+B)\,x(x+1)$$

Now, A and B can be obtained by comparing coefficients of like powers of x.

SOLVED EXAMPLES

Concept-based Straight Objective Type Questions

Example 1: If $f(x) = \frac{\log x}{x^3}$, then its antiderivative $F(x)$ given by

(a) $C - \frac{1}{2x^2}\log\left(x\sqrt{e}\right)$ (b) $C + \frac{1}{2x^2}\log x$

(c) $C - \frac{1}{2x^2}\log(xe)$ (d) $C + \frac{1}{2x^3}\log(xe)$

Ans. (a)

Solution: $F(x) = \int \frac{\log x}{x^3}\,dx = \log x \int \frac{1}{x^3}\,dx - \int \frac{1}{x}\left(\int \frac{1}{x^3}\,dx\right)dx$ (integration by parts)

$$= -\frac{1}{2x^2}\log x + \frac{1}{2}\int \frac{1}{x^3}\,dx + \text{Constant}$$

$$= -\frac{1}{2x^2}\log x - \frac{1}{4x^2} + C$$

$$= -\frac{1}{2x^2}\left[\log x + \frac{1}{2}\log e\right] + C$$

$$= -\frac{1}{2x^2}\log x\sqrt{e} + C$$

Example 2: The value of $\int \frac{1+\sin x}{1-\sin x}\,dx$ is

(a) $2\tan\left(\frac{x}{2}+\frac{\pi}{4}\right) + C$

(b) $2\tan\left(\frac{x}{2}+\frac{\pi}{4}\right) + x + C$

(c) $2\tan\left(\frac{x}{2}+\frac{\pi}{4}\right) - x + C$

(d) $2\tan^2\left(\frac{x}{2}+\frac{\pi}{4}\right) - x + C$

Ans. (c)

Solution: $\int \frac{1+\sin x}{1-\sin x}\,dx = \int \frac{(1+\sin x)^2}{1-\sin^2 x}\,dx$

$$= \int (\sec x + \tan x)^2\,dx$$

$$= \int \sec^2 x + \int (\sec^2 x - 1)\,dx + 2\int \sec x \tan x\,dx$$

$$= 2\tan x - x + 2\sec x + C$$

$$= 2\left(\frac{1+\sin x}{\cos x}\right) - x + C$$

$$= 2\left(\frac{1-\cos\left(x+\frac{\pi}{2}\right)}{\sin\left(x+\frac{\pi}{2}\right)}\right) - x + C$$

$$= 2\,\frac{2\sin^2\left(\frac{x}{2}+\frac{\pi}{4}\right)}{2\sin\left(\frac{x}{2}+\frac{\pi}{4}\right)\cos\left(\frac{x}{2}+\frac{\pi}{4}\right)} - x + C$$

$$= 2\tan\left(\frac{x}{2}+\frac{\pi}{4}\right) - x + C$$

Example 3: The value of $\int \frac{dx}{\sqrt{4x-3-x^2}}$ is equal to

(a) $\sin^{-1}(x-1) + C$

(b) $\log\left|(x-2) + \sqrt{4x-3-x^2}\right|$

(c) $\log\left|(x-1) + \sqrt{4x-3-x^2}\right| + C$

(d) $\sin^{-1}(x-2) + C$

Ans. (d)

Solution: $\sqrt{4x-3-x^2} = \sqrt{-\left(x^2-4x+3\right)}$

$$= \sqrt{-\left((x-2)^2-1\right)} = \sqrt{1-(x-2)^2}$$

So, $\displaystyle\int \frac{dx}{\sqrt{4x-3-x^2}} = \int \frac{dx}{\sqrt{1-(x-2)^2}} = \sin^{-1}(x-2) + C$

Example 4: $\displaystyle\int \frac{x^4}{x^2+1}\,dx$ is equal to

(a) $\dfrac{x^3}{3} + x + \tan^{-1} x + C$

(b) $\dfrac{x^3}{3} - x + \tan^{-1} + C$

(c) $\dfrac{x^2}{2} - x + 2\tan^{-1} x + C$

(d) $\dfrac{x^3}{3} - x - \tan^{-1} x + C$

Ans. (b)

Solution: Since degree of numerator is greater than the degree of denominator, we divide them

$$\frac{x^4}{x^2+1} = x^2 - 1 + \frac{1}{x^2+1}$$

so $\displaystyle\int \frac{x^4}{x^2+1}\,dx = \frac{x^3}{3} - x + \tan^{-1} x + C$

Example 5: If $\displaystyle\int \frac{2x - \sqrt{\sin^{-1} x}}{\sqrt{1-x^2}}\,dx = C - 2\sqrt{1-x^2} - \frac{2}{3}\sqrt{f(x)}$ then $f(x)$ is equal to

(a) $\sin^{-1}x$ (b) $2\sin^{-1} x$

(c) $(\sin^{-1}x)^3$ (d) $3(\sin^{-1}x)^3$

Ans. (c)

Solution: The integrand is equal to $\dfrac{2x}{\sqrt{1-x^2}} - \dfrac{\sqrt{\sin^{-1} x}}{\sqrt{1-x^2}}$.

The first part is of form $\dfrac{-g'(x)}{\sqrt{g(x)}}$ where $g(x) = (1-x^2)$

and other part is of the form $\sqrt{h(x)}\; h'(x)$, $h(x) = \sin^{-1} x$ Hence the required integral

$C - 2\sqrt{1-x^2} - \dfrac{2}{3}\left(\sin^{-1} x\right)^{3/2}$. Thus $f(x) = (\sin^{-1} x)^3$

Example 6: If $\displaystyle\int \frac{dx}{1+\sqrt[3]{x+1}} = \frac{3}{2}(x+1)^{2/3} - 3(x+1)^{1/3}$ $+ f(x) + C$ then $f(x)$ is equal to

(a) $\log\left|1+\sqrt[3]{x+1}\right|$ (b) $3\log\left|1+\sqrt[3]{x+1}\right|$

(c) $\dfrac{2}{3}\log\left|1+\sqrt[3]{x+1}\right|$ (d) $\dfrac{1}{3}\log\left|1+\sqrt[3]{x+1}\right|$

Ans. (b)

Solution: Put $x + 1 = t^3$, we have

$$\int \frac{dx}{1+\sqrt[3]{x+1}} = \int \frac{3t^2\,dt}{1+t} = 3\int\left(t - 1 + \frac{1}{1+t}\right)dt$$

$$= 3\left[\frac{t^2}{2} - t + \log|1+t|\right] + C$$

$$= \frac{3}{2}(x+1)^{2/3} - 3(x+1)^{1/3} + 3\log\left|1+\sqrt[3]{x+1}\right| + C$$

Example 7: An antiderivative of the integral $\displaystyle\int e^x\left(\frac{1-x}{1+x^2}\right)^2 dx$ is

(a) $e^x(1+x^2)^2$ (b) $\dfrac{-xe^x}{\left(1+x^2\right)^2}$

(c) $\dfrac{e^x(1-x)}{\left(1+x^2\right)^2}$ (d) $\dfrac{e^x}{1+x^2}$

Ans. (d)

Solution: $e^x\left(\dfrac{1-x}{1+x^2}\right)^2 = e^x\left[\dfrac{1}{1+x^2} - \dfrac{2x}{\left(1+x^2\right)^2}\right]$

so $\displaystyle\int e^x\left(\frac{1-x}{1+x}\right)^2 dx$ (see Page 12.4(19))

$$= \int \frac{e^x}{1+x^2}\,dx - \int e^x \frac{2x}{\left(1+x^2\right)^2}\,dx$$

$$= \frac{e^x}{1+x^2} + \int e^x \frac{2x}{\left(1+x^2\right)^2}\,dx - \int e^x \frac{2x}{\left(1+x^2\right)^2}\,dx + C$$

$$= \frac{e^x}{1+x^2} + C$$

Example 8: $\displaystyle\int \frac{3^{x+1} - 7^{x-1}}{21^x}\,dx = K_1\,3^{-x} + K_2 7^{-x} + C$

(a) $K_1 = \dfrac{1}{7\log 3}$, $K_2 = \dfrac{1}{3\log 7}$

(b) $K_1 = \dfrac{1}{7\log 3}$, $K_2 = -\dfrac{1}{3\log 7}$

(c) $K_1 = \dfrac{1}{7\log 3}$, $K_2 = -\dfrac{3}{\log 7}$

(d) $k_1 = \dfrac{3}{\log 7}$, $k_2 = \dfrac{-7}{\log 3}$

Ans. (c)

◎ **Solution:** $\int \frac{3^{x+1} - 7^{x-1}}{21^x} dx = 3\int 7^{-x}\, dx - \frac{1}{7}\int 3^{-x}\, dx$

$$= -\, 3\frac{7^{-x}}{\log 7} + \frac{1}{7}\frac{3^{-x}}{\log 3} + C$$

$$K_1 = \frac{1}{7\log 3},\ K_2 = -\frac{3}{\log 7}$$

◉ **Example 9:** If $\int \cos x \cos 2x \cos 5x\, dx$
$= A_1 \sin 2x + A_2 \sin 4x + A_3 \sin 6x$
$+ A_4 \sin 8x + C$

then

(a) $A_1 = \frac{1}{2}, A_2 = \frac{1}{4}$ (b) $A_1 = \frac{1}{4}, A_2 = \frac{1}{8}$

(c) $A_2 = \frac{1}{16}, A_3 = \frac{1}{8}$ (d) $A_1 = \frac{1}{8}, A_4 = \frac{1}{32}$

Ans. (d)

◎ **Solution:** $(\cos x \cos 2x) \cos 5x$

$$= \frac{1}{2}(\cos x + \cos 3x) \cos 5x$$

$$= \frac{1}{4}[\cos 4x + \cos 6x] + \frac{1}{4}[\cos 2x + \cos 8x]$$

$$= \frac{1}{4}\cos 2x + \frac{1}{4}\cos 4x + \frac{1}{4}\cos 6x + \frac{1}{4}\cos 8x$$

$$\int \cos x \cos 2x \cos 5x\, dx = \frac{1}{8}\sin 2x + \frac{1}{16}\sin 4x + \frac{1}{24}\sin 6x + \frac{1}{32}\sin x + C$$

◉ **Example 10:** If $\int \frac{dx}{1+e^x} = x + \mathrm{K}\log(1+e^x) + C$ then K is equal to

(a) 1 (b) –1
(c) 2 (d) –2

Ans. (b)

◎ **Solution:** Substituting $1 + e^x = t$, we have

$$\int \frac{dx}{1+e^x} = \int \frac{dt}{t(t-1)} = \int \frac{1}{t-1}dt - \int \frac{dt}{t}$$

$$= \log[t-1] - \log t + C$$

$$= \log e^x - \log(1+e^x) + C$$

$$= x - \log(1+e^x) + C$$

LEVEL 1

Straight Objective Type Questions

◉ **Example 11:** Let $f(x) = 1 + 3^x \log 3$ and $F(x)$ be its antiderivative which assume the value 7 for $x = 2$. The value of x for which the curve $F(x)$ cuts the abscissa axis is

(a) 0 (b) 1
(c) 2 (d) 3

Ans. (b)

◎ **Solution:** $F(x) = \int f(x)\,\mathrm{d}x + C = x + 3^x + C$ but $F(2) = 7$ so $7 = 2 + 9 + C$

$\Rightarrow C = -4$. Hence $F(x) = x + 3^x - 4$. Now $F(x) = 0$
$\Rightarrow x = 1$.

◉ **Example 12:** If $f(x) = \frac{1}{\cos^2 x\sqrt{1+\tan x}}$ then its antiderivative $F(x)$ (given that $F(0) = 4$) is

(a) $\sqrt{1+\tan x} + 4$ (b) $\frac{2}{3}(1+\tan x)^{3/2}$

(c) $2\left(\sqrt{1+\tan x} + 1\right)$ (d) none of these

Ans. (c)

◎ **Solution:** $F(x) = \int \frac{\mathrm{d}x}{\cos^2 x\sqrt{1+\tan x}} + C$

$$= \int \frac{1}{\sqrt{1+t}}\,\mathrm{d}t + C\ (t = \tan x)$$

$$= 2(\sqrt{1+t}) + C$$

$$= 2\sqrt{1+\tan x} + C$$

Since $4 = F(0) = 2 + C \Rightarrow C = 2$. Hence

$F(x) = 2\left(\sqrt{1+\tan x} + 1\right)$.

◉ **Example 13:** Let $f(x) = \frac{1}{4 - 3\cos^2 x + 5\sin^2 x}$ and if its antiderivative $F(x) = (1/3)\tan^{-1}(g(x)) + C$ then $g(x)$ is equal to

(a) $3 \tan x$ (b) $(\sqrt{2})\tan x$
(c) $2 \tan x$ (d) none of these

Ans. (a)

◎ **Solution:** $F(x) = \int \frac{\mathrm{d}x}{4 - 3\cos^2 x + 5\sin^2 x} + C$

$$= \int \frac{\sec^2 x \ \mathrm{d}x}{4\left(1 + \tan^2 x\right) - 3 + 5\tan^2 x} + C$$

$$= \int \frac{\mathrm{d}t}{9t^2 + 1} + C \qquad (t = \tan x)$$

$$= \frac{1}{3}\tan^{-1} 3t + C$$

Therefore $g(x) = 3 \tan x$.

◉ **Example 14:** Let $f(x) = \frac{\sqrt{\tan x}}{\sin x \cos x}$ and $F(x)$ is its anti-derivative, if $F(\pi/4) = 6$ then $F(x)$ is equal to

(a) $2\left(\sqrt{\tan x} + 1\right)$ (b) $2\left(\sqrt{\tan x} + 3\right)$

(c) $2\left(\sqrt{\tan x} + 2\right)$ (d) none of these

Ans. (c)

◎ **Solution:** $F(x) = \int \frac{\sqrt{\tan x}}{\sin x \cos x}\mathrm{d}x = \int \frac{\sqrt{\tan x}}{\tan x}\sec^2 x \ \mathrm{d}x$ $(t = \tan x)$

$$= \int \frac{1}{\sqrt{t}}\,\mathrm{d}t + C = 2\sqrt{t} + C = 2\sqrt{\tan x} + C$$

Since $6 = F(\pi/4) = 2 + C$ so $C = 4$. Hence

$$F(x) = 2\left(\sqrt{\tan x} + 2\right)$$

◉ **Example 15:** The value $\int \frac{\mathrm{d}x}{x^4 + 5x^2 + 4}$ is

(a) $(1/3)\tan^{-1} x - (1/2)\tan^{-1}(x/2) + C$
(b) $3\tan^{-1}(x/3) + 2\tan^{-1}(x/2) + C$
(c) $(1/3)\tan^{-1} x + (1/6)\tan^{-1}(x/2) + C$
(d) $(1/3)\tan^{-1} x - (1/6)\tan^{-1}(x/2) + C$

Ans. (d)

◎ **Solution:** $I = \int \frac{\mathrm{d}x}{x^4 + 5x^2 + 4} = \int \frac{\mathrm{d}x}{\left(x^2 + 1\right)\left(x^2 + 4\right)}$

$$= \int \frac{1}{3}\left[\frac{1}{x^2 + 1} - \frac{1}{x^2 + 4}\right]dx$$

Therefore, $I = \frac{1}{3}\tan^{-1} x - \frac{1}{6}\tan^{-1}\frac{x}{2} + C.$

◉ **Example 16:** If $\int \frac{(x - 1)^2}{\left(x^2 + 1\right)^2}\,\mathrm{d}x = \tan^{-1} x + g(x) + K$ then $g(x)$ is equal to

(a) $\tan^{-1}(x/2)$ (b) $\frac{1}{x^2 + 1}$

(c) $\frac{1}{2\left(x^2 + 1\right)}$ (d) none of these

Ans. (b)

◎ **Solution:** $\frac{(x - 1)^2}{\left(x^2 + 1\right)^2} = \frac{x^2 - 2x + 1}{\left(x^2 + 1\right)^2}$

$$= \frac{x^2 + 1}{\left(x^2 + 1\right)^2} - \frac{2x}{\left(x^2 + 1\right)^2}$$

$$= \frac{1}{x^2 + 1} - \frac{2x}{\left(x^2 + 1\right)^2}$$

so $\int \frac{(x - 1)^2}{\left(x^2 + 1\right)^2}\,\mathrm{d}x = \int \frac{dx}{x^2 + 1} - \int \frac{2x}{\left(x^2 + 1\right)^2}\,\mathrm{d}x$

$$= \tan^{-1} x + \frac{1}{x^2 + 1} + K$$

Therefore, $g(x) = \frac{1}{x^2 + 1}$.

◉ **Example 17:** If the antiderivative of $f(x) = \frac{\sin x}{\sin^2 x + 4\cos^2 x}$ is $\left(1/\sqrt{3}\right)\tan^{-1}\left(\left(1/\sqrt{3}\right)g(x)\right) + C$ then $g(x)$ is equal to

(a) $\sec x$ (b) $\tan x$
(c) $\sin x$ (d) $\cos x$

Ans. (a)

◎ **Solution:** $f(x) = \frac{\sin x}{\sin^2 x + 4\cos^2 x} = \frac{\tan x \sec x}{\tan^2 x + 4}$

$$= \frac{\tan x \sec x}{\sec^2 x + 3}.$$

Putting $\sec x = t$, $\mathrm{d}x \sec x \tan x = \mathrm{d}t$ so

$$\int f(x)\,dx = \int \frac{\mathrm{d}t}{t^2 + 3} = \frac{1}{\sqrt{3}}\tan^{-1}\frac{\sec x}{\sqrt{3}} + C.$$

◉ **Example 18:** If $\int \frac{x}{x^2 - 4x + 8}\,\mathrm{d}x = K \log\left(x^2 - 4x + 8\right) + \tan^{-1}\left(\frac{x - 2}{2}\right) + C$ then the value of K is

(a) 1/2 (b) 1

(c) 2 (d) none of these

Ans. (a)

◎ **Solution:** Completing the square, we get

$$x^2 - 4x + 8 = (x - 2)^2 + 4 \text{ so put } x - 2 = u$$

$$\int \frac{x}{x^2-4x+8}\,dx = \int \frac{u+2}{u^2+4}\,du$$

$$= \frac{1}{2}\int \frac{2u}{u^2+4}\,du + 2\int \frac{du}{u^2+4}$$

$$= \frac{1}{2}\log(u^2+4) + \tan^{-1}\frac{u}{2} + C$$

$$= \frac{1}{2}\log(x^2-4x+8) + \tan^{-1}\frac{x-2}{2} + C.$$

Example 19: The value of integral $\int \frac{dx}{x\sqrt{1-x^3}}$ is given by

(a) $\frac{1}{3}\log\left|\frac{\sqrt{1-x^3}+1}{\sqrt{1-x^3}-1}\right| + C$

(b) $\frac{1}{3}\log\left|\frac{\sqrt{1-x^3}-1}{\sqrt{1-x^2}+1}\right| + C$

(c) $\frac{2}{3}\log\left|\frac{1}{\sqrt{1-x^3}}\right| + C$

(d) $\frac{1}{3}\log\left|1-x^3\right| + C$

Ans. (b)

Solution: Put $1 - x^3 = t^2$. Then $-3x^2dx = 2t\,dt$ and the integral becomes

$$-\frac{1}{3}\int\frac{-3x^2\,dx}{x^3\sqrt{1-x^3}} = -\frac{1}{3}\int\frac{2t\,dt}{\left(1-t^2\right)t} = \frac{2}{3}\int\frac{dt}{t^2-1}$$

$$= \frac{2}{3}\left(\frac{1}{2}\log\left|\frac{t-1}{t+1}\right|\right) + C$$

$$= \frac{1}{3}\log\left|\frac{\sqrt{1-x^3}-1}{\sqrt{1-x^3}+1}\right| + C.$$

Example 20: The integral $\int\frac{\cos 4x - 1}{\cot x - \tan x}$ is equal to

(a) $-\frac{1}{2}\cos 4x + C$ (b) $-\frac{1}{4}\cos 4x + C$

(c) $-\frac{1}{2}\sin 2x + C$ (d) none of these

Ans. (d)

Solution: Put $\cos 2x = t$. Then $-2\sin 2x\,dx = dt$ and the integral becomes

$$\int\left(\frac{-2\sin^2 2x}{\cos^2 x - \sin^2 x}\right)\cos x \sin x\,dx$$

$$= -\int\left(\frac{1-\cos^2 2x}{\cos 2x}\right)\sin 2x\,dx$$

$$= \frac{1}{2}\int\frac{1-t^2}{t}\,dt = \frac{1}{2}\left(\log|t| - \frac{t^2}{2}\right) + C$$

$$= \frac{1}{2}\log|\cos 2x| - \frac{1}{4}\cos^2 2x + C.$$

Example 21: The integral $\int e^{\tan^{-1}x}\left(\frac{1+x+x^2}{1+x^2}\right)dx$ is equal to

(a) $\frac{e^{\tan^{-1}x}}{1+x^2} + C$ (b) $\frac{x\,e^{\tan^{-1}x}}{1+x^2} + C$

(c) $x\,e^{\tan^{-1}x} + C$ (d) none of these

Ans. (c)

Solution: Putting $\tan^{-1}x = u$, we have $\frac{dx}{1+x^2} = du$

$$\int e^{\tan^{-1}x}\left(\frac{1+x+x^2}{1+x^2}\right)dx = \int e^u\,(1+\tan u + \tan^2 u)\,du$$

$$= \int e^u\,(\sec^2 u + \tan u)\,du$$

$$= \tan u\, e^u + C = x\,e^{\tan^{-1}x} + C.$$

$$\left(\text{using } \int e^x(f(x)+f'(x)\,dx = e^x f(x) + C\right)$$

Example 22: $\int\frac{dx}{\sqrt{2-3x-x^2}} = fog\,(x) + C$ then

(a) $f(x) = \sin^{-1}x$, $g(x) = \frac{2x-3}{\sqrt{17}}$

(b) $f(x) = \tan^{-1}x$, $g(x) = \frac{2x+3}{\sqrt{17}}$

(c) $f(x) = \sin^{-1}x$, $g(x) = \frac{2x+3}{\sqrt{17}}$

(d) none of these

Ans. (c)

Solution: $\int\frac{dx}{\sqrt{2-3x-x^2}} = \int\frac{dx}{\sqrt{-\left(x^2+3x-2\right)}}$

$$= \int\frac{dx}{\sqrt{-\left((x+3/2)^2 - 17/4\right)}}$$

$$= \int\frac{dx}{\sqrt{17/4 - (x+3/2)^2}}$$

$$= \sin^{-1}\frac{x+3/2}{\sqrt{17}/2} + C = \sin^{-1}\frac{2x+3}{\sqrt{17}} + C$$

Therefore, $g(x) = \frac{2x+3}{\sqrt{17}}$ and $f(x) = \sin^{-1}x$.

Example 23: If $\int \frac{d\,x}{x\sqrt{5\,x^2-3}} = K\tan^{-1} f(x) + C$ then

(a) $f(x) = \sqrt{\frac{5}{3}x^2-1}, K = \frac{1}{\sqrt{5}}$

(b) $f(x) = \sqrt{\frac{5}{3}x^2-1}, K = \frac{1}{\sqrt{3}}$

(c) $f(x) = \frac{1}{2}\sqrt{5\,x^2-3}, K = \frac{1}{\sqrt{5}}$

(d) none of these

Ans. (b)

Solution: Puting $5x^2 - 3 = t^2$ so $5x\,\mathrm{d}x = t\,\mathrm{d}t$

$$\int \frac{\mathrm{d}x}{x\sqrt{5x^2-3}} = \int \frac{x\,\mathrm{d}x}{x^2\sqrt{5x^2-3}} = \frac{1}{5}\int \frac{5t\,\mathrm{d}t}{\left(t^2+3\right)t}$$

$$= \int \frac{\mathrm{d}t}{t^2+3} = \frac{1}{\sqrt{3}}\tan^{-1}\frac{t}{\sqrt{3}} + C$$

$$= \frac{1}{\sqrt{3}}\tan^{-1}\sqrt{\frac{5x^2-3}{3}} + C.$$

Example 24: The value of $\int \frac{\sin x - \cos x}{\sqrt{\sin 2x - 1/2}}\,\mathrm{d}x$ is

(a) $\log|(\sin x + \cos x) + \sqrt{\sin 2x}| + C$

(b) $-\log|(\sin x + \cos x) + \sqrt{\sin 2x - 1/2}| + C$

(c) $-\frac{1}{\sqrt{2}}\log|(\sin x + \cos x) + \sqrt{\sin 2x - 1/2}| + C$

(d) none of these

Ans. (b)

Solution: The given integral can be written as

$$\int \frac{\sin x - \cos x}{\sqrt{(\sin x + \cos x)^2 - 3/2}}\,dx = -\int \frac{\mathrm{d}t}{\sqrt{t^2-3/2}}$$

$(t = \sin x + \cos x)$

$$= -\log\left|t + \sqrt{t^2 - 3/2}\right| + C$$

$$= -\log|\sin x + \cos x + \sqrt{\sin 2x - 1/2}| + C$$

Example 25: If $\int \frac{\cos 4\,x + 1}{\cot x - \tan x} = K\cos 4x + C$, then

(a) $K = -1/2$	(b) $K = -1/8$
(c) $K = -1/5$	(d) none of these

Ans. (b)

Solution: $\int \frac{\cos 4x + 1}{\cot x - \tan x}\,\mathrm{d}x$

$$= \int \frac{2\cos^2 2x}{\cos^2 x - \sin^2 x}\cdot \sin x \cos x\,\mathrm{d}x$$

$$= \int \cos 2x \sin 2x\,\mathrm{d}x = \frac{1}{2}\int \sin 4x\,\mathrm{d}x$$

$$= -\frac{1}{8}\cos 4x + C$$

Hence $K = -1/8$.

Example 26: $\int \frac{e^x(1+\sin x)}{1+\cos x}\,\mathrm{d}x$ is equal to

(a) $\log|\tan x| + C$	(b) $e^x \tan x/2 + C$
(c) $e^x \cot x + C$	(d) $\sin \log x + C$

Ans. (b)

Solution: $\int \frac{e^x(1+\sin x)}{1+\cos x}\,\mathrm{d}x$

$$= \int \frac{e^x\left[1 + 2\sin(x/2)\cos(x/2)\right]}{2\cos^2(x/2)}\,\mathrm{d}x$$

$$= \int e^x\left(\frac{1}{2}\sec^2\frac{x}{2} + \tan\frac{x}{2}\right)\mathrm{d}x$$

$$= \frac{1}{2}\int e^x \sec^2\frac{x}{2}\,\mathrm{d}x + \int e^x \tan\frac{x}{2}\,\mathrm{d}x$$

$$= \frac{1}{2}\int e^x\sec^2\frac{x}{2}\mathrm{d}x + e^x\tan\frac{x}{2} - \frac{1}{2}\int e^x\sec^2\frac{x}{2} + C$$

[integrating by parts]

$$= e^x\tan\frac{x}{2} + C$$

Example 27: If $\int \sqrt{1+\sec x}\,\mathrm{d}x = K\sin^{-1}(f(x)) + C$ then

(a) $f(x) = \sqrt{2}\sin(x/2)$

(b) $f(x) = \sqrt{2}\cos(x/2), K = 2$

(c) $f(x) = \sqrt{2}\tan(x/2), K = 2$

(d) $f(x) = \sqrt{2}\sin(x/2), K = \sqrt{2}$

Ans. (a)

Solution: $\sqrt{1+\sec x} = \sqrt{\frac{1+\cos x}{\cos x}} = \frac{\sqrt{2}\cos x/2}{\sqrt{1-2\sin^2 x/2}}$ so

putting $\sin x/2 = t$, we have

$$\int \sqrt{1+\sec x}\;dx = \int \frac{\sqrt{2}\cos x/2}{\sqrt{1-2\sin^2 x/2}}\,\mathrm{d}x$$

$$= 2\sin^{-1}\sqrt{2}t + C\ (t = \sin x/2)$$

$$= 2\sin^{-1}(\sqrt{2}\sin x/2) + C$$

so $\quad f(x) = \sqrt{2}\sin x/2$ and $K = 2$

Example 28: The antiderivative of $f(x) = \log(\log x) + (\log x)^{-2}$ whose graph passes through (e, e) is

(a) $x(\log(\log x) + (\log x)^{-1})$

(b) $x(-\log(\log x) + (\log x)^{-1}) + e$

(c) $x\,(\log(\log x) - (\log x)^{-1}) + 2e$

(d) none of these

Ans. (c)

◎ **Solution:** An antiderivative of $f(x) = F(x) =$

$$\int (\log(\log x) + (\log x)^{-2})\,\mathrm{d}x + C$$

$$= x \log(\log x) - \int \frac{x}{x \log x}\,\mathrm{d}x + \int (\log x)^{-2}\,\mathrm{d}x + C$$

(integrating by parts the first term)

$$= x \log(\log x) - [x(\log x)^{-1} + \int (\log x)^{-2}\,\mathrm{d}x] + \int (\log x)^{-2}\,\mathrm{d}x + C$$

(again integrating by parts $(\log x)^{-1}$)

$$= x \log(\log x) - x(\log x)^{-1} + C$$

Putting $x = e$, we have $e = 0 - e + C$ so $C = 2e$

Thus $F(x) = x\,(\log(\log x) - (\log x)^{-1}) + 2e$.

● **Example 29:** $\displaystyle\int \frac{\mathrm{d}x}{a^2\cos^2 x + b^2 \sin^2 x}$ $(a, b > 0)$ is equal to

(a) $\sin^{-1}((a/b)\tan x) + C$

(b) $\tan^{-1}((b/a)\tan x) + C$

(c) $\dfrac{1}{ab}\tan^{-1}\left(\left(\dfrac{b}{a}\right)\tan x\right) + C$

(d) none of these

Ans. (c)

◎ **Solution:** Putting $t = \tan x$, we get

$$\int \frac{\mathrm{d}x}{a^2\cos^2 x + b^2\sin^2 x} = \int \frac{\sec^2 x\,\mathrm{d}x}{a^2 + b^2\tan^2 x} = \int \frac{\mathrm{d}t}{a^2 + b^2 t^2}$$

$$= \frac{1}{b^2}\int \frac{\mathrm{d}t}{t^2 + (a^2/b^2)} = \frac{1}{b^2}\cdot\frac{b}{a}\tan^{-1}\left(\frac{b}{a}t\right) + C$$

$$= \frac{1}{ab}\tan^{-1}\left(\frac{b}{a}\tan x\right) + C.$$

● **Example 30:** If $\int x \log(x + 1/x)\,\mathrm{d}x = f(x)\log(x+1) + g(x)\,x^2 + Lx + C$, then

(a) $f(x) = (1/2)\,(x^2 - 1)$ (b) $g(x) = \log x$

(c) $L = 1$ (d) none of these

Ans. (a)

◎ **Solution:** The given integral equals

$$\int x \log\left(\frac{x+1}{x}\right)\mathrm{d}x = \int x \log(x+1)\,\mathrm{d}x - \int x \log x\,\mathrm{d}x$$

$$= \frac{x^2}{2}\log(x+1) - \frac{1}{2}\int \frac{x^2}{x+1}\,\mathrm{d}x - \frac{x^2}{2}\log x + \frac{1}{2}\int \frac{x^2}{x}\,\mathrm{d}x$$

$$= \frac{x^2}{2}\log(x+1) - \frac{x^2}{2}\log x - \frac{1}{2}\int\left(x - 1 + \frac{1}{x+1}\right)\mathrm{d}x + \frac{1}{2}\int x\,\mathrm{d}x$$

$$= \frac{x^2}{2}\log(x+1) - \frac{x^2}{2}\log x + \frac{x}{2} - \frac{1}{2}\log(x+1) + C$$

$$\Rightarrow f(x) = \frac{x^2}{2} - \frac{1}{2},\ g(x) = -\frac{1}{2}\log x \text{ and } L = \frac{1}{2}.$$

● **Example 31:** The function f whose graph passes through $(0, 7/3)$ and whose derivative is $x\sqrt{1 - x^2}$ is given by

(a) $f(x) = (1/3)\,((1 - x^2)^{3/2} + 7)$

(b) $f(x) = (3/2)\,[\sin^{-1} x + 6]$

(c) $f(x) = -(1/3)\,[(1 - x^2)^{3/2} - 8]$

(d) $f(x) = -(2/3)\,[(1 - x^2)^{3/2} - 8]$

Ans. (c)

◎ **Solution:** $f(x) = \int x\sqrt{1 - x^2}\,\mathrm{d}x$

$$= -\frac{1}{2}\int(-2x)\sqrt{1 - x^2}\,\mathrm{d}x$$

$$= -\frac{1}{3}(1 - x^2)^{3/2} + C$$

So $7/3 = -1/3 + C \Rightarrow C = 8/3$.

Therefore, $f(x) = -(1/3)\,[(1 - x^2)^{3/2} - 8]$.

● **Example 32:** The value of $\displaystyle\int \frac{\sin\alpha}{\sqrt{1 + \cos\alpha}}\,\mathrm{d}\alpha$ is

(a) $2\sqrt{2}\cos(\alpha/2) + C$

(b) $-2\sqrt{2}\cos(\alpha/2) + C$

(c) $\sqrt{2}\cos(\alpha/2) + C$

(d) $-\sqrt{2}\cos(\alpha/2) + C$

Ans. (b)

◎ **Solution:** $\displaystyle\int \frac{\sin\alpha}{\sqrt{1 + \cos\alpha}}\,\mathrm{d}\alpha = -\int \frac{\mathrm{d}x}{\sqrt{x}}$ $(x = 1 + \cos\alpha)$

$$= -2(1 + \cos\alpha)^{1/2} + C$$

$$= -2\sqrt{2}\cos\alpha/2 + C.$$

● **Example 33:** The value of $\displaystyle\int \frac{\mathrm{d}x}{5 + 4\cos x}$ is

(a) $\dfrac{1}{3}\tan^{-1}\left(\dfrac{1}{3}\tan x\right) + C$

(b) $\dfrac{1}{3}\tan^{-1}\left(\dfrac{1}{3}\tan\left(\dfrac{x}{2}\right)\right) + C$

(c) $\dfrac{2}{3}\tan^{-1}\left(\dfrac{1}{3}\tan x\right) + C$

(d) $\dfrac{2}{3}\tan^{-1}\left(\dfrac{1}{3}\tan\left(\dfrac{x}{2}\right)\right) + C$

Ans. (d)

◎ **Solution:** $\displaystyle\int \frac{\mathrm{d}x}{5 + 4\cos x} = \int \frac{2\,\mathrm{d}t}{5(1 + t^2) + 4(1 - t^2)}$

$(t = \tan(x/2))$

$$= 2\int \frac{dt}{9+t^2} = \frac{2}{3}\tan^{-1}\left(\frac{1}{3}\tan\left(\frac{x}{2}\right)\right) + C$$

Example 34: $\int \frac{dx}{x(x^4+1)}$ is equal to

(a) $\frac{1}{4}\log\frac{x^4+1}{x^4}+C$ (b) $\frac{1}{4}\log\left(\frac{x^4}{x^4+1}\right)+C$

(c) $\frac{1}{4}\log(x^4+1)+C$ (d) none of these

Ans. (b)

Solution: $\int \frac{dx}{x\left(x^4+1\right)} = \frac{1}{4}\int \frac{4x^3\,dx}{x^4\left(x^4+1\right)}$

$$= \frac{1}{4}\int \frac{dt}{t(t+1)} \qquad (t = x^4)$$

$$= \frac{1}{4}\int\left(\frac{1}{t}-\frac{1}{t+1}\right)dt = \frac{1}{4}\log\frac{x^4}{x^4+1} + C.$$

Example 35: $\int \frac{dx}{\sin x + \cos x}$ is equal to

(a) $\log\tan(\pi/4 + x/8) + C$

(b) $\sqrt{2}\,\log\tan(x/2 + \pi/8) + C$

(c) $\frac{1}{\sqrt{2}}\log\left|\tan\left(\frac{x}{2}+\frac{\pi}{8}\right)\right| + C$

(d) $\sqrt{2}\,\log\tan\left(\frac{x}{4}-\frac{\pi}{8}\right) + C$

Ans. (c)

Solution: $\int \frac{dx}{\sin x + \cos x}$

$$= \frac{1}{\sqrt{2}}\int \frac{dx}{\sin(\pi/4)\sin x + \cos(\pi/4)\cos x}$$

$$= \frac{1}{\sqrt{2}}\int \frac{dx}{\cos(x-\pi/4)} = \frac{1}{\sqrt{2}}\int \sec(x-\pi/4)\,dx$$

$$= \frac{1}{\sqrt{2}}\log\left|\tan\left(\frac{\pi}{4}+\frac{x}{2}-\frac{\pi}{8}\right)\right| + C$$

$$= \frac{1}{\sqrt{2}}\log\left|\tan\left(\frac{\pi}{8}+\frac{x}{2}\right)\right| + C.$$

Example 36: The primitive of $\frac{1}{(x-a)^{3/2}(b-x)^{1/2}}$ is

(a) $\frac{1}{b-a}\left[\frac{b-x}{x-a}\right]^{1/2} + C$

(b) $\frac{3}{4(b-a)}\left[\frac{b-x}{x-a}\right]^{1/2} + C$

(c) $\frac{1}{b-a}\left[\frac{x-a}{b-a}\right]^{1/2} + C$

(d) none of these

Ans. (d)

Solution: Putting $x - a = (1/t)$, we have $dx = (-1/t^2)\,dt$ and the given integral can be written as

$$\int \frac{-\frac{1}{t^2}\,dt}{(1/t)^{3/2}\left(b-a-\frac{1}{t}\right)^{1/2}} = -\int \frac{dt}{\sqrt{(b-a)t-1}}$$

$$= -2\,\frac{\sqrt{(b-a)t-1}}{b-a} + C.$$

$$= \frac{-2}{b-a}\sqrt{\frac{b-a-(x-a)}{x-a}} + C$$

$$= \frac{2}{a-b}\sqrt{\frac{b-x}{x-a}} + C.$$

Example 37: If $f(x)$ is the primitive of

$\frac{\sin\sqrt[3]{x}\,\log(1+3x)}{\left(\tan^{-1}\sqrt{x}\right)^2\left(e^{\sqrt[3]{x}}-1\right)}$ $(x \neq 0)$ then $\lim_{x\to 0} f'(x)$ is

(a) 0 (b) 3/5

(c) 5/3 (d) none of these

Ans. (d)

Solution: $\lim_{x\to 0} f'(x) = \lim_{x\to 0}\frac{\sin\sqrt[3]{x}\,\log(1+3x)}{\left(\tan^{-1}\sqrt{x}\right)^2\left(e^{\sqrt[3]{x}}-1\right)}$

$$= \lim_{x\to 0} 3\,\frac{\sin\sqrt[3]{x}}{\sqrt[3]{x}} \times \frac{\log(1+3x)}{3x} \times \left(\frac{\sqrt{x}}{\tan^{-1}\sqrt{x}}\right)^2 \frac{\sqrt[3]{x}}{e^{\sqrt[3]{x}}-1}$$

$$= 3(1)\,(1)\,(1)^2(1) = 3$$

Example 38: If the primitive of $f(x) = \frac{1}{3\sin x + \sin^3 x}$

is equal to $\frac{1}{6}\log\left|\frac{t-1}{t+1}\right| + \frac{1}{12}\log\left|\frac{2+t}{2-t}\right| + C$ then

(a) $t = \cos x$ (b) $t = \tan x/2$

(c) $t = 2\cos x$ (d) $t = \sin x$

Ans. (a)

Solution: $\int \frac{dx}{3\sin x + \sin^3 x} = \int \frac{\sin x\,dx}{\left(3+\sin^2 x\right)\sin^2 x}$

$$= \int \frac{\sin x\,dx}{\left(4-\cos^2 x\right)\left(1-\cos^2 x\right)}$$

$$= -\int \frac{\mathrm{d}t}{\left(4-t^2\right)\left(1-t^2\right)}$$

$$= -\frac{1}{3}\int\left(\frac{1}{t^2-4}-\frac{1}{t^2-1}\right) \qquad (t = \cos x)$$

$$= \frac{1}{6}\log\left|\frac{t-1}{t+1}\right| + \frac{1}{12}\log\left|\frac{2+t}{2-t}\right| + C.$$

Example 39: The value of $\int \frac{\cos x}{\sin x + \cos x}\,\mathrm{d}x$ is

(a) $\frac{x^2}{2} + \log|\sin x + \cos x| + C$
(b) $\frac{1}{2}(x + \log|\sin x + \cos x|) + C$
(c) $2\log|\sin x + \cos x| + x + C$
(d) none of these

Ans. (b)

Solution: $\int \frac{\cos x}{\sin x + \cos x}\,\mathrm{d}x$

$$= \frac{1}{2}\int \frac{\cos x + \sin x + \cos x - \sin x}{\sin x + \cos x}\,\mathrm{d}x$$

$$= \frac{1}{2}\int\left(1 + \frac{\cos x - \sin x}{\sin x + \cos x}\right)\mathrm{d}x$$

$$= (1/2)\,(x + \log|\sin x + \cos x|) + C.$$

Example 40: If the primitive of $\frac{1}{\left(e^x-1\right)^2}$ is $f(x) - \log|g(x)| + C$ then

(a) dom $f = \mathbf{R}$ (b) $g(x) = 1 - e^x$
(c) dom $f = \mathbf{R} \sim \{0\}$ (d) $f(x) = 1 - e^{-x}$

Ans. (c)

Solution: $\int \frac{1}{\left(e^x-1\right)^2}\,\mathrm{d}x = \int \frac{e^x\,\mathrm{d}x}{e^x\left(e^x-1\right)^2} = \int \frac{\mathrm{d}t}{t(t-1)^2}$

$(t = e^x)$

$$= \int \frac{1}{t-1}\left[\frac{1}{t-1} - \frac{1}{t}\right]\mathrm{d}t$$

$$= \int\left(\frac{1}{(t-1)^2} - \frac{1}{t-1} + \frac{1}{t}\right)\mathrm{d}t$$

$$= \frac{1}{1-t} - \log|t-1| + \log|t| + C$$

$$= (1-e^x)^{-1} - \log|1-e^{-x}| + C$$

Hence $f(x) = (1-e^x)^{-1}$ and $g(x) = 1 - e^{-x}$

The domain of $f = \mathbf{R} \sim \{0\}$

Example 41: If $\int \frac{\mathrm{d}x}{\sin^4 x + \cos^4 x} = \frac{1}{\sqrt{2}}\tan^{-1} f(x) + C$ then

(a) $f(x) = \tan x - \cot x$
(b) $f(\pi/4) = 0$
(c) $f(x)$ is continuous on **R**
(d) $f(x) = \frac{1}{2}(\tan x - \cot x)$

Ans. (b)

Solution: Dividing the numerator and denominator by $\cos^4 x$, the given integral can be written as

$$\int \frac{\sec^2 x\left(1+\tan^2 x\right)}{\tan^4 x + 1}\,\mathrm{d}x = \int \frac{1+t^2}{1+t^4}\,\mathrm{d}t \ (t = \tan x)$$

$$= \int \frac{1+1/t^2}{t^2+1/t^2}\,\mathrm{d}t = \int \frac{1+1/t^2}{\left(t-\frac{1}{t}\right)^2+2}\,\mathrm{d}t$$

$$= \frac{1}{\sqrt{2}}\tan^{-1}\frac{1}{\sqrt{2}}\left(t-\frac{1}{t}\right) + C$$

$$= \frac{1}{\sqrt{2}}\tan^{-1}\frac{\tan x - \cot x}{\sqrt{2}} + C$$

Thus $f(x) = \frac{\tan x - \cot x}{\sqrt{2}}$ so $f\left(\frac{\pi}{4}\right) = 0.$

Example 42: The $\int \frac{\sin^2 x}{\cos^6 x}\,\mathrm{d}x$ is a

(a) is a polynomial of degree 5 in $\sin x$
(b) is a polynomial of degree 4 in $\tan x$
(c) is a polynomial of degree 5 in $\tan x$
(d) is a polynomial of degree 5 in $\cos x$

Ans. (c)

Solution: Putting $\tan x = t$, the given integral can be written as $\int t^2(1+t^2)\,\mathrm{d}t = \frac{t^3}{3} + \frac{t^5}{5} + C = \frac{\tan^5 x}{5} + \frac{\tan^3 x}{3} + C$

which is a polynomial of degree 5 in $\tan x$.

Example 43: If $\int \tan^7 x\,\mathrm{d}x = f(x) + C$ then

(a) $f(x)$ is a polynomial of degree 8 in $\tan x$
(b) $f(x)$ is a polynomial of degree 5 in $\tan x$
(c) $f(x) = \frac{1}{6}\tan^6 x - \frac{1}{4}\tan^4 x + \frac{1}{2}\tan^2 x + \log|\cos x| + C$
(d) $f(x)$ is a polynomial of degree 6 in $\tan x$

Ans. (c)

Solution: Putting $\tan x = t$, we have $\mathrm{d}x = \frac{\mathrm{d}t}{1+t^2}$, so

$$\int \tan^7 x\,\mathrm{d}x = \int \frac{t^7}{1+t^2}\,\mathrm{d}t$$

$$= \int \left(t^5 - t^3 + t - \frac{t}{1+t^2} \right) \mathrm{d}t$$

$$= \frac{t^6}{6} - \frac{t^4}{4} + \frac{t^2}{2} - \frac{1}{2} \log (1 + t^2) + C$$

$$= \frac{1}{6} \tan^6 x - \frac{1}{4} \tan^4 x + \frac{1}{2} \tan^2 x - \frac{1}{2} \log \sec^2 x + C$$

$$= \frac{1}{6} \tan^6 x - \frac{1}{4} \tan^4 x + \frac{1}{2} \tan^2 x + \log |\cos x| + C.$$

Example 44: If $\int \frac{\mathrm{d}x}{\sin x \cos x} = \log |f(x)| + C$ then

(a) $f(x) = \sin x + \cos x$ (b) $f(x) = \tan x$

(c) $f(x) = \sec^2 x$ (d) none of these

Ans. (b)

Solution: $\int \frac{\mathrm{d}x}{\sin x \cos x} = \int \frac{\sin^2 x + \cos^2 x}{\sin x \cos x} \mathrm{d}x$

$$= \int (\tan x + \cot x)\, \mathrm{d}x$$

$$= -\log |\cos x| + \log |\sin x| + C$$

$= \log |\tan x| + C$. Thus $f(x) = \tan x$.

Example 45: If polynomials P and Q satisfies

$$\int ((3x - 1) \cos x + (1 - 2x) \sin x)\, \mathrm{d}x$$

$$= P \cos x + Q \sin x$$

(ignoring the constant of integration) then

(a) $P = 3x - 2$ (b) $Q = 2 + x$

(c) $P = 3(x - 1)$ (d) $Q = 3(x - 1)$

Ans. (d)

Solution: Integrating by parts, the given integral is equal to

$$(3x - 1) \sin x - 3 \int \sin x\, \mathrm{d}x - (1 - 2x) \cos x - 2 \int \cos x\, \mathrm{d}x$$

$= (3x - 1) \sin x + 3 \cos x - (1 - 2x) \cos x - 2 \sin x$

$= (3x - 3) \sin x + (2 + 2x) \cos x$

Hence $Q = 3(x - 1)$ and $P = 2(1 + x)$

Example 46: Let $f(x) = \int e^{x^2} (x - 2)(x - 3)(x - 4)\, dx$ then f increases on

(a) $(-\infty, 2)$ (b) $(2, \infty)$

(c) $(2, 3)$ (d) $(3, \infty)$

Ans. (c)

Solution: $f'(x) = e^{x^2} (x - 2)(x - 3)(x - 4)$

As $e^{x^2} > 0$ for all $x \in \mathbf{R}, f'(x) > 0$

if $(x - 2)(x - 3)(x - 4) > 0$ i.e., if $2 < x < 3$ or $x > 4$

Thus $f(x)$ increases on the interval $(2, 3)$

Example 47: $I = \int \frac{x^2 - 1}{x^3 \sqrt{2x^4 - 2x^2 + 1}}\, dx$ equal to

(a) $\frac{\sqrt{2x^4 - 2x^2 + 1}}{x^2} + C$

(b) $\frac{\sqrt{2x^4 - 2x^2 + 1}}{x^3} + C$

(c) $\frac{\sqrt{2x^4 - 2x^2 + 1}}{x} + C$

(d) $\frac{\sqrt{2x^4 - 2x^2 + 1}}{2x^2} + C$

Ans. (d)

Solution: $I = \int \frac{\left((1/x^3) - (1/x^5)\right)}{\sqrt{2 - (2/x^2) - (1/x^4)}}\, dx$

Put $2 - \frac{2}{x^2} - \frac{1}{x^4} = t^2 \Rightarrow \left(\frac{4}{x^3} + \frac{4}{x^5}\right) dx = 2t\, dt$

$\therefore$ $I = \frac{1}{2} \int \frac{t\, dt}{t} = \frac{1}{2} t + C$

$$= \frac{1}{2} \sqrt{2 - \frac{2}{x^2} - \frac{1}{x^4}} + C$$

$$= \frac{\sqrt{2x^4 - 2x^2 - 1}}{2x^2} + C$$

Example 48: Let $I = \int \frac{e^x}{e^{4x} + e^{2x} + 1}\, dx$, $J = \int \frac{e^{-x}}{e^{-4x} + e^{-2x} + 1}\, dx$. Then for an arbitrary constant C, the value of $I - J$ equals

(a) $\frac{1}{2} \log \left(\frac{e^{4x} - e^{2x} + 1}{e^{4x} + e^{2x} + 1} \right) + C$

(b) $\frac{1}{2} \log \left(\frac{e^{2x} + e^x + 1}{e^{2x} - e^x + 1} \right) + \mathrm{C}$

(c) $\frac{1}{2} \log \left(\frac{e^{2x} - e^x + 1}{e^{2x} + e^x + 1} \right) + C$

(d) $\frac{1}{2} \log \left(\frac{e^{4x} + e^{2x} + 1}{e^{4x} - e^{2x} + 1} \right) + C$

Ans. (b)

Solution: $I - J = \int \frac{e^x}{e^{4x} + e^{2x} + 1}\, dx - \int \frac{e^{3x}}{e^{4x} + e^{2x} + 1}\, dx$

$$= \int \frac{e^x\left(1-e^{2x}\right)}{e^{4x}+e^{2x}+1}\,dx$$

Put $e^x = t$, $e^x\,dx = dt$

$$I - J = \int \frac{\left(1-t^2\right)}{t^4+t^2+1}\,dt = \int \frac{\frac{1}{t^2}-1}{t^2+\frac{1}{t^2}+1}\,dt$$

$$= -\int \frac{1-\frac{1}{t^2}}{\left(t+\frac{1}{t}\right)^2-1} = \int \frac{du}{1-u^2},$$

$$u = t + \frac{1}{t}$$

$$= \frac{1}{2}\log\left|\frac{1+u}{1-u}\right| + C$$

$$= \frac{1}{2}\log\left|\frac{e^x+e^{-x}+1}{e^x+e^{-x}-1}\right| + C$$

$$= \frac{1}{2}\log\left|\frac{e^{2x}+e^x+1}{e^{2x}-e^x+1}\right| + C.$$

Example 49: The value of $I = \sqrt{2}\int \frac{\sin x}{\sin(x-\pi/4)}\,dx$ is

(a) $x + \log|\cos(x-\pi/4)| + C$

(b) $x - \log|\sin(x-\pi/4)| + C$

(c) $x + \log|\sin(x-\pi/4)| + C$

(d) $x - \log|\cos(x-\pi/4)| + C$

Ans. (c)

Solution: Put $x - \pi/4 = t$

$$I = \sqrt{2}\int \frac{\sin(\pi/4+t)}{\sin t}\,dt = \int(\cot t + 1)\,dt$$

$$= t + \log|\sin t| + C'$$

$$= x + \log|\sin(x-\pi/4)| + C,\ C = C' + \pi/4.$$

Example 50: If $\int\left[\log(\log x) + \frac{1}{(\log x)^2}\right]dx$

$= x[f(x) - g(x)] + C$, then :

(a) $f(x) = \log(\log x)$; $g(x) = \frac{1}{\log x}$

(b) $f(x) = \log x$; $g(x) = \frac{1}{\log x}$

(c) $f(x) = \frac{1}{\log x}$; $g(x) = \log(\log x)$

(d) $f(x) = \frac{1}{x\log x}; g(x) = \frac{1}{\log x}$

Ans. (a)

Solution: $\int \log(\log x)dx$

$$= x\log(\log x) - \int x\,\frac{1}{\log x}\cdot\frac{1}{x}\,dx$$

$$= x\log(\log x) - \int\frac{dx}{\log x}$$

$$= x\log(\log x) - x\,\frac{1}{\log x} + \int x\,\frac{(-1)}{(\log x)^2}\,\frac{1}{x}\,dx$$

$$\Rightarrow \int\left[\log(\log x) + \frac{1}{(\log x)^2}\right]dx = x[f(x) - g(x)] + C$$

where $f(x) = \log(\log x)$

and $g(x) = \frac{1}{\log x}$

Example 51: If $f\left(\frac{3x-4}{3x+4}\right) = x + 2$, then $\int f(x)\,dx$ is:

(a) $e^{x+2}\log\left|\frac{3x-4}{3x+4}\right| + c$

(b) $-\frac{8}{3}\log|1-x| + \frac{2}{3}x + c$

(c) $\frac{8}{3}\log|1-x| + \frac{x}{3} + c$

(d) $e^{[(3x-4)(3x+4)]} - \frac{x^2}{2} - 2x + c$

Ans. (b)

Solution: Put $x = \frac{3t-4}{3t+4} = 1 - \frac{8}{3t+4}$, $dx = \frac{24}{(3t+4)^2}\,dt$

Now
$$\int f(x)\,dx = \int f\left(\frac{3t-4}{3t+4}\right)\frac{24}{(3t+4)^2}\,dt$$

$$= \int \frac{t+2}{(3t+4)^2}(24)\,dt$$

$$= 8\int\frac{3t+4+2}{(3t+4)^2}\,dt$$

$$= 8\int\left[\frac{1}{3t+4} + \frac{2}{(3t+4)^2}\right]dt$$

$$= \frac{8}{3}\log|3t+4| - \frac{2}{3}\,\frac{8}{3t+4} + C_1$$

$$= \frac{8}{3}\log\left|\frac{8}{1-x}\right| - \frac{2}{3}(1-x) + C_1$$

$$= -\frac{8}{3}\log|1-x| + \frac{2}{3}x + C$$

Example 52: $I = \int \cos\left\{2\tan^{-1}\sqrt{\frac{1-x}{1+x}}\right\} dx$ is equal to

(a) $\frac{1}{2}x^2 + C$ (b) $\frac{1}{8}\left(x^2-1\right)+C$

(c) $\frac{1}{2}x + C$ (d) $\frac{1}{4}\left(x^2+1\right)+C$

Ans. (a)

Solution: Put $x = \cos\theta \Rightarrow dx = -\sin\theta\, d\theta$

$$I = \int \cos\left(2\tan^{-1}\tan\theta/2\right)(-\sin\theta)d\theta$$

$$= -\int \cos\theta \sin\theta\, d\theta$$

$$= \frac{\cos^2\theta}{2} + C = \frac{x^2}{2} + C\,.$$

Example 53: Let f be thrice differential function and if $u = -f''(\theta)\sin\theta + f'(\theta)\cos\theta$ and $v = f''(\theta)\cos\theta + f'(\theta)\sin\theta$ then $I = \int\left[\left(\frac{du}{d\theta}\right)^2 + \left(\frac{dv}{d\theta}\right)^2\right]^{1/2} d\theta$ is equal to

(a) $f(\theta) - f''(\theta) + C$

(b) $f(\theta) + f''(\theta) + C$

(c) $f'(\theta) + f''(\theta) + C$

(d) $f'(\theta) - f''(\theta) + C$

Ans. (b)

Solution: $\frac{du}{d\theta} = -f''(\theta)\cos\theta - f'''(\theta)\sin\theta + f''(\theta)\cos\theta - f'(\theta)\sin\theta$

$$= -(f'''(\theta) + f'(\theta))\sin\theta$$

$$\frac{dv}{d\theta} = f'''(\theta)\cos\theta - f''(\theta)\sin\theta + f''(\theta)\sin\theta + f'(\theta)\cos\theta$$

$$= (f'''(\theta) + f'(\theta))\cos\theta$$

$$\left(\frac{du}{d\theta}\right)^2 + \left(\frac{dv}{d\theta}\right)^2 = (f'''(\theta) + f'(\theta))^2$$

$$I = \int (f'''(\theta) + f'(\theta))\, d\theta$$

$$= f''(\theta) + f(\theta)) + C$$

Example 54: If the integral $\int \frac{5\tan x}{\tan x - 2} dx = x + a \log|\sin x - 2\cos x| + K$, then a is equal to

(a) -2 (b) 1

(c) 2 (d) -1

Ans. (c)

Solution: $I = \int \frac{5\tan x}{\tan x - 2} dx = \int \frac{5\sin x}{\sin - 2\cos x} dx$

Let $5\sin x = A(\sin x - 2\cos x) + B(\cos x + 2\sin x)$
Equating coefficients of $\sin x$ and $\cos x$, we get

$5 = A + 2B$ and $0 = -2A + B$

$\Rightarrow A = 1, B = 2$

$$\therefore \quad I = \int \frac{(\sin x - 2\cos x) + 2(\cos x + 2\sin x)}{\sin x - 2\cos x} dx$$

$$= x + 2\log|\sin x - 2\cos x| + K$$

$\therefore \quad a = 2$

Example 55:

$$\mathbf{I} = \int \frac{\sin^{10}x - \cos^8 x\sin^2 x + \sin^8 x\cos^2 x - \cos^{10} x}{1 - 2\sin^2 x\cos^2 x} dx$$ is equal to

(a) $\frac{1}{2}\sin 2x + C$ (b) $-\frac{1}{2}\sin 2x + C$

(c) $-\frac{1}{2}\sin x + C$ (d) $-\sin^2 x + C$

Ans. (b)

Solution: $\sin^{10}x - \cos^8 x\sin^2 x + \sin^8 x\cos^2 x - \cos^{10}x$

$$= \sin^2 x(\sin^8 x - \cos^8 x) + \cos^2 x(\sin^8 x - \cos^8 x)$$

$$= (\sin^2 x + \cos^2 x)(\sin^8 x - \cos^8 x)$$

$$= (\sin^2 x - \cos^2 x)(\sin^2 x + \cos^2 x)(\sin^4 x + \cos^4 x)$$

$$= (\sin^2 x - \cos^2 x)(1 - 2\sin^2 x\cos^2 x)$$

$$= -\cos 2x(1 - 2\sin^2 x\cos^2 x)$$

$$I = -\int \cos 2x\, dx = -\frac{\sin 2x}{2} + C$$

Example 56: The integral

$$\mathbf{I} = \int \frac{\sin^2 x\cos^2 x}{\left(\sin^5 x + \cos^3 x\sin^2 x + \sin^3 x\cos^2 x + \cos^5 x\right)^2}$$ is equal to

(a) $\frac{1}{3\left(1 - \tan^2 x\right)} + C$

(b) $\frac{1}{3\left(1 + \tan^3 x\right)} + C$

(c) $\frac{1}{3\left(2 + \tan^3 x\right)} + C$

(d) $-\frac{1}{3\left(1 + \tan^3 x\right)} + C$

Ans. (d)

◎ **Solution:**

$$\frac{\sin^2 x\cos^2 x}{\left(\sin^5 x+\cos^3 x\sin^2 x+\sin^3 x\cos^2 x+\cos^5 x\right)^2}$$

$$=\frac{\sin^2 x\cos^2 x}{\left(\sin^3 x+\cos^3 x\right)^2\left(\sin^2 x+\cos^2 x\right)^2}$$

$$=\frac{\sin^2 x\cos^2 x}{\left(\sin^3 x+\cos^3 x\right)^2}$$

$$=\frac{\tan^2 x\sec^2 x}{\left(1+\tan^3 x\right)^2}$$

So $$I=\int\frac{\tan^2 x\sec^2 x}{\left(1+\tan^3 x\right)^2}dx$$

$$=\int\frac{t^2}{\left(1+t^3\right)^2}dt \qquad (t=\tan x)$$

$$=\frac{1}{3}\int\frac{du}{u^2}\left(u=1+t^3\right)$$

$$=-\frac{1}{3u}+C=-\frac{1}{3\left(1+\tan^3 x\right)}+C.$$

Assertion-Reason Type Questions

Example 57: Let $f(x)=\dfrac{xe^x}{(1+x)^2}$, $x\neq -1$

Statement-1: The antiderivative F of $f(x)$ satisfying $F(0)=1$ is $\dfrac{1}{1+x}e^x$

Statement-2: $f(x)$ is of the form $(g(x)+g'(x))e^x$, for some $g(x)$

Ans. (a)

◎ **Solution:** $$F(x)=\int\frac{xe^x}{(1+x)^2}dx$$

$$=\int\left(\frac{1}{1+x}-\frac{1}{(1+x)^2}\right)e^x\,dx$$

$$=\frac{1}{1+x}e^x+C$$

$$F(0)=1 \quad\Rightarrow\quad C=0 \text{ so } F(x)=\frac{1}{1+x}e^x.$$

Example 58: Let $f(x)=\dfrac{2-\sin x}{2+\cos x}$

Statement-1: The antiderivative of f is a periodic function of period π

Statement-2: The period of the function $g(x)=\log(2+\cos x)+A\tan^{-1}(B\tan x/2)+C$, A, B, C being constants is 2π.

Ans. (d)

◎ **Solution:** $F(x)=2I_1+I_2$, $I_1=\displaystyle\int\frac{dx}{2+\cos x}$ and

$$I_2=-\int\frac{\sin x}{2+\cos x}dx$$

$= \log(2+\cos x)+$ constant.

$$I_1=\int\frac{2dt}{\left(1+t^2\right)\left(2+\dfrac{1-t^2}{1+t^2}\right)}=2\int\frac{dt}{3+t^2}$$

$(t=\tan(x/2))$

$$=\frac{2}{\sqrt{3}}\tan^{-1}\left(\frac{1}{\sqrt{3}}\tan(x/2)\right)+C$$

Hence $F(x)=\log(2+\cos x)+\dfrac{4}{\sqrt{3}}\tan^{-1}\left(\dfrac{1}{\sqrt{3}}\tan(x/2)\right)+C$ which is periodic with period 2π.

Example 59: Let $f(x)=\dfrac{1}{1-\sin^4 x}$ and F be an antiderivative of f.

Statement-1: $F(x)=\dfrac{1}{2}\tan x+\dfrac{1}{2\sqrt{2}}\tan^{-1}(\sqrt{2}\tan x)+C$

Statement-2: F is a one-one function of $\tan x$

Ans. (b)

◎ **Solution:** $$f(x)=\frac{1}{\cos^2 x\left(1+\sin^2 x\right)}=\frac{\sec^2 x\left(1+\tan^2 x\right)}{1+2\tan^2 x}$$

So, $$F(x)=\int\frac{1+t^2}{1+2t^2}dt\ (t=\tan x)$$

$$=\int\left(\frac{1}{2}+\frac{1}{4}\frac{1}{t^2+1/2}\right)dt$$

$$= \frac{1}{2}t + \frac{1}{4}\sqrt{2}\tan^{-1}\left(\sqrt{2}\tan x\right) + C$$

$$= \frac{1}{2}\tan x + \frac{1}{2\sqrt{2}}\tan^{-1}\left(\sqrt{2}\tan x\right) + C$$

which is a 1 – 1 function of tan x.

Example 60: Let $f(x) = \dfrac{1}{x^6 + x^4}$ and F be a antiderivative of f such that $F(1) = \dfrac{\pi}{4} + \dfrac{2}{3}$

Statement-1: $F\left(\dfrac{1}{\sqrt{3}}\right) = \dfrac{\pi}{6}$

Statement-2: $F(x) = \tan^{-1} x + \dfrac{1}{3x} - \dfrac{1}{x^3}$

Ans. (c)

Solution: $f(x) = \dfrac{1}{x^4\left(x^2+1\right)} = \dfrac{1}{x^4} - \dfrac{1}{x^2} + \dfrac{1}{x^2+1}$

So $\quad F(x) = -\dfrac{1}{3x^3} + \dfrac{1}{x} + \tan^{-1} x + C$

$$F(1) = \frac{2}{3} + \frac{\pi}{4} + C \text{ so } C = 0$$

$$F(x) = \tan^{-1} x + \frac{1}{x} - \frac{1}{3x^3} \quad \Rightarrow \quad F\left(\frac{1}{\sqrt{3}}\right) = \frac{\pi}{6}.$$

Example 61: Let $F(x) = \int e^{-x^2} x^5 \, dx$

Statement-1: If $F(0) = 0$, then $F(1) = 1 - \dfrac{5}{2}e^{-1}$

Statement-2: F increases on $(0, \infty)$

Ans. (b)

Solution: Put $x^2 = t$, $\int e^{-x^2} x^5 \, dx = \dfrac{1}{2}\int e^{-t} t^2 \, dt$

$$= C - \frac{1}{2}e^{-x^2}\ (x^4 + 2x^2 + 2)$$

$$F(0) = 0 \quad \Rightarrow \quad C = 1$$

Hence $F(x) = 1 - \dfrac{1}{2}e^{-x^2}\ (x^4 + 2x^2 + 2)$

$$F'(x) = e^{-x^2}\ x^5 > 0\ x \in (0, \infty).$$

Example 62: Statement 1: $\int e^x \sin x \, dx = \dfrac{e^x}{2}(\sin x - \cos x) + C$

Statement 2: If the integrand is of the form $e^x(f(x) + f'(x))$ then the integral in $e^x f(x)$

Ans. (b)

Solution: Let $I = \int e^x \sin x \, dx = -e^x \cos x + \int e^x \cos x \, dx$
$= -e^x \cos x + e^x \sin x - \int e^x \sin x \, dx + C$

$$\Rightarrow \quad 2I = e^x (\sin x - \cos x) + C$$

$$\Rightarrow \quad I = \frac{e^x}{2}\ (\sin x - \cos x) + C$$

Statement 2: is also true but is not correct explanation of statement 1.

Example 63: Statement 1: For $-1 < a < 4$,
$\displaystyle\int \frac{dx}{x^2 + 2(a-1)x + a + 5} = \lambda \log |g(x)| + C$, where λ and C are constants

Statement 2: For $-1 < a < 4$, $f(x) = \dfrac{1}{x^2 + 2(a-1)x + a + 5}$ is a continuous function

Ans. (d)

Solution: The discriminant of $x^2 + 2(a-1)x + a + 5 = 0$ is $4(a-1)^2 - 4(a+5) = 4(a^2 - 3a - 4) < 0$. Hence the integral
$\displaystyle\int \frac{dx}{x^2 + 2(a-1)x + a + 5} = \lambda \tan^{-1} g(x) + C$

Since the denominator is not zero for any value of x so f is a continuous function.

Example 64: Statement 1: $I =$
$\displaystyle\int \frac{f(x)\,g'(x) - f'(x)\,g(x)}{f(x)\,g(x)}\ \{\log g(x) - \log f(x)\}\ dx$

$$= \frac{1}{2}\left\{\log \frac{g(x)}{f(x)}\right\}^2 + C$$

Statement 2: $\int (\phi(x))^n\, \phi'(x) dx = \dfrac{(\phi(x))^{n+1}}{n+1} + C$

Ans. (a)

Solution: $I = \displaystyle\int \log\left(\frac{g(x)}{f(x)}\right) \frac{d}{dx}\left(\log \frac{g(x)}{f(x)}\right) dx$

$$= \frac{1}{2}\left(\log \frac{g(x)}{f(x)}\right)^2 + C$$

Put $\phi(x) = t$ in integral of Statement 2.

LEVEL 2

Straight Objective Type Questions

Example 65: If $\int \frac{dx}{x^3\,(x-1)^{1/2}} = \frac{\sqrt{x-1}\,(3x+2)}{4x^2} +$ $K\tan^{-1}\sqrt{x-1} + C$ then the value of K is

(a) 1/2 (b) 1

(c) 1/4 (d) 3/4

Ans. (d)

Solution: Put $x - 1 = t^2$ so that $dx = 2t\,dt$, and

$$\int \frac{dx}{x^3\,(x-1)^{1/2}} = \int \frac{2t\,dt}{\left(t^2+1\right)^3 t} = 2\int \frac{dt}{\left(t^2+1\right)^3}$$

Now we use formula of $\int \frac{dy}{(y^2+k^2)^n}$ to write

$$\int \frac{dt}{\left(t^2+1\right)^3} = \frac{t}{4\left(t^2+1\right)^2} + \frac{3}{4}\int \frac{dt}{\left(t^2+1\right)^2} \text{ and}$$

$$\int \frac{dt}{\left(t^2+1\right)^2} = \frac{t}{2\left(t^2+1\right)} + \frac{1}{2}\int \frac{dt}{t^2+1}$$

$$= \frac{t}{2\left(t^2+1\right)} + \frac{1}{2}\tan^{-1} t$$

Hence $\int \frac{dx}{x^3\,(x-1)^{1/2}}$

$$= \frac{t}{2\left(t^2+1\right)^2} + \frac{3t}{4\left(t^2+1\right)} + \frac{3}{4}\tan^{-1} t + C$$

$$= \frac{1}{4\left(t^2+1\right)^2}\,(2t + 3t^3 + 3t) + \frac{3}{4}\tan^{-1} t + C$$

$$= \frac{\sqrt{x-1}\,(3x+2)}{4x^2} + \frac{3}{4}\tan^{-1}\sqrt{x-1} + C.$$

Example 66: The value of $\int \frac{dx}{\sqrt{x} + \sqrt[3]{x}}$ is

(a) $3\sqrt{x} + 3(\sqrt[3]{x}) - 6(\sqrt[6]{x}) + 6\log\left(\sqrt[6]{x} + 1\right) + C$

(b) $2\sqrt{x} + 6\sqrt[6]{x} - 6\log\left(\sqrt[6]{x} + 1\right) + C$

(c) $2\sqrt{x} - 3(\sqrt[3]{x}) + 6(\sqrt[6]{x}) - 6\log\left(\sqrt[6]{x} + 1\right) + C$

(d) none of these

Ans. (c)

Solution: We want a substitution that will allow us to find both the square root and the cube root without getting fractional exponents. Thus we want a substitution of the form $x = u^k$ where k is a multiple of 2 and 3. Let us use the least common multiple 6.

Let $x = u^6,\ dx = 6u^5\,du$

$$\int \frac{dx}{\sqrt{x} + \sqrt[3]{x}} = \int \frac{6u^5\,du}{u^3 + u^2} = 6\int \frac{u^3}{u+1}\,du$$

$$= 6\int\left(u^2 - u + 1 - \frac{1}{u+1}\right)du$$

$$= 2u^3 - 3u^2 + 6u - 6\log(u+1) + C$$

$$= 2\sqrt{x} - 3(\sqrt[3]{x}) + 6\,(\sqrt[6]{x}) - 6\log\left(\sqrt[6]{x} + 1\right) + C$$

Example 67: The value of

$\int \frac{x^5 + x^4 + 4x^3 + 4x^2 + 4x + 4}{\left(x^2+2\right)^5}$ is equal to

(a) $\frac{4x-3}{\left(x^2+1\right)^2} + \frac{3}{8}\frac{x}{x^2+2} + \frac{1}{\sqrt{2}}\tan^{-1}\frac{x}{\sqrt{2}} + C$

(b) $\frac{1}{12}\frac{2x-3}{\left(x^2+2\right)^2} + \frac{3}{16}\frac{x}{x^2+2} + \frac{3}{16\sqrt{2}}\tan^{-1}\frac{x}{\sqrt{2}} + C$

(c) $\frac{2x-3}{\left(x^2+2\right)^2} + \frac{3}{8}\frac{x}{x^2+2} + \frac{1}{2\sqrt{2}}\tan^{-1}\frac{x}{\sqrt{2}} + C$

(d) none of these

Ans. (d)

Solution: $x^5 + x^4 + 4x^3 + 4x^2 + 4x + 4$

$$= x^3(x^2 + 2) + x^2(x^2 + 2) + 2x(x^2 + 2) + 2(x^2 + 2)$$

$$= (x^2 + 2)\,(x^3 + x^2 + 2x + 2)$$

$$= (x^2 + 2)\,(x(x^2 + 2) + (x^2 + 2))$$

$$= (x^2 + 2)^2\,(x + 2). \text{ Therefore,}$$

$$f(x) = \frac{x^5 + x^4 + 4x^3 + 4x^2 + 4x + 4}{\left(x^2+2\right)^5}$$

$$= \frac{x+2}{\left(x^2+2\right)^3} = \frac{1}{2}\frac{2x}{\left(x^2+2\right)^3} + \frac{2}{\left(x^2+2\right)^3}$$

Now $\int \frac{\mathrm{d}x}{\left(x^2+2\right)^3} = \frac{1}{8}\frac{x}{\left(x^2+2\right)^2} + \frac{3}{8}\int \frac{\mathrm{d}x}{\left(x^2+2\right)^2}$

$$\left(\text{using} \int \frac{\mathrm{d}y}{(y^2+k^2)^n}\right)$$

$$\int \frac{\mathrm{d}x}{\left(x^2+2\right)^2} = \frac{1}{4}\frac{x}{x^2+2} + \frac{1}{4}\frac{1}{\sqrt{2}} = \tan^{-1}\frac{x}{\sqrt{2}} + C$$

$$\therefore \quad \int f(x)\,dx = -\frac{1}{4\left(x^2+2\right)^2} + \frac{1}{4}\frac{x}{\left(x^2+2\right)^2}$$

$$+\frac{3}{4}\left[\frac{1}{4}\frac{x}{x^2+2} + \frac{1}{4\sqrt{2}}\tan^{-1}\frac{x}{\sqrt{2}}\right] + C$$

$$= \frac{x-1}{4\left(x^2+2\right)^2} + \frac{3}{16}\frac{x}{x^2+2} + \frac{3}{16\sqrt{2}}\tan^{-1}\frac{x}{\sqrt{2}} + C$$

Example 68: If $\int \frac{x\tan^{-1}x}{\sqrt{1+x^2}}\,\mathrm{d}x =$

$\sqrt{1+x^2}\; f(x) + K\log\left(x+\sqrt{x^2+1}\right) + C$ then

(a) $f(x) = \tan^{-1}x$, $K = -1$
(b) $f(x) = \tan^{-1}x$, $K = 1$
(c) $f(x) = 2\tan^{-1}x$, $K = -1$
(d) $f(x) = 2\tan^{-1}x$, $K = 1$

Ans. (a)

Solution: $\int \frac{x}{\sqrt{1+x^2}}\,\mathrm{d}x$

$$= \frac{1}{2}\int \frac{\mathrm{d}t}{\sqrt{t}} = \frac{1}{2}\cdot\frac{\sqrt{t}}{1/2} = \sqrt{t} = \sqrt{1+x^2}$$

[where $1 + x^2 = t$]

We integrate by parts, taking $\tan^{-1}x$ as the first function and $x/\sqrt{1+x^2}$ as the second.

$$\Rightarrow \quad \int \frac{x\tan^{-1}x}{\sqrt{1+x^2}}\,\mathrm{d}x$$

$$= (\tan^{-1}x)\,\sqrt{1+x^2} - \int \frac{1}{1+x^2}\cdot\sqrt{1+x^2}\,\mathrm{d}x$$

$$= \sqrt{1+x^2}\,\tan^{-1}x - \int \frac{\mathrm{d}x}{\sqrt{1+x^2}}$$

$$= \sqrt{1+x^2}\,\tan^{-1}x - \log\left(x+\sqrt{x^2+1}\right) + C$$

Thus $f(x) = \tan^{-1}x$, $K = -1$.

Example 69: The value of $\int \frac{\sin x}{\sin 4x}\,\mathrm{d}x$ is

(a) $\frac{1}{4}\log\left|\frac{\sin x - 1}{\sin x + 1}\right| - \frac{1}{\sqrt{2}}\log\left|\frac{\sqrt{2}\sin x - 1}{\sqrt{2}\sin x + 1}\right| + C$

(b) $\frac{1}{8}\log\left|\frac{\cos x - 1}{\cos x + 1}\right| - \frac{1}{2\sqrt{2}}\log\left|\frac{\sqrt{2}\cos x - 1}{\sqrt{2}\cos x + 1}\right| + C$

(c) $\frac{1}{8}\log\left|\frac{\sin x - 1}{\sin x + 1}\right| - \frac{1}{4\sqrt{2}}\log\left|\frac{\sqrt{2}\sin x - 1}{\sqrt{2}\sin x + 1}\right| + C$

(d) none of these

Ans. (c)

Solution: The given integrand can be written as

$$\frac{1}{4\cos x\cos 2x} = \frac{\cos x}{4\left(1-\sin^2 x\right)\left(1-2\sin^2 x\right)}, \text{ hence}$$

$$\int \frac{\sin x}{\sin 4x}\,\mathrm{d}x = \frac{1}{4}\int \frac{\mathrm{d}t}{\left(1-t^2\right)\left(1-2t^2\right)} \qquad (t = \sin x)$$

$$= \frac{1}{4}\int\left[\frac{1}{t^2-1} - \frac{1}{t^2-1/2}\right]\mathrm{d}t$$

$$= \frac{1}{4}\left[\frac{1}{2}\log\left|\frac{t-1}{t+1}\right| - \frac{1}{\sqrt{2}}\log\left|\frac{t-1/\sqrt{2}}{t+1/\sqrt{2}}\right|\right] + C$$

$$= \frac{1}{8}\log\left|\frac{\sin x-1}{\sin x+1}\right| - \frac{1}{4\sqrt{2}}\log\left|\frac{\sqrt{2}\sin x-1}{\sqrt{2}\sin x+1}\right| + C.$$

Example 70: If $\int \frac{\mathrm{d}x}{(x+1)\sqrt{2x^2+3x+4}}$ $= K\log f(x) + C$ then

(a) $K = -\frac{1}{\sqrt{3}}, f(x)$
$= \frac{5-x}{\sqrt{23}\,(x+1)} + \sqrt{\left(\frac{5-x}{\sqrt{23}\,(x+1)}\right)^2 + \frac{23}{26}}$

(b) $K = \frac{1}{\sqrt{3}}\;\; f(x) = \frac{4-x}{(x+1)} + \sqrt{\left(\frac{4-x}{(x+1)}\right)^2 + \frac{23}{16}}$

(c) $K = 2, f(x) = y + \sqrt{y^2+1}, y = \frac{5-x}{x+1}$

(d) none of these

Ans. (d)

Solution: Putting $x + 1 = 1/y$, the given integral can be written as $-\int \frac{\mathrm{d}y}{\sqrt{3y^2-y+2}}$

$$= -\frac{1}{\sqrt{3}}\int \frac{\mathrm{d}y}{\sqrt{(y-1/6)^2+\left(\sqrt{23}/6\right)^2}}$$

$$= -\frac{1}{\sqrt{3}}\log\left|(y-1/6)+\sqrt{(y-1/6)^2+\left(\sqrt{23/6}\right)^2}\right| + C$$

$$= -\frac{1}{\sqrt{3}}\log\left|\frac{5-x}{6\,(x+1)}+\sqrt{\left(\frac{5-x}{6\,(x+1)}\right)^2+\left(\frac{\sqrt{23}}{6}\right)^2}\right| + C.$$

Example 71: If $\int \frac{\mathrm{d}x}{(1+x^2)\sqrt{1-x^2}} = F(x)$ and $F(1) = 0$, then for $x > 0$, $F(x)$ is equal to

(a) $\frac{1}{\sqrt{2}}\tan^{-1}\left(\frac{\sqrt{2}x}{\sqrt{1+x^2}}\right)+\frac{\pi}{\sqrt{2}}$

(b) $\frac{1}{2}\tan^{-1}\left(\frac{\sqrt{2}x}{\sqrt{1+x^2}}\right)-\frac{\pi}{2\sqrt{2}}$

(c) $\frac{1}{\sqrt{2}}\tan^{-1}\left(\frac{\sqrt{2}x}{\sqrt{1-x^2}}\right)+\frac{\pi}{2\sqrt{2}}$

(d) none of these

Ans. (b)

Solution: Putting $x = \frac{1}{t}$ so that $\mathrm{d}x = -\frac{1}{t^2}\,\mathrm{d}t$

We have

$$\int \frac{\mathrm{d}x}{(1+x^2)\sqrt{1-x^2}} = \int \frac{-t\,\mathrm{d}t}{(1+t^2)\sqrt{t^2-1}}$$

$$= -\int \frac{\mathrm{d}x}{2+u^2}\;(t^2-1=u^2)$$

$$= -\frac{1}{\sqrt{2}}\tan^{-1}\frac{u}{2}+C$$

$$= -\frac{1}{\sqrt{2}}\tan^{-1}\left(\frac{1}{\sqrt{2}}\frac{\sqrt{1-x^2}}{x}\right)+C$$

Since $F(1) = 0$, so $C = 0$. Hence

$$F(x) = -\frac{1}{\sqrt{2}}\left[\frac{\pi}{2}-\cot^{-1}\left(\frac{1}{\sqrt{2}}\frac{\sqrt{1-x^2}}{x}\right)\right]$$

$$[\tan^{-1}\theta+\cot^{-1}\theta=\pi/2]$$

$$= -\frac{\pi}{2\sqrt{2}}+\frac{1}{\sqrt{2}}\tan^{-1}\left(\frac{\sqrt{2}x}{\sqrt{1-x^2}}\right)$$

$$\left(\begin{array}{l}\cot^{-1}\theta=\tan^{-1}\frac{1}{\theta},\text{for }\theta>0\text{ and}\\ \cot^{-1}\theta=\tan^{-1}\frac{1}{\theta}+\pi,\text{ for }\theta<0\end{array}\right)$$

Example 72: Let $f(x)$ be a polynomial of degree three such that $f(0) = 1$, $f(1) = 2$ and 0 is a critical point of $f(x)$ such that $f(x)$ does not have a local extremum at 0. Then $\int \frac{f(x)}{x^2+1}\mathrm{d}x$ is equal to

(a) $x - \log(x^2+1) + \tan^{-1}x + C$

(b) $x + (1/2)\log(x^2+1) - \tan^{-1}x + C$

(c) $(1/2)x^2 + (1/2)\log(x^2+1) - \tan^{-1}x + C$

(d) $(1/2)(x^2 - \log(x^2+1)) + \tan^{-1}x + C$

Ans. (d)

Solution: Let $f(x) = ax^3 + bx^2 + cx + d$. Since $f(0) = 1$, so $d = 1$. Moreover, $f(1) = 2$ implies that $a + b + c = 1$ since 0 is a critical point, $0 = f'(0) = 3a\,.0 + 2b.0 + C$ i.e., $C = 0$. Also $f''(x) = 6ax + 2b$ and since $f(x)$ does not have extremum at 0 so $0 = f''(0) = b$. Hence $a = 1$ and

$$\int \frac{f(x)}{x^2+1}\mathrm{d}x = \int \frac{x^3+1}{x^2+1}\mathrm{d}x = \int\left(x-\frac{1}{2}\frac{2x}{x^2+1}+\frac{1}{x^2+1}\right)\mathrm{d}x$$

$$= \frac{1}{2}\,[x^2-\log(x^2+1)]+\tan^{-1}x+C.$$

Example 73: If $\int \frac{\log\left(x+\sqrt{1+x^2}\right)}{\sqrt{1+x^2}}\mathrm{d}x = g\ o\ f\ (x) +$ Const. then

(a) $f(x) = \log\left(x+\sqrt{x^2+1}\right)$

(b) $f(x) = \log\left(x+\sqrt{x^2+1}\right)$ and $g(x) = x^2$

(c) $f(x) = \log\left(x+\sqrt{x^2+1}\right)$ and $g(x) = x^2/2$

(d) $f(x) = x^2/2$ and $g(x) = \log\left(x+\sqrt{x^2+1}\right)$

Ans. (c)

Solution: Putting $\log\left(x+\sqrt{1+x^2}\right) = t$, we have

$$\frac{1}{x+\sqrt{1+x^2}}\times\left(1+\frac{x}{\sqrt{1+x^2}}\right)\mathrm{d}x=\mathrm{d}t\ \text{ i.e. }\ \frac{\mathrm{d}x}{\sqrt{1+x^2}}=\mathrm{d}t$$

So $$\int \frac{\log\left(x+\sqrt{1+x^2}\right)}{\sqrt{1+x^2}}\mathrm{d}x = \int t\,\mathrm{d}t=\frac{1}{2}t^2+C$$

$$=\frac{1}{2}\left(\log\,(x+\sqrt{x^2+1})\right)^2+C$$

Thus $f(x) = \left(\log\,(x+\sqrt{x^2+1})\right)$ and $g(x) = x^2/2$.

Example 74: The value of $\int \frac{\cos^3 x+\cos^5 x}{\sin^2 x+\sin^4 x}\mathrm{d}x$ is

(a) $\sin x - 6\tan^{-1}(\sin x) + C$

(b) $\sin x - 2(\sin x)^{-1} + C$

(c) $\sin x - 2(\sin x)^{-1} + 5\tan^{-1}(\sin x) + C$
(d) none of these

Ans. (d)

Solution: Since the integrand satisfies.

$R(\sin x, -\cos x) = -R(\sin x, \cos x)$

Therefore, we substitute $\sin x = t$, so that $\cos x\, dx = dt$.

$$\int \frac{\cos^3 x + \cos^5 x}{\sin^2 x + \sin^4 x} dx$$

$$= \int \frac{\cos x\left[(1-\sin^2 x) + (1-\sin^2 x)^2\right]}{\sin^2 x + \sin^4 x} dx$$

$$= \int \frac{(1-t^2)(2-t^2)}{t^2 + t^4} dt$$

$$= \int \left(1 + \frac{2}{t^2} - \frac{6}{1+t^2}\right) dt$$

$$= t - \frac{2}{t} - 6\tan^{-1} t + C$$

$$= \sin x - 2(\sin x)^{-1} - 6\tan^{-1}(\sin x) + C.$$

Example 75: If $f(x) = \dfrac{x+2}{2x+3}$. Then $\displaystyle\int \left(\frac{f(x)}{x^2}\right)^{1/2} dx$ is equal to $\dfrac{1}{\sqrt{2}}\, g\left(\dfrac{1+\sqrt{2f(x)}}{1-\sqrt{2f(x)}}\right) - \sqrt{\dfrac{2}{3}}\, h\left(\dfrac{\sqrt{3f(x)}+\sqrt{2}}{\sqrt{3f(x)}-\sqrt{2}}\right)$ $+ C$ where

(a) $g(x) = \tan^{-1} x$, $h(x) = \log|x|$
(b) $g(x) = \log|x|$, $h(x) = \tan^{-1} x$
(c) $g(x) = h(x) = \tan^{-1} x$
(d) $g(x) = \log|x|$, $h(x) = \log|x|$

Ans. (d)

Solution: Putting $y^2 = f(x) = \dfrac{x+2}{2x+3}$, we have

$$x = \frac{3y^2-2}{1-2y^2} \text{ and } dx = -\frac{2y}{(1-2y^2)^2} dy.$$

So $$\int (f(x))^{1/2} \frac{dx}{x}$$

$$= -\int y \cdot \frac{2y}{(1-2y^2)^2} \cdot \frac{1-2y^2}{3y^2-2} dy$$

$$= 2\int \frac{y^2}{(2y^2-1)(3y^2-2)} dy$$

$$= -2\int \left[\frac{1}{2y^2-1} - \frac{2}{3y^2-2}\right] dy$$

$$= \frac{1}{\sqrt{2}} \log\left|\frac{1+\sqrt{2}y}{1-\sqrt{2}y}\right| - \sqrt{\frac{2}{3}} \log\left|\frac{\sqrt{3}y+\sqrt{2}}{\sqrt{3}y-\sqrt{2}}\right| + C$$

Thus $g(x) = \log|x|$ and $h(x) = \log|x|$.

Example 76: The value of $\displaystyle\int \frac{\sec x\, dx}{\sqrt{\sin(2x+\theta) + \sin\theta}}$ is

(a) $\sqrt{(\tan x + \tan\theta)\sec\theta} + C$
(b) $\sqrt{2(\tan x + \tan\theta)\sec\theta} + C$
(c) $\sqrt{2(\sin x + \tan\theta)\sec\theta} + C$
(d) none of these

Ans. (b)

Solution: The given integral can be written as

$$\int \frac{\sec x\, dx}{\sqrt{2\sin(x+\theta)\cos x}}$$

$$= \frac{1}{\sqrt{2}} \int \frac{\sec^{3/2} x\, dx}{\sqrt{\sin x\cos\theta + \sin\theta\cos x}}$$

$$= \frac{1}{\sqrt{2}} \int \frac{\sec^2 x\, dx}{\sqrt{\tan x\cos\theta + \sin\theta}}$$

$$= \frac{1}{\sqrt{2}} \int \frac{dt}{\sqrt{t\cos\theta + \sin\theta}} \qquad (t = \tan x)$$

$$= \frac{2}{\sqrt{2}} \frac{\sqrt{t\cos\theta + \sin\theta}}{\cos\theta} + C$$

$$= \sqrt{2(\tan x\sec\theta + \tan\theta\sec\theta)} + C$$

Example 77: If $\displaystyle\int \frac{e^{4x}-1}{e^{2x}} \log\left(\frac{e^{2x}+1}{e^{2x}-1}\right) dx$

$$= \frac{t^2}{2}\log t - \frac{t^2}{4} + \frac{u^2}{2}\log u - \frac{u^2}{4} + C \text{ then}$$

(a) $t = e^{-x} - e^x$ $u = e^x + e^{-x}$
(b) $t = e^x - e^{-x}$, $u = e^x + e^{-x}$
(c) $t = e^x + e^{-x}$, $u = e^x - e^{-x}$
(d) none of these

Ans. (c)

Solution: The integrand can be written as

$$(e^{2x} - e^{-2x})\log(e^x + e^{-x}) - (e^{2x} - e^{-2x})\log(e^x - e^{-x})$$

$$= (e^x + e^{-x})(e^x - e^{-x})\log(e^x + e^{-x})$$

$$- (e^x + e^{-x})(e^x - e^{-x})\log(e^x - e^{-x}).$$

Hence the given integral is equal to

$$\int t\log t\, dt - \int u\log u\, du$$

$(t = e^x + e^{-x}, u = e^x - e^{-x})$

$$= \frac{t^2}{2}\log t - \frac{1}{2}\int t\, dt + \frac{u^2}{2}\log u - \frac{1}{2}\int u\, du$$

(integration by parts)

$$= \frac{t^2}{2}\ \log t - \frac{t^2}{4} + \frac{u^2}{2}\ \log u - \frac{u^2}{4} + C,$$

where $t = e^x + e^{-x}$ and $u = e^x - e^{-x}$.

◉ **Example 78:** If the primitive of $\sin^{-3/2} x \sin^{-1/2} (x + \theta)$ is $-2 \operatorname{cosec} \theta \sqrt{f(x)} + C$ then

(a) $f(x) = \dfrac{\sin x}{\sin (x+\theta)}$

(b) $f(x) = \tan (x + \theta)$

(c) $f(x) = \dfrac{\sin (x+\theta)}{\sin x}$

(d) $f(x) = \dfrac{\tan (x+\theta)}{\tan x}$

Ans. (c)

◎ **Solution:** The primitive of the given function is

$$\int \frac{dx}{\sqrt{\sin^3 x \sin (x+\theta)}}$$

$$= \int \frac{dx}{\sqrt{\sin^3 x (\sin x \cos \theta + \cos x \sin \theta)}}$$

$$= \int \frac{\operatorname{cosec}^2 x\, dx}{\sqrt{\cos \theta + \cot x \sin \theta}}$$

$$= -\frac{1}{\sqrt{\sin \theta}} \int \frac{dt}{\sqrt{\cot \theta + t}} \quad (t = \cot x)$$

$$= -\frac{2}{\sqrt{\sin \theta}}\ (\cot \theta + t)^{1/2} + C$$

$$= -\frac{2}{\sin \theta} (\cos \theta + \sin \theta\, t)^{1/2} + C$$

$$= \frac{-2 \operatorname{cosec} \theta\, (\sin x \cos \theta + \sin \theta \cos x)^{1/2}}{\sqrt{\sin x}} + C$$

$$= -2 \operatorname{cosec} \theta \left(\frac{\sin (\theta + x)}{\sin x}\right)^{1/2} + C.$$

◉ **Example 79:** If the primitive of $\dfrac{\sin x}{\sqrt{1 + \sin x}}$ is $-2\sqrt{f(x)} + \sqrt{2}\ \log |\tan g(x)| + C$ then

(a) $f(x) = 1 + \sin x$

(b) $g(x) = (3\pi/8) - (x/4)$

(c) $f(x) = 2(1 - \sin x)$

(d) none of these

Ans. (b)

◎ **Solution:** $\displaystyle\int \frac{\sin x}{\sqrt{1+\sin x}}\, dx$

$$= -\int \frac{\cos u}{\sqrt{1 + \cos u}}\, du \left(x = \left(\frac{\pi}{2}\right) - u\right)$$

$$= -\int \frac{2\cos^2 (u/2) - 1}{\sqrt{2} \cos (u/2)}\, du$$

$$= -\sqrt{2} \int \cos (u/2)\, du + \frac{1}{\sqrt{2}} \int \sec (u/2)\, du$$

$$= -2\sqrt{2} \sin (u/2)$$
$$+ \sqrt{2} \log |\tan (\pi/4) + (u/4)| + C.$$

$$= -2\sqrt{2} \sin \left(\frac{\pi}{4} - \frac{x}{2}\right)$$
$$+ \sqrt{2} \log \left|\tan \left(\frac{3\pi}{8} - \frac{x}{4}\right)\right| + C.$$

◉ **Example 80:** If $\displaystyle\int \frac{(x^2 - 1)\, dx}{(x^4 + 3x^2 + 1) \tan^{-1} \frac{x^2+1}{x}} = \log |\tan^{-1} f(x)| + C$ then

(a) $f(x) = x^2 + 1$ (b) $f(x) = \dfrac{x^2+1}{2x}$

(c) $f(x) = \dfrac{1}{2}\ (x^2 + 1)$ (d) $f(x) = \dfrac{x^2+1}{x}$

Ans. (d)

◎ **Solution:** Dividing the numerator and denominator by x^2, the given integral transforms into

$$\int \frac{(1 - 1/x^2)\, dx}{((x + 1/x)^2 + 1) \tan^{-1} (x + 1/x)}$$

$$= \int \frac{dt}{(t^2 + 1) \tan^{-1} t} \qquad (t = (x + 1/x))$$

$$= \int \frac{du}{u}, \qquad (u = \tan^{-1} t)$$

$$= \log \left|\tan^{-1} \frac{x^2+1}{x}\right| + C.$$

Thus $f(x) = \dfrac{x^2+1}{x}$.

◉ **Example 81:** If $f(x) = \displaystyle\lim_{n \to \infty} \frac{x^n - x^{-n}}{x^n + x^{-n}}$, $0 < x < 1$, $n \in N$ then

$\int (\sin^{-1} x) f(x)\, dx$ is equal to

(a) $-[x \sin^{-1} x + \sqrt{1 - x^2}\ ] + C$

(b) $x \sin^{-1} x + \sqrt{1 - x^2} + C$

(c) constant

(d) none of these

Ans. (a)

Solution: $f(x) = \lim\limits_{n\to\infty} \dfrac{x^{2n}-1}{x^{2n}+1} = -1 \ (0 < x < 1)$, so

$$\int \sin^{-1} x\,(f(x))\,\mathrm{d}x = -\int \sin^{-1} x\,\mathrm{d}x$$
$$= -[x\sin^{-1} x + \sqrt{1-x^2}\,] + C$$

Example 82: If $f(x) = \lim\limits_{n\to\infty} [2x + 4x^3 + \ldots + 2nx^{2n-1}]$ $(0 < x < 1)$ then $\int f(x)\,\mathrm{d}x$ is equal to

(a) $-\sqrt{1-x^2}$ (b) $\dfrac{1}{\sqrt{1-x^2}}$

(c) $\dfrac{1}{x^2-1}$ (d) $\dfrac{1}{1-x^2}$

Ans. (d)

Solution: Let $g_n(x) = 1 + x^2 + x^4 + \ldots + x^{2n} = \dfrac{x^{2n+2}-1}{x^2-1}$

so $\quad h_n(x) = g'_n(x) = \dfrac{2x\left(nx^{2n+2}-(n+1)x^{2n}+1\right)}{\left(x^2-1\right)^2}$

Now $\ f(x) = \lim\limits_{n\to\infty} h_n(x) = \dfrac{2x}{\left(x^2-1\right)^2}$ as $0 < x < 1$.

Thus $\ \int f(x)\,\mathrm{d}x = \int \dfrac{2x}{\left(x^2-1\right)^2}\,\mathrm{d}x = -\dfrac{1}{x^2-1} = \dfrac{1}{1-x^2}$.

Example 83: If $f(x) = \lim\limits_{n\to\infty} e^{x\tan(1/n)\log(1/n)}$, and $\displaystyle\int \frac{f(x)}{\sqrt[3]{\sin^{11} x\cos x}}\,\mathrm{d}x = g(x) + C$ (C being the constant of integration), then

(a) $g(\pi/4) = 3/2$

(b) $g(x)$ is continuous for all $x \in \mathbf{R}$

(c) $g(\pi/4) = -15/8$

(d) $g(\pi/4) = 1/2$

Ans. (c)

Solution: $f(x) = \lim\limits_{n\to\infty} e^{x\tan(1/n)\cdot\log(1/n)}$.

But $\lim\limits_{n\to\infty} \tan(1/n)\log(1/n) = \lim\limits_{n\to\infty} -\dfrac{\log n}{n}\,\dfrac{\tan(1/n)}{1/n} = 0$

So $\quad f(x) = e^0 = 1$. Hence

$$\int \frac{f(x)}{\sqrt[3]{\sin^{11} x\cos x}}\,\mathrm{d}x = \int \frac{\mathrm{d}x}{\sqrt[3]{\sin^{11} x\cos x}}$$

$$= \int \frac{1+t^2}{t^{11/3}}\,\mathrm{d}t \ (t = \tan x)$$

$$= \int (t^{-11/3} + t^{-5/3})\,\mathrm{d}t$$

$$= -\frac{3}{8}\,t^{-8/3} - \frac{3}{2}\,t^{-2/3} + C$$

$$= -\frac{3}{8}\,\frac{\left(1+4\tan^2 x\right)}{\tan^2 x\sqrt[3]{\tan^2 x}} + C$$

Thus $\quad g(x) = -\dfrac{3}{8}\,\dfrac{\left(1+4\tan^2 x\right)}{\tan^2 x\sqrt[3]{\tan^2 x}}$, $g(\pi/4) = -\dfrac{15}{8}$.

Clearly g is not defined at $x = 0$.

Example 84: If $f(x) = \lim\limits_{n\to\infty} n^2\left(x^{1/n} - x^{1/(n+1)}\right)$, $x > 0$ then $\int x f(x)\,\mathrm{d}x$ is equal to

(a) $x^2/2$ (b) 0

(c) $x^2\log x - \dfrac{1}{2}x^2 + C$ (d) none of these

Ans. (d)

Solution: $f(x) = \lim\limits_{n\to\infty} n^2 x^{1/(n+1)}\left[x^{\frac{1}{n}-\frac{1}{n+1}} - 1\right]$

$$= \lim_{n\to\infty} \frac{x^{1(n+1)}\left(x^{\frac{1}{n(n+1)}} - 1\right)}{\dfrac{1}{n(n+1)} \times \dfrac{n(n+1)}{n^2}} = \log x.$$

Hence $\ \int x f(x)\,\mathrm{d}x = \int x\log x\,\mathrm{d}x = \dfrac{x^2}{2}\log x - \dfrac{1}{4}x^2 + C.$

Example 85: Let $f(x) = \int e^x(x-1)(x-2)\,\mathrm{d}x$. Then f decreases in the interval

(a) $(-\infty, -2)$ (b) $(-2, -1)$

(c) $(1, 2)$ (d) $(2, \infty)$

Ans. (c)

Solution: We have $f'(x) = e^x(x-1)(x-2)$. Since $e^x > 0$ for $x \in \mathbf{R}$ so $f'(x) < 0$ if and only if $(x-1)(x-2) < 0$ i.e. if $1 < x < 2$.

Example 86: If $\displaystyle\int \frac{\sqrt{1+\sqrt[3]{x}}}{x^{2/3}}\,\mathrm{d}x = 2f(x)^{3/2} + C$ then $f(x)$ is equal to

(a) $1 + x^{2/3}$ (b) $1 + x^{1/3}$

(c) $1 - x^{1/3}$ (d) $1 - x^{2/3}$

Ans. (b)

◎ **Solution:** $I = \int x^{-2/3}(1 + x^{1/3})^{1/2}\,dx$.

Here $m = -2/3$, $n = 1/3$, $p = 1/2$; $\dfrac{m+1}{n} = \dfrac{(-2/3+1)}{1/3} = 1$ (see theorem). Put $1 + x^{1/3} = t^2$, $(1/3)x^{-2/3}dx = 2t\,dt$.

Hence $\quad I = 6\int t^2 dt = 2t^3 + C = 2(1+x^{1/3})^{3/2} + C$.

Example 87: Let *f* and *g* be two polynomials then $\int (f(x)\,g''(x) - f''(x)\,g(x))\,dx$ is equal to (ignoring the constant of integration)

(a) $\dfrac{f(x)}{g'(x)}$

(b) $f'(x)\,g(x) - f(x)\,g'(x)$

(c) $f(x)\,g'(x) - f'(x)\,g(x)$

(d) $f'(x)\,g'(x) + f'(x)\,g(x)$

Ans. (c)

◎ **Solution:** $\int (f(x)g''(x) - f''(x)g(x))\,dx$

$$= f(x)\,g'(x) - \int f'(x)\,g'(x)\,dx - [g(x)\,f(x) - \int f'(x)g'(x)\,dx]$$

$$= f(x)\,g'(x) - g(x)\,f'(x)$$

EXERCISE

Concept-based Straight Objective Type Questions

1. If $\int(1 - \tan 3x)^2\,dx = \dfrac{1}{3}[\tan 3x + \log f(x)] + C$ then $f(x)$ is given by

(a) $\cos 3x$ (b) $\cos^2 3x$

(c) $\sin^2 3x$ (d) $\cos^3 3x$

2. If $\int \dfrac{dx}{x^4 - x^2} = \dfrac{1}{x} + \log|f(x)| + C$ then $f(x)$ is given by

(a) $\dfrac{x+1}{x-1}$ (b) $\dfrac{x-1}{x+1}$

(c) $\left(\dfrac{x-1}{x+1}\right)^{1/2}$ (d) $\left(\dfrac{x-1}{x+1}\right)^2$

3. $\int \dfrac{x^3 - 1}{4x^3 - x}$ is equal to

(a) $\dfrac{1}{4}x + \log|x| - \dfrac{3}{16}\log|2x-1| - \dfrac{9}{16}\log|2x+1| + C$

(b) $\dfrac{1}{4}x - \log|x| - \dfrac{5}{16}\log|2x-1| - \dfrac{7}{16}\log|2x+1| + C$

(c) $\dfrac{1}{4}x - \log|x| - \dfrac{7}{16}\log|2x-1| + \dfrac{9}{16}\log|2x+1| + C$

(d) $\dfrac{1}{4}x + \log|x| - \dfrac{7}{16}\log|2x-1| - \dfrac{9}{16}\log|2x+1| + C$

4. $\int x^5\sqrt[3]{(1+x^3)^2}\,dx$ is equal to

(a) $\dfrac{1}{8}u^{8/3} - \dfrac{1}{5}u^{5/3} + C,\ u = 1 + x^3$

(b) $\dfrac{3}{8}u^{8/3} - \dfrac{3}{5}u^{5/3} + C,\ u = 1 + x^3$

(c) $-\dfrac{3}{8}u^{8/3} + \dfrac{3}{5}u^{5/3} + C,\ u = 1 + x^3$

(d) $-\dfrac{1}{8}u^{8/3} + \dfrac{1}{5}u^{5/3} + C,\ u = 1 + x^3$

5. $\int \dfrac{dx}{\sin^5 x\cos^5 x}$ is equal to

(a) $\dfrac{1}{4}(\tan^4 x - \cot^4 x) + 2(\tan^2 x - \cot^2 x) + C$

(b) $\dfrac{1}{4}(\tan^4 x - \cot^4 x) + 2(\tan^2 x - \cot^2 x) + 6\log|\tan x| + C$

(c) $\dfrac{1}{4}(\tan^4 x - \cot^4 x) + 2(\cot^2 x - \tan^2 x) + 6\log|\cot x| + C$

(d) $\dfrac{1}{4}(\cot^4 x - \tan^4 x) + 2(\cot^2 x - \tan^2 x) + 6\log|\tan x| + C$

6. If $\int \dfrac{dx}{5 - 4\sin x + 3\cos x}$ is equal to $\dfrac{1}{2 + f(x)} + C$ then $f(x)$ is equal to

(a) $\tan x$ (b) $\tan\dfrac{x}{2}$

(c) $-\tan\dfrac{x}{2}$ (d) $\tan x - \tan^2 x$

7. If $\int \dfrac{dx}{1+e^x} = x + f(x) + C$, then $f(x)$ is equal to

(a) $\log(1 + e^x)$ (b) $\log\dfrac{1}{1+e^x}$

(c) $2\log(1 + e^x)$ (d) $\dfrac{x+e^x}{1+e^x}$

8. If $\int e^x\cos 4x\,dx = A\,e^{5x}\left(\sin 4x + \dfrac{5}{4}\cos 4x\right) + C$ then A is equal to

(a) $\frac{4}{41}$ (b) $\frac{3}{41}$

(c) $\frac{5}{41}$ (d) $\frac{9}{41}$

9. The integral of $f(x) = 3^x \cos x$ is given by

(a) $3^x (\sin x + \cos x \log 3) + C$

(b) $3^x (\log 3 \sin x + \cos x) + C$

(c) $\frac{3^x (\sin x + \cos \log 3)}{\left(1 + (\log 3)^2\right)}$

(d) $\frac{3^x (\log 3 \sin x + \cos x)}{\left(1 + (\log 3)^2\right)} + C$

10. If $\int \frac{dx}{\sin 2x - 2\sin x} = C - \frac{1}{4} \log |f(x)| + \frac{1}{8 \sin^2 \frac{x}{2}}$ then $f(x)$ is equal to

(a) $\tan^2 x$ (b) $2 \tan \frac{x}{2}$

(c) $\tan \frac{x}{2}$ (d) $\sin \frac{x}{2}$

LEVEL 1

Straight Objective Type Questions

11. If $f_n(x) = \log \log \ldots \log x$ (log is repeated n times) then $\int [x f_1(x) f_2(x) \ldots f_n(x)]^{-1}$ dx is equal to

(a) $f_{n+1}(x) + C$ (b) $\frac{f_{n+1}(x)}{n+1} + C$

(c) $n f_n(x) + C$ (d) none of these

12. $\int 3^{3^{3^x}} 3^{3^x} 3^x \, dx$ is equal to

(a) $\frac{x^{3^x}}{(\log 3)^3} + C$ (b) $3^{3^{3^x}} (\log 3)^3 + C$

(c) $\frac{3^{3^{3^x}}}{(\log 3)^3} + C$ (d) none of these

13. The value of $\int \log (1 - \sqrt{x}) \, dx$ is

(a) $x \log (1 - \sqrt{x}) - \frac{1}{2} x - \frac{3}{2} \sqrt{x} + C$

(b) $(x - 1) \log (1 - \sqrt{x}) - \frac{1}{2} x - \sqrt{x} + C$

(c) $x^2 \log\left(1 - \sqrt{x}\right) - \frac{1}{2} \sqrt{x} + C$

(d) none of these

14. The value of $\int \frac{(x+1)}{x(1 + xe^x)} \, dx$ is

(a) $\log |1 + x e^x| + x + C$

(d) $\frac{1}{2} \log \left| \frac{x(1 + xe^x)}{x+1} \right| + C$

(c) $\log \left| \frac{xe^x}{1 + xe^x} \right| + C$

(d) $\log \left| \frac{(x+1) e^x}{1 + xe^x} \right| + C$

15. If $\int (\sin 2x - \cos 2x) \, dx = \frac{1}{\sqrt{2}} \sin (2x + k) + C$ then

(a) $k = \pi/4$ (b) $k = 5\pi/4$

(c) $k = 3\pi/4$ (d) none of these

16. If $\int \frac{x + \sin x}{1 + \cos x} dx = f(x) \tan \frac{x}{2} + C$

(a) $f(x) = x^2$ (b) $f(x) = x$

(c) $f(x) = 1 + \cos x$ (d) none of these

17. If $\int \frac{\sin 2x}{\cos^4 x + \sin^4 x} dx = \tan^{-1}(f(x)) + C$ then

(a) $f(x) = x^2$ (b) $f(x) = \cos x$

(c) $f(x) = \sin x$ (d) $f(x) = \tan^2 x$

18. The function f whose graph passes through $(\pi/4, 0)$ and whose derivative is $\frac{\log (\tan x)}{\sin x \cos x}$ is given by

(a) $(\log \tan x)^2 + \frac{\pi}{4}$ (b) $\frac{1}{2} (\log \cos x)^2$

(c) $\frac{1}{2} (\log \sin x)^2$ (d) $\frac{1}{2} (\log \tan x)^2$

19. The function f whose graph passes through $(4, -20)$ and whose derivative is $\cos \left(\sqrt{4 - x}\right)$ is given by

(a) $\sqrt{4-x} \sin \sqrt{4-x} + (4 - 6x) \cos \sqrt{4-x}$

(b) $\sqrt{4-x} \sin \sqrt{4-x} + \sqrt{4-x} \cos \sqrt{4-x} - 20$

(c) $-2\left(\sqrt{4-x} \sin \sqrt{4-x} + \cos \sqrt{4-x}\right) - 18$

(d) $-(2x + 12) \sqrt{4-x} \sin \sqrt{4-x}$

$+(4 - 6x) \cos \sqrt{4-x}$

20. If it is known that at the point $x = 1$ two antiderivative of $f(x) = e^x$ differ by 2. The difference of these antiderivatives at $x = 100$ is

(a) e^{100} (b) 100
(c) 2 (d) none of these

21. If $\int \frac{dx}{\cos^6 x + \sin^6 x} = \tan^{-1}(k \tan 2x) + C$ then

(a) $k = 1/2$ (b) $k = 1/4$
(c) $k = 1/6$ (d) k depends on x

22. If $\int \frac{\sin^2 x}{1 + \sin^2 x} dx = x - K \tan^{-1}(M \tan x) + C$ then

(a) $M = \frac{1}{\sqrt{2}}$ (b) $K = \frac{1}{\sqrt{2}}$
(c) $M = -\frac{1}{\sqrt{2}}$ (d) $K = -\frac{1}{\sqrt{2}}$

23. If $\int \tan^4 x\, dx = K \tan^3 x + L \tan x + f(x)$, then

(a) $K = 2/3$ (b) $L = -2$
(c) $f(x) = x + C$ (d) $K = 4/3$

24. If $\int \log(\sqrt{1-x} + \sqrt{1+x})\ dx = xf(x) + Lx + M \sin^{-1} x + C$, then

(a) $f(x) = \log(\sqrt{1-x} + \sqrt{1+x})$
(b) $L = -1/3$
(c) $M = -2/3$ (d) $M = -1/2$.

25. If $\int x \log\left(1 + \frac{1}{x}\right) dx = f(x) \log(x + 1) + g(x)x^2 + Lx + C$, then

(a) $f(x) = (1/2)\, x^2$ (b) $g(x) = \log x$
(c) $L = 1$ (d) none of these.

26. If $\int \frac{dx}{(x^2 + 1)(x^2 + 4)} = K \tan^{-1} x + L \tan^{-1} \frac{x}{2} + C$, then

(a) $K = 2/3$ (b) $L = 2/3$
(c) $K = -2/3$ (d) $L = -1/6$.

27. If $\int \frac{\cos^4 x}{\sin^2 x} dx = K \cot x + M \sin 2x + L \frac{x}{2} + C$, then

(a) $L = 1$ (b) $K = -2$
(c) $M = -1/4$ (d) none of these.

28. If $\int \frac{xe^x}{\sqrt{1 + e^x}} dx = f(x)\sqrt{1 + e^x} - 2 \log |g(x)| + C$, then

(a) $g(x) = \frac{\sqrt{1+e^x} + 1}{\sqrt{1+e^x} - 1}$ (b) $g(x) = \frac{\sqrt{1+e^x} - 1}{\sqrt{1+e^x} + 1}$
(c) $f(x) = x - 1$ (d) $f(x) = 3(x - 2)$

29. The value of the integral $\int \frac{\log(x+1) - \log x}{x(x+1)} dx$ is

(a) $-\frac{1}{2}[\log |(x + 1)|]^2 - \frac{1}{2}(\log |x|)^2 + \log |x + 1| \log |x| + C$
(b) $-[\{\log(x + 1)\}^2 - (\log x)^2] + \log(x + 1) \log x + C$
(c) $C - (1/2)[\log(1 + 1/x)]$
(d) none of these.

30. If $\int \operatorname{cosec} 2x\, dx = f |g(x)| + C$ then

(a) range of $g(x) = [0, \infty)$
(b) dom $f = (0, \infty)$
(c) $g'(x) = -\operatorname{cosec}^2 x$
(d) $f'(x) = 1/x$ for all $x \in (0, \infty)$

31. If $\int f(x)\, dx = -2 \cos \sqrt{x} + C$ then $f(x)$ is equal to

(a) $\sin \sqrt{x}$ (b) $\frac{\sin \sqrt{x}}{\sqrt{x}}$
(c) $2 \cos \sqrt{x}$ (d) none of these

32. If $\int \frac{dx}{2 \sin x - \cos x + 5} = A \tan^{-1} \frac{1}{\sqrt{5}} f(x) + C$, then

(a) $A = 1/\sqrt{5}$
(b) $A = \sqrt{5}$
(c) $f(x) = 5 \tan(x/2) + 1$
(d) $f(x) = 2 \tan(x/2) + 1$

33. The antiderivative of $\frac{1}{\sin^2 x + \tan^2 x}$ is

(a) $(-1/2)\left[\tan x + (1/\sqrt{2}) \tan^{-1}(1/\sqrt{2}) \tan x\right] + C$
(b) $(-1/2)\left[\cot x + \left(1/\sqrt{2}\right) \tan^{-1}\left((1/\sqrt{2}) \tan x\right)\right] + C$
(c) $-\left[\cot x + (1/\sqrt{2}) \tan^{-1}\left((1/\sqrt{2}) \tan x\right)\right]$
(d) none of these

34. If the antiderivative of $\frac{1}{\sqrt{x + x^{3/2}}}$ is $A\sqrt{1 + \sqrt{x}} + C$ then A is equal to

(a) 2 (b) 1
(c) 3 (d) 4

35. If the antiderivative of $\frac{e^{3x} + e^x}{e^{4x} - e^{2x} + 1}$ is $f(e^x - e^{-x}) + C$ then $f(x)$ is equal to

(a) $\sin x$ (b) $\cos^{-1} x$
(c) $\tan^{-1} x$ (d) $\tan x$

36. The value of $\int e^{\sec x}\sec^3 x\,(\sin^2 x + \cos x + \sin x + \sin x \cos x)\,dx$ is
(a) $e^{\sec x}(\sec x + \tan x) + C$
(b) $e^{\sec x}(\sec^2 x + \sec x \tan x) + C$
(c) $e^{\sec x}(\sec^2 x + \tan x) + C$
(d) none of these

37. If $\int \frac{3\cos x + 2\sin x}{4\sin x + 5\cos x}\,dx = Ax + B\log|4\sin x + 5\cos x| + C$ then
(a) $A = 23/41, B = 1/41$
(b) $A = 23/41, B = 2/41$
(c) $A = 11/23, B = 2/23$
(d) $A = 12/23, B = 2/23$

38. If $\int \frac{dx}{4 - 3\cos^2 x + 5\sin^2 x} = \frac{1}{3} f(3\tan x) + C$, then $f(x)$ is equal to
(a) $3\tan^{-1} x$ (b) x^2
(c) $x^2 + 1$ (d) $\tan^{-1} x$

39. If $f(x) = \frac{x^2}{1+x^2}$ and $g(x) = \sin x$ then $\int fo\, g(x)\cos x\,dx$ is
(a) $\sin x - \tan^{-1}(\sin x) + C$
(b) $\cos x + \tan^{-1}(\cos x) + C$
(c) $\sin x + 2\tan^{-1}(\sin x) + C$
(d) none of these

40. If $P(x) = \int \frac{x^3}{x^3 - x^2}\,dx$, $Q(x) = \int \frac{1}{x^3 - x^2}\,dx$ and $(P + Q)(2) = 5/2$ then $P(3) + Q(3)$ is equal to
(a) $5/2$ (b) $\frac{5}{4} + \log\frac{4}{3}$
(c) $\frac{10}{3} + \log\frac{4}{3}$ (d) none of these

41. $\int \frac{x^4 - 1}{x^2\left(x^4 + x^2 + 1\right)^{1/2}}\,dx$ is equal to
(a) $\sqrt{\frac{x^4 + x^2 + 1}{x}} + C$
(b) $\frac{x^2}{\sqrt{x^4 + x^2 + 1}} + C$
(c) $x\left(x^4 + x^2 + 1\right)^{3/2} + C$
(d) $\frac{\sqrt{x^4 + x^2 + 1}}{x} + C$

42. $\int \frac{1}{x}\log_{ex} e\,dx$ is equal to
(a) $\log_e\left(1 - \log_e x\right) + C$
(b) $\log_e\left(\log_e ex - 1\right) + C$
(c) $\log_e\left(\log_e x - 1\right) + C$
(d) $\log_e\left(1 + \log_e x\right) + C$

43. $\int \frac{x + \left(\cos^{-1} 3x\right)^2}{\sqrt{1 - 9x^2}}\,dx$ is equal to
(a) $C - \left(\frac{1}{9}\sqrt{1 - 9x^2} + \left(\cos^{-1} 3x\right)^3\right)$
(b) $C + \left(\frac{1}{9}\sqrt{1 - 9x^2} + \left(\cos^{-1} 3x\right)^3\right)$
(c) $C - \left(\sqrt{1 - 9x^2} + \left(\cos^{-1} 3x\right)^3\right)$
(d) $\frac{1}{9}\sqrt{1 - 9x^2} - \left(\cos^{-1} 3x\right)^3 + C$

44. If $I = \int \frac{\log\left(x + \sqrt{1 + x^2}\right)}{\sqrt{1 + x^2}}\,dx$, then I equals
(a) $(1/2)\log\left(x + \sqrt{1 + x^2}\right) + C$
(b) $(1/2)\left(\log\left(x + \sqrt{1 + x^2}\right)\right)^2 + C$
(c) $x\log\left(x + \sqrt{1 + x^2}\right) + C$
(d) $\log\left(x + \sqrt{1 + x^2}\right) + C$

45. If $I = \int \sec^{-1}\sqrt{x}\,dx$, then I equals
(a) $x\sec^{-1}\sqrt{x} - \log(1 + x) + C$
(b) $\sec^{-1}\sqrt{x} - \tan^{-1}\sqrt{x} + C$
(c) $x\sec^{-1}\sqrt{x} - \sqrt{x - 1} + C$
(d) $x\sec^{-1}\sqrt{x} + \log(1 + x) + C$

Assertion-Reason Type Questions

46. Let $I = \int \frac{e^{\sqrt{x}}}{\sqrt{x}}\,dx$ and $J = \int \frac{dx}{e^x\sqrt{1-e^{-2x}}}$ then

    Statement-1: $I + J = 2e^{\sqrt{x}} - \sin^{-1} e^{-x} + C$

    Statement-2: Suitable substitution is $\sqrt{x} = t$ in $I + J$

47. Let $f(x) = \frac{1}{\sqrt{x - x^2}}$ and F be the antiderivative of f satisfying $F(0) = 0$

    Statement-1: $F(1) = \pi$

    Statement-2: $F(x) = 4\tan^{-1}\sqrt{x}$

48. **Statement-1:** $I = \int \frac{(x+1)}{x\left(1+xe^x\right)}\,dx = \log\left|\frac{xe^x}{1+xe^x}\right| + C$

    Statement-2: Suitable substitution for computing I is $xe^x = t$.

49. Let $f(x) = \frac{1}{\sin 2x - 2\sin x}$ and $F(x)$ be an antiderivative of $f(x)$

    Statement-1: $F(x)$ is a periodic function with period 2π

    Statement-2: $F(x) = C - \frac{1}{4}\log|\cos x| + \frac{1}{8\sin^2\frac{x}{2}}$

50. If $\int xe^{x^2}\left(x^2+1\right)dx = f(x)e^{x^2} + C$

    Statement-1: $f(x)$ is of the form $\frac{x^n}{2}$ for some n

    Statement-2: f is an even function

LEVEL 2

Straight Objective Type Questions

51. If $f(x) = \int (x^3 - 2x^2 + 3)e^{3x}\,dx$ then the number of critical points of f are
    (a) 1
    (b) 2
    (c) 3
    (d) 4

52. If $f(x) = \int \frac{3x+2}{x^4 - x^3 + x^2 - 1}\,dx$, then $f(x)$ has
    (a) one critical point
    (b) two critical points
    (c) three critical points
    (d) no critical point

53. The function $f(x) = \int \frac{(x-2)\,dx}{x^2 - 7x + 12}$
    (a) decreases on **R**
    (b) increases on **R** ~ (2, 3)
    (c) increases on [2, 3) ∪ (4, ∞)
    (d) decreases on (2, ∞)

54. If $f(x) = \sin x$ then $\int \frac{e^{f(x)}\left(x\cos^3 x - f(x)\right)}{1-(f(x))^2}\,dx$ is equal to
    (a) $e^{f(x)}(x - \sin x) + C$
    (b) $e^{f(x)}(x - \sec x) + C$
    (c) $e^{f(x)}(x + \sec x) + C$
    (d) $e^{f(x)}(x + \sec^2 x) + C$

55. If $\int \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}}\,dx = Ax + B\log(9e^{2x} - 4) + C$ then
    (a) $A = 3/2, B = 35/36$
    (b) $A = -5/4, B = 23/24$
    (c) $A = -3/2, B = 35/36$
    (d) $A = 5/4, B = -35/36$

56. Let f be a continuous function satisfying $f(x + y) = f(x)f(y)$ $(x, y \in \mathbf{R})$ with $f(1) = e$ then the value of $\int \frac{xf(x)}{\sqrt{1+f(x)}}\,dx$ is
    (a) $2x\sqrt{1+e^x} - 4\sqrt{1+e^x} - 2\log\left|\frac{\sqrt{1+e^x}-1}{\sqrt{1+e^x}+1}\right| + C$
    (b) $2\sqrt{1+e^x} - 4\sqrt{1+f(x)} - 2\log\left|\sqrt{1+f(x)} - 1\right| + C$
    (c) $2\sqrt{1+f(x)} - 4\sqrt{1+f(x)} - 2\log\left|\frac{\sqrt{1+f(x)}-1}{\sqrt{1+f(x)}+1}\right| + C$
    (d) none of these.

57. If $\int \frac{x^7}{\left(1+x^4\right)^2} \mathrm{d}x = \frac{1}{4}\left[\log(1+x^4) + f(x)\right] + C$ then

(a) $f(x) = 1 + x^4$

(b) $f(x) = \frac{1}{\left(1+x^4\right)^2}$

(c) $f(x) = \frac{1}{1+x^4}$

(d) $f(x) = \tan^{-1}(1 + x^4)$

58. The function f whose graph passes through (0, 0) and whose derivative is $\frac{\cos^4 x + \sin^4 x}{\cos^2 x - \sin^2 x}$ is given by

(a) $\frac{1}{4}\log\left|\frac{1+\tan x}{1-\tan x}\right| + \frac{1}{2}\sin x \cos x$

(b) $\log\left|\frac{\cos x + \sin x}{\cos x - \sin x}\right| + \sin 2x$

(c) $\log\left|\frac{\cos x - \sin x}{\cos x + \sin x}\right| + \frac{1}{2}\sin x \cos x + x$

(d) none of these

59. Let $P(x)$ be a polynomial of degree n with leading coefficient 1. Let $v(x)$ be any function and $v_1(x) = \int v(x)\, \mathrm{d}x$,

$$v_2(x) = \int v_1(x)\, \mathrm{d}x \ \ldots\ v_{n+1}(x) = \int v_n(x)\, \mathrm{d}x.$$

then $\int P(x)\, v(x)\, \mathrm{d}x$ is equal to

(a) $P(x)\, v_1(x) + \frac{P'(x)v_2(x)}{2!} + \frac{P''(x)v_3(x)}{3!} \ldots + \frac{v_{n+1}(x)}{(n+1)!}$

(b) $P(x)\, v_1(x) - P'(x)\, v_2(x) + P''(x)\, v_3(x) \ldots + (-1)^n\, n!\, v_{n+1}(x)$

(c) $P(x)\, v_1(x) + P'(x)\, v_2(x) + P''(x)\, v_3(x) \ldots + n\, v_{n+1}(x)$

(d) $P(x)\, v_1(x) - \frac{P'(x)v_2(x)}{2!} + \frac{P''(x)v_3(x)}{3!} \ldots + (-1)^n \frac{v_{n+1}(x)}{(n+1)!}$

60. If $\int \frac{x+1}{\left(x^2+x+1\right)} \frac{\mathrm{d}x}{\sqrt{x^2+x+1}} = k\frac{x-1}{\sqrt{x^2+x+1}} + C$ then the value of k is

(a) 1/2 (b) 1/3

(c) 2/3 (d) none of these

61. Let f be a continuous function satisfying $f(x + y) = f(x) + f(y)$, for each $x, y \in \mathbf{R}$ and $f(1) = 2$ then $\int \frac{f(x)\tan^{-1} x}{\left(1+x^2\right)^2} \mathrm{d}x$ is equal to

(a) cannot be determined explicitly

(b) $C - \frac{\tan^{-1} x}{2(1+x^2)} + \frac{1}{4}\tan^{-1} x + \frac{f(x)}{1+(f(x))^2}$

(c) $C - \frac{\tan x}{2(1+x^2)} + \frac{\tan^{-1} x}{4} + \frac{x}{4(1+x^2)}$

(d) $C - \frac{1}{(1+x^2)}\tan^{-1} x + \frac{1}{2}\tan^{-1} x + \frac{x}{2(1+x^2)}$

62. The value of $\int \frac{dx}{\sqrt[4]{(x-1)^3(x+2)^5}}$ is

(a) $3(x-1)^{1/4} - (5/3)(x+2)^{3/4} + C$

(b) $4\left(\sqrt[4]{x-1}\right) - 5\left(\sqrt[4]{(x+2)^5}\right) + C$

(c) $\frac{4}{3}\sqrt[4]{\frac{x-1}{x+2}} + C$

(d) none of these

63. The integral $\int \frac{\cos 4x - 1}{\cot x - \tan x}$ is equal to

(a) $-\frac{1}{2}\cos 4x + C$ (b) $-\frac{1}{4}\cos 4x + C$

(c) $-\frac{1}{2}\sin 2x + C$ (d) none of these.

64. If $f(x) = \lim\limits_{x\to\infty} \frac{x^n - x^{-n}}{x^n + x^{-n}}, x > 1$ then $\int \frac{x f(x) \log\left(x + \sqrt{1+x^2}\right)}{\sqrt{1+x^2}} \mathrm{d}x$ is

(a) $\log\left(x + \sqrt{1+x^2}\right) - x + C$

(b) $\left(\frac{1}{2}\right)x^2\left(\log\left(x+\sqrt{1+x^2}\right) - 1\right) + C$

(c) $(x-1)\log\left(x + \sqrt{1+x^2}\right) + C$

(d) none of these

65. The value of $\int \sin\sqrt[3]{x}\, dx$ is

(a) $\{(2 - x^{2/3})\cos x^{1/3} + 2x^{1/3}\sin x^{1/3}\} + C$

(b) $3\{(2 - x^{2/3})\cos x^{1/3} + 2x^{1/3}\sin x^{1/3}\} + C$

(c) $3\,\{(2 - x^{2/3}) \sin x^{1/3} - 2\,x^{1/3} \cos x^{1/3}\} + C$

(d) none of these

66. Let $f(x)$ be a function satisfying $f'(x) = f(x)$ and $f(0) = 2$. Then $\int \frac{f(x)}{3+4f(x)}\,dx$ is equal to

(a) $(1/4) \log (3 + 8e^x) + C$

(b) $(1/2) \log (3 + 5e^x) + C$

(c) $(1/4) \log (3 + 4e^{2x}) + C$

(d) none of these

67. If $\int \frac{f(x)}{x^2 - x + 1}\,dx = \frac{3}{2} \log (x^2 - x + 1) + \frac{1}{\sqrt{3}} \tan^{-1} \frac{2x-1}{\sqrt{3}} + C$ then $f(x)$ is equal to

(a) $3x$ (b) $3x - 4$

(c) $3x - 1$ (d) $\frac{1}{1+x^2}$

68. If the antiderivative of $\frac{1}{x^2\sqrt{1+x^2}}$ is $-\frac{\sqrt{f(x)}}{x} + C$ then $f(x)$ is equal to

(a) $1 + 1/x^2$ (b) $\tan^{-1} x$

(c) $1 + x^2$ (d) $2\sqrt{1+x^2}$

69. The value of the integeral $\int \frac{dx}{\cos^3 x\sqrt{\sin 2x}}$ can be expressed as

(a) a rational function of tan x

(b) an irrational function tan x

(c) a rational function of cos x

(d) a rational function of sin x

70. If $f(x) = \sqrt{x}$, $g(x) = e^x - 1$ and $h(x) = \tan^{-1} x$ then the antiderivative of $f \text{ o } g(x)$ is

(a) $2\,[g \text{ o } f(x) - g \text{ o } f \text{ o } h(x)] + C$

(b) $2\,[f \text{ o } g(x) - f \text{ o } g \text{ o } h(x)] + C$

(c) $f \text{ o } g(x) + f \text{ o } g \text{ o } h(x) + C$

(d) $2\,[f \text{ o } g(x) - h \text{ o } f \text{ o } g(x)] + C$

71. If $f(x) = \sqrt{4x^2 + 4x - 3}$ then $\int \frac{x+3}{f(x)}\,dx$ is equal

(a) $(1/4) f(x) + (2/3) \log |2x + 1 + f(x)| + C$

(b) $(1/4) f(x) + (5/4) \log |2x + 1 + f(x)| + C$

(c) $(1/3) f(x) + (2/3) \log |(x + 3) + f(x)| + C$

(d) $(2/3) f(x) + (1/3) \log |(x + 3) + f(x)|$

72. If $f(x) = \frac{1+\sqrt{2}\cos x}{1-\sqrt{2}\cos x}$ and $g(x) = \tan \frac{x}{2}$ and $h(x) = \log |x|$ then $\int \frac{dx}{\sin x(2\cos^2 x - 1)}$ is equal to

(a) $(1/\sqrt{2}) \log |f(x)| + g \text{ o } h(x) + C$

(b) $\sqrt{2}\; h \text{ o } f(x) + h \text{ o } g(x) + C$

(c) $h \text{ o } (f + g)(x) + C$

(d) $(1/\sqrt{2})\; f \text{ o } (g + h)(x) + C$

73. If $f(x) = \sqrt{x^2 + 4}$ then $\int \frac{f(x)}{x^6}\,dx$ is equal to

(a) $\frac{(f(x))^3\left((f(x))^2 - 10\right)}{120x^5} + C$

(b) $\frac{(f(x))^3\left((f(x))^2 - 4\right)}{6x^5} + C$

(c) $\frac{(f(x))^2\left((f(x))^3 - 2\right)}{20x^4} + C$

(d) $\frac{(f(x))^3\left(x^2 - 6\right)}{6x^5} + C$

74. If $f(x) = \cos x$ and $g(x) = \sin x$ then $\int \frac{\log f(x)}{(f(x))^2}\,dx$ is

(a) $f(x)(\log f(x) + 1) + x + C$

(b) $\frac{g(x)}{f(x)} (\log f(x) + 1) + \frac{x^2}{2} + C$

(c) $\frac{f(x)}{g(x)} (\log g(x) + 1) + x + C$

(d) $\frac{g(x)}{f(x)} [\log f(x) + 1] - x + C$

75. If $f(x) = \cos x$ then $\int (2(f(x))^2 - 1)(4(f(x))^3 - 3 f(x))\,dx$ is equal to

(a) $\frac{1}{10} \sin 5x + \frac{1}{2} \sin x + C$

(b) $\frac{1}{5} \sin 5x + \sin x + C$

(c) $\frac{1}{15} \sin 5x - \frac{1}{2} \sin x + C$

(d) none of these

76. If $I_n = \int \cot^n x\,dx$, and $I_0 + I_1 + 2\,(I_2 + \ldots + I_8) + I_9 + I_{10} = A\left(u + \frac{u^2}{2} + \ldots + \frac{u^9}{9}\right)$, where $u = \cot x$ then

(a) $A = 1$ (b) $A = -1$

(c) $A = 1/2$ (d) $A = -1/2$

77. $f(x) = \int \frac{dx}{\sin^4 x}$ is a

(a) polynomial of degree 3 in $\cot x$
(b) polynomial of degree 4 in $\cot x$
(c) polynomial of degree 4 in $\sin x$
(d) polynomial of degree 3 in $\tan x$

78. If $f(x) = \sqrt{x^2 - a^2}$ then $\int \frac{x^2}{f(x)} dx$ is

(a) $x f(x) + \frac{a^2}{2} \log|x + f(x)| + C$

(b) $\frac{x^2}{2} f(x) - \frac{a^2}{2} \log|x + f(x)| + C$

(c) $\frac{x^2}{2} f(x) + a^2 \log|x - f(x)| + C$

(d) $\frac{x}{2} f(x) + \frac{a^2}{2} \log|x + f(x)| + C$

79. Let $f(x) = \frac{x}{(1 + x^n)^{1/n}}$ for $n \geq 2$ and $g(x) = \underbrace{\frac{f \circ f \ldots \circ f}{n\ times}}$. Then $\int x^{n-2} g(x)\, dx$ equals

(a) $\frac{1}{n(n-1)} (1 + n x^n)^{1 - 1/n} + k$

(b) $\frac{1}{n-1} (1 + n x^n)^{1 - 1/n} + k$

(c) $\frac{1}{n(n-1)} (1 + n x^n)^{1 + 1/n} + k$

(d) $\frac{1}{n-1} (1 + n x^n)^{1 + 1/n} + k.$

80. If $\int f(x)\, dx = \phi(x)$ i.e. ϕ is a function such that $\phi'(x) = f(x)$, then $\int x^9 f(x^5)\, dx$ is equal to

(a) $\frac{1}{5} [x^5 \phi(x^5) - \int x^4 \phi(x^5) dx] + C$

(b) $\frac{1}{5} x^5 \phi(x^5) - 5 \int x^5 \phi(x^5)\, dx + C$

(c) $\frac{1}{5} x^5 \phi(x^5) - \int x^4 \phi(x^5)\, dx + C$

(d) $\frac{1}{5} [x^5 \phi(x^5) - \int x^5 \phi(x^5) dx] + C$

Previous Years' AIEEE/JEE Main Questions

1. If $\int \frac{\sin x}{\sin(x - \alpha)} dx = Ax + B \log \sin(x - \alpha) \sin + C$ then the value of (A, B) is

(a) $(-\sin\alpha, \cos\alpha)$
(b) $(\cos\alpha, \sin\alpha)$
(c) $(\sin\alpha, \cos\alpha)$
(d) $(-\cos\alpha, \sin\alpha)$ **[2004]**

2. $\int \frac{dx}{\cos x - \sin x}$ is equal to

(a) $\frac{1}{\sqrt{2}} \log\left|\tan\left(\frac{x}{2} - \frac{3\pi}{8}\right)\right| + C$

(b) $\frac{1}{\sqrt{2}} \log\left|\cot\frac{x}{2}\right| + C$

(c) $\frac{1}{\sqrt{2}} \log\left|\tan\left(\frac{x}{2} - \frac{\pi}{8}\right)\right| + C$

(d) $\frac{1}{\sqrt{2}} \log\left|\tan\left(\frac{x}{2} + \frac{3\pi}{8}\right)\right| + C$ **[2004]**

3. $\int \left\{\frac{(\log x - 1)}{1 + (\log x)^2}\right\}^2 dx$ is equal to

(a) $\frac{x e^x}{1 + x^2} + C$ (b) $\frac{x}{(\log x)^2 + 1} + C$

(c) $\frac{\log x}{(\log x)^2 + 1} + C$ (d) $\frac{x}{x^2 + 1} + C$ **[2005]**

4. $\int \frac{dx}{\cos x + \sqrt{3} \sin x}$ equals

(a) $\frac{1}{2} \log \tan\left(\frac{x}{2} + \frac{\pi}{12}\right) + C$

(b) $\frac{1}{2} \log \tan\left(\frac{x}{2} - \frac{\pi}{12}\right) + C$

(c) $\log \tan\left(\frac{x}{2} + \frac{\pi}{12}\right) + C$

(d) $\log \tan\left(\frac{x}{2} - \frac{\pi}{12}\right) + C$ **[2007]**

5. The value of $\sqrt{2}\int \dfrac{\sin x}{\sin\left(x-\dfrac{\pi}{4}\right)}$ is

(a) $x+\log\left|\cos\left(x-\dfrac{\pi}{4}\right)\right|+C$

(b) $x-\log\left|\sin\left(x-\dfrac{\pi}{4}\right)\right|+C$

(c) $x+\log\left|\sin\left(x-\dfrac{\pi}{4}\right)\right|+C$

(d) $x-\log\left|\cos\left(x-\dfrac{\pi}{4}\right)\right|+C$ **[2008]**

6. If the integral $\int \dfrac{5\tan x}{\tan x-2}\,dx$ = $x + a\log|\sin x - 2\cos x| + k$, then a is equal to

(a) –2 (b) 1
(c) 2 (d) –1 **[2012]**

7. If $\int \dfrac{x^2-x+1}{x^2+1}\, e^{\cot^{-1}x}\,dx = A(x)\,e^{\cot^{-1}x} + C$

(a) $-x$ (b) x
(c) $\sqrt{1-x}$ (d) $\sqrt{1+x}$ **[2013, online]**

8. The integral $\int \dfrac{x\,dx}{2-x^2+\sqrt{2-x^2}}$ equals

(a) $\log\left|1+\sqrt{2+x^2}\right|+C$

(b) $-\log\left|1+\sqrt{2-x^2}\right|+C$

(c) $-x\log\left|1-\sqrt{2-x^2}\right|+C$

(d) $x\log\left|1-\sqrt{2+x^2}\right|+C$ **[2013, online]**

9. If $\int \dfrac{dx}{x+x^7} = p(x)$ then, $\int \dfrac{x^6}{x+x^7}\,dx$ is equal to

(a) $\log|x| - p(x) + C$
(b) $\log|x| + p(x) + C$
(c) $x - p(x) + C$
(d) $x + p(x) + C$ **[2013, online]**

10. If $\int f(x)\,dx = \psi(x)$, then $\int x^5 f(x^3)\,dx$ is equal to

(a) $\dfrac{1}{3}\,x^3\,\psi(x)^3 - 3\int x^3\,\psi(x^3)\,dx + C$

(b) $\dfrac{1}{3}\,x^3\,\psi(x^3) - \int x^2\,\psi(x^3)\,dx + C$

(c) $\dfrac{1}{3}\,[x^3\,\psi(x^3) - \int x^3\,\psi(x^3)\,dx] + C$

(d) $\dfrac{1}{3}\,[x^3\,\Psi(x^3) - \int x^2\,\Psi(x^3)\,dx] + C$ **[2013]**

11. The integral $\int \left(1+x-\dfrac{1}{x}\right)e^{x+\frac{1}{x}}\,dx$ is equal to

(a) $(x-1)\,e^{x+\frac{1}{x}}+C$

(b) $x\,e^{x+\frac{1}{x}}+C$

(c) $(x+1)\,e^{x+\frac{1}{x}}+C$

(d) $-x\,e^{x+\frac{1}{x}}+C$ **[2014]**

12. **I** = $\int \dfrac{\sin^8 x-\cos^8 x}{1-2\sin^2 x\cos^2 x}\,dx$ is equal to

(a) $\dfrac{1}{2}\sin 2x + C$

(b) $-\dfrac{1}{2}\sin 2x + C$

(c) $-\dfrac{1}{2}\sin x + C$

(d) $-\sin^2 x + C$ **[2014, online]**

13. The integral $\int x\cos^{-1}\left(\dfrac{1-x^2}{1+x^2}\right)dx$ $(x > 0)$ is equal to

(a) $-x + (1+x^2)\tan^{-1}x + C$
(b) $x - (1+x^2)\cot^{-1}x + C$
(c) $-x + (1+x^2)\cot^{-1}x + C$
(d) $x - (1+x^2)\tan^{-1}x + C$ **[2014, online]**

14. The integral $\int \dfrac{\sin^2 x\cos^2 x}{\left(\sin^3 x+\cos^3 x\right)^2}\,dx$ is equal to

(a) $\dfrac{1}{1+\cot^3 x}+C$

(b) $-\dfrac{1}{3\left(1+\tan^3 x\right)}+C$

(c) $\dfrac{\sin^3 x}{1+\cos^3 x}+C$

(d) $\dfrac{\cos^3 x}{3\left(1+\sin^3 x\right)}+C$ **[2014, online]**

15. If m is non zero number and

$\int \dfrac{x^{5m-1}+2x^{4m-1}}{\left(x^{2m}+x^m+1\right)^3}\,dx = f(x) + C$, then $f(x)$ is

(a) $\dfrac{x^{5m}}{2m\left(x^{2m}+x^m+1\right)^2}$ (c) $\dfrac{2m\left(x^{5m}+x^{4m}\right)}{\left(x^{2m}+x^m+1\right)^2}$

(b) $\dfrac{x^{4m}}{2m\left(x^{2m}+x^m+1\right)^2}$ (d) $\dfrac{x^{5m}+x^{4m}}{2m\left(x^{2m}+x^m+1\right)^2}$

[2014, online]

16. The integral $\int \dfrac{dx}{x^2(x^4+1)^{3/4}}$ equals

(a) $\left(\dfrac{x^4+1}{x^4}\right)^{\frac{1}{4}}+C$ (b) $\left(x^4+1\right)^{\frac{1}{4}}+C$

(c) $-\left(x^4+1\right)^{\frac{1}{4}}+C$ (d) $-\left(\dfrac{x^4+1}{x^4}\right)^{\frac{1}{4}}+C$ **[2015]**

17. The integral $I = \int \dfrac{dx}{(x+1)^{3/4}(x-2)^{5/4}}$ is equal to

(a) $4\left(\dfrac{x+1}{x-2}\right)^{1/4}+C$ (b) $4\left(\dfrac{x-2}{x+2}\right)^{1/4}+C$

(c) $-\dfrac{4}{3}\left(\dfrac{x+1}{x-2}\right)^{1/4}+C$ (d) $-\dfrac{4}{3}\left(\dfrac{x-2}{x+1}\right)^{1/4}+C$

[2015, online]

18. If $I = \int \dfrac{\log\left(t+\sqrt{1+t^2}\right)}{\sqrt{1+t^2}}dt = \dfrac{1}{2}(g(t))^2 + C$, where C is a constant, then $g(2)$ is equal to

(a) $2\log(2+\sqrt{5})$ (b) $\log(2+\sqrt{5})$

(c) $\dfrac{1}{\sqrt{5}}\log(2+\sqrt{5})$ (d) $\dfrac{1}{2}\log(2+\sqrt{5})$

[2015, online]

19. The integral $I = \int \dfrac{2x^{12}+5x^9}{(x^5+x^3+1)^3}dx$ is equal to

(a) $\dfrac{-x^5}{(x^5+x^3+1)^2}+C$

(b) $\dfrac{x^{10}}{2(x^5+x^3+1)^5}+C$

(c) $\dfrac{x^5}{2(x^5+x^3+1)^2}+C$

(d) $\dfrac{-x^{10}}{2(x^5+x^3+1)^2}+C$ **[2016]**

20. The integral $I = \int \dfrac{dx}{(1+\sqrt{x})\sqrt{x-x^2}}$ is equal to (where C is a constant of integration)

(a) $-2\sqrt{\dfrac{1-\sqrt{x}}{1+\sqrt{x}}}+C$ (b) $-\sqrt{\dfrac{1-\sqrt{x}}{1+\sqrt{x}}}+C$

(c) $-2\sqrt{\dfrac{1-\sqrt{x}}{1+\sqrt{x}}}+C$ (d) $2\sqrt{\dfrac{1+\sqrt{x}}{1-\sqrt{x}}}+C$

[2016, online]

21. If $I = \int \dfrac{dx}{\cos^3 x\sqrt{2\sin 2x}} = (\tan x)^A + C\,(\tan x)^B + k$, where k is a constant of integration, then $A + B + C$ equals:

(a) $\dfrac{16}{5}$ (b) $\dfrac{27}{10}$

(c) $\dfrac{7}{10}$ (d) $\dfrac{21}{5}$ **[2016, online]**

Previous Years' B-Architecture Entrance Examination Questions

1. An antiderivative of the integral $\int e^x\left(\dfrac{1-x}{1+x^2}\right)^2 dx$ is

(a) $e^x(1+x^2)^2$ (b) $\dfrac{-xe^x}{\left(1+x^2\right)^2}$

(c) $\dfrac{e^x(1-x)}{\left(1+x^2\right)^2}$ (d) $\dfrac{e^x}{1+x^2}$ **[2007]**

2. Let $f : (11, \infty) \to (0, \infty)$ be given by

$f(x) = \prod_{l=1}^{10} \dfrac{1}{(x-l)}$

where for real number $a_1 \cdots a_n$

$\prod_{l=1}^{n} a_l$ denotes the product $a_1 \times a_2 \cdots \times a_n$

Statement 1: $\int f(x)\,dx = \sum_{l=1}^{10} \frac{(-1)^l \log|x-l|}{(l-1)!\,(10-l)!}$

Statement 2: For $x \in [11, \infty)$ $f(x) = \sum_{l=1}^{10} \frac{A_l}{x-l}$

where $A_1 = \prod_{j=1}^{10} \frac{j}{l-j}$ $l = 1, 2, 10$ **[2008]**

3. $\int \frac{2^{x+1} - 5^{x-1}}{10^x}\,dx$ equals

(a) $\frac{1}{5\log 2} 2^{x+1} - \frac{2}{\log 5} 5^{x-1} + C$

(b) $\frac{2(x+1)}{5^{x+1}} - \frac{x}{2^x} + C$

(c) $\frac{2(x+1)}{5^{x+1}} + \frac{x}{2^x} + C$

(d) $\frac{1}{5\log 2} 2^{-x} - \frac{2}{\log 5} 5^{-x} + C$ **[2009]**

4. The integral $\int \frac{dx}{(a^2 - b^2x^2)^{3/2}}$ equals

(a) $\frac{x}{\sqrt{a^2 - b^2x^2}} + C$

(b) $\frac{x}{a^2\sqrt{a^2 - b^2x^2}} + C$

(c) $\frac{ax}{\sqrt{a^2 - b^2x^2}} + C$

(d) $\frac{1}{a^2\sqrt{a^2 - b^2x^2}} + C$ **[2012]**

5. $\int \frac{7x^{13} + 5x^{15}}{(x^7 + x^2 + 1)^3}$ equals

(a) $\frac{x^{14}}{(x^7 + x^2 + 1)^2} + C$

(b) $\frac{x^{14}}{2(x^7 + x^2 + 1)^2} + C$

(c) $\frac{x^7}{(x^7 + x^2 + 1)^2} + C$

(d) $\frac{x^7}{2(x^7 + x^2 + 1)^2} + C$ **[2013]**

6. If $\int \frac{1 - 5\sin^2 x}{\cos^5 x \sin^2 x}\,dx = \frac{f(x)}{\cos^5 x} + C$, then $f(x)$:

(a) $-\operatorname{cosec} x$ (b) $\operatorname{cosec} x$
(c) $\cot x$ (d) $-\cot x$ **[2014]**

7. If $\int \frac{1 - x^9}{x(1 + x^9)}\,dx = A \log|x| + B \log|1 + x^9| + C$, then the ratio $A : B$ is equal to
(a) $-2 : 9$ (b) $2 : 9$
(c) $9 : -2$ (d) $9 : 2$ **[2015]**

8. If $I = \int \frac{dx}{x^3(1 + x^6)^{2/3}} = f(x)\,(1 + x^{-6})^{1/3} + C$, where C is a constant of integration, then $f(x)$ is equal to:

(a) $-\frac{1}{6}$ (b) $-\frac{6}{x}$

(c) $-\frac{x}{2}$ (d) $-\frac{1}{2}$ **[2016]**

Hints and Solutions

Concept-based

1. $\int(1 - \tan 3x)^2 = \int(1 + \tan^2 3x - 2\tan 3x)\, dx$

$= \int(\sec^2 3x - 2 \tan 3x)\, dx$

$= \dfrac{\tan 3x}{3} - \dfrac{2}{3} \log|\sec 3x| + C$

$= \dfrac{1}{3} [\tan 3x + \log \cos^2 3x] + C$

2. $\dfrac{1}{x^4 - x^2} = \dfrac{1}{x^2\,(x-1)\,(x+1)} = \dfrac{1}{2}\dfrac{1}{x^2}\left[\dfrac{1}{x-1} - \dfrac{1}{x+1}\right]$

$= \dfrac{1}{2}\left[\dfrac{1}{x-1} - \dfrac{1}{x} - \dfrac{1}{x^2} - \left[\dfrac{1}{x^2} - \left(\dfrac{1}{x} - \dfrac{1}{x+1}\right)\right]\right]$

$= \dfrac{1}{2}\left[\dfrac{1}{x-1} - \dfrac{2}{x^2} - \dfrac{1}{x+1}\right]$

$\int\dfrac{dx}{x^4 - x^2} = \dfrac{1}{2}\left[\log|x-1| - \log|x+1| + \dfrac{1}{x}\right] + C$

$= \dfrac{1}{x} + \log\left|\dfrac{x-1}{x+1}\right|^{1/2} + C.$

3. $\dfrac{x^3 - 1}{4x^3 - x} = \dfrac{1}{4} + \dfrac{\frac{1}{4}x - 1}{x(2x-1)(2x+1)}$

$= \dfrac{1}{4} + \dfrac{1}{x} - \dfrac{7}{8}\dfrac{1}{2x-1} - \dfrac{9}{8}\dfrac{1}{2x+1}$

$\int\dfrac{x^3 - 1}{4x^3 - x}\, dx = \dfrac{1}{4} + \log|x| - \dfrac{7}{16} \log|2x - 1|$

$- \dfrac{9}{16} \log|2x + 1| + C.$

4. Put $1 + x^3 = t^3 \Rightarrow x^2\, dx = t^2\, dt$

$$\int x^5 \sqrt[3]{(1 + x^3)^2}\, dx = \int(t^3 - 1)\, t^4\, dt$$

$= \dfrac{t^8}{8} - \dfrac{t^5}{5} + C$

$= \dfrac{1}{8}(1 + x^3)^{8/3} - \dfrac{1}{5}(1 + x^3)^{5/3} + C.$

5. Substitute $\tan x = t$, $\sec^2 x\, dx = dt \Rightarrow dx = \dfrac{dt}{1+t^2}$

$\int\dfrac{dx}{\sin^5 x \cos^5 x} = \int\dfrac{dt}{(1+t^2)\left(\dfrac{t}{\sqrt{1+t^2}}\right)^5\left(\dfrac{1}{\sqrt{1+t^2}}\right)^5}$

$= \int\dfrac{(1+t^2)^4}{t^5}\, dt$

$= \int\left(\dfrac{1}{t^5} + \dfrac{4}{t^3} + 6\dfrac{1}{t} + 4t + t^3\right) dt$

$= -\dfrac{t^4}{4} - 2t^{-2} + 6 \log|t| + 4\dfrac{t^2}{2} + \dfrac{t^4}{4} + C$

$= \dfrac{1}{4}(\tan^4 x - \cot^4 x) + 2(\tan^2 x - \cot^2 x) + 6 \log|\tan x|$
$+ C$

6. Put $\tan\dfrac{x}{2} = t \Rightarrow dx = \dfrac{2dt}{1+t^2}$

$\int\dfrac{dx}{5 - 4\sin x + 3\cos x}$

$= \int\dfrac{2dt}{(1+t^2)\left(5 - \dfrac{8t}{1+t^2} + \dfrac{3(1-t^2)}{1+t^2}\right)}$

$= 2\int\dfrac{dt}{2t^2 - 8t + 8}$

$= \int\dfrac{dt}{t^2 - 4t + 4} = \int\dfrac{dt}{(t-2)^2}$

$= -\dfrac{1}{t-2} + C = \dfrac{1}{2 - \tan\dfrac{x}{2}} + C$

7. Let $1 + e^x = t \Rightarrow e^x = t - 1 \Rightarrow x = \log(t - 1)$

so $dx = \dfrac{1}{t-1}\, dt$

Thus $I = \int\dfrac{dx}{1+e^x} = \int\dfrac{dt}{t\,(t-1)} = \int\left(\dfrac{1}{t-1} - \dfrac{1}{t}\right) dt$

$= \log(t - 1) - \log t + C$

$= \log e^x - \log(1 + e^x) + C$

$= x - \log(1 + e^x) + C$

$= x + \log\dfrac{1}{1+e^x} + C$

8. Integrating by parts, taking e^{4x} as first function, we have

$$\mathbf{I} = \int e^{5x} \cos 4x \, dx = \frac{1}{4} e^{5x} \sin 4x - \frac{5}{4} \int e^{5x} \sin 4x \, dx$$

$$= \frac{1}{4} e^{5x} \sin 4x - \frac{5}{4} \left[-e^{5x} \frac{\cos 4x}{4} + \frac{5}{4} \int e^{5x} \cos 4x \, dx \right]$$

$$= \frac{1}{4} e^{5x} \sin 4x + \frac{5}{16} e^{5x} \cos 4x - \frac{25}{16} \mathbf{I}$$

$$\Rightarrow \left(1 + \frac{25}{16}\right) \mathbf{I} = \frac{4}{16} e^{5x} \left(\sin 4x + \frac{5}{4} \cos 4x\right)$$

$$\Rightarrow \mathbf{I} = \frac{4}{41} e^{5x} \left(\sin 4x + \frac{5}{4} \cos x\right) + C$$

9. $\mathbf{I} = \int (3^x \cos x \, dx$

$$= 3^x \sin x - \log 3 \int 3^x \sin x \, dx$$

$$= 3^x \sin x - \log 3 \left[- 3^x \cos x + (\log 3) \int 3^x \cos x \, dx\right]$$

$$= 3^x \sin x + (\log 3), 3^x \cos x - (\log 3)^2$$

$$\Rightarrow \quad (1 + (\log 3)^2) \mathbf{I} = 3^x (\sin x + (\log 3) \cos x)$$

$$\mathbf{I} = \frac{3^x (\sin x + (\log 3) \cos x)}{\left(1 + (\log 3)^2\right)}.$$

10. $$\int \frac{dx}{\sin 2x - 2 \sin x} = \frac{1}{2} \int \frac{dx}{\sin x (\cos x - 1)}$$

$$= \frac{1}{2} \int \frac{\sin x \, dx}{\left(1 - \cos^2 x\right) (\cos x - 1)}$$

$$= \frac{1}{2} \int \frac{-\sin x \, dx}{(1 - \cos x)^2 \, (1 + \cos x)}$$

$$= \frac{1}{2} \int \frac{dt}{(1 - t)^2 \, (1 + t)} \qquad (t = \cos x)$$

$$= \frac{1}{4} \int \left(\frac{1}{2} \frac{t}{1 + t} + \frac{1}{2} \frac{1}{1 - t} + \frac{1}{(1 - t)^2} \right) dt$$

$$= \frac{1}{4} \left[\frac{1}{2} \log |1 + t| - \frac{1}{2} \log |1 - t| + \frac{1}{1 - t} \right] + C$$

$$= \frac{1}{4} \left[\frac{1}{1 - \cos x} + \frac{1}{2} \log \left| \frac{1 + \cos x}{1 - \cos x} \right| \right] + C$$

$$= \frac{1}{8} \frac{1}{\sin^2 \frac{x}{2}} - \frac{1}{8} \log \left| \frac{2 \sin^2 x/2}{2 \cos^2 x/2} \right| + C$$

$$= \frac{1}{8} \frac{1}{\sin^2 x/2} - \frac{1}{4} \log |\tan x/2| + C$$

Level 1

11. Put $f_n(x) = t$, $\dfrac{dt}{dx} = \dfrac{1}{x \, f_1(x) \ldots f_{n-1}(x)}$

So $\int [x \, f_1(x) \ldots f_n(x)]^{-1} \, dx = \int \frac{dt}{t} = \log t + C$

$= f_{n+1}(x) + C.$

12. Put $3^{3^{3^x}} = t \Rightarrow (\log 3)^3 \; 3^{3^{3^x}} \,.\, 3^{3^x} \,.\, 3x = \dfrac{dt}{dx}$

So given integral is equal to $\displaystyle\int \frac{dt}{(\log 3)^3} = \frac{t}{(\log 3)^3} + C.$

13. Integrating by parts taking $\log (1 - \sqrt{x})$ as the first function, the given integral can be written as

$$x \log (1 - \sqrt{x}) + \frac{1}{2} \int \frac{\sqrt{x}}{1 - \sqrt{x}} \, dx$$

$$= x \log (1 - \sqrt{x}) + \int \frac{t^2}{1 - t} \, dt$$

$$= x \log (1 - \sqrt{x}) + \int \left(-t - 1 + \frac{1}{1 - t} \right) dt$$

$$= (x - 1) \log (1 - \sqrt{x}) \frac{x}{2} - \sqrt{x} + C.$$

14. Write the integrand as $\dfrac{1}{x} + 1 - \dfrac{(x + 1) \, e^x}{1 + x \, e^x}$.

So the given integral is equal to

$\log x + x - \log (1 + x \, e^x) + C$

$= \log x + \log e^x - \log (1 + x \, e^x) + C$

$= \log \dfrac{xe^x}{1 + xe^x} + C.$

15. Write the given integral as $- \sqrt{2} \int \cos (2x + x/4) \, dx$.

$$= -\frac{1}{\sqrt{2}} \sin \left(2x + \frac{\pi}{4}\right) + C = \frac{1}{\sqrt{2}} \sin \left(2x + \frac{5\pi}{4}\right) + C.$$

16. $$\int \frac{x + \sin x}{1 + \cos x} dx = \frac{1}{2} \int x \sec^2 \frac{x}{2} \, dx + \int \frac{\sin x}{1 + \cos x} dx$$

$$= \frac{1}{2} \left[2x \tan \frac{x}{2} - 2 \int \tan \frac{x}{2} \right] + \int \tan \frac{x}{2} \, dx$$

$$= x \tan \frac{x}{2} + C.$$

17. $$\frac{\sin 2x}{\cos^4 x + \sin^4 x} = \frac{2 \sin x \cos x}{\cos^4 x + \sin^4 x} = \frac{2 \tan x \sec^2 x}{1 + \tan^4 x}$$

Now put $\tan^2 x = t$.

18. $f(x) = \displaystyle\int \frac{\log (\tan x)}{\sin x \cos x} = \frac{1}{2} (\log \tan x)^2 + C$

$0 = f \left(\dfrac{\pi}{4}\right) = \dfrac{1}{2} (\log 1)^2 + C \Rightarrow C = 0$

19. $f(x) = \displaystyle\int \cos \sqrt{4 - x} \; dx + C$

$= - 2 \displaystyle\int t \cos t \, dt, t = \sqrt{4 - x}$

$$= -2\left(\sqrt{4-x}\sin\sqrt{4-x}+\cos\sqrt{4-x}\right)+C$$

$-20 = f(4) = -2 + C \Rightarrow C = -18.$

20. Let the two antiderivates be $e^x + C_1$ and $e^x + C_2$
At $x = 1$, $C_1 - C_2 = 2$
At $x = 100$ it is $e^{100} + C_1 - e^{100} - C_2$
$= C_1 - C_2 = 2.$

21. $$\frac{1}{\cos^6 x+\sin^6 x}=\frac{1}{1-3\sin^2 x\cos^2 x}$$

$$= \frac{\sec^4 x}{\sec^4 x-3\tan^2 x}=\frac{(1+\tan^2 x)\sec^2 x}{(1+\tan^2 x)^2-3\tan^2 x}$$

Putting $\tan x = t$, the given integral reduces to

$$\int\frac{1+t^2}{1+t^4-t^2}\,dt=\int\frac{1+1/t^2}{t^2+1/t^2-1}\,dt$$

$$= \int\frac{du}{u^2+1},\ u = t - 1/t$$

$$= \tan^{-1}(\tan x - \cot x) + C$$

$$= \cot^{-1}\left(-\frac{1}{2}\tan 2x\right) + C$$

$$= \tan^{-1}\left(\frac{1}{2}\tan 2x\right) + \text{Const.}$$

22. $$\frac{\sin^2 x}{1+\sin^2 x}=1-\frac{1}{1+\sin^2 x}=1-\frac{\sec^2 x}{1+2\tan^2 x}$$

So $$\int\frac{\sin^2 x}{1+\sin^2 x} = x - \frac{1}{\sqrt{2}}\tan^{-1}(\sqrt{2}\tan x) + C.$$

23. $$\int\tan^4 x\,dx=\int\tan^2 x(\sec^2 x-1)dx$$

$$= \frac{\tan^3 x}{3}-\int(\sec^2 x-1)\,dx$$

$$= \frac{\tan^2 x}{3} - \tan x + x + C.$$

24. Integrating by parts, the given integral equals

$$x\log\left(\sqrt{1-x}+\sqrt{1+x}\right)-I$$

where $$I = \int x\frac{d}{dx}\left(\log\left(\sqrt{1-x}+\sqrt{1+x}\right)\right)dx$$

$$= \frac{1}{2}\int\frac{x}{\sqrt{1-x^2}}\left(\frac{\sqrt{1-x}-\sqrt{1+x}}{\sqrt{1-x}+\sqrt{1+x}}\right)dx$$

$$= \frac{1}{2}\int\frac{x}{\sqrt{1-x^2}}\left(\frac{2-2\sqrt{1-x^2}}{-2x}\right)dx \text{ (Rationalizing)}$$

$$= -\frac{1}{2}\int\frac{dx}{\sqrt{1-x^2}}+\frac{1}{2}\int dx=-\frac{1}{2}\sin^{-1}x+\frac{1}{2}x+C$$

25. The given integral is equal to

$$\int x\log(x+1)dx-\int x\log x\,dx$$

$$= \frac{x^2}{2}\log(x+1)-\frac{1}{2}\int\frac{x^2}{x+1}\,dx$$

$$-\frac{x^2}{2}\log x+\frac{1}{2}\int\frac{x^2}{x}\,dx$$

$$= \frac{x^2}{2}\log(x+1)-\frac{x^2}{2}\log x$$

$$-\frac{1}{2}\int\left(x-1+\frac{1}{x+1}\right)dx+\frac{1}{2}\int x\,dx$$

$$= \frac{x^2}{2}\log(x+1)-\frac{x^2}{2}\log x+\frac{x}{2}-\frac{1}{2}\log(x+1)+C$$

$$\Rightarrow f(x) = \frac{x^2}{2}-\frac{1}{2},\ g(x) = -\frac{1}{2}\log x,\ L = \frac{1}{2}.$$

26. The integrand is equal $\dfrac{1}{3}\left(\dfrac{1}{x^2+1}-\dfrac{1}{x^2+4}\right)$

The integral can now be easily evaluated to give

$$\frac{1}{3}\tan^{-1}x-\frac{1}{6}\tan^{-1}\frac{x}{2}+C.$$

27. The integrand can be written as

$$\text{cosec}^2 x+\frac{1-\cos 2x}{2}-2.$$

So the integral is $-\cot x - \dfrac{1}{4}\sin^2 x-\dfrac{3}{2}+C.$

28. Putting $1 + e^x = t^2$. The given integral reduces to

$$2\int\log(t^2-1)\,dt$$

$$= 2\left[t\log(t^2-1)-2\int\left(1+\frac{1}{t^2-1}\right)dt\right]$$

$$= 2\left[t\log(t^2-1)-2\left(t+\frac{1}{2}\log\frac{t-1}{t+1}\right)\right]+C$$

$$= 2x\sqrt{1+e^x}-4\sqrt{1+e^x}-2\log\frac{\sqrt{1+e^x}-1}{\sqrt{1+e^x}+1}+C$$

So $$f(x) = 2(x-2),\ g(x) = \frac{\sqrt{1+e^x}-1}{\sqrt{1+e^x}+1}.$$

29. Put $t = 1 + \frac{1}{x}$, the given integral reduces to

$$-\int\frac{\log t}{t} = -\frac{1}{2}(\log t)^2 + C$$

$$= -\frac{1}{2}[\log(x+1)]^2 - \frac{1}{2}(\log x)^2$$

$$+ \log(x+1)\log x + C.$$

30. The given integral is equal to $\frac{1}{2}$ [log | tan x | + C

So $f(x) = \log x$ and $g(x) = \tan x$, dom $f = (0, \infty)$.

31. Differentiating both sides, we get

$$f(x) = \frac{\sin\sqrt{x}}{\sqrt{x}}.$$

32. Putting $t = \tan\frac{x}{2}$, the given integral reduces to

$$\int\frac{dt}{3t^2+2t+2} = \frac{1}{3}\int\frac{dt}{(t+1/3)^2+(\sqrt{5}/3)^2}$$

$$= \frac{1}{\sqrt{5}}\tan^{-1}\frac{3\tan x/2+1}{\sqrt{5}} + C.$$

33. The integrand can be written as $\frac{\sec^2 x}{\tan^2 x(2+\tan^2 x)}$

putting $\tan x = t$, the integral reduces to

$$\int\frac{dt}{t^2(2+t^2)} = \frac{1}{2}\int\left(\frac{1}{t^2}-\frac{1}{2+t^2}\right)dt$$

$$= \frac{1}{2}\left[-\frac{1}{t}-\frac{1}{\sqrt{2}}\tan^{-1}\frac{t}{\sqrt{2}}\right] + C$$

$$= \left(-\frac{1}{2}\right)\left[\cot x+\left(\frac{1}{\sqrt{2}}\right)\tan^{-1}\left(\left(\frac{1}{\sqrt{2}}\right)\tan x\right)\right]+C$$

34. Put $x^{1/2} = t$, the given integral reduces to

$$2\int\frac{t\,dt}{\sqrt{t^2+t^3}} = 2\int\frac{dt}{\sqrt{t+1}} = 4\sqrt{1+x^{1/2}} + C$$

35. Putting $t = e^x$, the integral reduces to

$$\int\frac{t^2+1}{t^4-t^2+1} = \int\frac{1+1/t^2}{(t-1/t)^2+1}\,dt$$

$$= \int\frac{du}{u^2+1}\quad(u = t - 1/t)$$

$$= \tan^{-1}(e^x - e^{-x}) + C$$

36. The given integral is equal to

$$\int e^{\sec x}\sec x(\sec x\tan x + \tan^2 x + \sec x + \tan x)dx$$

$$= \int e^{\sec x}\sec x\tan x(\sec x + \tan x) + e^{\sec x}(\sec^2 x + \sec x\tan x)\,dx$$

$$= \int\frac{d}{dx}(e^{\sec x}(\sec x + \tan x))dx$$

$$= e^{\sec x}(\sec x + \tan x) + C.$$

37. Writing $3\cos x + 2\sin x = A(4\sin x + 5\cos x) + B(4\cos x - 5\sin x)$ and comparing the coefficients we obtain $A = \frac{23}{41}$ and $B = \frac{2}{41}$. Thus the given integral reduces to

$$\frac{23}{41}\int dx + \frac{2}{41}\int\frac{4\cos x - 5\sin x}{4\sin x + 5\cos x}dx$$

$$= \frac{23}{41}x + \frac{2}{41}\log|4\sin x + 5\cos x| + C.$$

38. Dividing numerator by $\cos^2 x$, the given integral reduces to

$$\int\frac{\sec^2 x\,dx}{4(1+\tan^2 x) - 3 + 5\tan^2 x} = \int\frac{dt}{9t^2+1}$$

$$= \frac{1}{9}\int\frac{dt}{t^2+(1/3)^2} = \frac{1}{3}\tan^{-1}(3t) + C.$$

39. $f\,o\,g(x) = \frac{\sin^2 x}{1+\sin^2 x}$, put $\sin x = t$, the given integral reduces to $\int\frac{t^2}{1+t^2}\,dt$

$$= \int 1\,dt - \int\frac{dt}{1+t^2} = \sin x - \tan^{-1}(\sin x) + C$$

40. $P(x) + Q(x) = \int\frac{x^3+1}{x^3-x^2}\,dx$

$$= \int\left(1+\frac{2}{x-1}-\frac{1}{x}-\frac{1}{x^2}\right)dx$$

$$= x + 2\log|x-1| - \log|x| + \frac{1}{x} + C$$

Since

$(P + Q)(2) = \frac{5}{2}$ so $C = \log 2$.

Hence

$(P + Q)(3) = \frac{10}{3} + \log\frac{8}{3}$.

41. $$\frac{x^4-1}{x^2\left(1+x^2+x^4\right)^{1/2}} = \frac{\left(x^2-1\right)\left(x^2+1\right)}{x^3\left(x^2+1+1/x^2\right)^{1/2}}$$

$$= \frac{(x+1/x)\left(1-1/x^2\right)}{\left((x+1/x)^2-1\right)^{1/2}}$$

$$\int \frac{x^4 - 1}{x^2\left(1 + x^2 + x^4\right)^{1/2}}\, dx = \int \frac{u}{(u^2 - 1)^{1/2}}\, du,$$

$$u = x + 1/x$$

$$= \sqrt{u^2 - 1} + C$$

$$= \sqrt{x^2 + \frac{1}{x^2} + 1} + C = \sqrt{\frac{x^4 + x^2 + 1}{x}} + C.$$

42. $\int \frac{1}{x} \log_{ex} e\, dx = \int \frac{1}{x} \frac{\log_c e}{\log_e ex}\, dx$

$$= \int \frac{1}{x} \frac{1}{1 + \log_e x}\, dx = \log_e\left(1 + \log_e x\right) + C.$$

43. The given integral is equal to $I_1 + I_2$ where

$$I_1 = \int \frac{x}{\sqrt{1 - 9x^2}}\, dx = -\frac{1}{18} \int \frac{dt}{\sqrt{t}} \left(t = 1 - 9x^2\right)$$

$$= \frac{-1}{9} \sqrt{1 - 9x^2} + C$$

$$I_2 = \int \frac{\left(\cos^{-1} 3x\right)^2}{\sqrt{1 - 9x^2}}\, dx = \frac{-1}{3} \int t^2\, dt, t = \cos^{-1} 3x$$

$$= -\frac{\left(\cos^{-1} 3x\right)^3}{9}.$$

44. Put $\log\left(x + \sqrt{1 + x^2}\right) = t,\ dt = \frac{dx}{\sqrt{1 + x^2}}$

45. Put $\sqrt{x} = \sec \theta$, given integral reduces to

$$\int \theta\, 2\sec^2 \theta \tan \theta\, d\theta = \int \theta \frac{d}{d\theta}\left(\sec^2 \theta\right) d\theta$$

$$= \theta \sec^2 \theta - \int \sec^2 \theta\, d\theta$$

$$= \theta \sec^2 \theta - \tan \theta + C$$

46. Put $\sqrt{x} = t$ in I and $e^{-x} = t$ in J.

47. Put $x = \sin^2 u$.

48. Put $x e^x = t$.

49. $F(x) = C - \frac{1}{4} \log\left|\tan \frac{x}{2}\right| + \frac{1}{8 \sin^2 \frac{x}{2}}$

(Put $\tan x/2 = t$)

50. $\int x e^x \left(x^2 + 1\right) dx = (1/2) \int e^t (t + 1)\, dt \quad (t = x^2)$

$$= (1/2)\ e^t.t + c = e^{x^2} . \frac{x^2}{2} + c.$$

Level 2

51. We have

$$f'(x) = (x^3 - 2x^2 + 3)\ e^{3x}$$

$$= (x + 1)\ (x^2 - 3x + 3)\ e^{3x}$$

As e^{3x} and $x^2 - 3x + 3 > 0\ \forall\ x \in \mathbf{R}$

We get $f'(x) = 0 \Rightarrow x = -1$.

Thus, number of critical points of f is 1.

52. We have

$$f'(x) = \frac{3x + 2}{x^4 - x^3 + x^2 - 1} = \frac{3x + 2}{(x - 1)(x^3 + x + 1)}$$

Note that $x^3 + x + 1 = 0$ has exactly one real root, say α.

$\therefore f'(x)$ does not exist for $x = 1$ and $x = \alpha$.

Also, $f'(x) = 0$ for $x = -2/3$.

Thus, f has 3 critical points.

53. $f'(x) = \frac{x - 2}{x^2 - 7x + 12} = \frac{x - 2}{(x - 3)(x - 4)}$

Note that

$$f'(x) < 0 \text{ for } x < 2$$
$$> 0 \text{ for } 2 < x < 3$$
$$< 0 \text{ for } 3 < x < 4$$
$$> 0 \text{ for } x > 4$$

Thus, $f(x)$ increases on $(2, 3) \cup (4, \infty)$.

54. Let $I = \int e^{\sin x} \frac{(x \cos^3 x - \sin x)}{1 - \sin^2 x}\, dx$

$$= \int e^{\sin x} (x \cos x - \tan x \sec x)\, dx.$$

$$= \int x e^{\sin x} \cos x\, dx - \int e^{\sin x} \tan x \sec x\, dx$$

$$= x e^{\sin x} - \int e^{\sin x}\, dx$$

$$- e^{\sin x} \sec x + \int e^{\sin x} \cos x \sec x\, dx$$

$$= e^{\sin x} (x - \sec x) + C$$

55. Let $I = \int \frac{4e^x + 6e^{-x}}{9e^x - 4e^{-x}}\, dx$

$$= \int \frac{4e^{2x} + 6}{9e^{2x} - 4}\, dx$$

Put $e^{2x} = t$, so that

$$I = \int \frac{4t + 6}{9t - 4} \cdot \frac{1}{2t}\, dt$$

$$= \int\left[\frac{-3}{4}\frac{1}{t} + \frac{35}{4}\frac{1}{9t-4}\right]dt$$

$$= \frac{-3}{4}\ln|t| + \frac{35}{36}\ln|9t-4| + C$$

$$= \frac{-3}{2}x + \frac{35}{36}\ln\left(9e^{2x}-4\right) + C$$

$\therefore\ A = \frac{-3}{2},\ B = \frac{35}{36}.$

Alternatively differentiate both the sides w.r.t. x, we get

$$\frac{4\,e^{x}+6\,e^{-x}}{9\,e^{x}-4\,e^{-x}} = A + \frac{18\,Be^{2x}}{9\,e^{2x}-4}$$

$\Rightarrow 4e^{x} + 6e^{-x} = A\ (9e^{x} - 4^{e-x}) + 18\ Be^{x}$

Equating the coefficients of e^{x} and $e,^{-x}$

We get $4 = 9A + 18\ B$ and $6 = -4A$

$\Rightarrow A = \frac{-3}{2},\ B = \frac{35}{36}$

56. First show that $f(x) = e^{x}$

Let $I = \int\frac{x\,e^{x}}{\sqrt{1+e^{x}}}dx$

$$= 2x\sqrt{1+e^{x}} - 2I_1$$

where $I_1 = \int\sqrt{1+e^{x}}\,dx$

Put $1 + e^{x} = t^{2}$, so that

$$I_1 = \int\frac{t\,2t}{t^{2}-1}dt = 2\int\left[1+\frac{1}{t^{2}-1}\right]dt$$

$$= 2\left[t+\frac{1}{2}\log\left|\frac{t-1}{t+1}\right|\right]$$

$$= 2\sqrt{1+e^{x}} + \log\left|\frac{\sqrt{1+e^{x}}-1}{\sqrt{1+e^{x}}+1}\right|$$

Thus,

$$I = 2x\sqrt{1+e^{x}} - 4\sqrt{1+e^{x}} - 2\log\left|\frac{\sqrt{1+e^{x}-1}}{\sqrt{1+e^{x}+1}}\right| + C$$

57. Put $1 + x^{4} = t$, so that

$$\int\frac{x^{7}}{\left(1+x^{4}\right)^{2}}dx = \frac{1}{4}\int\frac{(t-1)}{t^{2}}dt$$

$$= \frac{1}{4}\ \log|t| + \frac{1}{4}\frac{1}{t} + C$$

$$= \frac{1}{4}\left[\log(1+x^{4}) + \frac{1}{1+x^{4}}\right] + C$$

$$\therefore\ f(x) = \frac{1}{1+x^{4}}$$

58. We have

$$f(x) = \int\frac{\cos^{4}x+\sin^{4}x}{\cos^{2}x-\sin^{2}x}dx$$

Using, $2(\cos^{4}x + \sin^{4}x)$

$= (\cos^{2}x + \sin^{2}x)^{2} + (\cos^{2}x - \sin^{2}x)^{2}$, we can write

$$f(x) = \frac{1}{2}\int\frac{1}{\cos^{2}x-\sin^{2}x}dx + \frac{1}{2}\int\left(\cos^{2}x-\sin^{2}x\right)dx$$

$$= \frac{1}{2}\int\sec 2x\,dx + \frac{1}{2}\int\cos 2x\,dx$$

$$= \frac{1}{4}\log\left|\tan\left(x+\frac{\pi}{4}\right)\right| + \frac{1}{4}\ \sin 2\,x + C$$

$$= \frac{1}{4}\log\left|\frac{1+\tan x}{1-\tan x}\right| + \frac{1}{2}\sin x\ \cos x + C$$

Since $f(0) = 0$, we get $C = 0$.

59. Integrating by parts repeatedly, we get

$\int P(x)\ v\ (x)dx = P(x)\ v_1\ (x) - \int P'(x)\ v_1\ (x)dx$

$= P(x)\ v_1\ (x) - P'(x)\ v_2\ (x) + \int P''(x)v_2\ (x)\ dx$

$= P(x)\ v_1\ (x) - P'(x)\ v_2\ (x) + P''\ (x)\ v_3\ (x) - \ldots.$

$+ (-1)^{n}\int P^{(n)}\ (x)\ v_n\ (x)\ dx$

Now, use $P^{(n)}\ (x) = n!$

60. Differentiating both the sides w · r · t · x, and simplifying, we get

$$\frac{x+1}{(x^{2}+x+1)^{3/2}} = \frac{3k}{2}\frac{x+1}{(x^{2}+x+1)^{3/2}} \Rightarrow k = \frac{2}{3}.$$

61. First show that $f(x) = 2x$. Now,

$$I = \int\frac{f\ (x)\tan^{-1}x}{(1+x^{2})^{2}}dx = \int\frac{2x}{(1+x^{2})^{2}}\ \tan^{-1}x\ dx$$

Put $x = \tan\ \theta$, so that

$$I = \int\frac{2\tan\theta}{\sec^{4}\theta}\theta\sec^{2}\theta\,d\theta$$

$$= \int\theta\sin(2\theta)\,d\theta$$

$$= -\frac{1}{2}\theta\cos 2\theta + \frac{1}{4}\ \sin 2\theta + C$$

$$= C - \frac{1}{2}\theta\frac{1-\tan^{2}\theta}{1+\tan^{2}\theta} + \frac{1}{2}\frac{\tan\theta}{1+\tan^{2}\theta}$$

$$= C - \frac{1}{2}\frac{1-x^{2}}{1+x^{2}}\tan^{-1}x + \frac{1}{2}\frac{x}{1+x^{2}}$$

$$= C - \frac{1}{1+x^2}\tan^{-1} x + \frac{1}{2}\tan^{-1} x + \frac{1}{2}\frac{x}{1+x^2}.$$

62. $I = \int \frac{dx}{4\sqrt{(x-1)^3\,(x+2)^5}}$

$$= \int \left(\frac{x-1}{x+2}\right)^{-3/4} \frac{1}{(x+1)^2}\,dx$$

Now, put $\frac{x-1}{x+1} = t$, to obtain

$$I = \frac{1}{3}\int t^{-3/4}\,dt = \frac{4}{3}t^{1/4} + C\cdot$$

63. We can write

$$I = \int \frac{-2\sin^2 2x\cos x\sin x}{\cos^2 x - \sin^2 x}\,dx.$$

$$= -\int \frac{\sin^3 2x}{\cos 2x}\,dx = -\int \frac{\sin^3 2x}{1-\sin^2 2x}\cos 2x\,dx$$

Put $\sin 2x = t$, to obtain

$$I = -\frac{1}{2}\int \frac{t^3}{1-t^2}\,dt = \frac{1}{2}\int \frac{t(1-t^2)-t}{1-t^2}\,dt$$

$$= \frac{1}{4}t^2 + \frac{1}{4}\log|1-t^2| + C$$

$$= \frac{1}{4}\sin^2 2x + \frac{1}{2}\log|\cos 2x| + C.$$

64. $f'(x) = \lim_{n\to\infty} \frac{x^n - x^{-n}}{x^n + x^{-n}} = \lim_{n\to\infty} \frac{1-(1/x)^{2n}}{1+(1/x)^{2n}} = 1$

$(1/x < 1)$

Using integration by parts, we get

$$I = \int \frac{x\log\left(x+\sqrt{1+x^2}\right)}{\sqrt{1+x^2}}\,dx$$

$$= \sqrt{1+x^2}\log\left(x+\sqrt{1+x^2}\right)dx - \int dx$$

$$= \sqrt{1+x^2}\log\left(x+\sqrt{1+x^2}\right) - x + C.$$

65. Put $x^{1/3} = \theta$ so that $dx = 3\theta^2 d\theta$

$$\therefore I = 3\int \theta^2 \sin\theta\,d\theta$$

$$= -3\theta^2\cos\theta + 6\int \theta\cos\theta\,d\theta$$

$$= -3\theta^2\cos\theta + 6\theta\sin\theta - 6\int \sin\theta\,d\theta$$

$$= 3(2-\theta^2)\cos\theta + 6\theta\sin\theta + C.$$

66. First show that $f(x) = 2e^x$. Now,

$$I = \int \frac{2e^x}{3+8e^x}\,dx$$

$$= \frac{1}{4}\log(3+8e^x) + C.$$

67. Differentiating both the sides w.r.t. x, we get

$$\frac{f(x)}{x^2-x+1} = \frac{3}{2}\frac{2x-1}{x^2-x+1} + \frac{1}{\sqrt{3}}\frac{1}{1+(2x-1)^{2/3}}\left(\frac{2}{\sqrt{3}}\right)$$

$$= \frac{3}{2}\frac{2x-1}{x^2-x+1} + \frac{1}{2(x^2-x+1)}$$

$\Rightarrow f(x) = 3x - 1.$

68. Let $I = \int \frac{dx}{x^2\sqrt{1+x^2}}$

Put $x = 1/t$, to obtain

$$I = -\int \frac{t\,d\,t}{\sqrt{1+t^2}} = -\sqrt{1+t^2} + C$$

$$= C - \frac{\sqrt{1+x^2}}{x}$$

Thus, $f(x) = 1 + x^2$.

69. Write the given integral as

$$I = \frac{1}{\sqrt{2}}\int \frac{dx}{\cos^4 x\sqrt{\tan x}}$$

Put $\tan x = t$ to obtain

$$I = \frac{1}{\sqrt{2}}\int \frac{1+t^2}{\sqrt{t}}\,dt = \frac{1}{\sqrt{2}}\int [t^{-1/2} + t^{3/2}]\,dt$$

$$= \frac{1}{\sqrt{2}}\left[2\sqrt{t} + \frac{2}{5}t^{5/2}\right] + C$$

$$= \sqrt{2}\left[\sqrt{\tan x} + \frac{1}{5}(\tan x)^{5/2}\right] + C.$$

Thus, I is an irrational function of $\tan x$.

70. $I = \int \sqrt{e^x - 1}\,dx$

Put $e^x - 1 = t^2$, so that $e^x dx = 2t\,dt$

$$\therefore I = \int \frac{t\,2t}{t^2+1}\,dt = 2\int \frac{t^2+1-1}{t^2+1}\,dt$$

$$= 2[t - \tan^{-1} t] + C$$

$$= 2\left[\sqrt{e^x-1} - \tan^{-1}\sqrt{e^x-1}\right] + C$$

$= 2\,[(\text{fog})\,(x) - (\text{hofog})\,(x)\,] + C.$

71. Put $2x + 1 = t$, so that $f(x) = \sqrt{t^2-4}$, then

$$I = \frac{1}{4}\int \frac{t+5}{\sqrt{t^2-4}}\,dt$$

$$= \frac{1}{4}\sqrt{t^2-4} + \frac{5}{4}\log\left|t+\sqrt{t^2-4}\right| + C$$

$$= \frac{1}{4}f\,(x) + \frac{5}{4}\log\,|2x + 1 + f(x)| + C.$$

72. $I = \displaystyle\int \frac{\sin x\,dx}{(1-\cos^2 x)(2\cos^2 x - 1)}$

Put $\cos x = t$, so that

$$I = \int \frac{dt}{(1-t^2)(1-2t^2)}$$

$$= \int\left[\frac{2}{1-2t^2} - \frac{1}{1-t^2}\right]dt$$

$$= \frac{2}{\sqrt{2}}\ \log\left|\frac{1+\sqrt{2}t}{1-\sqrt{2}t}\right| - \log\ \left|\frac{1+t}{1-t}\right| + C$$

$= \sqrt{2}\,(\text{hof})\,(x) + (\text{hog})\,(x).$

73. $I = \displaystyle\int \frac{\sqrt{x^2+4}}{x^6}\,dx = \int \frac{\sqrt{1+4/x^2}}{x^2}\,\frac{dx}{x^3}$

Put $\dfrac{1}{x^2} = t$, so that

$$I = \int t\sqrt{1+4t}\,\frac{(-1)}{2}\,dt$$

$$= -\frac{1}{8}\int (4t+1-1)\sqrt{1+4t}\ dt$$

$$= -\frac{1}{8}\left[(4t+1)^{5/2}\left(\frac{2}{5}\right)\left(\frac{1}{4}\right) - \left(\frac{2}{3}\right)\left(\frac{1}{4}\right)(1+4t)^{3/2}\right] + C$$

$$= \frac{1}{48}\left(1+\frac{4}{x^2}\right)^{3/2} - \frac{1}{80}\left(1+\frac{4}{x^2}\right)^{5/2} + C$$

$$= \frac{1}{240x^5}\ [5x^2\,(f(x))^3 - 3(f(x))^5] + C.$$

74. $I = \displaystyle\int \frac{\log\cos x}{\cos^2 x}\,dx\ = \int \sec^2 x\log\cos x\,dx$

$$= (\tan x)\,\log\,\cos\,x - \int \tan x\left(\frac{-\sin x}{\cos x}\right)dx$$

$$= (\tan x)\,\log\,\cos\,x + \int (\sec^2 - 1)\,dx$$

$$= (\tan x)\,[\log\,\cos\,x + 1] - x + C$$

$$= \frac{g\,(x)}{f(x)}\ [\log f(x) + 1] - x + C.$$

75. $I = \displaystyle\int (2\cos^2 x - 1)\,(4\cos^3 x - 3\cos x)\,dx$

$$= \int \cos 2x\cos 3x\,dx$$

$$= \frac{1}{2}\int [\cos 5x + \cos x]\,dx$$

$$= \frac{1}{10}\sin 5x + \frac{1}{2}\sin x + C\,.$$

76. $I_n + I_{n+2} = \displaystyle\int \cot^n x\,\text{cosec}^2 x\,dx = -\frac{1}{n+1}\cot^{n+1} x$

Now,

$I_0 + I_1 + 2\,(I_2 + I_3 + \cdots + I_8) + I_9 + I_{10}$

$= (I_0 + I_2) + (I_1 + I_3) + (I_2 + I_3)$

$+ \cdots + (I_7 + I_9) + (I_8 + I_{10})$

$$= -\left(u + \frac{1}{2}u^2 + \frac{1}{3}u^3 + \cdots + \frac{1}{9}u^9\right)$$

where $u = \cot x$.

Thus, $A = -1$

77. $f(x) = \displaystyle\int (1+\cot^2 x)\,\text{cosec}^2 x\,dx$

$$= -\left(\cot x + \frac{1}{3}\cot^3 x\right) + C$$

which is a polynomial of degree 3.

78. $I = \displaystyle\int \frac{x^2}{\sqrt{x^2-a^2}}\,dx$

$$= \int \sqrt{x^2-a^2}\ dx + a^2\int \frac{dx}{\sqrt{x^2-a^2}}$$

$$= \frac{1}{2}x\sqrt{x^2-a^2} - \frac{1}{2}a^2\,\log\,\left|x+\sqrt{x^2-a^2}\right|$$

$$+\ a^2\log\left|x+\sqrt{x^2-a^2}\right| + c$$

$$= \frac{1}{2}x\,f\,(x) + \frac{1}{2}a^2\log|x + f(x)| + C$$

79. We have

$$(\text{fof})(x)\ = f(f(x)) = \frac{f(x)}{\left[1+(f(x))^n\right]^{1/n}}$$

$$= \frac{x}{\left(1+2x^n\right)^{1/n}}$$

Similarly, $(\text{fofof})\,(x)\ = \dfrac{x}{\left(1+3x^n\right)^{1/n}}$

Continuing in this way we get

$$g(x) = \underbrace{(\text{fof}\cdots\text{of})(x)}_{n\text{ times}} = \frac{x}{(1+nx^n)^{1/n}}$$

Thus, $I = \int x^{n-2}\frac{x}{(1+nx^n)^{1/n}}\,dx$

Put $1 + nx^n = t^n$ to obtain

$$I = \frac{1}{n}\int \frac{t^{n-1}}{t}\,dt = \frac{1}{n}\int t^{n-2}\,dt$$

$$= \frac{1}{n(n-1)}t^{n-1}+C = \frac{1}{n\left(n-1\right)}\left(1+nx^n\right)^{1-1/n}+C$$

80. Let $x^5 = t$, so $\int x^9 f(x^5)\,dx$

$$= \frac{1}{5}\int t\,f(t)\,dt$$

$$= \frac{1}{5}\left[t\int f(t)\,dt - \int \phi(t)\,dt\right]$$

$$= \frac{1}{5}\left[x^5\,\phi(x^5) - 5\int \phi(x^5)\,x^4\,dx\right] + C$$

$$= \frac{1}{5}\,x^5\,\phi(x^5) - \int x^4\,\phi(x^5)\,dx + C$$

Previous Years' AIEEE/JEE Main Questions

1. $I = \int\frac{\sin x}{\sin(x-\alpha)}dx = \int\frac{\sin\{(x-\alpha)+\alpha\}}{\sin(x-\alpha)}dx$

$$= \int[\cos\alpha+\sin\alpha\cot(x-\alpha)]dx$$

$= x\cos\alpha + \sin\alpha\log|\sin(x-\alpha)|\ C$

$\therefore\ (A, B) = (\cos\alpha, \sin\alpha)$

2. $\int\frac{dx}{\cos x-\sin x} = \int\frac{dx}{\cos x+\cos\left(\frac{\pi}{2}+x\right)}$

$$= \frac{1}{2}\int\frac{dx}{\cos(\pi/4)\cos(x+\pi/4)}$$

$$= \frac{1}{\sqrt{2}}\int\sec\left(x+\frac{\pi}{4}\right)dx$$

$$= \frac{1}{\sqrt{2}}\log\left|\tan\left(\frac{x}{2}+\frac{\pi}{8}+\frac{\pi}{4}\right)\right|+C$$

$$= \frac{1}{\sqrt{2}}\log\left|\tan\left(\frac{x}{2}+\frac{3\pi}{8}\right)\right|+C$$

3. Put $\log x = t$, so that $x = e^t$ and $dx = e^t dt$. Thus

$$I = \int\frac{(t-1)^2}{(1+t^2)^2}e^t\,dt = \int\frac{t^2+1-2t^2}{(1+t^2)^2}e^t\,dt$$

$$= \int\left[\frac{1}{1+t^2}-\frac{2t}{(1+t^2)^2}\right]e^t\,dt$$

$$= \int[f(t)+f'(t)]\,e^t\,dt \quad\text{where } f(t) = \frac{1}{1+t^2}$$

$$= f(t)\ e^t + C$$

$$= x\cdot\frac{1}{1+(\log x)^2} + C$$

4. $I = \int\frac{dx}{\cos x+\sqrt{3}\sin x}$

$$= \frac{1}{2}\int\frac{dx}{\frac{1}{2}\cos x+\frac{\sqrt{3}}{2}\sin x}$$

$$= \frac{1}{2}\int\frac{dx}{\cos\left(x-\frac{\pi}{3}\right)}$$

$$= \frac{1}{2}\int\sec\left(x-\frac{\pi}{3}\right)dx$$

$$= \frac{1}{2}\log\left|\tan\left(\frac{x}{2}-\frac{\pi}{6}+\frac{\pi}{4}\right)\right|+C$$

$$= \frac{1}{2}\log\left|\tan\left(\frac{x}{2}+\frac{\pi}{12}\right)\right|+C$$

5. Same as Q1. Take $\alpha = \frac{\pi}{4}$, so $\int\frac{\sin x}{\sin\left(x-\frac{\pi}{4}\right)}dx$

$$= \cos\frac{\pi}{4}x+\sin\frac{\pi}{4}\log\left|\sin\left(x-\frac{\pi}{4}\right)\right|+\text{Const}$$

$$= \frac{1}{\sqrt{2}}\left[x+\log\left|\sin\left(x-\frac{\pi}{4}\right)\right|\right]+\text{Const}$$

6. Let $I = \int\frac{5\tan x}{\tan x-2}\,dx = \int\frac{5\sin x}{\sin x-2\cos x}\,dx$

Let $5\sin x = A(\sin x - 2\cos x) + B(\cos x + 2\sin x)$. Equating coefficients of $\sin x$ and $\cos x$, we get $5 = A + 2B$ and $0 = -2A + B \Rightarrow A = 1,\ B = 2$
